---------------	--------------------------------------

Implements [Go::ParamVolume](#).

29.321.3.15 `void Go::Parallelepiped::swapParameterDirection ( int pardir1, int pardir2 )` [virtual]

Swaps two parameter directions

#### Parameters

<i>pardir1</i>	One of the parameter directions (0, 1 or 2) to be swapped
<i>pardir2</i>	The other parameter direction (0, 1 or 2) to be swapped

Implements [Go::ParamVolume](#).

29.321.3.16 `DirectionCone Go::Parallelepiped::tangentCone ( int pardir ) const` [virtual]

Creates a [DirectionCone](#) covering all tangents to this volume along a given parameter direction.

#### Parameters

<i>pardir</i>	if 1, the <a href="#">DirectionCone</a> will be defined on basis of the volume's tangents along the first parameter direction. If 2, the second parameter direction will be used. If 3, the third parameter direction will be used.
---------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this volume along the specified parameter direction.

Implements [Go::ParamVolume](#).

29.321.3.17 `virtual void Go::Parallelepiped::translate ( const Point & vec )` [virtual]

Translate.

Implements [Go::ParamVolume](#).

29.321.3.18 `virtual void Go::Parallelepiped::write ( std::ostream & os ) const` [virtual]

write object to stream

## Parameters

<i>os</i>	stream to which object is written
-----------	-----------------------------------

Implements [Go::Streamable](#).

### 29.322.1 Detailed Description

This is a class that represents the "intersection object" of a scalar (a "0-variate" function).

Definition at line 53 of file Param0FunctionInt.h.

### 29.322.2 Constructor & Destructor Documentation

#### 29.322.2.1 Go::Param0FunctionInt::Param0FunctionInt ( double C ) [explicit]

Constructor.

Parameters

<code>C</code>	the constant defining the object.
----------------	-----------------------------------

#### 29.322.2.2 Go::Param0FunctionInt::Param0FunctionInt ( double C, ParamFunctionInt \* parent ) [explicit]

Constructor.

Parameters

<code>C</code>	the constant defining the object.
<code>parent</code>	the parent object to this object.

29.322.2.3 virtual Go::Param0FunctionInt::~~Param0FunctionInt ( ) [virtual]

Destructor.

### 29.322.3 Member Function Documentation

29.322.3.1 virtual bool Go::Param0FunctionInt::boundaryPoint ( const double \* *par*, double *eps* ) const [virtual]

Return true if the specified point lies within eps from the boundary.

#### Parameters

<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .
<i>eps</i>	the tolerance defining boundary neighbourhood.

Implements [Go::ParamObjectInt](#).

29.322.3.2 virtual bool Go::Param0FunctionInt::canDivide ( int *pardir* ) [virtual]

Return true if we are allowed to divide in the specified parameter direction.

#### Parameters

<i>pardir</i>	the parameter direction in question.
---------------	--------------------------------------

Implements [Go::ParamObjectInt](#).

29.322.3.3 virtual CompositeBox Go::Param0FunctionInt::compositeBox ( ) const [virtual]

Return the [CompositeBox](#) for the parametric object.

Implements [Go::ParamObjectInt](#).

29.322.3.4 int Go::Param0FunctionInt::dimension ( )

Return the dimension of the geometric space.

29.322.3.5 virtual double Go::Param0FunctionInt::endParam ( int *pardir* ) const [virtual]

Return the end parameter in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

29.322.3.6 `virtual void Go::Param0FunctionInt::getBoundaryObjects ( std::vector< shared_ptr< BoundaryFunctionInt > & bd_objs ) [virtual]`

Return the boundary objects of this object.

Parameters

<i>bd_objs</i>	the boundary objects of this object.
----------------	--------------------------------------

Implements [Go::ParamFunctionInt](#).

29.322.3.7 `virtual std::vector<double> Go::Param0FunctionInt::getCriticalVals ( int padir ) const [virtual]`

Return the critical parameter values in the specified direction.

Parameters

<i>padir</i>	the parameter direction in question. Indexing starts at 0.
--------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

29.322.3.8 `virtual std::vector<double> Go::Param0FunctionInt::getCriticalValsAndKnots ( int padir ) const [virtual]`

Return the critical parameter values and inner knots for object.

Parameters

<i>padir</i>	the parameter direction in question. Indexing starts at 0.
--------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

29.322.3.9 `virtual std::vector<double> Go::Param0FunctionInt::getInnerKnotVals ( int padir, bool sort = false ) const [virtual]`

Return the inner knot values in the specified direction.

Parameters

<i>padir</i>	the parameter direction in question. Indexing starts at 0.
<i>sort</i>	the returned values may be sorted by the function.

Implements [Go::ParamObjectInt](#).

29.322.3.10 `virtual void Go::Param0FunctionInt::getLengthAndWiggle ( double * length, double * wiggle )` [virtual]

Return an estimate on the size and wiggle of the object.

#### Parameters

<i>length</i>	the approximative length of the object in the corresponding parameter directions. The size of the array should be equal to <code>numParams()</code> .
<i>wiggle</i>	a scalar representing the wiggle of the object in the corresponding parameter directions. The size of the array should be equal to <code>numParams()</code> .

Implements [Go::ParamObjectInt](#).

29.322.3.11 `virtual std::vector<double>::iterator Go::Param0FunctionInt::getMesh ( )` [virtual]

Return the geometric sample mesh for the parametric function.

Implements [Go::ParamFunctionInt](#).

29.322.3.12 `virtual int Go::Param0FunctionInt::getMeshSize ( int dir )` [virtual]

Return the size of the geometric sample mesh in the specified direction.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
------------	------------------------------------------------------------

Implements [Go::ParamFunctionInt](#).

29.322.3.13 `virtual Param0FunctionInt* Go::Param0FunctionInt::getParam0FunctionInt ( )` [virtual]

Return pointer to this object.

Reimplemented from [Go::ParamFunctionInt](#).

29.322.3.14 `double Go::Param0FunctionInt::getValue ( ) const` [inline]

Return the scalar value of this object.

Definition at line 238 of file `Param0FunctionInt.h`.

29.322.3.15 `virtual bool Go::Param0FunctionInt::hasCriticalVals ( int pardir ) const` [virtual]

Return true if the object has any critical parameter values in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

**29.322.3.16** `virtual bool Go::Param0FunctionInt::hasCriticalValsOrKnots ( int pardir ) const` [virtual]

Return true if the object has any critical parameter values or inner knots in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

**29.322.3.17** `virtual bool Go::Param0FunctionInt::hasInnerKnots ( int pardir ) const` [virtual]

Return true if the object has any inner knots in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

**29.322.3.18** `virtual int Go::Param0FunctionInt::knotIntervalFuzzy ( double & t, double tol ) const` [virtual]

Return the knot interval for which *t* lies inside, possibly moving the value *t* if it lies close to a knot.

## Parameters

<i>t</i>	the parameter value
<i>tol</i>	the parametric tolerance deciding if the input parameter should be moved.

**29.322.3.19** `virtual bool Go::Param0FunctionInt::monotone ( Point & dir, double tol = 1.0e-15 ) const` [virtual]

Return true if the object is monotone in any direction.

## Parameters

<i>dir</i>	the direction in which the object is monotone. Relevant only if object is monotone.
------------	-------------------------------------------------------------------------------------

Implements [Go::ParamFunctionInt](#).

29.322.3.20 `virtual double Go::Param0FunctionInt::nextSegmentVal ( double par, bool forward ) const` [virtual]

Return the value of the knot closest to the input parameter.

Parameters

<i>par</i>	the parameter value
<i>forward</i>	if true we return the closest knot to the right, otherwise the closest knot to the left.

29.322.3.21 `virtual int Go::Param0FunctionInt::numParams ( ) const` [virtual]

The number of parameters in the object.

Implements [Go::ParamObjectInt](#).

29.322.3.22 `virtual double Go::Param0FunctionInt::paramFromMesh ( int dir, int idx )` [virtual]

Return the corresponding mesh parameter.

Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>idx</i>	the mesh idx in the specified direction. Indexing starts at 0.

Implements [Go::ParamFunctionInt](#).

29.322.3.23 `virtual void Go::Param0FunctionInt::point ( Point & res, const double * par ) const` [virtual]

Evaluate the object in the input parameter.

Parameters

<i>res</i>	the <a href="#">Point</a> to be returned.
<i>par</i>	the parameter in which to evaluate. The size of the array should be equal to <a href="#">numParams()</a> .

Implements [Go::ParamObjectInt](#).

29.322.3.24 `virtual void Go::Param0FunctionInt::point ( std::vector< Point > & pt, const double * tpar, int derivs, const bool * from_right = 0, double resolution = 1.0e-12 ) const` [inline],[virtual]

Evaluate the object in the input parameter, with the specified number of derivatives.

Parameters

<i>pt</i>	the <a href="#">Point</a> to be returned.
-----------	-------------------------------------------

## Parameters

<i>tpar</i>	the parameter in which to evaluate. The size of the array should be equal to <code>numParams()</code> .
<i>derivs</i>	the number of derivatives to calculate.
<i>from_right</i>	if true the evaluation is to be performed from the right side of the parameter value.
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular: knot values in case of spline objects).

Implements [Go::ParamObjectInt](#).

Definition at line 85 of file `Param0FunctionInt.h`.

**29.322.3.25** `virtual double Go::Param0FunctionInt::startParam ( int parDir ) const` `[virtual]`

Return the start parameter value in the specified direction.

## Parameters

<i>parDir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

**29.322.3.26** `virtual void Go::Param0FunctionInt::subdivide ( int parDir, double par, std::vector< shared_ptr< ParamFunctionInt > > & subdiv_objs, std::vector< shared_ptr< ParamFunctionInt > > & bd_objs )` `[virtual]`

Subdivide the object in the specified parameter direction and parameter value.

## Parameters

<i>parDir</i>	direction in which to subdivide. Indexing starts at 0.
<i>par</i>	parameter in which to subdivide.
<i>subdiv_objs</i>	the subparts of this object. Of the same geometric dimension as this object.
<i>bd_objs</i>	the boundaries between the returned <i>subdiv_objs</i> . Of geometric dimension 1 less than this object.

Implements [Go::ParamFunctionInt](#).

## 29.322.4 Member Data Documentation

**29.322.4.1** `double Go::Param0FunctionInt::C_` `[protected]`

Definition at line 243 of file `Param0FunctionInt.h`.

**29.322.4.2** `int Go::Param0FunctionInt::dim_` `[protected]`

Definition at line 245 of file `Param0FunctionInt.h`.

29.322.4.3 `ParamFunctionInt* Go::Param0FunctionInt::parentcurve_` [protected]

Definition at line 247 of file Param0FunctionInt.h.

### 29.323.1 Detailed Description

Class that represents an "intersection object" of a parametric curve of dimension 1.

Definition at line 54 of file [Param1FunctionInt.h](#).

### 29.323.2 Constructor & Destructor Documentation

**29.323.2.1** [Go::Param1FunctionInt::Param1FunctionInt](#) ( shared\_ptr< [ParamCurve](#) > [curve](#) ) [\[explicit\]](#)

Constructor.

Parameters

<i>curve</i>	the parametric 1-dimensional curve defining the intersection object.
--------------	----------------------------------------------------------------------

29.323.2.2 `Go::Param1FunctionInt::Param1FunctionInt ( shared_ptr< ParamCurve > curve, ParamFunctionInt * parent ) [explicit]`

Constructor.

Parameters

<i>curve</i>	the parametric 1-dimensional curve defining the intersection object.
<i>parent</i>	the parent object to this object. Can be either a curve or a surface.

29.323.2.3 `virtual Go::Param1FunctionInt::~~Param1FunctionInt ( ) [virtual]`

Destructor.

### 29.323.3 Member Function Documentation

29.323.3.1 `void Go::Param1FunctionInt::assureInRange ( double & t )`

Make sure that the input parameter lies inside the range of the parametric curve. Set *t* equal to *tmin* if it lies below *tmin*, or *tmax* if it lies above *tmax*.

Parameters

<i>t</i>	the input parameter
----------	---------------------

29.323.3.2 `virtual bool Go::Param1FunctionInt::boundaryPoint ( const double * par, double eps ) const [virtual]`

Return true if the specified point lies within *eps* from the boundary.

Parameters

<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .
<i>eps</i>	the tolerance defining boundary neighbourhood.

Implements [Go::ParamObjectInt](#).

29.323.3.3 `virtual bool Go::Param1FunctionInt::canDivide ( int pardir ) [virtual]`

Return true if we are allowed to divide in the specified parameter direction.

Parameters

<i>pardir</i>	the parameter direction in question.
---------------	--------------------------------------

Implements [Go::ParamObjectInt](#).

29.323.3.4 `virtual CompositeBox Go::Param1FunctionInt::compositeBox ( ) const [virtual]`

Return the [CompositeBox](#) for the parametric object.

Implements [Go::ParamObjectInt](#).

29.323.3.5 `int Go::Param1FunctionInt::dimension ( ) [inline]`

Return the dimension of the geometric space.

Definition at line 256 of file Param1FunctionInt.h.

29.323.3.6 `virtual double Go::Param1FunctionInt::endParam ( int pardir ) const [inline],[virtual]`

Return the end parameter in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Definition at line 215 of file Param1FunctionInt.h.

29.323.3.7 `double Go::Param1FunctionInt::endparam ( ) const [inline]`

Return the end parameter of the curve.

Definition at line 263 of file Param1FunctionInt.h.

29.323.3.8 `virtual void Go::Param1FunctionInt::getBoundaryObjects ( std::vector< shared_ptr< BoundaryFunctionInt > & bd_objs ) [virtual]`

Return the boundary objects of this object.

#### Parameters

<i>bd_objs</i>	the boundary objects of this object.
----------------	--------------------------------------

Implements [Go::ParamFunctionInt](#).

29.323.3.9 `virtual std::vector<double> Go::Param1FunctionInt::getCriticalVals ( int pardir ) const [virtual]`

Return the critical parameter values in the specified direction.

## Parameters

<i>parDir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

29.323.3.10 `virtual std::vector<double> Go::Param1FunctionInt::getCriticalValsAndKnots ( int parDir ) const`  
[virtual]

Return the critical parameter values and inner knots for object.

## Parameters

<i>parDir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::Spline1FunctionInt](#).

29.323.3.11 `virtual std::vector<double> Go::Param1FunctionInt::getInnerKnotVals ( int parDir, bool sort = false ) const`  
[virtual]

Return the inner knot values in the specified direction.

## Parameters

<i>parDir</i>	the parameter direction in question. Indexing starts at 0.
<i>sort</i>	the returned values may be sorted by the function.

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::Spline1FunctionInt](#).

29.323.3.12 `virtual void Go::Param1FunctionInt::getLengthAndWiggle ( double * length, double * wiggle )` [virtual]

Return an estimate on the size and wiggle of the object.

## Parameters

<i>length</i>	the approximative length of the object in the corresponding parameter directions. The size of the array should be equal to <a href="#">numParams()</a> .
<i>wiggle</i>	a scalar representing the wiggle of the object in the corresponding parameter directions. The size of the array should be equal to <a href="#">numParams()</a> .

Implements [Go::ParamObjectInt](#).

29.323.3.13 `virtual std::vector<double>::iterator Go::Param1FunctionInt::getMesh ( ) [virtual]`

Return the geometric sample mesh for the parametric function.

Implements [Go::ParamFunctionInt](#).

Reimplemented in [Go::Spline1FunctionInt](#).

29.323.3.14 `virtual int Go::Param1FunctionInt::getMeshSize ( int dir ) [virtual]`

Return the size of the geometric sample mesh in the specified direction.

Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
------------	------------------------------------------------------------

Implements [Go::ParamFunctionInt](#).

Reimplemented in [Go::Spline1FunctionInt](#).

29.323.3.15 `virtual Param1FunctionInt* Go::Param1FunctionInt::getParam1FunctionInt ( ) [virtual]`

Return pointer to this object.

Reimplemented from [Go::ParamFunctionInt](#).

29.323.3.16 `shared_ptr<ParamCurve> Go::Param1FunctionInt::getParamCurve ( )`

Return pointer to the parametric curve.

29.323.3.17 `shared_ptr<const ParamCurve> Go::Param1FunctionInt::getParamCurve ( ) const`

Return pointer to the parametric curve.

29.323.3.18 `shared_ptr<ParamCurve> Go::Param1FunctionInt::getParentParamCurve ( double & start, double & end )`

Return pointer to a subpart of the parent curve of this object. If a parent curve does not exist, return pointer to curve in this object. To reduce numerical noise we go straight to the source (undivided) curve.

29.323.3.19 `shared_ptr<ParamCurve> Go::Param1FunctionInt::getParentParamCurve ( )`

Return pointer to the parent curve of this object. If a parent curve does not exist, return pointer to curve in this object. To reduce numerical noise we go straight to the source (undivided) curve.

29.323.3.20 `virtual bool Go::Param1FunctionInt::hasCriticalVals ( int pardir ) const [virtual]`

Return true if the object has any critical parameter values in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

**29.323.3.21** `virtual bool Go::Param1FunctionInt::hasCriticalValsOrKnots ( int pardir ) const` [virtual]

Return true if the object has any critical parameter values or inner knots in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::Spline1FunctionInt](#).

**29.323.3.22** `virtual bool Go::Param1FunctionInt::hasInnerKnots ( int pardir ) const` [virtual]

Return true if the object has any inner knots in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::Spline1FunctionInt](#).

**29.323.3.23** `virtual bool Go::Param1FunctionInt::isDegenerate ( double epsge, int dir, double * par )` [virtual]

Return true if the object is degenerate in the specified direction and parameter.

## Parameters

<i>epsge</i>	the geometric tolerance defining degeneracy.
<i>dir</i>	the parameter direction in question.
<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .

Reimplemented from [Go::ParamObjectInt](#).

**29.323.3.24** `virtual int Go::Param1FunctionInt::knotIntervalFuzzy ( double & t, double tol ) const` [virtual]

Return the knot interval for which *t* lies inside, moving the value *t* if it lies close to a knot.

## Parameters

<i>t</i>	the parameter value
<i>tol</i>	the parametric tolerance deciding if the input parameter <i>t</i> should be moved.

Reimplemented in [Go::Spline1FunctionInt](#).

```
29.323.3.25 virtual shared_ptr<Param1FunctionInt> Go::Param1FunctionInt::makeIntFunction (shared_ptr<
ParamCurve > curve) [virtual]
```

Return an intersection object for the input curve. This object is used as the parent for the intersection object.

## Parameters

<i>curve</i>	the parametric curve defining the intersection object.
--------------	--------------------------------------------------------

Reimplemented in [Go::Spline1FunctionInt](#).

```
29.323.3.26 virtual bool Go::Param1FunctionInt::monotone (Point & dir, double tol=1.0e-15) const [virtual]
```

Return true if the curve is monotone.

## Parameters

<i>dir</i>	the direction in which the object is monotone. Is not of interest here as the curve has only 1 parameter direction.
------------	---------------------------------------------------------------------------------------------------------------------

## Returns

Whether or not the curve is monotone.

Implements [Go::ParamFunctionInt](#).

Reimplemented in [Go::Spline1FunctionInt](#).

```
29.323.3.27 virtual double Go::Param1FunctionInt::nextSegmentVal (double par, bool forward) const [virtual]
```

Return the value of the knot next to the input parameter *par*.

## Parameters

<i>par</i>	the parameter value
<i>forward</i>	if true we return the closest knot to the right, otherwise the closest knot to the left.

**Returns**

The knot closest to the input parameter.

Reimplemented in [Go::Spline1FunctionInt](#).

**29.323.3.28** `virtual int Go::Param1FunctionInt::numParams ( ) const [virtual]`

The number of parameters in the object.

Implements [Go::ParamObjectInt](#).

**29.323.3.29** `virtual double Go::Param1FunctionInt::paramFromMesh ( int dir, int idx ) [virtual]`

Return the corresponding mesh parameter.

**Parameters**

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>idx</i>	the mesh idx in the specified direction. Indexing starts at 0.

Implements [Go::ParamFunctionInt](#).

Reimplemented in [Go::Spline1FunctionInt](#).

**29.323.3.30** `virtual void Go::Param1FunctionInt::point ( Point & res, const double * par ) const [inline], [virtual]`

Evaluate the object in the input parameter.

**Parameters**

<i>res</i>	the <a href="#">Point</a> to be returned.
<i>par</i>	the parameter in which to evaluate. The size of the array should be equal to <a href="#">numParams()</a> .

Implements [Go::ParamObjectInt](#).

Definition at line 76 of file Param1FunctionInt.h.

**29.323.3.31** `virtual void Go::Param1FunctionInt::point ( std::vector< Point > & res, double par, int der ) [inline], [virtual]`

Evaluate the object in the input parameter, with the specified number of derivatives.

**Parameters**

<i>res</i>	the <a href="#">Point</a> to be returned.
<i>par</i>	the parameter in which to evaluate. The size of the array should be equal to <a href="#">numParams()</a> .
<i>der</i>	the number of derivatives to calculate.

Definition at line 85 of file Param1FunctionInt.h.

```
29.323.3.32 virtual void Go::Param1FunctionInt::point (std::vector< Point > & pt, const double * tpar, int derivs, const
bool * from_right = 0, double resolution = 1.0e-12) const [inline],[virtual]
```

Evaluate the object in the input parameter, with the specified number of derivatives.

#### Parameters

<i>pt</i>	the <a href="#">Point</a> to be returned.
<i>tpar</i>	the parameter in which to evaluate. The size of the array should be equal to <a href="#">numParams()</a> .
<i>derivs</i>	the number of derivatives to calculate.
<i>from_right</i>	if true the evaluation is to be performed from the right side of the parameter value.
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular: knot values in case of spline objects).

Implements [Go::ParamObjectInt](#).

Definition at line 99 of file Param1FunctionInt.h.

```
29.323.3.33 virtual double Go::Param1FunctionInt::startParam (int pardir) const [inline],[virtual]
```

Return the start parameter value in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Definition at line 209 of file Param1FunctionInt.h.

```
29.323.3.34 double Go::Param1FunctionInt::startparam () const [inline]
```

Return the start parameter of the curve.

Definition at line 260 of file Param1FunctionInt.h.

```
29.323.3.35 virtual void Go::Param1FunctionInt::subdivide (int pardir, double par, std::vector< shared_ptr<
ParamFunctionInt > > & subdiv_objs, std::vector< shared_ptr< ParamFunctionInt > > & bd_objs)
[virtual]
```

Subdivide the object in the specified parameter direction and parameter value.

#### Parameters

<i>pardir</i>	direction in which to subdivide. Indexing starts at 0.
<i>par</i>	parameter in which to subdivide.
<i>subdiv_objs</i>	The subparts of this object. Of the same geometric dimension as this object. <span style="float: right;">Generated by Doxygen</span>
<i>bd_objs</i>	the boundaries between the returned <i>subdiv_objs</i> . Of geometric dimension 1 less than this object.

Implements [Go::ParamFunctionInt](#).

### 29.324.1 Detailed Description

Class that represents the "intersection object" of a parametric surface of dimension 1.

Definition at line 57 of file Param2FunctionInt.h.

### 29.324.2 Constructor & Destructor Documentation

**29.324.2.1** `Go::Param2FunctionInt::Param2FunctionInt ( shared_ptr< ParamSurface > surf ) [explicit]`

Constructor.

#### Parameters

<i>surf</i>	the parametric 1-dimensional surface defining the object.
-------------	-----------------------------------------------------------

**29.324.2.2** `Go::Param2FunctionInt::Param2FunctionInt ( shared_ptr< ParamSurface > surf, Param2FunctionInt * parent ) [explicit]`

Constructor.

#### Parameters

<i>surf</i>	the parametric 1-dimensional surface defining the object.
<i>parent</i>	the parent object to this object.

**29.324.2.3** `virtual Go::Param2FunctionInt::~~Param2FunctionInt ( ) [inline],[virtual]`

Destructor.

Definition at line 72 of file Param2FunctionInt.h.

### 29.324.3 Member Function Documentation

29.324.3.1 void Go::Param2FunctionInt::assureInRange ( int *pardir*, double & *t* )

Make sure that the input parameter lies inside the range of the parametric surface. Set *t* equal to *umin/vmin* if it lies below *umin/vmin*, or *umax/vmax* if it lies above *umax/vmax*.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
<i>t</i>	the input parameter

29.324.3.2 virtual bool Go::Param2FunctionInt::boundaryPoint ( const double \* *par*, double *eps* ) const [virtual]

Return true if the specified point lies within *eps* from the boundary.

#### Parameters

<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .
<i>eps</i>	the tolerance defining boundary neighbourhood.

Implements [Go::ParamObjectInt](#).

29.324.3.3 virtual bool Go::Param2FunctionInt::canDivide ( int *pardir* ) [virtual]

Return true if we are allowed to divide in the specified parameter direction.

#### Parameters

<i>pardir</i>	the parameter direction in question.
---------------	--------------------------------------

Implements [Go::ParamObjectInt](#).

29.324.3.4 virtual CompositeBox Go::Param2FunctionInt::compositeBox ( ) const [virtual]

Return the [CompositeBox](#) for the parametric object.

#### Returns

The [compositeBox](#) for the parametric object.

Implements [Go::ParamObjectInt](#).

29.324.3.5 `void Go::Param2FunctionInt::derivs ( double u, double v, Point & deriv_u, Point & deriv_v ) const`  
`[inline]`

Return the partial derivatives in the input parameter point.

#### Parameters

<i>u</i>	the u-parameter
<i>v</i>	the v-parameter
<i>deriv</i> <sub>↔<i>u</i></sub>	the partial derivative in the u-direction.
<i>deriv</i> <sub>↔<i>v</i></sub>	the partial derivative in the v-direction.

Definition at line 351 of file Param2FunctionInt.h.

29.324.3.6 `int Go::Param2FunctionInt::dimension ( )` `[inline]`

Return the dimension of the geometric space.

Definition at line 278 of file Param2FunctionInt.h.

29.324.3.7 `virtual double Go::Param2FunctionInt::endParam ( int par_dir ) const` `[virtual]`

Return the end parameter in the specified direction.

#### Parameters

<i>par_dir</i>	the parameter direction in question. Indexing starts at 0.
----------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::Spline2FunctionInt](#).

29.324.3.8 `Go::SplineCurve* Go::Param2FunctionInt::extractBdCurve ( const Go::SplineSurface &, int bdidx, int & par_dir, double & tpar ) const` `[protected]`

29.324.3.9 `virtual void Go::Param2FunctionInt::getBoundaryObjects ( std::vector< shared_ptr< BoundaryFunctionInt > & bd_objs )` `[virtual]`

Return the boundary objects of this object.

#### Parameters

<i>bd_objs</i>	the boundary objects of this object.
----------------	--------------------------------------

Implements [Go::ParamFunctionInt](#).

Reimplemented in [Go::Spline2FunctionInt](#).

29.324.3.10 `shared_ptr<ParamCurve> Go::Param2FunctionInt::getConstantParameterCurve ( int dir, double par )`

Return a curveOnSurface along the current surface in the given direction and parameter value

29.324.3.11 `virtual std::vector<double> Go::Param2FunctionInt::getCriticalVals ( int pardir ) const [virtual]`

Return the critical parameter values in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

29.324.3.12 `virtual std::vector<double> Go::Param2FunctionInt::getCriticalValsAndKnots ( int pardir ) const [virtual]`

Return the critical parameter values and inner knots for the object.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::Spline2FunctionInt](#).

29.324.3.13 `virtual std::vector<double> Go::Param2FunctionInt::getInnerKnotVals ( int pardir, bool sort = false ) const [virtual]`

Return the inner knot values in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
<i>sort</i>	the returned values may be sorted by the function.

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::Spline2FunctionInt](#).

29.324.3.14 `shared_ptr<ParamCurve> Go::Param2FunctionInt::getIsoCurve ( double param_start, double param_end, double isoval, bool pardir_is_u ) const`

Returns the specified isocurve.

## Parameters

<i>param_start</i>	start parameter for the isocurve.
<i>param_end</i>	end parameter for the isocurve.
<i>isoval</i>	the value for the isoparameter.
<i>pardir_is_u</i> ↔ <i>_u</i>	if 'pardir_is_u' is 'true', then the first parameter is the running direction and the second parameter is the isoparameter; vice versa for 'pardir_is_u' equal to 'false'.

29.324.3.15 `virtual void Go::Param2FunctionInt::getLengthAndWiggle ( double * length, double * wiggle ) [virtual]`

Return an estimate on the size and wiggle of the object.

## Parameters

<i>length</i>	the approximative length of the object in the corresponding parameter directions. The size of the array should be equal to <a href="#">numParams()</a> .
<i>wiggle</i>	a scalar representing the wiggle of the object in the corresponding parameter directions. The size of the array should be equal to <a href="#">numParams()</a> .

Implements [Go::ParamObjectInt](#).

29.324.3.16 `virtual std::vector<double>::iterator Go::Param2FunctionInt::getMesh ( ) [virtual]`

Return the geometric sample mesh for the parametric function.

Implements [Go::ParamFunctionInt](#).

29.324.3.17 `virtual int Go::Param2FunctionInt::getMeshSize ( int dir ) [virtual]`

Return the size of the geometric sample mesh in the specified direction.

## Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
------------	------------------------------------------------------------

Implements [Go::ParamFunctionInt](#).

29.324.3.18 `std::vector<double> Go::Param2FunctionInt::getMima ( ) const`

Return the domain of the surface.

## Returns

The returned vector consists of (umin, umax, vmin, vmax).

29.324.3.19 `virtual Param2FunctionInt* Go::Param2FunctionInt::getParam2FunctionInt ( ) [virtual]`

Return pointer to this object.

Reimplemented from [Go::ParamFunctionInt](#).

29.324.3.20 `shared_ptr<ParamSurface> Go::Param2FunctionInt::getParamSurface ( )`

Return pointer to the parametric surface.

29.324.3.21 `shared_ptr<const ParamSurface> Go::Param2FunctionInt::getParamSurface ( ) const`

Return pointer to the parametric surface.

29.324.3.22 `shared_ptr<ParamSurface> Go::Param2FunctionInt::getParentParamSurface ( RectDomain & domain )`

Return pointer to a subpart of the parent surface of this object. If a parent surface does not exist, return pointer to surface in this object. To reduce numerical noise we go straight to the source (undivided) surface.

29.324.3.23 `shared_ptr<ParamSurface> Go::Param2FunctionInt::getParentParamSurface ( )`

Return pointer to the parent-curve of this object. If a parent surface does not exist, return pointer to surface in this object. To reduce numerical noise we go straight to the source (undivided) surface.

29.324.3.24 `shared_ptr<ParamSurface> Go::Param2FunctionInt::getSurface ( ) [inline]`

Return pointer to the parametric surface.

#### Returns

The pointer to the parametric surface.

Definition at line 338 of file Param2FunctionInt.h.

29.324.3.25 `shared_ptr<const ParamSurface> Go::Param2FunctionInt::getSurface ( ) const [inline]`

Return pointer to the parametric surface.

#### Returns

The pointer to the parametric surface.

Definition at line 343 of file Param2FunctionInt.h.

29.324.3.26 `virtual bool Go::Param2FunctionInt::hasCriticalVals ( int pdir ) const [virtual]`

Return true if the object has any critical parameter values in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

**29.324.3.27** `virtual bool Go::Param2FunctionInt::hasCriticalValsOrKnots ( int pardir ) const` [virtual]

Return true if the object has any critical parameter values or inner knots in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::Spline2FunctionInt](#).

**29.324.3.28** `virtual bool Go::Param2FunctionInt::hasInnerKnots ( int pardir ) const` [virtual]

Return true if the object has any inner knots in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::Spline2FunctionInt](#).

**29.324.3.29** `bool Go::Param2FunctionInt::isDegenerate ( double epsge, int pardir )`

Return true if the object is degenerate in the specified direction.

## Parameters

<i>epsge</i>	the geometric tolerance defining degeneracy.
<i>pardir</i>	the parameter direction in question.

**29.324.3.30** `virtual bool Go::Param2FunctionInt::isDegenerate ( double epsge, int pardir, double * par )` [virtual]

Return true if the object is degenerate in the specified direction and parameter.

## Parameters

<i>epsge</i>	the geometric tolerance defining degeneracy.
<i>pardir</i>	the parameter direction in question.
<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .

Reimplemented from [Go::ParamObjectInt](#).

**29.324.3.31** `double Go::Param2FunctionInt::isolateDegPar ( int dir, int deg_edge, double threshold )`

Return info on parameter domain which needs special treatment near a degenerated edge.

## Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>deg_edge</i>	the degenerate edge
<i>threshold</i>	a tolerance

## Returns

a safe parameter value that is isolated from the degenerate value

**29.324.3.32** `virtual int Go::Param2FunctionInt::knotIntervalFuzzy ( int pardir, double & t, double tol ) const` `[virtual]`

Return the knot interval for which t lies inside, moving the value t if it lies close to a knot.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
<i>t</i>	the parameter value.
<i>tol</i>	the parametric tolerance deciding if the input parameter t should be moved.

Reimplemented in [Go::Spline2FunctionInt](#).

**29.324.3.33** `virtual shared_ptr<Param2FunctionInt> Go::Param2FunctionInt::makeIntFunction ( shared_ptr<ParamSurface> surf )` `[virtual]`

Return an intersection object for the input surface. This object is used as the parent for the intersection object.

## Parameters

<i>surf</i>	the parametric surface defining the intersection object.
-------------	----------------------------------------------------------

Reimplemented in [Go::Spline2FunctionInt](#).

29.324.3.34 `virtual bool Go::Param2FunctionInt::monotone ( Point & dir, double tol = 1.0e-15 ) const` [virtual]

Return true if the surface is monotone in any direction.

#### Parameters

<i>dir</i>	the direction in which the surface is monotone. Pertains only if surface is monotone.
------------	---------------------------------------------------------------------------------------

#### Returns

Whether or not the surface is monotone.

Implements [Go::ParamFunctionInt](#).

Reimplemented in [Go::Spline2FunctionInt](#).

29.324.3.35 `virtual double Go::Param2FunctionInt::nextSegmentVal ( int pdir, double par, bool forward ) const`  
[virtual]

Return the value of the knot next to the input parameter par.

#### Parameters

<i>pdir</i>	the parameter direction in question. Indexing starts at 0.
<i>par</i>	the parameter value
<i>forward</i>	if true we return the closest knot to the right, otherwise the closest knot to the left.

#### Returns

The knot closest to the input parameter.

Reimplemented in [Go::Spline2FunctionInt](#).

29.324.3.36 `virtual int Go::Param2FunctionInt::numParams ( ) const` [virtual]

The number of parameters in the object.

Implements [Go::ParamObjectInt](#).

29.324.3.37 `virtual double Go::Param2FunctionInt::paramFromMesh ( int dir, int idx )` [virtual]

Return the corresponding mesh parameter.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>idx</i>	the mesh idx in the specified direction. Indexing starts at 0.

Implements [Go::ParamFunctionInt](#).

**29.324.3.38** `virtual void Go::Param2FunctionInt::point ( Point & res, const double * par ) const [inline], [virtual]`

Evaluate the object in the input parameter.

#### Parameters

<i>res</i>	the <a href="#">Point</a> to be returned.
<i>par</i>	the parameter in which to evaluate. The size of the array should be equal to <a href="#">numParams()</a> .

Implements [Go::ParamObjectInt](#).

Definition at line 78 of file Param2FunctionInt.h.

**29.324.3.39** `virtual void Go::Param2FunctionInt::point ( std::vector< Point > & pt, const double * tpar, int der, const bool * from_right = 0, double resolution = 1.0e-12 ) const [inline], [virtual]`

Evaluate the object in the input parameter, with the specified number of derivatives.

#### Parameters

<i>pt</i>	the vector of points to be returned.
<i>tpar</i>	the parameter in which to evaluate. The size of the array should be equal to <a href="#">numParams()</a> .
<i>der</i>	the number of derivatives to calculate.
<i>from_right</i>	if true the evaluation is to be performed from the right side of the parameter value.
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular: knot values in case of spline objects).

Implements [Go::ParamObjectInt](#).

Definition at line 92 of file Param2FunctionInt.h.

**29.324.3.40** `virtual double Go::Param2FunctionInt::startParam ( int paddir ) const [virtual]`

Return the start parameter value in the specified direction.

#### Parameters

<i>paddir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::Spline2FunctionInt](#).

29.324.3.41 `virtual void Go::Param2FunctionInt::subdivide ( int pardir, double par, std::vector< shared_ptr< ParamFunctionInt > > & subdiv_objs, std::vector< shared_ptr< ParamFunctionInt > > & bd_objs )`  
`[virtual]`

Subdivide the object in the specified parameter direction and parameter value.

#### Parameters

<i>pardir</i>	direction in which to subdivide. Indexing starts at 0.
<i>par</i>	parameter in which to subdivide.
<i>subdiv_objs</i>	The subparts of this object. Of the same geometric dimension as this object.
<i>bd_objs</i>	the boundaries between the returned <i>subdiv_objs</i> . Of geometric dimension 1 less than this object.

Implements [Go::ParamFunctionInt](#).

## Additional Inherited Members

### 29.325.1 Detailed Description

Base class for parametric curves in [Go](#)

Definition at line 62 of file ParamCurve.h.

### 29.325.2 Constructor & Destructor Documentation

29.325.2.1 `virtual Go::ParamCurve::~~ParamCurve ( ) [virtual]`

virtual destructor - ensures safe inheritance

### 29.325.3 Member Function Documentation

29.325.3.1 `virtual void Go::ParamCurve::appendCurve ( ParamCurve * cv, bool reparam = true ) [pure virtual]`

append a curve to this curve, with eventual reparametrization NB: This virtual member function currently only works for SplineCurves and CurveOnSurfaces. Moreover, 'this' curve and the 'cv' curve must be of the same type.

#### Parameters

<i>cv</i>	the curve to append to 'this' curve.
<i>reparam</i>	specify whether or not there should be reparametrization

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Circle](#), [Go::Line](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

29.325.3.2 `virtual void Go::ParamCurve::appendCurve ( ParamCurve * cv, int continuity, double & dist, bool reparam = true ) [pure virtual]`

append a curve to this curve, with eventual reparametrization

#### Parameters

<i>cv</i>	the curve to append to 'this' curve.
<i>continuity</i>	the required continuity at the transition. Can be $G^{(-1)}$ and upwards.
<i>dist</i>	a measure of the local distortion around the transition in order to achieve the specified continuity.
<i>reparam</i>	specify whether or not there should be reparametrization

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Circle](#), [Go::Line](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

29.325.3.3 `virtual ParamCurve* Go::ParamCurve::clone ( ) const` `[pure virtual]`

The clone-function is inherited from [GeomObject](#), but overridden here to get a covariant return type (for those compilers that allow this).

Implements [Go::GeomObject](#).

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Line](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), [Go::Ellipse](#), and [Go::ElementaryCurve](#).

29.325.3.4 `virtual void Go::ParamCurve::closestPoint ( const Point & pt, double tmin, double tmax, double & clo_t, Point & clo_pt, double & clo_dist, double const * seed = 0 ) const` `[pure virtual]`

Compute the closest point from an interval of this curve to a specified point.

Parameters

<i>pt</i>	point we want to find the closest point to
<i>tmin</i>	start parameter of search interval
<i>tmax</i>	end parameter of search interval
<i>clo_t</i>	upon function return, 'clo_t' will contain the parameter value of the closest point found.
<i>clo_pt</i>	upon function return, 'clo_pt' will contain the position of the closest point found.
<i>clo_dist</i>	upon function return, 'clo_dist' will contain the distance between 'pt' and the closest point found.
<i>seed</i>	pointer to initial guess value, provided by the user (can be 0, for which the algorithm will determine a (hopefully) reasonable choice).

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Circle](#), [Go::Line](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

29.325.3.5 `void Go::ParamCurve::closestPoint ( const Point & pt, double & clo_t, Point & clo_pt, double & clo_dist ) const`

Compute the closest point from this curve to a specified point, taking the whole curve into account (not just an interval of it).

Parameters

<i>pt</i>	point we want to find the closest point to
<i>clo_t</i>	upon function return, 'clo_t' will contain the parameter value of the closest point found.
<i>clo_pt</i>	upon function return, 'clo_pt' will contain the position of the closest point found.
<i>clo_dist</i>	upon function return, 'clo_dist' will contain the distance between 'pt' and the closest point found.

29.325.3.6 `void Go::ParamCurve::closestPointGeneric ( const Point & pt, double tmin, double tmax, double guess_param, double & clo_t, Point & clo_pt, double & clo_dist ) const` `[protected]`

29.325.3.7 `virtual CompositeBox Go::ParamCurve::compositeBox ( ) const` `[virtual]`

Creates a composite box enclosing the curve. The composite box consists of an inner and an edge box. The inner box is supposed to be made from the interior of the curve, while the edge box is made from the start and end points.

The default implementation simply makes both boxes identical to the regular bounding box.

#### Returns

the [CompositeBox](#) enclosing the curve.

Reimplemented in [Go::SplineCurve](#).

**29.325.3.8** `virtual DirectionCone Go::ParamCurve::directionCone ( ) const [pure virtual]`

Creates a [DirectionCone](#) which covers all tangent directions of this curve.

#### Returns

the smallest [DirectionCone](#) containing all tangent directions of this curve.

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::BoundedCurve](#), [Go::Circle](#), [Go::Line](#), [Go::Hyperbola](#), [Go::Parabola](#), [Go::Ellipse](#), and [Go::CurveOnVolume](#).

**29.325.3.9** `virtual double Go::ParamCurve::endparam ( ) const [pure virtual]`

Query the end parameter of the curve

#### Returns

the curve's end parameter

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Line](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

**29.325.3.10** `double Go::ParamCurve::estimatedCurveLength ( int numpts = 4 ) const`

Estimate the length of the curve, by sampling it at a certain number of points and calculating the linear approximation to the curve through these points.

#### Parameters

<i>numpts</i>	number of sample points used
---------------	------------------------------

#### Returns

the estimated curve length

**29.325.3.11** `double Go::ParamCurve::estimatedCurveLength ( double tmin, double tmax, int numpts = 4 ) const`

Estimate the length of an interval of the curve, by sampling it at a certain number of points in the interval and calculating the linear approximation through these points.

## Parameters

<i>tmin</i>	parameter at start of interval
<i>tmax</i>	parameter at end of interval
<i>numpts</i>	number of sample points used

## Returns

the estimated curve length

**29.325.3.12** `virtual SplineCurve* Go::ParamCurve::geometryCurve ( )` [pure virtual]

If the definition of this [ParamCurve](#) contains a [SplineCurve](#) describing its spatial shape, then this function will return a pointer to this [SplineCurve](#). Otherwise it will return a null pointer. The returned curve is NEWed, so the user is responsible for deleting it. This function may have side-effects.

## Returns

a pointer to a [SplineCurve](#) representation of the [ParamCurve](#), if it exists. Null pointer otherwise.

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Line](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

**29.325.3.13** `virtual bool Go::ParamCurve::isAxisRotational ( Point & centre, Point & axis, Point & vec, double & angle )`  
[inline], [virtual]

Check if the curve is axis rotational. Only true if a connection to an axis rotational elementary curve exist The axis and rotational angle is only specified if the curve is actually rotational

Reimplemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::Circle](#), and [Go::BoundedCurve](#).

Definition at line 313 of file ParamCurve.h.

**29.325.3.14** `virtual bool Go::ParamCurve::isClosed ( )` [virtual]

Query whether the curve is closed. Periodic curves like circles and ellipses are closed.

## Returns

`true` if the curve is closed, `false` otherwise.

**29.325.3.15** `virtual bool Go::ParamCurve::isDegenerate ( double degenerate_epsilon )` [pure virtual]

Query whether the curve is degenerate (collapsed into a single point).

## Parameters

<i>degenerate_epsilon</i>	the tolerance used in determine whether the curve is degenerate. A curve is considered degenerate if its total length is shorter than this value.
---------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

`true` if the curve is degenerate, `false` otherwise.

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Circle](#), [Go::Line](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

**29.325.3.16** `virtual bool Go::ParamCurve::isInPlane ( const Point & loc, const Point & axis, double eps, Point & normal ) const` [virtual]

Check if the curves lies in a plane passing through a given axis.

Reimplemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::Circle](#), [Go::Line](#), and [Go::BoundedCurve](#).

**29.325.3.17** `virtual bool Go::ParamCurve::isInPlane ( const Point & norm, double eps, Point & pos ) const` [virtual]

Check if the curve lies in a plane with a given normal.

Reimplemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::Circle](#), [Go::Line](#), [Go::Ellipse](#), [Go::Hyperbola](#), and [Go::Parabola](#).

**29.325.3.18** `virtual bool Go::ParamCurve::isLinear ( Point & dir, double tol )` [virtual]

Check if the curve is linear.

Reimplemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::Line](#), and [Go::BoundedCurve](#).

**29.325.3.19** `virtual double Go::ParamCurve::length ( double tol )` [pure virtual]

Compute the total length of this curve up to some tolerance

## Parameters

<i>tol</i>	the relative tolerance when approximating the length, i.e. stop iteration when error becomes smaller than <code>tol/(curve length)</code>
------------	-------------------------------------------------------------------------------------------------------------------------------------------

## Returns

the length calculated

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Circle](#), [Go::Line](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

29.325.3.20 `virtual double Go::ParamCurve::length ( double tol, double tstart, double tend ) [virtual]`

Compute the length of a segment of this curve up to some tolerance

#### Parameters

<i>tol</i>	the relative tolerance when approximating the length, i.e. stop iteration when error becomes smaller than $tol/(curve\ length)$
<i>tstart</i>	the parameter value for the start point of the segment
<i>tend</i>	the parameter value for the end point of the segment

#### Returns

the length calculated

29.325.3.21 `virtual double Go::ParamCurve::nextSegmentVal ( double par, bool forward, double tol ) const [virtual]`

If the [ParamCurve](#) is divided up into logical segments, this function will return the parameter value of the "next segment", starting from a parameter given by the user. If no division into logical segments exist, then it is the start- or end parameter that is returned.

#### Parameters

<i>par</i>	the parameter from which we start the search for the next segment.
<i>forward</i>	whether to search forwards or backwards along the parameter domain.
<i>tol</i>	the tolerance to determine or not 'par' is already located on the start of the next segment.

#### Returns

the parameter value of the next segment.

Reimplemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), and [Go::CurveOnVolume](#).

29.325.3.22 `virtual void Go::ParamCurve::point ( Point & pt, double tpar ) const [pure virtual]`

Evaluate the curve's position at a given parameter

#### Parameters

<i>pt</i>	the evaluated position will be written to this <a href="#">Point</a>
<i>tpar</i>	the parameter for which we wish to evaluate the curve

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Line](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

29.325.3.23 `virtual void Go::ParamCurve::point ( std::vector< Point > & pts, double tpar, int derivs, bool from_right = true ) const` [pure virtual]

Evaluate the curve's position and a certain number of derivatives at a given parameter.

#### Parameters

<i>pts</i>	the evaluated position and derivatives (tangent, curvature vector, etc.) will be written to this vector. The first entry will be the position, the second entry will be the first derivative, etc. The size of this vector must be set to 'derivs'+ 1 prior to calling this function.
<i>tpar</i>	the parameter for which we want to evaluate the curve
<i>derivs</i>	the number of derivatives we want to have calculated
<i>from_right</i>	specify whether we should calculate derivatives 'from the right' or 'from the left' (default is from the right). This matters only when the curve presents discontinuities in its derivatives.

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Line](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

29.325.3.24 `Point Go::ParamCurve::point ( double tpar ) const`

Evaluate the curve's position at a certain parameter

#### Parameters

<i>tpar</i>	the parameter for which we want to evaluate the curve's position
-------------	------------------------------------------------------------------

#### Returns

the curve's position for the parameter 'tpar'. NB: This function is implemented in terms of the [ParamCurve](#)'s virtual 'point(...)' functions, but is itself not virtual. If you make a concrete subclass and wish to make this function visible to the user, you must put a 'using [ParamCurve::point](#)' statement in the class definition.

29.325.3.25 `std::vector<Point> Go::ParamCurve::point ( double tpar, int derivs, bool from_right = true ) const`

Evaluate the curve's position and a certain number of derivatives at a given parameter.

#### Parameters

<i>tpar</i>	the parameter for which we want to evaluate the curve
<i>derivs</i>	the number of derivatives we want to have calculated
<i>from_right</i>	specify whether we should calculate derivatives 'from the right' or 'from the left' (default is from the right). This matters only when the curve presents discontinuities in its derivatives.

#### Returns

a STL vector containing the evaluated position and the specified number of derivatives. The first entry will be the position, the second entry will be the first derivative, etc. The total size of the returned vector will be 'derivs' + 1. NB: This function is implemented in terms of the [ParamCurve](#)'s virtual 'point(...)' functions, but is

itself not virtual. If you make a concrete subclass and wish to make this function visible to the user, you must put a 'using [ParamCurve::point](#)' in the class definition.

**29.325.3.26** `virtual void Go::ParamCurve::reverseParameterDirection ( bool switchparam = false )` [pure virtual]

Set the parameter direction of the curve. The curve's parameter interval will always remain constant, but by flipping the parameter direction, the curve will be traced the opposite way when moving a parameter over the parameter interval.

#### Parameters

<i>switchparam</i>	if true, and the curve is 2D, the x and y coordinates should be swapped. This is used when turning the orientation of bounded (trimmed) surfaces.
--------------------	---------------------------------------------------------------------------------------------------------------------------------------------------

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), and [Go::ElementaryCurve](#).

**29.325.3.27** `void Go::ParamCurve::s1771 ( Point pt, double aepsge, double astart, double aend, double anext, double & cpos, int * jstat ) const` [protected]

**29.325.3.28** `double Go::ParamCurve::s1771_s9del ( double * eco, double * eco1, double * eco2, int idim ) const` [protected]

**29.325.3.29** `void Go::ParamCurve::s1771_s9point ( Point pt, std::vector< Point > val, Point diff, double astart, double aend, int max_it, double * cnext, double * ad, double adel, double * cdist, double aprev, int * jstat ) const` [protected]

**29.325.3.30** `virtual void Go::ParamCurve::setParameterInterval ( double t1, double t2 )` [pure virtual]

Linear reparametrization. The meaning is changed for elementary curves.

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Line](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

**29.325.3.31** `virtual std::vector<shared_ptr<ParamCurve>> > Go::ParamCurve::split ( double param, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const` [virtual]

Split curve in a specified parameter value.

Reimplemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), and [Go::CurveOnVolume](#).

**29.325.3.32** `virtual double Go::ParamCurve::startparam ( ) const` [pure virtual]

Query the start parameter of the curve

#### Returns

the curve's start parameter

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Line](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

29.325.3.33 `virtual ParamCurve* Go::ParamCurve::subCurve ( double from_par, double to_par, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [pure virtual]`

Returns a curve which is a part of this curve. The result is NEWed, so the user is responsible for deleting it. NB: It is not guaranteed that the [ParamCurve](#) that is returned is of the same type as the curve itself. Thus, the returned curve might be a [SplineCurve](#).

#### Parameters

<i>from_par</i>	start value of parameter interval that will define the subcurve
<i>to_par</i>	end value of parameter interval that will define the subcurve
<i>fuzzy</i>	since subCurve works on those curves who are spline-based, this tolerance defines how close the start and end parameter must be to an existing knot in order to be considered <i>on</i> the knot.

#### Returns

a pointer to a new subcurve which represents the part of the curve between 'from\_par' and 'to\_par'. It will be spline-based and have a k-regular knotvector. The user is responsible for deleting this subcurve when it is no longer needed.

Implemented in [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::CurveOnVolume](#), [Go::BoundedCurve](#), [Go::Circle](#), [Go::Line](#), [Go::Hyperbola](#), [Go::Parabola](#), [Go::Ellipse](#), and [Go::ElementaryCurve](#).

29.325.3.34 `virtual void Go::ParamCurve::uniformEvaluator ( int num, std::vector< Point > & points, std::vector< double > & param ) const [virtual]`

Evaluate points on a regular set of parameter values

#### Parameters

<i>num</i>	number of values to evaluate
<i>points</i>	upon function return, this vector holds all the evaluated points
<i>param</i>	upon function return, this vector holds all the numerical values where evaluation has taken place

### 29.326.1 Detailed Description

This class represents the "intersection object" of a parametric curve.

Definition at line 56 of file ParamCurveInt.h.

### 29.326.2 Constructor & Destructor Documentation

29.326.2.1 `Go::ParamCurveInt::ParamCurveInt ( shared_ptr< ParamCurve > curve, ParamGeomInt * parent = 0 )`  
`[explicit]`

Constructor.

Parameters

<i>curve</i>	the parametric curve defining the intersection object.
<i>parent</i>	the parent object to this object. Can be either a curve or a surface.

29.326.2.2 `virtual Go::ParamCurveInt::~~ParamCurveInt ( )` `[inline],[virtual]`

Destructor.

Definition at line 67 of file ParamCurveInt.h.

### 29.326.3 Member Function Documentation

29.326.3.1 `void Go::ParamCurveInt::assureInRange ( double & t )`

Make sure that the input parameter lies inside the range of the parametric curve. Set `t` equal to `tmin` if it lies below `tmin`, or `tmax` if it lies above `tmax`.

Parameters

<i>t</i>	the input parameter
----------	---------------------

29.326.3.2 void Go::ParamCurveInt::axisFromEndpts ( Point & axis ) const

Create an axis by interpolating the end points.

#### Returns

The created axis.

29.326.3.3 virtual bool Go::ParamCurveInt::boundaryPoint ( const double \* par, double eps ) const [virtual]

Return true if the specified point lies within eps from the boundary.

#### Parameters

<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .
<i>eps</i>	the tolerance defining the boundary neighbourhood.

Implements [Go::ParamObjectInt](#).

29.326.3.4 virtual bool Go::ParamCurveInt::canDivide ( int pdir ) [virtual]

Return true if we are allowed to divide in the specified parameter direction.

#### Parameters

<i>pdir</i>	the parameter direction in question.
-------------	--------------------------------------

Implements [Go::ParamObjectInt](#).

29.326.3.5 virtual int Go::ParamCurveInt::checkPeriodicity ( int pdir = 0 ) const [virtual]

Check if the object is periodic. Analyze periodicity of curve based on number of repeating knots and control points. The return value is -1 if the curve ends are disjoint, otherwise k if cv is  $C^k$  continuous. These are sufficient but not necessary conditions for periodicity, so it is possible that a higher degree of periodicity exists. Should not be called on this layer, should be overruled by inherited class.

#### Parameters

<i>pdir</i>	the parameter direction in question. Does not pertain to for a curve.
-------------	-----------------------------------------------------------------------

#### Returns

-1 if the curve ends are disjoint, or k if the curve is proven to be  $C^k$  continuous.

Reimplemented from [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineCurveInt](#).

29.326.3.6 virtual **CompositeBox** Go::ParamCurveInt::compositeBox ( ) const [virtual]

Create the [CompositeBox](#) for the parametric object.

#### Returns

The [CompositeBox](#) for the parametric object.

Implements [Go::ParamGeomInt](#).

29.326.3.7 virtual int Go::ParamCurveInt::dimension ( ) const [inline],[virtual]

The dimension of the geometric space.

Implements [Go::ParamGeomInt](#).

Definition at line 273 of file ParamCurveInt.h.

29.326.3.8 virtual **DirectionCone** Go::ParamCurveInt::directionCone ( ) const [virtual]

A cone which contains all normals of the object.

#### Returns

A cone which contains all normals of the object.

Implements [Go::ParamGeomInt](#).

29.326.3.9 virtual double Go::ParamCurveInt::endParam ( int *pardir* ) const [inline],[virtual]

Return the end parameter in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Definition at line 222 of file ParamCurveInt.h.

29.326.3.10 double Go::ParamCurveInt::endparam ( ) const [inline]

The end parameter of the curve.

#### Returns

The end parameter of the curve.

Definition at line 283 of file ParamCurveInt.h.

29.326.3.11 `virtual void Go::ParamCurveInt::getBoundaryObjects ( std::vector< shared_ptr< BoundaryGeomInt > > & bd_objs ) [virtual]`

Return the boundary objects of this object.

#### Parameters

<i>bd_objs</i>	the boundary objects of this object.
----------------	--------------------------------------

Implements [Go::ParamGeomInt](#).

29.326.3.12 `virtual std::vector<double> Go::ParamCurveInt::getCriticalVals ( int pardir ) const [virtual]`

Return the critical parameter values in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

29.326.3.13 `virtual std::vector<double> Go::ParamCurveInt::getCriticalValsAndKnots ( int pardir ) const [virtual]`

Return the critical parameter values and inner knots for object.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::SplineCurveInt](#).

29.326.3.14 `virtual std::vector<double> Go::ParamCurveInt::getInnerKnotVals ( int pardir, bool sort = false ) const [virtual]`

Return the inner knot values in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
<i>sort</i>	the returned values may be sorted by the function.

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::SplineCurveInt](#).

29.326.3.15 `virtual void Go::ParamCurveInt::getLengthAndWiggle ( double * length, double * wiggle ) [virtual]`

Return an estimate on the size and wiggle of the object.

#### Parameters

<i>length</i>	the approximative length of the object in the corresponding parameter directions. The size of the array should be equal to <code>numParams()</code> .
<i>wiggle</i>	a scalar representing the wiggle of the object in the corresponding parameter directions. The size of the array should be equal to <code>numParams()</code> .

Implements [Go::ParamObjectInt](#).

29.326.3.16 `virtual std::vector<double>::iterator Go::ParamCurveInt::getMesh ( ) [virtual]`

Return the geometric sample mesh for the parametric function.

Implements [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineCurveInt](#).

29.326.3.17 `virtual int Go::ParamCurveInt::getMeshSize ( int dir ) [virtual]`

Return the size of the geometric sample mesh in the specified direction.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
------------	------------------------------------------------------------

Implements [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineCurveInt](#).

29.326.3.18 `virtual double Go::ParamCurveInt::getOptimizedConeAngle ( Point & axis1, Point & axis2 ) [virtual]`

We try to treat problems which will never result in a simple case by shrinking the domain slightly, resulting in smaller cones. This is useful for scenarios where the normals are parallel in a boundary point.

#### Parameters

<i>axis1</i>	first vector defining a projection plane
<i>axis2</i>	second vector defining a projection plane

#### Returns

The optimized cone angle

Implements [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineCurveInt](#).

**29.326.3.19** `shared_ptr<ParamCurve> Go::ParamCurveInt::getParamCurve ( )`

Return pointer to the parametric curve defining this object.

**Returns**

Pointer to the parametric curve defining this object.

**29.326.3.20** `shared_ptr<const ParamCurve> Go::ParamCurveInt::getParamCurve ( ) const`

Return pointer to the parametric curve defining this object.

**Returns**

Pointer to the parametric curve defining this object.

**29.326.3.21** `virtual ParamCurveInt* Go::ParamCurveInt::getParamCurveInt ( ) [virtual]`

Return a pointer to this object.

**Returns**

Pointer to this object.

Reimplemented from [Go::ParamObjectInt](#).

**29.326.3.22** `virtual ParamSurfaceInt* Go::ParamCurveInt::getParamSurfaceInt ( ) [inline],[virtual]`

Return a NULL pointer (as this object is not of the correct type).

**Returns**

NULL pointer (as this object is not of the correct type).

Reimplemented from [Go::ParamObjectInt](#).

Definition at line 106 of file ParamCurveInt.h.

**29.326.3.23** `shared_ptr<ParamCurve> Go::ParamCurveInt::getParentParamCurve ( double & start, double & end )`

Return pointer to a subcurve of the parent curve for this object. If no such curve exist, we use the curve of this object instead.

## Parameters

<i>start</i>	the start parameter of the subcurve.
<i>end</i>	the end parameter of the subcurve.

## Returns

Pointer to a subcurve of the parent curve for this object.

29.326.3.24 `shared_ptr<ParamCurve> Go::ParamCurveInt::getParentParamCurve ( )`

Return pointer to the parent curve for this object. If no such curve exist, we use the curve of this object instead.

## Returns

Pointer to a subcurve of the parent curve for this object.

29.326.3.25 `virtual RotatedBox Go::ParamCurveInt::getRotatedBox ( std::vector< Point > & axis ) const [virtual]`

Create a box containing the geometric sample mesh in the input coordinate system.

## Parameters

<i>axis</i>	the axis defining the coordinate system. The size of vector axis is 2, the last point is given as the cross product axis[0]axis[1].
-------------	-------------------------------------------------------------------------------------------------------------------------------------

## Returns

The rotated box

Reimplemented in [Go::SplineCurveInt](#).

29.326.3.26 `virtual const SplineCurve* Go::ParamCurveInt::getSpline ( ) [inline],[virtual]`

Reimplemented in [Go::SplineCurveInt](#).

Definition at line 324 of file ParamCurveInt.h.

29.326.3.27 `virtual bool Go::ParamCurveInt::hasCriticalVals ( int pdir ) const [virtual]`

Return true if the object has any critical parameter values in the specified parameter direction.

## Parameters

<i>pdir</i>	the parameter direction in question. Indexing starts at 0.
-------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

**29.326.3.28** `virtual bool Go::ParamCurveInt::hasCriticalValsOrKnots ( int pardir ) const` [virtual]

Return true if the object has any critical parameter values or inner knots in the specified parameter direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::SplineCurveInt](#).

**29.326.3.29** `virtual bool Go::ParamCurveInt::hasInnerKnots ( int pardir ) const` [virtual]

Return true if the object has any inner knots in the specified parameter direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::SplineCurveInt](#).

**29.326.3.30** `virtual bool Go::ParamCurveInt::isDegenerate ( double epsge, int dir, double * par )` [virtual]

Verify whether the object is degenerate in the specified direction and parameter.

#### Parameters

<i>epsge</i>	the geometric tolerance defining degeneracy.
<i>dir</i>	the parameter direction in question.
<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .

#### Returns

True if the object is degenerate.

Implements [Go::ParamGeomInt](#).

**29.326.3.31** `virtual bool Go::ParamCurveInt::isSpline ( )` [virtual]

Verify whether the object is a spline.

**Returns**

True if the object is a spline.

Implements [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineCurveInt](#).

29.326.3.32 `virtual int Go::ParamCurveInt::knotIntervalFuzzy ( double & t, double tol ) const` [virtual]

Find the knot interval for which t lies inside, moving the value t if it lies close to a knot.

**Parameters**

<i>t</i>	the parameter value
<i>tol</i>	the parametric tolerance deciding if the input parameter t should be moved.

Reimplemented in [Go::SplineCurveInt](#).

29.326.3.33 `virtual shared_ptr<ParamCurveInt> Go::ParamCurveInt::makeIntObject ( shared_ptr< ParamCurve > curve )` [virtual]

Return an intersection object for the input curve. This object is used as the parent for the intersection object.

**Parameters**

<i>curve</i>	the parametric curve defining the intersection object.
--------------	--------------------------------------------------------

Reimplemented in [Go::SplineCurveInt](#).

29.326.3.34 `virtual double Go::ParamCurveInt::nextSegmentVal ( double par, bool forward, double tol ) const` [virtual]

Return the value of the knot next to the input parameter par.

**Parameters**

<i>par</i>	the parameter value
<i>forward</i>	if true we return the closest knot to the right, otherwise the closest knot to the left.
<i>tol</i>	the tolerance to determine if <i>par</i> is already located on the start of the next segment.

**Returns**

The knot closest to the input parameter.

Reimplemented in [Go::SplineCurveInt](#).

29.326.3.35 `virtual int Go::ParamCurveInt::numParams ( ) const [virtual]`

The number of parameters in the object.

Implements [Go::ParamObjectInt](#).

29.326.3.36 `virtual double Go::ParamCurveInt::paramFromMesh ( int dir, int idx ) [virtual]`

Return the corresponding mesh parameter.

Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>idx</i>	the mesh idx in the specified direction. Indexing starts at 0.

Implements [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineCurveInt](#).

29.326.3.37 `virtual void Go::ParamCurveInt::point ( Point & res, const double * par ) const [inline],[virtual]`

Evaluate the object in the input parameter.

Parameters

<i>res</i>	the <a href="#">Point</a> to be returned.
<i>par</i>	the parameter in which to evaluate. The size of the array should be equal to <a href="#">numParams()</a> .

Implements [Go::ParamObjectInt](#).

Definition at line 73 of file [ParamCurveInt.h](#).

29.326.3.38 `virtual void Go::ParamCurveInt::point ( std::vector< Point > & res, const double * par, int der, const bool * from_right = 0, double resolution = 1.0e-12 ) const [inline],[virtual]`

Evaluate the object in the input parameter, with the specified number of derivatives.

Parameters

<i>res</i>	the <a href="#">Point</a> to be returned.
<i>par</i>	the parameter in which to evaluate. The size of the array should be equal to <a href="#">numParams()</a> .
<i>der</i>	the number of derivatives to calculate.
<i>from_right</i>	if true the evaluation is to be performed from the right side of the parameter value.
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular: knot values in case of spline objects).

Implements [Go::ParamObjectInt](#).

Definition at line 87 of file ParamCurveInt.h.

29.326.3.39 `virtual void Go::ParamCurveInt::setCriticalVal ( int pardir, double par )` [virtual]

Set info about subdivision value.

Reimplemented from [Go::ParamObjectInt](#).

29.326.3.40 `virtual double Go::ParamCurveInt::startParam ( int pardir ) const` [inline],[virtual]

Return the start parameter value in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Definition at line 216 of file ParamCurveInt.h.

29.326.3.41 `double Go::ParamCurveInt::startparam ( ) const` [inline]

The start parameter of the curve.

#### Returns

The start parameter of the curve.

Definition at line 278 of file ParamCurveInt.h.

29.326.3.42 `virtual void Go::ParamCurveInt::subdivide ( int pardir, double par, std::vector< shared_ptr< ParamGeomInt >> & subdiv_objs, std::vector< shared_ptr< ParamGeomInt >> & bd_objs )` [virtual]

Subdivide the object in the specified parameter direction and parameter value.

#### Parameters

<i>pardir</i>	direction in which to subdivide. Indexing starts at 0.
<i>par</i>	parameter in which to subdivide.
<i>subdiv_objs</i>	The subparts of this object. Of the same geometric dimension as this object.
<i>bd_objs</i>	the boundaries between the returned <i>subdiv_objs</i> . Of geometric dimension 1 less than this object.

Implements [Go::ParamGeomInt](#).

## 29.326.4 Member Data Documentation

### 29.329.1 Detailed Description

This class is a base class providing an interface to the parametric "intersection objects" with 1-dimensional range.

Definition at line 61 of file [ParamFunctionInt.h](#).

### 29.329.2 Constructor & Destructor Documentation

**29.329.2.1** virtual [Go::ParamFunctionInt::~ParamFunctionInt](#) ( ) `[inline]`, `[virtual]`

Destructor.

Definition at line 64 of file [ParamFunctionInt.h](#).

### 29.329.3 Member Function Documentation

**29.329.3.1** virtual void [Go::ParamFunctionInt::getBoundaryObjects](#) ( std::vector< shared\_ptr< [BoundaryFunctionInt](#) > > & *bd\_objs* ) `[pure virtual]`

Return the boundary objects of this object.

Parameters

<i>bd_objs</i>	the boundary objects of this object.
----------------	--------------------------------------

Implemented in [Go::Param2FunctionInt](#), [Go::Param1FunctionInt](#), [Go::Param0FunctionInt](#), and [Go::Spline2FunctionInt](#).

**29.329.3.2** virtual std::vector<double>::iterator [Go::ParamFunctionInt::getMesh](#) ( ) `[pure virtual]`

Return the geometric sample mesh for the parametric function.

Implemented in [Go::Param2FunctionInt](#), [Go::Param1FunctionInt](#), [Go::Param0FunctionInt](#), and [Go::Spline1↔FunctionInt](#).

**29.329.3.3** `virtual int Go::ParamFunctionInt::getMeshSize ( int dir ) [pure virtual]`

Return the size of the geometric sample mesh in the specified direction.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
------------	------------------------------------------------------------

Implemented in [Go::Param2FunctionInt](#), [Go::Param1FunctionInt](#), [Go::Param0FunctionInt](#), and [Go::Spline1↔FunctionInt](#).

**29.329.3.4** `virtual Param0FunctionInt* Go::ParamFunctionInt::getParam0FunctionInt ( ) [inline], [virtual]`

If the object is not of type [Param0FunctionInt](#), return NULL, otherwise return the object.

Reimplemented in [Go::Param0FunctionInt](#).

Definition at line 68 of file ParamFunctionInt.h.

**29.329.3.5** `virtual Param1FunctionInt* Go::ParamFunctionInt::getParam1FunctionInt ( ) [inline], [virtual]`

If the object is not of type [Param1FunctionInt](#), return NULL, otherwise return the object.

Reimplemented in [Go::Param1FunctionInt](#).

Definition at line 73 of file ParamFunctionInt.h.

**29.329.3.6** `virtual Param2FunctionInt* Go::ParamFunctionInt::getParam2FunctionInt ( ) [inline], [virtual]`

If the object is not of type [Param2FunctionInt](#), return NULL, otherwise return the object.

Reimplemented in [Go::Param2FunctionInt](#).

Definition at line 78 of file ParamFunctionInt.h.

**29.329.3.7** `virtual bool Go::ParamFunctionInt::monotone ( Point & dir, double tol = 1.0e-15 ) const [pure virtual]`

Returns true if the object is monotone in any direction.

#### Parameters

<i>dir</i>	the direction in which the object is monotone. Relevant only if object is monotone.
------------	-------------------------------------------------------------------------------------

Implemented in [Go::Param2FunctionInt](#), [Go::Param1FunctionInt](#), [Go::Param0FunctionInt](#), [Go::Spline1FunctionInt](#), and [Go::Spline2FunctionInt](#).

**29.329.3.8** `virtual double Go::ParamFunctionInt::paramFromMesh ( int dir, int idx ) [pure virtual]`

Return the corresponding mesh parameter.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>idx</i>	the mesh idx in the specified direction. Indexing starts at 0.

Implemented in [Go::Param2FunctionInt](#), [Go::Param1FunctionInt](#), [Go::Param0FunctionInt](#), and [Go::Spline1↔FunctionInt](#).

**29.329.3.9** `virtual void Go::ParamFunctionInt::subdivide ( int pardir, double par, std::vector< shared_ptr< ParamFunctionInt > > & subdiv_objs, std::vector< shared_ptr< ParamFunctionInt > > & bd_objs ) [pure virtual]`

Subdivide the object in the specified parameter direction and parameter value.

#### Parameters

<i>pardir</i>	direction in which to subdivide. Indexing starts at 0.
<i>par</i>	parameter in which to subdivide.
<i>subdiv_objs</i>	The subparts of this object. Of the same geometric dimension as this object.
<i>bd_objs</i>	the boundaries between the returned <i>subdiv_objs</i> . Of geometric dimension 1 less than this object.

Implemented in [Go::Param2FunctionInt](#), [Go::Param1FunctionInt](#), and [Go::Param0FunctionInt](#).

## 29.329.4 Member Data Documentation

### 29.330.1 Detailed Description

This class is a base class providing an interface to the parametric "intersection objects".

Definition at line 62 of file ParamGeomInt.h.

### 29.330.2 Constructor & Destructor Documentation

29.330.2.1 `Go::ParamGeomInt::ParamGeomInt ( ParamGeomInt * parent = 0 ) [inline]`

Constructor

Parameters

<code>parent</code>	the parent to this intersection object.
---------------------	-----------------------------------------

Definition at line 66 of file ParamGeomInt.h.

29.330.2.2 `virtual Go::ParamGeomInt::~~ParamGeomInt ( ) [inline],[virtual]`

Destructor.

Definition at line 69 of file ParamGeomInt.h.

### 29.330.3 Member Function Documentation

29.330.3.1 `virtual int Go::ParamGeomInt::checkPeriodicity ( int pardir ) const [inline],[virtual]`

Check if the object is periodic. Analyze periodicity of curve based on number of repeating knots and control points. The return value is -1 if the curve ends are disjoint, otherwise k if cv is  $C^k$  continuous. These are sufficient but not necessary conditions for periodicity, so it is possible that a higher degree of periodicity exists. Should not be called on this layer, should be overruled by inherited class.

#### Parameters

<i>pardir</i>	the parameter direction in question.
---------------	--------------------------------------

#### Returns

-1 if the curve ends are disjoint, or k if the curve is proven to be  $C^k$  continuous.

Reimplemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), [Go::SplineSurfaceInt](#), and [Go::SplineCurveInt](#).

Definition at line 84 of file ParamGeomInt.h.

29.330.3.2 `virtual CompositeBox Go::ParamGeomInt::compositeBox ( ) const [pure virtual]`

Return the [CompositeBox](#) for the parametric object.

#### Returns

The compositeBox for the parametric object.

Implements [Go::ParamObjectInt](#).

Implemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), and [Go::ParamPointInt](#).

29.330.3.3 `bool Go::ParamGeomInt::coneLargerThanPi ( )`

Check if the associated direction cone has an angle larger than pi.

29.330.3.4 `virtual int Go::ParamGeomInt::dimension ( ) const [pure virtual]`

The dimension of the geometric space.

Implemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), and [Go::ParamPointInt](#).

29.330.3.5 virtual **DirectionCone** Go::ParamGeomInt::directionCone ( ) const [pure virtual]

A cone which contains all normals of the object.

#### Returns

A cone which contains all normals of the object.

Implemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), [Go::ParamPointInt](#), and [Go::SplineSurfaceInt](#).

29.330.3.6 **BoundaryGeomInt\*** Go::ParamGeomInt::getBoundaryObject ( int *bd\_idx* ) const [inline]

Return the specified boundary object.

#### Parameters

<i>bd_idx</i>	index of the boundary object.
---------------	-------------------------------

#### Returns

The boundary object.

Definition at line 150 of file ParamGeomInt.h.

29.330.3.7 virtual void Go::ParamGeomInt::getBoundaryObjects ( std::vector< shared\_ptr< **BoundaryGeomInt** > > & *bd\_objs* ) [pure virtual]

Return the boundary objects of this object.

#### Parameters

<i>bd_objs</i>	the boundary objects of this object.
----------------	--------------------------------------

Implemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), [Go::ParamPointInt](#), and [Go::SplineSurfaceInt](#).

29.330.3.8 virtual std::vector<double>::iterator Go::ParamGeomInt::getMesh ( ) [pure virtual]

Return the geometric sample mesh for the parametric function.

Implemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), [Go::ParamPointInt](#), [Go::SplineSurfaceInt](#), and [Go::SplineCurveInt](#).

29.330.3.9 virtual int Go::ParamGeomInt::getMeshSize ( int *dir* ) [pure virtual]

Return the size of the geometric sample mesh in the specified direction.

## Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
------------	------------------------------------------------------------

Implemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), [Go::ParamPointInt](#), [Go::SplineSurfaceInt](#), and [Go::SplineCurveInt](#).

29.330.3.10 `virtual double Go::ParamGeomInt::getOptimizedConeAngle ( Point & axis1, Point & axis2 ) [pure virtual]`

We try to treat problems which will never result in a simple case by shrinking the domain slightly, resulting in smaller cones. This is useful for scenarios where the normals are parallel in a boundary point.

Implemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), [Go::ParamPointInt](#), [Go::SplineSurfaceInt](#), and [Go::SplineCurveInt](#).

29.330.3.11 `virtual int Go::ParamGeomInt::isDegenerate ( double epsge, int dir ) [inline],[virtual]`

Return true if the object is degenerate in the specified direction. Specialized for surface

## Parameters

<i>epsge</i>	the geometric tolerance defining degeneracy.
<i>dir</i>	the parameter direction in question.

Reimplemented in [Go::ParamSurfaceInt](#).

Definition at line 160 of file ParamGeomInt.h.

29.330.3.12 `virtual bool Go::ParamGeomInt::isDegenerate ( double epsge, int dir, double * par ) [pure virtual]`

Return true if the object is degenerate in the specified direction and parameter.

## Parameters

<i>epsge</i>	the geometric tolerance defining degeneracy.
<i>dir</i>	the parameter direction in question.
<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .

Reimplemented from [Go::ParamObjectInt](#).

Implemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), and [Go::ParamPointInt](#).

29.330.3.13 `virtual bool Go::ParamGeomInt::isLinear ( double epsge ) [virtual]`

Check the linearity of the object.

29.330.3.14 `virtual bool Go::ParamGeomInt::isSpline ( ) [pure virtual]`

Return whether or not the object is a spline.

#### Returns

True if the object is a spline.

Implemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), [Go::ParamPointInt](#), [Go::SplineSurfaceInt](#), and [Go::SplineCurveInt](#).

29.330.3.15 `int Go::ParamGeomInt::nmbBdObj ( ) const [inline]`

Return the number of boundary objects.

#### Returns

The number of boundary objects.

Definition at line 144 of file `ParamGeomInt.h`.

29.330.3.16 `virtual double Go::ParamGeomInt::paramFromMesh ( int dir, int idx ) [pure virtual]`

Return the corresponding mesh parameter.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>idx</i>	the mesh idx in the specified direction. Indexing starts at 0.

Implemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), [Go::ParamPointInt](#), [Go::SplineSurfaceInt](#), and [Go::SplineCurveInt](#).

29.330.3.17 `virtual DirectionCone Go::ParamGeomInt::reducedDirectionCone ( bool reduce_at_bd[4], double epsge ) const [virtual]`

Try to make a smaller direction cone.

#### Parameters

<i>reduce_at_bd</i>	indicates which boundaries the reduction attempt should be made
<i>epsge</i>	the geometric tolerancedefining degeneracy

#### Returns

A direction cone. This is either the same cone or a smaller one.

Reimplemented in [Go::SplineSurfaceInt](#).

29.330.3.18 `virtual void Go::ParamGeomInt::subdivide ( int pardir, double par, std::vector< shared_ptr< ParamGeomInt >> & subdiv_objs, std::vector< shared_ptr< ParamGeomInt >> & bd_objs )` [pure virtual]

Subdivide the object in the specified parameter direction and parameter value.

#### Parameters

<i>pardir</i>	direction in which to subdivide. Indexing starts at 0.
<i>par</i>	parameter in which to subdivide.
<i>subdiv_objs</i>	The subparts of this object. Of the same geometric dimension as this object.
<i>bd_objs</i>	the boundaries between the returned <i>subdiv_objs</i> . Of geometric dimension 1 less than this object.

Implemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), and [Go::ParamPointInt](#).

### 29.330.4 Member Data Documentation

29.330.4.1 `std::vector<shared_ptr<BoundaryGeomInt>> Go::ParamGeomInt::boundary_obj_` [protected]

### 29.331.1 Detailed Description

This class is a base class providing an interface to the "intersection objects". The object is parametric.

Definition at line 61 of file `ParamObjectInt.h`.

### 29.331.2 Constructor & Destructor Documentation

29.331.2.1 `Go::ParamObjectInt::ParamObjectInt ( ParamObjectInt * parent = 0 )` `[inline]`

Constructor.

#### Parameters

<code>parent</code>	is a parametric object for which this object constitutes only a subpart (0 if there is no parent).
---------------------	----------------------------------------------------------------------------------------------------

Definition at line 66 of file `ParamObjectInt.h`.

29.331.2.2 `virtual Go::ParamObjectInt::~~ParamObjectInt ( )` `[inline]`, `[virtual]`

Destructor.

Definition at line 69 of file `ParamObjectInt.h`.

### 29.331.3 Member Function Documentation

29.331.3.1 `virtual bool Go::ParamObjectInt::boundaryPoint ( const double * par, double eps ) const` [pure virtual]

Return true if the specified point lies within *eps* from the boundary.

#### Parameters

<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .
<i>eps</i>	the tolerance defining boundary neighbourhood.

Implemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::ParamPointInt](#), and [Go::Param0FunctionInt](#).

29.331.3.2 `virtual bool Go::ParamObjectInt::canDivide ( int pardir )` [pure virtual]

Return true if we are allowed to divide in the specified parameter direction.

#### Parameters

<i>pardir</i>	the parameter direction in question.
---------------	--------------------------------------

Implemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::Param0FunctionInt](#), and [Go::ParamPointInt](#).

29.331.3.3 `virtual bool Go::ParamObjectInt::canDivideTinyTriang ( int pardir )` [inline],[virtual]

Reimplemented in [Go::ParamSurfaceInt](#).

Definition at line 153 of file [ParamObjectInt.h](#).

29.331.3.4 `virtual CompositeBox Go::ParamObjectInt::compositeBox ( ) const` [pure virtual]

Return the [CompositeBox](#) for the parametric object.

Implemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::Param1FunctionInt](#), [Go::ParamCurveInt](#), [Go::ParamPointInt](#), [Go::Param0FunctionInt](#), and [Go::ParamGeomInt](#).

29.331.3.5 `virtual double Go::ParamObjectInt::endParam ( int pardir ) const` [pure virtual]

Return the end parameter in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::ParamPointInt](#), [Go::Param0FunctionInt](#), and [Go::Spline2FunctionInt](#).

29.331.3.6 `virtual std::vector<double> Go::ParamObjectInt::getCriticalVals ( int pardir ) const` [pure virtual]

Return the critical parameter values in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::ParamPointInt](#), and [Go::Param0FunctionInt](#).

29.331.3.7 `virtual std::vector<double> Go::ParamObjectInt::getCriticalValsAndKnots ( int pardir ) const` [pure virtual]

Return the critical parameter values and inner knots for object.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::ParamPointInt](#), [Go::Param0FunctionInt](#), [Go::SplineSurfaceInt](#), [Go::Spline1FunctionInt](#), [Go::SplineCurveInt](#), and [Go::Spline2FunctionInt](#).

29.331.3.8 `virtual std::vector<double> Go::ParamObjectInt::getInnerKnotVals ( int pardir, bool sort = false ) const` [pure virtual]

Return the inner knot values in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
<i>sort</i>	the returned values may be sorted by the function.

Implemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::ParamPointInt](#), [Go::Param0FunctionInt](#), [Go::SplineSurfaceInt](#), [Go::Spline1FunctionInt](#), [Go::SplineCurveInt](#), and [Go::Spline2FunctionInt](#).

29.331.3.9 `virtual void Go::ParamObjectInt::getLengthAndWiggle ( double * length, double * wiggle )` [pure virtual]

Return an estimate on the size and wiggle of the object.

## Parameters

<i>length</i>	the approximative length of the object in the corresponding parameter directions. The size of the array should be equal to <a href="#">numParams()</a> .
<i>wiggle</i>	a scalar representing the wiggle of the object in the corresponding parameter directions. The size of the array should be equal to <a href="#">numParams()</a> .

Implemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::ParamPointInt](#), and [Go::Param0FunctionInt](#).

**29.331.3.10** `virtual ParamCurveInt* Go::ParamObjectInt::getParamCurveInt ( ) [inline],[virtual]`

Return pointer to a parametric intersection curve.

## Returns

Pointer to a parametric intersection curve. If that is not the class type for this object a NULL pointer is returned.

Reimplemented in [Go::ParamCurveInt](#).

Definition at line 80 of file ParamObjectInt.h.

**29.331.3.11** `virtual ParamPointInt* Go::ParamObjectInt::getParamPointInt ( ) [inline],[virtual]`

Return pointer to a parametric intersection point.

## Returns

Pointer to a parametric intersection point. If that is not the class type for this object a NULL pointer is returned.

Reimplemented in [Go::ParamPointInt](#).

Definition at line 74 of file ParamObjectInt.h.

**29.331.3.12** `virtual ParamSurfaceInt* Go::ParamObjectInt::getParamSurfaceInt ( ) [inline],[virtual]`

Return pointer to a parametric intersection surface.

## Returns

Pointer to a parametric intersection surface. If that is not the class type for this object a NULL pointer is returned.

Reimplemented in [Go::ParamCurveInt](#), and [Go::ParamSurfaceInt](#).

Definition at line 87 of file ParamObjectInt.h.

29.331.3.13 **ParamObjectInt\*** `Go::ParamObjectInt::getParent ( ) const` `[inline]`

Return the parent of this object.

Definition at line 208 of file ParamObjectInt.h.

29.331.3.14 **const ParamObjectInt\*** `Go::ParamObjectInt::getSameTypeAncestor ( ) const` `[inline]`

Return an ancestor of the same type. If the object has no parent, or if its parent has a higher number of parameters, return a pointer to itself. Else, call this function recursively on the parent.

Definition at line 218 of file ParamObjectInt.h.

29.331.3.15 **virtual bool** `Go::ParamObjectInt::hasCriticalVals ( int pardir ) const` `[pure virtual]`

Return true if the object has any critical parameter values in the specified parameter direction.

Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::ParamPointInt](#), and [Go::Param0FunctionInt](#).

29.331.3.16 **virtual bool** `Go::ParamObjectInt::hasCriticalValsOrKnots ( int pardir ) const` `[pure virtual]`

Return true if the object has any critical parameter values or inner knots in the specified parameter direction.

Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::ParamPointInt](#), [Go::Param0FunctionInt](#), [Go::SplineSurfaceInt](#), [Go::Spline1FunctionInt](#), [Go::SplineCurveInt](#), and [Go::Spline2FunctionInt](#).

29.331.3.17 **virtual bool** `Go::ParamObjectInt::hasInnerKnots ( int pardir ) const` `[pure virtual]`

Return true if the object has any inner knots in the specified parameter direction.

Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::ParamPointInt](#), [Go::Param0FunctionInt](#), [Go::SplineSurfaceInt](#), [Go::Spline1FunctionInt](#), [Go::SplineCurveInt](#), and [Go::Spline2FunctionInt](#).

[Go::Spline2FunctionInt](#).

29.331.3.18 `virtual bool Go::ParamObjectInt::inCorner ( const double * par, double epspar ) const [inline], [virtual]`

Check if parameter point lies close to a corner of the parameter domain.

#### Parameters

<i>par</i>	the input parameter point.
<i>epspar</i>	the parametric tolerance defining the neighbourhood.

Reimplemented in [Go::ParamSurfaceInt](#).

Definition at line 232 of file ParamObjectInt.h.

29.331.3.19 `virtual bool Go::ParamObjectInt::isDegenerate ( double epsge, int dir, double * par ) [inline], [virtual]`

Return true if the object is degenerate in the specified direction and parameter.

#### Parameters

<i>epsge</i>	the geometric tolerance defining degeneracy.
<i>dir</i>	the parameter direction in question.
<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .

Reimplemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::ParamPointInt](#), and [Go::ParamGeomInt](#).

Definition at line 192 of file ParamObjectInt.h.

29.331.3.20 `virtual int Go::ParamObjectInt::numParams ( ) const [pure virtual]`

The number of parameters in the object.

Implemented in [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::Param2FunctionInt](#), [Go::ParamPointInt](#), and [Go::Param0FunctionInt](#).

29.331.3.21 `virtual void Go::ParamObjectInt::point ( Point & pt, const double * tpar ) const [pure virtual]`

Evaluate the object in the input parameter.

#### Parameters

<i>pt</i>	the <a href="#">Point</a> to be returned.
<i>tpar</i>	the parameter in which to evaluate. The size of the array should be equal to <a href="#">numParams()</a> .

Implemented in [Go::Param2FunctionInt](#), [Go::Param1FunctionInt](#), [Go::ParamPointInt](#), [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), and [Go::Param0FunctionInt](#).

**29.331.3.22** `virtual void Go::ParamObjectInt::point ( std::vector< Point > & pt, const double * tpar, int derivs, const bool * from_right = 0, double resolution = 1.0e-12 ) const` [pure virtual]

Evaluate the object in the input parameter, with the specified number of derivatives.

#### Parameters

<i>pt</i>	the <a href="#">Point</a> to be returned.
<i>tpar</i>	the parameter in which to evaluate. The size of the array should be equal to <a href="#">numParams()</a> .
<i>derivs</i>	the number of derivatives to calculate.
<i>from_right</i>	if true the evaluation is to be performed from the right of the parameter value.
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular: knot values in case of spline objects).

Implemented in [Go::Param1FunctionInt](#), [Go::Param2FunctionInt](#), [Go::ParamPointInt](#), [Go::ParamSurfaceInt](#), [Go::ParamCurveInt](#), and [Go::Param0FunctionInt](#).

**29.331.3.23** `virtual void Go::ParamObjectInt::setCriticalVal ( int paddir, double par )` [inline],[virtual]

Set info about subdivision value.

Reimplemented in [Go::ParamCurveInt](#).

Definition at line 139 of file [ParamObjectInt.h](#).

**29.331.3.24** `void Go::ParamObjectInt::setParent ( ParamObjectInt * parent )` [inline]

Set the parent of this object.

#### Parameters

<i>parent</i>	the parent of this object.
---------------	----------------------------

Definition at line 204 of file [ParamObjectInt.h](#).

**29.331.3.25** `virtual double Go::ParamObjectInt::startParam ( int paddir ) const` [pure virtual]

Return the start parameter value in the specified direction.

#### Parameters

<i>paddir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implemented in [Go::ParamSurfaceInt](#), [Go::Param2FunctionInt](#), [Go::ParamCurveInt](#), [Go::Param1FunctionInt](#), [Go::ParamPointInt](#), [Go::Param0FunctionInt](#), and [Go::Spline2FunctionInt](#).

### 29.332.1 Detailed Description

Class representing the "intersection object" of a parametric curve.

Definition at line 57 of file ParamPointInt.h.

### 29.332.2 Constructor & Destructor Documentation

29.332.2.1 `Go::ParamPointInt::ParamPointInt ( shared_ptr< Point > point, ParamGeomInt * parent = 0 )`  
[explicit]

Constructor.

Parameters

<i>point</i>	the point defining the intersection object.
<i>parent</i>	the parent object to this object. Can be either a curve or a surface.

29.332.2.2 `virtual Go::ParamPointInt::~~ParamPointInt ( )` [inline],[virtual]

Destructor.

Definition at line 68 of file ParamPointInt.h.

### 29.332.3 Member Function Documentation

29.332.3.1 `virtual bool Go::ParamPointInt::boundaryPoint ( const double * par, double eps ) const` [inline],[virtual]

Return true if the specified point lies within eps from the boundary.

## Parameters

<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .
<i>eps</i>	the tolerance defining boundary neighbourhood.

Implements [Go::ParamObjectInt](#).

Definition at line 219 of file ParamPointInt.h.

**29.332.3.2** `virtual bool Go::ParamPointInt::canDivide ( int pardir ) [inline],[virtual]`

Return true if we are allowed to divide in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question.
---------------	--------------------------------------

Implements [Go::ParamObjectInt](#).

Definition at line 148 of file ParamPointInt.h.

**29.332.3.3** `virtual CompositeBox Go::ParamPointInt::compositeBox ( ) const [virtual]`

Create the [CompositeBox](#) for the parametric object.

## Returns

The [CompositeBox](#) for the parametric object.

Implements [Go::ParamGeomInt](#).

**29.332.3.4** `virtual int Go::ParamPointInt::dimension ( ) const [inline],[virtual]`

The dimension of the geometric space.

Implements [Go::ParamGeomInt](#).

Definition at line 251 of file ParamPointInt.h.

**29.332.3.5** `virtual DirectionCone Go::ParamPointInt::directionCone ( ) const [virtual]`

A cone which contains all normals of the object. As a normal is not defined for a point, the zero vector is returned.

## Returns

A cone which contains all normals of the object.

Implements [Go::ParamGeomInt](#).

**29.332.3.6** `virtual double Go::ParamPointInt::endParam ( int pardir ) const [inline],[virtual]`

Return the end parameter in the specified direction. Does not apply to a point.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Definition at line 211 of file ParamPointInt.h.

```
29.332.3.7 virtual void Go::ParamPointInt::getBoundaryObjects (std::vector< shared_ptr< BoundaryGeomInt > > &
 bd_objs) [virtual]
```

Return the boundary objects of this object.

## Parameters

<i>bd_objs</i>	the boundary objects of this object.
----------------	--------------------------------------

Implements [Go::ParamGeomInt](#).

```
29.332.3.8 virtual std::vector<double> Go::ParamPointInt::getCriticalVals (int pardir) const [inline],[virtual]
```

Return the critical parameter values in the specified direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Definition at line 154 of file ParamPointInt.h.

```
29.332.3.9 virtual std::vector<double> Go::ParamPointInt::getCriticalValsAndKnots (int pardir) const [inline],
 [virtual]
```

Return the critical parameter values and inner knots for object.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Definition at line 175 of file ParamPointInt.h.

29.332.3.10 `virtual std::vector<double> Go::ParamPointInt::getInnerKnotVals ( int pardir, bool sort = false ) const`  
`[inline],[virtual]`

Return the inner knot values in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
<i>sort</i>	the returned values may be sorted by the function.

Implements [Go::ParamObjectInt](#).

Definition at line 164 of file ParamPointInt.h.

29.332.3.11 `virtual void Go::ParamPointInt::getLengthAndWiggle ( double * length, double * wiggle )` `[inline],[virtual]`

Return an estimate on the size and wiggle of the object. Does not apply to a point.

#### Parameters

<i>length</i>	the approximative length of the object in the corresponding parameter directions. The size of the array should be equal to <a href="#">numParams()</a> .
<i>wiggle</i>	a scalar representing the wiggle of the object in the corresponding parameter directions. The size of the array should be equal to <a href="#">numParams()</a> .

Implements [Go::ParamObjectInt](#).

Definition at line 122 of file ParamPointInt.h.

29.332.3.12 `virtual std::vector<double>::iterator Go::ParamPointInt::getMesh ( )` `[inline],[virtual]`

Return the geometric sample mesh for the parametric function.

Implements [Go::ParamGeomInt](#).

Definition at line 198 of file ParamPointInt.h.

29.332.3.13 `virtual int Go::ParamPointInt::getMeshSize ( int dir )` `[inline],[virtual]`

Return the size of the geometric sample mesh in the specified direction.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
------------	------------------------------------------------------------

Implements [Go::ParamGeomInt](#).

Definition at line 185 of file ParamPointInt.h.

**29.332.3.14** `virtual double Go::ParamPointInt::getOptimizedConeAngle ( Point & axis1, Point & axis2 ) [inline], [virtual]`

We try to treat problems which will never result in a simple case by shrinking the domain slightly, resulting in smaller cones. This is useful for scenarios where the normals are parallel in a boundary point.

#### Parameters

<i>axis1</i>	first vector defining a projection plane
<i>axis2</i>	second vector defining a projection plane

#### Returns

The optimized cone angle

Implements [Go::ParamGeomInt](#).

Definition at line 275 of file ParamPointInt.h.

**29.332.3.15** `virtual ParamPointInt* Go::ParamPointInt::getParamPointInt ( ) [inline], [virtual]`

Return a pointer to this object.

#### Returns

Pointer to this object.

Reimplemented from [Go::ParamObjectInt](#).

Definition at line 106 of file ParamPointInt.h.

**29.332.3.16** `RotatedBox Go::ParamPointInt::getRotatedBox ( std::vector< Point > & axis ) const`

Create a box containing the geometric sample mesh in the input coordinate system.

#### Parameters

<i>axis</i>	the axis defining the coordinate system. The size of vector axis is 2, the last point is given as the cross product axis[0]axis[1].
-------------	-------------------------------------------------------------------------------------------------------------------------------------

**29.332.3.17** `virtual bool Go::ParamPointInt::hasCriticalVals ( int pardir ) const [inline], [virtual]`

Return true if the object has any critical parameter values in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Definition at line 135 of file ParamPointInt.h.

**29.332.3.18** `virtual bool Go::ParamPointInt::hasCriticalValsOrKnots ( int pardir ) const` `[inline],[virtual]`

Return true if the object has any critical parameter values or inner knots in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Definition at line 142 of file ParamPointInt.h.

**29.332.3.19** `virtual bool Go::ParamPointInt::hasInnerKnots ( int pardir ) const` `[inline],[virtual]`

Return true if the object has any inner knots in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Definition at line 128 of file ParamPointInt.h.

**29.332.3.20** `virtual bool Go::ParamPointInt::isDegenerate ( double epsge, int dir, double * par )` `[inline],[virtual]`

Verify whether or not the object is degenerate in the specified direction and parameter.

## Parameters

<i>epsge</i>	the geometric tolerance defining degeneracy.
<i>dir</i>	the parameter direction in question.
<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .

Implements [Go::ParamGeomInt](#).

Definition at line 260 of file ParamPointInt.h.

29.332.3.21 `virtual bool Go::ParamPointInt::isSpline ( ) [inline],[virtual]`

Verify whether the object is a spline.

#### Returns

True if the object is a spline.

Implements [Go::ParamGeomInt](#).

Definition at line 265 of file ParamPointInt.h.

29.332.3.22 `virtual int Go::ParamPointInt::numParams ( ) const [inline],[virtual]`

The number of parameters in the object.

Implements [Go::ParamObjectInt](#).

Definition at line 110 of file ParamPointInt.h.

29.332.3.23 `virtual double Go::ParamPointInt::paramFromMesh ( int dir, int idx ) [inline],[virtual]`

Return the corresponding mesh parameter. Does not apply to a point.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>idx</i>	the mesh idx in the specified direction. Indexing starts at 0.

Implements [Go::ParamGeomInt](#).

Definition at line 194 of file ParamPointInt.h.

29.332.3.24 `virtual void Go::ParamPointInt::point ( Point & pt, const double * tpar ) const [inline],[virtual]`

Evaluate the object in the input parameter.

#### Parameters

<i>pt</i>	the <a href="#">Point</a> to be returned.
<i>tpar</i>	the parameter in which to evaluate. The parameter is not used as the parameter domain of a point is of dimension 0.

Implements [Go::ParamObjectInt](#).

Definition at line 75 of file ParamPointInt.h.

29.332.3.25 `virtual void Go::ParamPointInt::point ( std::vector< Point > & pt, const double * tpar, int derivs, const bool * from_right = 0, double resolution = 1.0e-12 ) const [inline],[virtual]`

Evaluate the object in the input parameter, with the specified number of derivatives.

#### Parameters

<i>pt</i>	the <a href="#">Point</a> to be returned.
<i>tpar</i>	the parameter in which to evaluate. The parameter is not used as the parameter domain of a point is of dimension 0.
<i>derivs</i>	the number of derivatives to calculate. Should be 0.
<i>from_right</i>	if true the evaluation is to be performed from the right side of the parameter value. Not used.
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular: knot values in case of spline objects. Not used.

Implements [Go::ParamObjectInt](#).

Definition at line 92 of file ParamPointInt.h.

29.332.3.26 `virtual double Go::ParamPointInt::startParam ( int paddir ) const [inline],[virtual]`

Return the start parameter value in the specified direction. Does not apply to a point.

#### Parameters

<i>paddir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Definition at line 204 of file ParamPointInt.h.

29.332.3.27 `virtual void Go::ParamPointInt::subdivide ( int paddir, double par, std::vector< shared_ptr< ParamGeomInt > & subdiv_objs, std::vector< shared_ptr< ParamGeomInt > & bd_objs ) [inline],[virtual]`

Subdivide the object in the specified parameter direction and parameter value. Does not apply to a point.

#### Parameters

<i>paddir</i>	direction in which to subdivide. Indexing starts at 0.
<i>par</i>	parameter in which to subdivide.
<i>subdiv_objs</i>	The subparts of this object. Of the same geometric dimension as this object.
<i>bd_objs</i>	the boundaries between the returned <i>subdiv_objs</i> . Of geometric dimension 1 less than this object.

Implements [Go::ParamGeomInt](#).

Definition at line 232 of file ParamPointInt.h.

### 29.333.1 Detailed Description

Base class for parametric surfaces in [Go](#)

Definition at line 66 of file `ParamSurface.h`.

### 29.333.2 Constructor & Destructor Documentation

29.333.2.1 virtual `Go::ParamSurface::~~ParamSurface ( )` `[virtual]`

Virtual destructor, enables safe inheritance.

29.333.2.2 `Go::ParamSurface::ParamSurface ( )` `[inline],[protected]`

Definition at line 519 of file `ParamSurface.h`.

### 29.333.3 Member Function Documentation

29.333.3.1 virtual `std::vector<CurveLoop> Go::ParamSurface::allBoundaryLoops ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const` `[pure virtual]`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

#### Parameters

<code><i>degenerate_epsilon</i></code>	edges whose length is smaller than this value are ignored.
----------------------------------------	------------------------------------------------------------

**Returns**

a vector containing CurveLoops. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), and [Go::Sphere](#).

**29.333.3.2** `virtual double Go::ParamSurface::area ( double tol ) const` [pure virtual]

Compute the total area of this surface up to some tolerance

**Parameters**

<i>tol</i>	the relative tolerance when approximating the area, i.e. stop iteration when error becomes smaller than tol/(surface area)
------------	----------------------------------------------------------------------------------------------------------------------------

**Returns**

the area calculated

Implemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::LRSplineSurface](#), [Go::CompositeSurface](#), [Go::SurfaceOnVolume](#), [Go::SurfaceOfRevolution](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::ElementarySurface](#).

**29.333.3.3** `virtual SplineSurface* Go::ParamSurface::asSplineSurface ( )` [inline],[virtual]

Return the spline surface represented by this surface, if any.

Reimplemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), and [Go::ElementarySurface](#).

Definition at line 78 of file ParamSurface.h.

**29.333.3.4** `virtual ParamSurface* Go::ParamSurface::clone ( ) const` [pure virtual]

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

**Returns**

pointer to cloned object

Implements [Go::GeomObject](#).

Implemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfRevolution](#), [Go::CompositeSurface](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Sphere](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::ElementarySurface](#).

```
29.333.3.5 virtual void Go::ParamSurface::closestBoundaryPoint (const Point & pt, double & clo_u, double & clo_v,
 Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * rd = NULL, double * seed = 0)
 const [pure virtual]
```

Iterates to the closest point to pt on the boundary of the surface.

See also

[closestPoint\(\)](#)

Implemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::LRSplineSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Plane](#), and [Go::Sphere](#).

```
29.333.3.6 virtual Point Go::ParamSurface::closestInDomain (double u, double v) const [pure virtual]
```

Fetch the parameter value in the parameter domain of the surface closest to the parameter pair (u,v)

Implemented in [Go::CompositeSurface](#), [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::SurfaceOfRevolution](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::ElementarySurface](#).

```
29.333.3.7 virtual void Go::ParamSurface::closestPoint (const Point & pt, double & clo_u, double & clo_v, Point &
 clo_pt, double & clo_dist, double epsilon, const RectDomain * domain_of_interest = NULL, double *
 seed = 0) const [virtual]
```

Iterates to the closest point to pt on the surface.

Parameters

<i>pt</i>	the point to find the closest point to
<i>clo_u</i>	u parameter of the closest point
<i>clo_v</i>	v parameter of the closest point
<i>clo_pt</i>	the geometric position of the closest point
<i>clo_dist</i>	the distance between pt and clo_pt
<i>epsilon</i>	parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)
<i>domain_of_interest</i>	pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched.
<i>seed</i>	pointer to parameter values where iteration starts.

Reimplemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Plane](#), and [Go::Sphere](#).

```
29.333.3.8 void Go::ParamSurface::closestPoint (const Point & pt, double & clo_u, double & clo_v, Point & clo_pt,
 double & clo_dist, double epsilon, int maxiter, const RectDomain * domain_of_interest = NULL, double *
 seed = 0) const
```

29.333.3.9 virtual `CompositeBox` `Go::ParamSurface::compositeBox ( ) const` `[virtual]`

Creates a composite box enclosing the surface. The composite box consists of an inner and an edge box. The inner box is supposed to be made from the interior of the surface, while the edge box is made from the boundary curves. The default implementation simply makes both boxes identical to the regular bounding box.

#### Returns

the [CompositeBox](#) of the surface, as specified above

Reimplemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::SurfaceOnVolume](#), and [Go::CompositeSurface](#).

29.333.3.10 virtual `std::vector<shared_ptr<ParamCurve>>` `Go::ParamSurface::constParamCurves ( double parameter, bool pardir_is_u ) const` `[pure virtual]`

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

#### Parameters

<i>parameter</i>	parameter value for the constant parameter (either u or v)
<i>pardir_is_u</i>	specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one.

#### Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), and [Go::Sphere](#).

29.333.3.11 virtual `RectDomain` `Go::ParamSurface::containingDomain ( ) const` `[pure virtual]`

Get a rectangular parameter domain that is guaranteed to contain the surface's [parameterDomain\(\)](#). It may be the same. There is no guarantee that this is the smallest domain containing the actual domain.

#### Returns

a [RectDomain](#) that is guaranteed to include the surface's total parameter domain.

Implemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::ElementarySurface](#).

29.333.3.12 virtual `int` `Go::ParamSurface::ElementBoundaryStatus ( int elem_ix, double eps )` `[inline],[virtual]`

Check if a polynomial element (for spline surfaces) intersects the (trimming) boundaries of this [ftSurface](#), is inside or outside

## Parameters

<i>elem_ix</i>	Element index counted according to distinct knot values. Sequence of coordinates: x runs fastest, then y
<i>eps</i>	Intersection tolerance

## Returns

-1: Not a spline surface or element index out of range 0: Outside trimmed volume 1: On boundary (intersection with boundary found) 2: Internal to trimmed surfaces Note that a touch with the boundaries of the underlying surface is not considered a boundary intersection while touching a trimming curve is seen as an intersection

Reimplemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), and [Go::SurfaceOnVolume](#).

Definition at line 493 of file ParamSurface.h.

```
29.333.3.13 virtual int Go::ParamSurface::ElementOnBoundary (int elem_ix, double eps) [inline],[virtual]
```

Check if a polynomial element (for spline surfaces) intersects the (trimming) boundaries of this surface

## Parameters

<i>elem_ix</i>	Element index counted according to distinct knot values. Sequence of coordinates: x runs fastest, then y
<i>eps</i>	Intersection tolerance

## Returns

-1: Not a spline surface or element index out of range 0: Not on boundary or touching a boundary curve 1: On boundary (intersection with boundary found) Note that a touch with the boundaries of the underlying surfaces is not considered a boundary intersection while touching a trimming curve is seen as an intersection

Reimplemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), and [Go::SurfaceOnVolume](#).

Definition at line 476 of file ParamSurface.h.

```
29.333.3.14 void Go::ParamSurface::estimateSfSize (double & u_size, double & v_size, int u_nmb = 5, int v_nmb = 5) const
```

Estimate the size of the surface in the two parameter directions.

```
29.333.3.15 virtual void Go::ParamSurface::evalGrid (int num_u, int num_v, double umin, double umax, double vmin, double vmax, std::vector< double > & points, double nodata_val = -9999) const [virtual]
```

Evaluate points in a grid. The nodata value is applicable for bounded surfaces and grid points outside the trimming loop(s) will get this value

Reimplemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), and [Go::LRSplineSurface](#).

29.333.3.16 `virtual void Go::ParamSurface::getBoundaryInfo ( Point & pt1, Point & pt2, double epsilon, SplineCurve *& cv, SplineCurve *& crosscv, double knot_tol = 1e-05 ) const` [pure virtual]

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

#### Parameters

<i>pt1</i>	the first point on the boundary, given by the user
<i>pt2</i>	the second point on the boundary, given by the user
<i>epsilon</i>	the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.
<i>cv</i>	upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.
<i>crosscv</i>	upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary.
<i>knot_tol</i>	tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.

Implemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::LRSplineSurface](#), [Go::CompositeSurface](#), [Go::SurfaceOnVolume](#), [Go::SurfaceOfRevolution](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Plane](#), and [Go::Sphere](#).

29.333.3.17 `virtual void Go::ParamSurface::getCornerPoints ( std::vector< std::pair< Point, Point > > & corners ) const` [pure virtual]

Return surface corners, geometric and parametric points in that sequence

Implemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::LRSplineSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::ElementarySurface](#).

29.333.3.18 `virtual void Go::ParamSurface::getDegenerateCorners ( std::vector< Point > & deg_corners, double tol ) const` [pure virtual]

Check for parallel and anti-parallel partial derivatives in surface corners.

Implemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::LRSplineSurface](#), [Go::CompositeSurface](#), [Go::SurfaceOnVolume](#), [Go::SurfaceOfRevolution](#), [Go::Torus](#), [Go::Disc](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Sphere](#), [Go::Cone](#), [Go::Cylinder](#), and [Go::Plane](#).

29.333.3.19 `virtual Point Go::ParamSurface::getInternalPoint ( double & u, double & v ) const` [virtual]

Fetch an arbitrary internal point in the surface Used for localization purposes

Reimplemented in [Go::BoundedSurface](#).

29.333.3.20 `virtual bool Go::ParamSurface::inDomain ( double u, double v, double eps = 1.0e-4 ) const` [pure virtual]

Check if a parameter pair lies inside the domain of this surface.

Implemented in [Go::CompositeSurface](#), [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::SurfaceOfRevolution](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::ElementarySurface](#).

29.333.3.21 `virtual int Go::ParamSurface::inDomain2 ( double u, double v, double eps = 1.0e-4 ) const` [pure virtual]

Check if a parameter pair lies inside the domain of this surface return value = 0: outside = 1: internal = 2: at the boundary

Implemented in [Go::CompositeSurface](#), [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::SurfaceOfRevolution](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::ElementarySurface](#).

29.333.3.22 `virtual bool Go::ParamSurface::isAxisRotational ( Point & centre, Point & axis, Point & vec, double & angle )` [inline], [virtual]

Check if the surface is axis rotational. Only true if a connection to an axis rotational elementary surface exist The axis and rotational angle is only specified if the surface is actually rotational

Reimplemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::Cone](#), [Go::Cylinder](#), and [Go::Sphere](#).

Definition at line 448 of file ParamSurface.h.

29.333.3.23 `virtual bool Go::ParamSurface::isDegenerate ( bool & b, bool & r, bool & t, bool & l, double tolerance ) const` [virtual]

The order of the edge indicators (bottom, right, top, left) matches the edge\_number of edgeCurve(). Query whether any of the four boundary curves are degenerate (zero length) within a certain tolerance. In the below, we refer to 'u' as the first parameter and 'v' as the second.

#### Parameters

<i>b</i>	'true' upon return of function if the boundary (v = v_min) is degenerate
<i>r</i>	'true' upon return of function if the boundary (v = v_max) is degenerate
<i>t</i>	'true' upon return of function if the boundary (u = u_min) is degenerate
<i>l</i>	'true' upon return of function if the boundary (u = u_max) is degenerate
<i>tolerance</i>	boundaries are considered degenerate if their length is shorter than this value, given by the user

#### Returns

'true' if at least one boundary curve was found to be degenerate, 'false' otherwise.

Reimplemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::LRSplineSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::Disc](#), [Go::Torus](#), [Go::Sphere](#), [Go::Cone](#), [Go::Cylinder](#), and [Go::Plane](#).

29.333.3.24 `virtual bool Go::ParamSurface::isIsoTrimmed ( double tol ) const [inline],[virtual]`

Check if the current surface is trimmed along constant parameter curves.

Reimplemented in [Go::BoundedSurface](#), and [Go::SurfaceOnVolume](#).

Definition at line 433 of file ParamSurface.h.

29.333.3.25 `virtual bool Go::ParamSurface::isLinear ( Point & dir1, Point & dir2, double tol ) [virtual]`

Check if the surface is linear in one or both parameter directions.

Reimplemented in [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::Cylinder](#), and [Go::Plane](#).

29.333.3.26 `virtual bool Go::ParamSurface::isPlanar ( Point & normal, double tol ) [virtual]`

Check if the surface is planar.

Reimplemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), and [Go::Plane](#).

29.333.3.27 `virtual bool Go::ParamSurface::isSpline ( ) const [inline],[virtual]`

Check if the surface is of type spline.

Reimplemented in [Go::SplineSurface](#).

Definition at line 439 of file ParamSurface.h.

29.333.3.28 `virtual ParamSurface* Go::ParamSurface::mirrorSurface ( const Point & pos, const Point & norm ) const [inline],[virtual]`

Mirror a surface around a specified plane.

Reimplemented in [Go::SplineSurface](#), and [Go::LRSplineSurface](#).

Definition at line 142 of file ParamSurface.h.

29.333.3.29 `virtual double Go::ParamSurface::nextSegmentVal ( int dir, double par, bool forward, double tol ) const [pure virtual]`

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0 or 1)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the 'par' is already located on the next segment value

**Returns**

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Plane](#), and [Go::Sphere](#).

**29.333.3.30** `virtual void Go::ParamSurface::normal ( Point & n, double upar, double vpar ) const` [pure virtual]

Evaluates the surface normal for a given parameter pair

**Parameters**

<i>n</i>	the computed normal will be written to this variable
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), and [Go::Sphere](#).

**29.333.3.31** `virtual DirectionCone Go::ParamSurface::normalCone ( ) const` [pure virtual]

Creates a [DirectionCone](#) covering all normals to this surface.

**Returns**

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::SurfaceOnVolume](#), [Go::BoundedSurface](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), and [Go::Sphere](#).

**29.333.3.32** `virtual bool Go::ParamSurface::onBoundary ( double u, double v, double eps = 1.0e-4 ) const` [pure virtual]

Check if a parameter pair lies at the boundary of this surface.

Implemented in [Go::CompositeSurface](#), [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::SurfaceOfRevolution](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::ElementarySurface](#).

**29.333.3.33** `virtual CurveLoop Go::ParamSurface::outerBoundaryLoop ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const` [pure virtual]

Returns the anticlockwise, outer boundary loop of the surface.

## Parameters

<i>degenerate_epsilon</i>	edges whose length is smaller than this value are ignored.
---------------------------	------------------------------------------------------------

## Returns

a [CurveLoop](#) describing the anticlockwise, outer boundary loop of the surface. A negative *degenerate\_epsilon* indicates that all curves, also the degenerate ones are wanted

Implemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::ElementarySurface](#).

**29.333.3.34** `virtual const Domain& Go::ParamSurface::parameterDomain ( ) const` [pure virtual]

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

## Returns

a [Domain](#) object describing the parametric domain of the surface

Implemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::Disc](#), [Go::Torus](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Sphere](#), and [Go::SurfaceOfLinearExtrusion](#).

**29.333.3.35** `virtual void Go::ParamSurface::point ( Point & pt, double upar, double vpar ) const` [pure virtual]

Evaluates the surface's position for a given parameter pair.

## Parameters

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), and [Go::Sphere](#).

**29.333.3.36** `virtual void Go::ParamSurface::point ( std::vector< Point > & pts, double upar, double vpar, int derivs, bool u_from_right = true, bool v_from_right = true, double resolution = 1.0e-12 ) const` [pure virtual]

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

## Parameters

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(\text{derivs}+1) * (\text{derivs}+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives.
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::LRSplineSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), and [Go::Sphere](#).

### 29.333.3.37 Point `Go::ParamSurface::point ( double upar, double vpar ) const`

Evaluate the surface's position at a certain parameter pair

## Parameters

<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

## Returns

the surface's position for this parameter pair. NB: This function is implemented in terms of the [ParamSurface](#)'s virtual 'point(...)' function, but is itself not virtual. If you make a concrete subclass and wish to make this function visible to the user, you must put a 'using [ParamSurface::point](#)' statement in the class definition.

### 29.333.3.38 `std::vector<Point> Go::ParamSurface::point ( double upar, double vpar, int derivs ) const`

Evaluate the surface's position and a certain number of derivatives at a given parameter.

## Parameters

<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>derivs</i>	number of requested derivatives

## Returns

the vector containing the evaluated values. Its size will be equal to  $(\text{derivs}+1) * (\text{derivs}+2) / 2$ . Its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives. NB: This function is implemented in terms of the [ParamSurface](#)'s virtual 'point(...)' functions, but is itself not virtual. If you make a concrete subclass and wish to make this function visible to the user, you must put a 'using [ParamCurve::point](#)' in the class definition.

29.333.3.39 `virtual void Go::ParamSurface::reverseParameterDirection ( bool direction_is_u ) [pure virtual]`

Reverses the direction of the basis in input direction.

## Parameters

<i>direction_is_u</i>	if 'true', the first parameter direction will be reversed, otherwise, the second parameter direction will be reversed
-----------------------	-----------------------------------------------------------------------------------------------------------------------

Implemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::LRSplineSurface](#), [Go::CompositeSurface](#), [Go::SurfaceOnVolume](#), [Go::SurfaceOfRevolution](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::ElementarySurface](#).

29.333.3.40 `void Go::ParamSurface::s1773 ( const double ppoint[], double aepsge, double estart[], double eend[], double enext[], double gpos[], int maxiter, int * jstat ) const [protected]`

29.333.3.41 `void Go::ParamSurface::s1773_s9corr ( double gd[], double acoef1, double acoef2, double astart1, double aend1, double astart2, double aend2 ) const [protected]`

29.333.3.42 `void Go::ParamSurface::s1773_s9dir ( double * cdist, double * cdiff1, double * cdiff2, double PS[], const double * eval1, std::vector< Point > eval2, double aepsge, int idim, int * jstat ) const [protected]`

29.333.3.43 `virtual void Go::ParamSurface::setIterator ( IteratorType type ) [inline],[virtual]`

Set type of closest point iterator type == Iterator\_parametric - use conjugate gradient iteration type == Iterator\_geometric - sisl type geometric closest point iteration

Reimplemented in [Go::BoundedSurface](#).

Definition at line 427 of file ParamSurface.h.

29.333.3.44 `virtual void Go::ParamSurface::setParameterDomain ( double u1, double u2, double v1, double v2 ) [virtual]`

set the parameter domain to a given rectangle

## Parameters

<i>u1</i>	new min. value of first parameter span
<i>u2</i>	new max. value of first parameter span
<i>v1</i>	new min. value of second parameter span
<i>v2</i>	new max. value of second parameter span

Reimplemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::LRSplineSurface](#), and [Go::CompositeSurface](#).

29.333.3.45 `void Go::ParamSurface::singularity ( double & sing_u, double & sing_v, Point & sing_pt, double & sing_dist, double epsilon, const RectDomain * rd = NULL, double * seed = 0 ) const`

29.333.3.46 `virtual std::vector<shared_ptr<ParamSurface> > Go::ParamSurface::subSurfaces ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [pure virtual]`

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

#### Parameters

<i>from_upar</i>	lower value for the first parameter in the subdomain
<i>from_vpar</i>	lower value for the second parameter in the subdomain
<i>to_upar</i>	upper value for the first parameter in the subdomain
<i>to_vpar</i>	upper value for the second parameter in the subdomain
<i>fuzzy</i>	tolerance used when determining intersection with interior boundaries

#### Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Plane](#), and [Go::Sphere](#).

29.333.3.47 `virtual void Go::ParamSurface::swapParameterDirection ( ) [pure virtual]`

Swaps the two parameter directions.

Implemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::LRSplineSurface](#), [Go::CompositeSurface](#), [Go::SurfaceOnVolume](#), [Go::SurfaceOfRevolution](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::ElementarySurface](#).

29.333.3.48 `virtual DirectionCone Go::ParamSurface::tangentCone ( bool paddir_is_u ) const [pure virtual]`

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

#### Parameters

<i>paddir_is_u</i>	if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used.
--------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Returns**

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implemented in [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::SurfaceOnVolume](#), [Go::BoundedSurface](#), [Go::CompositeSurface](#), [Go::SurfaceOfRevolution](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), and [Go::Sphere](#).

**29.333.3.49** `virtual void Go::ParamSurface::turnOrientation ( ) [pure virtual]`

Turns the direction of the normal of the surface.

Implemented in [Go::SplineSurface](#), [Go::BoundedSurface](#), [Go::LRSplineSurface](#), [Go::CompositeSurface](#), [Go::SurfaceOnVolume](#), [Go::SurfaceOfRevolution](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::ElementarySurface](#).

### 29.334.1 Detailed Description

Class that represents the "intersection object" of a parametric surface.

Definition at line 59 of file ParamSurfacelnt.h.

### 29.334.2 Constructor & Destructor Documentation

29.334.2.1 `Go::ParamSurfacelnt::ParamSurfacelnt ( shared_ptr< ParamSurface > surf, ParamGeomInt * parent = 0 )`  
`[explicit]`

Constructor.

Parameters

<i>surf</i>	the parametric surface defining the intersection object.
<i>parent</i>	the parent object to this object.

29.334.2.2 `virtual Go::ParamSurfacelnt::~~ParamSurfacelnt ( )` `[virtual]`

Destructor.

### 29.334.3 Member Function Documentation

29.334.3.1 `bool Go::ParamSurfacelnt::atDegenerateBd ( const double * par, double epsge, double epspar )`

29.334.3.2 `void Go::ParamSurfacelnt::axisFromCorners ( Point & axis1, Point & axis2 ) const`

Use the corner points of the parameter domain to create axes.

Parameters

<i>axis1</i>	the first axis.
<i>axis2</i>	the second axis.

29.334.3.3 `virtual bool Go::ParamSurfacelnt::boundaryPoint ( const double * par, double eps ) const` `[virtual]`

Return true if the specified point lies within eps from the boundary.

Parameters

<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <code>numParams()</code> .
<i>eps</i>	the tolerance defining the boundary neighbourhood.

Implements [Go::ParamObjectInt](#).

**29.334.3.4** `virtual bool Go::ParamSurfaceInt::canDivide ( int pardir ) [virtual]`

Return true if we are allowed to divide in the specified parameter direction.

#### Parameters

<i>pardir</i>	the parameter direction in question.
---------------	--------------------------------------

Implements [Go::ParamObjectInt](#).

**29.334.3.5** `virtual bool Go::ParamSurfaceInt::canDivideTinyTriang ( int pardir ) [virtual]`

Reimplemented from [Go::ParamObjectInt](#).

**29.334.3.6** `virtual bool Go::ParamSurfaceInt::canImplicitize ( ) [inline],[virtual]`

Check whether the objects fulfills the requirements to implicitize.

#### Returns

Return true if we may implicitize the object.

Reimplemented in [Go::SplineSurfaceInt](#).

Definition at line 621 of file ParamSurfaceInt.h.

**29.334.3.7** `bool Go::ParamSurfaceInt::canSelfIntersect ( double epsge ) const`

Check if the current surface can selfintersect. Uses normal cone and tangent cones.

#### Parameters

<i>epsge</i>	a geometric tolerance
--------------	-----------------------

**29.334.3.8** `virtual int Go::ParamSurfaceInt::checkPeriodicity ( int pardir ) const [virtual]`

Check if the object is periodic in the specified direction. Analyze periodicity of surface based on number of repeating knots and control points. The return value is -1 if the surface ends are disjoint, otherwise k if cv is  $C^k$  continuous. These are sufficient but not necessary conditions for periodicity, so it is possible that a higher degree of periodicity exists. Should not be called on this layer, should be overruled by inherited class.

## Parameters

<i>parDir</i>	the parameter direction in question.
---------------	--------------------------------------

## Returns

-1 if the curve ends are disjoint, or k if the surface is proven to be  $C^k$  continuous.

Reimplemented from [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineSurfaceInt](#).

**29.334.3.9** virtual **CompositeBox** `Go::ParamSurfaceInt::compositeBox ( ) const` `[virtual]`

Create the [CompositeBox](#) for the parametric object.

## Returns

The [CompositeBox](#) for the parametric object.

Implements [Go::ParamGeomInt](#).

**29.334.3.10** void `Go::ParamSurfaceInt::derivs ( double u, double v, Point & deriv_u, Point & deriv_v, bool from_right_1 = true, bool from_right_2 = true ) const` `[inline]`

Return the partial derivatives in the input parameter point.

## Parameters

<i>u</i>	the first parameter value.
<i>v</i>	the second parameter value.
<i>deriv_u</i>	the partial derivative in the u-direction.
<i>deriv_v</i>	the partial derivative in the u-direction.
<i>from_right_1</i>	if true then calculate from the left int the first parameter parameter direction, otherwise from the right.
<i>from_right_2</i>	if true then calculate from the left int the second parameter parameter direction, otherwise from the right.

Definition at line 534 of file `ParamSurfaceInt.h`.

**29.334.3.11** virtual int `Go::ParamSurfaceInt::dimension ( ) const` `[inline],[virtual]`

The dimension of the geometric space.

Implements [Go::ParamGeomInt](#).

Definition at line 349 of file `ParamSurfaceInt.h`.

29.334.3.12 `virtual DirectionCone Go::ParamSurfaceInt::directionCone ( ) const [virtual]`

A cone which contains all normals of the object.

#### Returns

A cone which contains all normals of the object.

Implements [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.13 `virtual double Go::ParamSurfaceInt::endParam ( int pardir ) const [virtual]`

Return the end parameter in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

29.334.3.14 `void Go::ParamSurfaceInt::first_fund_form ( double u, double v, bool u_from_right, bool v_from_right, double & E, double & F, double & G ) const [inline]`

Return the coefficients necessary to calculate the first fundamental form of the surface in the parameter point.

#### Parameters

<i>u</i>	the first parameter value.
<i>v</i>	the second parameter value.
<i>u_from_right</i>	if true then evaluate from the right, otherwise from the left.
<i>v_from_right</i>	if true then evaluate from the right, otherwise from the left.
<i>E</i>	the first coefficient for the first fundamental form.
<i>F</i>	the second coefficient for the first fundamental form.
<i>G</i>	the third coefficient for the first fundamental form.

Definition at line 470 of file ParamSurfaceInt.h.

29.334.3.15 `virtual void Go::ParamSurfaceInt::getBoundaryObjects ( std::vector< shared_ptr< BoundaryGeomInt > > & bd_objs ) [virtual]`

Return the boundary objects of this object.

#### Parameters

<i>bd_objs</i>	the boundary objects of this object.
----------------	--------------------------------------

Implements [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.16 `shared_ptr<ParamCurve> Go::ParamSurfaceInt::getConstantParameterCurve ( int dir, double par )`

Return a curveOnSurface along the current surface in the given direction and parameter value

Parameters

<i>dir</i>	the direction of the constant parameter curve. Indexing starts at 0.
<i>par</i>	the isoparameter for the curve.

29.334.3.17 `shared_ptr<ParamCurve> Go::ParamSurfaceInt::getConstantParameterCurve ( int dir, double par, double tmin, double tmax )`

29.334.3.18 `virtual std::vector<double> Go::ParamSurfaceInt::getCriticalVals ( int pardir ) const [virtual]`

Return the critical parameter values in the specified direction.

Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

29.334.3.19 `virtual std::vector<double> Go::ParamSurfaceInt::getCriticalValsAndKnots ( int pardir ) const [virtual]`

Return the critical parameter values and inner knots for object.

Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.20 `const RectDomain& Go::ParamSurfaceInt::getDegDomain ( double epsge )`

Return a rectangular domain of the surface which is slightly reduced in the degenerate case

Returns

Return the rectangular domain of the surface.

29.334.3.21 **bool** Go::ParamSurfaceInt::getDegTriang ( ) `[inline]`

Get deg\_triang info. Variable useful for surfaces with degenerated edge(s).

Definition at line 446 of file ParamSurfaceInt.h.

29.334.3.22 **virtual const RectDomain&** Go::ParamSurfaceInt::getDomain ( ) **const** `[inline],[virtual]`

Return the rectangular domain of the surface.

#### Returns

Return the rectangular domain of the surface.

Definition at line 354 of file ParamSurfaceInt.h.

29.334.3.23 **virtual bool** Go::ParamSurfaceInt::getImplicit ( **double** *tol*, **double &** *tol2*, **AlgObj3DInt &** *alg\_obj\_3d\_int* ) `[inline],[virtual]`

Get the implicit representation of the object. Garbage is returned if we are not able to implicitize.

#### Parameters

<i>tol</i>	geometric tolerance for the implicitization procedure.
<i>tol2</i>	geometric estimate for the accuracy of the implicitized object. Not yet in use!!!
<i>alg_obj_3d_int</i>	the algebraic object containing the implicitized surface.

#### Returns

True if the implicitization was a success.

Reimplemented in [Go::SplineSurfaceInt](#).

Definition at line 640 of file ParamSurfaceInt.h.

29.334.3.24 **virtual std::vector<double>** Go::ParamSurfaceInt::getInnerKnotVals ( **int** *parDir*, **bool** *sort = false* ) **const** `[virtual]`

Return the inner knot values in the specified direction.

#### Parameters

<i>parDir</i>	the parameter direction in question. Indexing starts at 0.
<i>sort</i>	the returned values may be sorted by the function.

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.25 `shared_ptr<ParamCurve> Go::ParamSurfaceInt::getIsoCurve ( double param_start, double param_end, double isoval, bool pardir_is_u ) const`

Returns the specified isocurve.

#### Parameters

<i>param_start</i>	start parameter for the isocurve.
<i>param_end</i>	end parameter for the isocurve.
<i>isoval</i>	the value for the isoparameter.
<i>pardir_is_u</i>	if 'pardir_is_u' is 'true', then the first parameter is the running direction and the second parameter is the isoparameter; vice versa for 'pardir_is_u' equal to 'false'.

29.334.3.26 `virtual void Go::ParamSurfaceInt::getLengthAndWiggle ( double * length, double * wiggle ) [virtual]`

Return an estimate on the size and wiggle of the object.

#### Parameters

<i>length</i>	the approximative length of the object in the corresponding parameter directions. The size of the array should be equal to <code>numParams()</code> .
<i>wiggle</i>	a scalar representing the wiggle of the object in the corresponding parameter directions. The size of the array should be equal to <code>numParams()</code> .

Implements [Go::ParamObjectInt](#).

29.334.3.27 `virtual std::vector<double>::iterator Go::ParamSurfaceInt::getMesh ( ) [virtual]`

Return the geometric sample mesh for the parametric function.

Implements [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.28 `virtual int Go::ParamSurfaceInt::getMeshSize ( int dir ) [virtual]`

Return the size of the geometric sample mesh in the specified direction.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
------------	------------------------------------------------------------

Implements [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.29 `std::vector<double> Go::ParamSurfaceInt::getMima ( ) const`

Return the domain of the surface.

#### Returns

The returned vector consists of (umin, umax, vmin, vmax).

29.334.3.30 `virtual shared_ptr<ParamSurfaceInt> Go::ParamSurfaceInt::getNormalSurface ( ) const [inline], [virtual]`

Returns the normal surface corresponding to this surface.

#### Returns

Pointer to the [SplineSurface](#) defining the normal surface. Not implemented for a general parametric surface.

Reimplemented in [Go::SplineSurfaceInt](#).

Definition at line 612 of file ParamSurfaceInt.h.

29.334.3.31 `virtual double Go::ParamSurfaceInt::getOptimizedConeAngle ( Point & axis1, Point & axis2 ) [virtual]`

We try to treat problems which will never result in a simple case by shrinking the domain slightly, resulting in smaller cones. This is useful for scenarios where the normals are parallel in a boundary point.

#### Parameters

<i>axis1</i>	first vector defining a projection plane
<i>axis2</i>	second vector defining a projection plane

#### Returns

The optimized cone angle

Implements [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.32 `shared_ptr<ParamSurface> Go::ParamSurfaceInt::getParamSurface ( ) [inline]`

Return pointer to the parametric surface defining this object.

#### Returns

Pointer to the parametric surface defining this object.

Definition at line 116 of file ParamSurfaceInt.h.

29.334.3.33 `shared_ptr<const ParamSurface> Go::ParamSurfaceInt::getParamSurface ( ) const [inline]`

Return pointer to the parametric surface defining this object.

#### Returns

Pointer to the parametric surface defining this object.

Definition at line 122 of file ParamSurfaceInt.h.

29.334.3.34 `virtual ParamSurfaceInt* Go::ParamSurfaceInt::getParamSurfaceInt ( ) [virtual]`

Return a pointer to this object.

#### Returns

Pointer to this object.

Reimplemented from [Go::ParamObjectInt](#).

29.334.3.35 `shared_ptr<ParamSurface> Go::ParamSurfaceInt::getParentParamSurface ( RectDomain & domain )`

Return pointer to a subsurface of the parent surface for this object. If no such surface exist, we use the surface of this object instead.

#### Parameters

<i>domain</i>	the parametric domain of the subsurface.
---------------	------------------------------------------

#### Returns

Pointer to a subsurface of the parent surface for this object.

29.334.3.36 `shared_ptr<ParamSurface> Go::ParamSurfaceInt::getParentParamSurface ( )`

Return pointer to the parent surface for this object. If no such surface exist, we use the surface of this object instead.

#### Returns

Pointer to a subsurface of the parent surface for this object.

29.334.3.37 `double Go::ParamSurfaceInt::getParOffBd ( int dir, bool atstart, double tol ) const`

Estimate the parameter value of a surface a specified distance from a given edge.

## Parameters

<i>dir</i>	the parameter direction in question.
<i>atstart</i>	true if we are the start of the parameter interval, false otherwise.
<i>tol</i>	influencing how far from the edge we should move.

## Returns

the computed parameter value.

29.334.3.38 `virtual RotatedBox Go::ParamSurfaceInt::getRotatedBox ( std::vector< Point > & axis ) const` [virtual]

Create a box containing the geometric sample mesh in the input coordinate system.

## Parameters

<i>axis</i>	the axis defining the coordinate system. The size of vector axis is 2, the last point is given as the cross product axis[0]axis[1].
-------------	-------------------------------------------------------------------------------------------------------------------------------------

## Returns

the rotated box

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.39 `void Go::ParamSurfaceInt::getSingularity ( double eps, double sing_par[], Point & sing_pt, double & sing_val, double * seed )`

Iterate for a surface singularity.

## Parameters

<i>eps</i>	numerical tolerance
<i>sing_par</i>	parameters of the singularity
<i>sing_pt</i>	the singular point
<i>sing_val</i>	a number that measures the quality of the singularity
<i>seed</i>	initial guess for singularity in parameter plane

29.334.3.40 `virtual bool Go::ParamSurfaceInt::hasCriticalVals ( int padir ) const` [virtual]

Return true if the object has any critical parameter values in the specified parameter direction.

## Parameters

<i>padir</i>	the parameter direction in question. Indexing starts at 0.
--------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

29.334.3.41 `virtual bool Go::ParamSurfaceInt::hasCriticalValsOrKnots ( int pardir ) const` [virtual]

Return true if the object has any critical parameter values or inner knots in the specified parameter direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.42 `virtual bool Go::ParamSurfaceInt::hasInnerKnots ( int pardir ) const` [virtual]

Return true if the object has any inner knots in the specified parameter direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.43 `virtual bool Go::ParamSurfaceInt::implicitize ( double tol )` [inline],[virtual]

Implicitize the object.

#### Parameters

<i>tol</i>	the geoemtric tolerance for the implicitization.
------------	--------------------------------------------------

#### Returns

True if the implicitization was a success.

Reimplemented in [Go::SplineSurfaceInt](#).

Definition at line 627 of file ParamSurfaceInt.h.

29.334.3.44 `virtual bool Go::ParamSurfaceInt::inCorner ( const double * par, double epspar ) const` [virtual]

Check if parameter point lies close to a corner of the parameter domain.

## Parameters

<i>par</i>	the input parameter point.
<i>epspar</i>	the parametric tolerance defining the neighbourhood.

Reimplemented from [Go::ParamObjectInt](#).

29.334.3.45 **bool** `Go::ParamSurfaceInt::isDegenerate ( double epsge )`

Verify whether the object is degenerate.

## Parameters

<i>epsge</i>	the geometric tolerance defining degeneracy.
--------------	----------------------------------------------

29.334.3.46 **virtual int** `Go::ParamSurfaceInt::isDegenerate ( double epsge, int dir )` [virtual]

Verify whether the object is degenerate in the specified direction.

## Parameters

<i>epsge</i>	the geometric tolerance defining degeneracy.
<i>dir</i>	the parameter direction in question.

Reimplemented from [Go::ParamGeomInt](#).

29.334.3.47 **virtual bool** `Go::ParamSurfaceInt::isDegenerate ( double epsge, int dir, double * par )` [virtual]

Verify whether the object is degenerate in the specified direction and parameter.

## Parameters

<i>epsge</i>	the geometric tolerance defining degeneracy.
<i>dir</i>	the parameter direction in question.
<i>par</i>	the parameter in which to evaluate. Size of array should be equal to <a href="#">numParams()</a> .

Implements [Go::ParamGeomInt](#).

29.334.3.48 **virtual bool** `Go::ParamSurfaceInt::isIsoParametric ( ParamCurveInt * curve, int dir, double par, double ptol, double tol )` [inline], [virtual]

Check if a curve is an iso parametric curve in the current surface. NB! Only valid for splines

Reimplemented in [Go::SplineSurfaceInt](#).

Definition at line 374 of file ParamSurfaceInt.h.

29.334.3.49 **double** Go::ParamSurfaceInt::isolateDegPar ( int *dir*, int *deg\_edge*, double *threshold*, double \* *deg\_factor* = NULL )

Return info on parameter domain which needs special treatment near a degenerated edge.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>deg_edge</i>	the degenerate edge
<i>threshold</i>	a tolerance

#### Returns

a safe parameter value that is isolated from the degenerate value

29.334.3.50 **virtual bool** Go::ParamSurfaceInt::isSimple ( ) [virtual]

Estimates if the current surface is simple enough for a singularity iteration. Checks the span of the normal cone and the size of the surface

#### Returns

True if the surface is characterized as simple.

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.51 **virtual bool** Go::ParamSurfaceInt::isSpline ( ) [virtual]

Verify whether the object is a spline.

#### Returns

True if the object is a spline.

Implements [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.52 **virtual void** Go::ParamSurfaceInt::knotIntervalFuzzy ( double & *u*, double & *v*, double *utol*, double *vtoI* ) const [virtual]

Find the knot intervals for which *u* and *v* lie inside, moving the value *u* or *v* if they lie close to a knot.

#### Parameters

<i>u</i>	the <i>u</i> parameter value
<i>v</i>	the <i>v</i> parameter value
<i>utol</i>	the parametric tolerance deciding if the input parameter <i>u</i> should be moved.
<i>vtoI</i>	the parametric tolerance deciding if the input parameter <i>v</i> should be moved.

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.53 `virtual shared_ptr<ParamCurveInt> Go::ParamSurfaceInt::makeIntCurve ( shared_ptr< ParamCurve > crv, ParamGeomInt * parent ) [virtual]`

Return an intersection object for the input curve, using parameter *parent* as parent.

#### Parameters

<i>crv</i>	the parametric curve defining the intersection object.
<i>parent</i>	the parent to the created intersection object.

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.54 `virtual shared_ptr<ParamSurfaceInt> Go::ParamSurfaceInt::makeIntObject ( shared_ptr< ParamSurface > surf ) [virtual]`

Return an intersection object for the input surface, using this object as parent.

#### Parameters

<i>surf</i>	the parametric surface defining the intersection object.
-------------	----------------------------------------------------------

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.55 `void Go::ParamSurfaceInt::maxCurvatures ( bool dir_is_u, int nmb_params, double iso_from, double iso_to, double guess_param, std::vector< double > & max_curv_params, std::vector< double > & max_curvatures )`

29.334.3.56 `void Go::ParamSurfaceInt::minimumAlongCurve ( int dir, double par, double tmin, double tmax, Point & pnt, double & minpar, Point & minval, double & mindist )`

29.334.3.57 `virtual double Go::ParamSurfaceInt::nextSegmentVal ( int dir, double par, bool forward, double tol ) const [virtual]`

Return the value of the knot next to the input parameter *par*.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>par</i>	the parameter value
<i>forward</i>	if true we return the closest knot to the right, otherwise the closest knot to the left.
<i>tol</i>	the tolerance to determine if <i>par</i> is already located on the start of the next segment.

## Returns

The knot closest to the input parameter.

Reimplemented in [Go::SplineSurfaceInt](#).

**29.334.3.58** `void Go::ParamSurfaceInt::normal ( double u, double v, Point & normal, bool from_right_1 = true, bool from_right_2 = true ) const` `[inline]`

Calculate the normal in the specified parameter point.

## Parameters

<i>u</i>	the first parameter value.
<i>v</i>	the second parameter value.
<i>normal</i>	the calculated normal in the parameter point.
<i>from_right_1</i>	if true then calculate from the left int the first parameter parameter direction, otherwise from the right.
<i>from_right_2</i>	if true then calculate from the left int the second parameter parameter direction, otherwise from the right.

Definition at line 557 of file ParamSurfaceInt.h.

**29.334.3.59** `virtual int Go::ParamSurfaceInt::numParams ( ) const` `[inline],[virtual]`

The number of parameters in the object.

Implements [Go::ParamObjectInt](#).

Definition at line 155 of file ParamSurfaceInt.h.

**29.334.3.60** `virtual double Go::ParamSurfaceInt::paramFromMesh ( int dir, int idx )` `[virtual]`

Return the corresponding mesh parameter.

## Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>idx</i>	the mesh idx in the specified direction. Indexing starts at 0.

Implements [Go::ParamGeomInt](#).

Reimplemented in [Go::SplineSurfaceInt](#).

**29.334.3.61** `virtual void Go::ParamSurfaceInt::point ( Point & pt, const double * tpar ) const` `[inline],[virtual]`

Evaluate the object in the input parameter.

## Parameters

<i>pt</i>	the <a href="#">Point</a> to be returned.
<i>tpar</i>	the parameter in which to evaluate. The size of the array should be equal to <a href="#">numParams()</a> .

Implements [Go::ParamObjectInt](#).

Definition at line 75 of file ParamSurfaceInt.h.

```
29.334.3.62 virtual void Go::ParamSurfaceInt::point (std::vector< Point > & pt, const double * tpar, int derivs, const
bool * from_right = 0, double resolution = 1.0e-12) const [inline],[virtual]
```

Evaluate the object in the input parameter, with the specified number of derivatives.

## Parameters

<i>pt</i>	the vecotr of points to be returned.
<i>tpar</i>	the parameter in which to evaluate. The size of the array should be equal to <a href="#">numParams()</a> .
<i>derivs</i>	the number of derivatives to calculate.
<i>from_right</i>	if true the evaluation is to be performed from the right side of the parameter value.
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular: knot values in case of spline objects).

Implements [Go::ParamObjectInt](#).

Definition at line 89 of file ParamSurfaceInt.h.

```
29.334.3.63 void Go::ParamSurfaceInt::second_fund_form (double u, double v, bool u_from_right, bool v_from_right,
double & L, double & M, double & N) const [inline]
```

Return the coefficients necessary to calculate the second fundamental form of the surface in the parameter point.

## Parameters

<i>u</i>	the first parameter value.
<i>v</i>	the second parameter value.
<i>u_from_right</i>	if true then evaluate from the right, otherwise from the left.
<i>v_from_right</i>	if true then evaluate from the right, otherwise from the left.
<i>L</i>	the first coefficient for the second fundamental form.
<i>M</i>	the second coefficient for the second fundamental form.
<i>N</i>	the third coefficient for the second fundamental form.

Definition at line 501 of file ParamSurfaceInt.h.

```
29.334.3.64 void Go::ParamSurfaceInt::setDegTriang () [inline]
```

Set dege\_triang info. Variable useful for surfaces with degenerated edge(s).

Definition at line 441 of file ParamSurfaceInt.h.

29.334.3.65 `virtual void Go::ParamSurfaceInt::splitAtG0 ( double angtol, std::vector< shared_ptr< ParamSurfaceInt > > & subG1 ) [virtual]`

Requests from selfintersection computation. Split at G1 discontinuities

#### Parameters

<i>angtol</i>	angular tolerance defining G1 discontinuity
<i>subG1</i>	vector of subdivided patches that are G1

Reimplemented in [Go::SplineSurfaceInt](#).

29.334.3.66 `virtual double Go::ParamSurfaceInt::startParam ( int pardir ) const [virtual]`

Return the start parameter value in the specified direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Implements [Go::ParamObjectInt](#).

29.334.3.67 `virtual void Go::ParamSurfaceInt::subdivide ( int pardir, double par, std::vector< shared_ptr< ParamGeomInt > > & subdiv_objs, std::vector< shared_ptr< ParamGeomInt > > & bd_objs ) [virtual]`

Subdivide the object in the specified parameter direction and parameter value.

#### Parameters

<i>pardir</i>	direction in which to subdivide. Indexing starts at 0.
<i>par</i>	parameter in which to subdivide.
<i>subdiv_objs</i>	The subparts of this object. Of the same geometric dimension as this object.
<i>bd_objs</i>	the boundaries between the returned <i>subdiv_objs</i> . Of geometric dimension 1 less than this object.

Implements [Go::ParamGeomInt](#).

29.334.3.68 `virtual std::vector< shared_ptr< ParamSurfaceInt > > Go::ParamSurfaceInt::subSurfaces ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy ) [virtual]`

Return the subsurface(s) on the input domain. For a trimmed surface there may be more than one surface, for a surface defined on a rectangular domain there will be only one.

#### Parameters

<i>from_upar</i>	start parameter in the first parameter direction.
<i>from_vpar</i>	start parameter in the second parameter direction.
<i>to_upar</i>	end parameter in the first parameter direction.

## Parameters

<i>to_vpar</i>	end parameter in the second parameter direction.
<i>fuzzy</i>	allowed alteration of an input parameter value. Typically this applies to a spline surface, where we do not want knots to lie too close whilst not being equal.

## Additional Inherited Members

### 29.335.1 Detailed Description

Base class for parametric Volumes in [Go](#)

Definition at line 59 of file ParamVolume.h.

### 29.335.2 Constructor & Destructor Documentation

29.335.2.1 virtual [Go::ParamVolume::~ParamVolume](#) ( ) [virtual]

Virtual destructor, enables safe inheritance.

### 29.335.3 Member Function Documentation

29.335.3.1 virtual [SplineVolume](#)\* [Go::ParamVolume::asSplineVolume](#) ( ) [inline],[virtual]

Return the spline volume represented by this volume, if any.

Reimplemented in [Go::SplineVolume](#).

Definition at line 202 of file ParamVolume.h.

29.335.3.2 `virtual ParamVolume* Go::ParamVolume::clone ( ) const [pure virtual]`

make a clone of this volume and return a pointer to it (user is responsible for clearing up memory afterwards).

#### Returns

pointer to cloned object

Implements [Go::GeomObject](#).

Implemented in [Go::SplineVolume](#), [Go::TorusVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), [Go::SphereVolume](#), [Go::Parallelepiped](#), and [Go::ElementaryVolume](#).

29.335.3.3 `virtual void Go::ParamVolume::closestPoint ( const Point & pt, double & clo_u, double & clo_v, double & clo_w, Point & clo_pt, double & clo_dist, double epsilon, double * seed = 0 ) const [pure virtual]`

Iterates to the closest point to pt on the volume.

#### Parameters

<i>pt</i>	the point to find the closest point to
<i>clo_u</i>	u parameter of the closest point
<i>clo_v</i>	v parameter of the closest point
<i>clo_w</i>	w parameter of the closest point
<i>clo_pt</i>	the geometric position of the closest point
<i>clo_dist</i>	the distance between pt and clo_pt
<i>epsilon</i>	parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)
<i>seed</i>	pointer to parameter values where iteration starts.

Implemented in [Go::SplineVolume](#), [Go::TorusVolume](#), [Go::SphereVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), and [Go::Parallelepiped](#).

29.335.3.4 `virtual ParamSurface* Go::ParamVolume::constParamSurface ( double parameter, int paddir ) const [inline], [virtual]`

Generate and return a [ParamSurface](#) that represents a constant parameter surface on the volume

#### Parameters

<i>parameter</i>	value of the fixed parameter
<i>paddir</i>	0 if the surface is constant in the u-parameter, 1 if the surface is constant in the v-parameter, 2 if the surface is constant in the w-parameter.

#### Returns

pointer to a newly constructed [SplineSurface](#) representing the specified constant parameter surface. It is the user's responsibility to delete it when it is no longer needed.

Reimplemented in [Go::SplineVolume](#).

Definition at line 188 of file ParamVolume.h.

**29.335.3.5** `virtual std::vector<shared_ptr<ParamSurface> > Go::ParamVolume::getAllBoundarySurfaces ( ) const`  
[pure virtual]

Fetch all boundary surfaces corresponding to the volume.

Implemented in [Go::SplineVolume](#), [Go::TorusVolume](#), [Go::SphereVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), and [Go::Parallelepiped](#).

**29.335.3.6** `virtual bool Go::ParamVolume::isSpline ( ) const` [inline],[virtual]

Check if the volume is of type spline.

Reimplemented in [Go::SplineVolume](#).

Definition at line 196 of file ParamVolume.h.

**29.335.3.7** `virtual double Go::ParamVolume::nextSegmentVal ( int dir, double par, bool forward, double tol ) const`  
[pure virtual]

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0, 1 or 2)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value

#### Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implemented in [Go::SplineVolume](#), [Go::TorusVolume](#), [Go::SphereVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), and [Go::Parallelepiped](#).

**29.335.3.8** `virtual const Array<double,6> Go::ParamVolume::parameterSpan ( ) const` [pure virtual]

Return the parameter domain of the volume. This is an array containing the start and end parameter values. The spline's parameter *i* has its start value at the array position (2*i*) and its end parameter value at the array position (2*i*+1)

**Returns**

An array describing the parametric domain of the volume

Implemented in [Go::SplineVolume](#), [Go::TorusVolume](#), [Go::SphereVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), and [Go::Parallelepiped](#).

```
29.335.3.9 virtual void Go::ParamVolume::point (Point & pt, double upar, double vpar, double wpar) const [pure virtual]
```

Evaluates the volume's position for a given parameter triple.

**Parameters**

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>wpar</i>	the third parameter

Implemented in [Go::SplineVolume](#), [Go::TorusVolume](#), [Go::SphereVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), and [Go::Parallelepiped](#).

```
29.335.3.10 virtual void Go::ParamVolume::point (std::vector< Point > & pts, double upar, double vpar, double wpar, int derivs, bool u_from_right = true, bool v_from_right = true, bool w_from_right = true, double resolution = 1.0e-12) const [pure virtual]
```

Evaluates the volume's position and a certain number of derivatives for a given parameter triple.

**Parameters**

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function. Upon completion of the function, its first entry is the volume's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the volume tangents along the first, second and third parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dudw, dv2, dvdw, dw2), and similar for even higher derivatives.
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>wpar</i>	the third parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>w_from_right</i>	specify whether derivatives along the third parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implemented in [Go::SplineVolume](#), [Go::TorusVolume](#), [Go::SphereVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#),

and [Go::Parallelepiped](#).

29.335.3.11 `virtual void Go::ParamVolume::reverseParameterDirection ( int pardir ) [pure virtual]`

Reverses the direction of the basis in input direction.

#### Parameters

<i>pardir</i>	which parameter direction to reverse
---------------	--------------------------------------

Implemented in [Go::SplineVolume](#), [Go::TorusVolume](#), [Go::SphereVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), and [Go::Parallelepiped](#).

29.335.3.12 `virtual void Go::ParamVolume::swapParameterDirection ( int pardir1, int pardir2 ) [pure virtual]`

Swaps two parameter directions

#### Parameters

<i>pardir1</i>	One of the parameter directions (0, 1 or 2) to be swapped
<i>pardir2</i>	The other parameter direction (0, 1 or 2) to be swapped

Implemented in [Go::SplineVolume](#), [Go::TorusVolume](#), [Go::SphereVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), and [Go::Parallelepiped](#).

29.335.3.13 `virtual DirectionCone Go::ParamVolume::tangentCone ( int pardir ) const [pure virtual]`

Creates a [DirectionCone](#) covering all tangents to this volume along a given parameter direction.

#### Parameters

<i>pardir</i>	if 1, the <a href="#">DirectionCone</a> will be defined on basis of the volume's tangents along the first parameter direction. If 2, the second parameter direction will be used. If 3, the third parameter direction will be used.
---------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this volume along the specified parameter direction.

Implemented in [Go::SplineVolume](#), [Go::TorusVolume](#), [Go::SphereVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), and [Go::Parallelepiped](#).

29.335.3.14 `virtual void Go::ParamVolume::translate ( const Point & vec ) [pure virtual]`

Translate.

Implemented in [Go::SplineVolume](#), [Go::TorusVolume](#), [Go::SphereVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), and [Go::Parallelepiped](#).

## 29.337.1 Detailed Description

Class that represents a plane. It is a subclass of [ElementarySurface](#), and thus has a parametrization and is non-selfintersecting.

A [Plane](#) has a natural parametrization in terms of its location  $\mathbf{C}$  and spanning vectors  $\mathbf{x}$  and  $\mathbf{y}$ :  $p(u, v) = \mathbf{C} + u\mathbf{x} + v\mathbf{y}$ . This parametrization might be unbounded:  $-\infty < u, v < \infty$ .

Definition at line 63 of file [Plane.h](#).

## 29.337.2 Constructor & Destructor Documentation

### 29.337.2.1 [Go::Plane::Plane](#) ( ) [inline]

Default constructor. Constructs an uninitialized [Plane](#) which can only be assigned to or read into.

Definition at line 68 of file [Plane.h](#).

### 29.337.2.2 [Go::Plane::Plane](#) ( [Point location](#), [Point normal](#), bool *isSwapped* = false )

Constructor. Input is location and normal.

29.337.2.3 `Go::Plane::Plane ( Point location, Point normal, Point x_axis, bool isSwapped = false )`

Constructor. Input is location, normal and (local, approximate) x-axis

29.337.2.4 `Go::Plane::Plane ( double a, double b, double c, double d, bool isSwapped = false )`

Constructor. Input is coefficients of implicit equation + point suggestion

29.337.2.5 `virtual Go::Plane::~~Plane ( ) [virtual]`

virtual destructor - ensures safe inheritance

### 29.337.3 Member Function Documentation

29.337.3.1 `std::vector<CurveLoop> Go::Plane::allBoundaryLoops ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [virtual]`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

#### Parameters

<code>degenerate_epsilon</code>	edges whose length is smaller than this value are ignored.
---------------------------------	------------------------------------------------------------

#### Returns

a vector containing CurveLoops. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

29.337.3.2 `virtual BoundingBox Go::Plane::boundingBox ( ) const [virtual]`

Return empty box if infinite plane.

Implements [Go::GeomObject](#).

29.337.3.3 `static ClassType Go::Plane::classType ( ) [inline],[static]`

Definition at line 102 of file Plane.h.

29.337.3.4 `virtual Plane* Go::Plane::clone ( ) const [virtual]`

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

#### Returns

pointer to cloned object

Implements [Go::ElementarySurface](#).

29.337.3.5 `void Go::Plane::closestBoundaryPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * rd=NULL, double * seed=0 ) const [virtual]`

Iterates to the closest point to pt on the boundary of the surface.

#### See also

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

29.337.3.6 `void Go::Plane::closestPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * domain_of_interest=NULL, double * seed=0 ) const [virtual]`

Iterates to the closest point to pt on the surface.

#### Parameters

<i>pt</i>	the point to find the closest point to
<i>clo_u</i>	u parameter of the closest point
<i>clo_v</i>	v parameter of the closest point
<i>clo_pt</i>	the geometric position of the closest point
<i>clo_dist</i>	the distance between pt and clo_pt
<i>epsilon</i>	parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)
<i>domain_of_interest</i>	pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched.
<i>seed</i>	pointer to parameter values where iteration starts.

Reimplemented from [Go::ParamSurface](#).

29.337.3.7 `std::vector<shared_ptr<ParamCurve>> Go::Plane::constParamCurves ( double parameter, bool pardir_is_u ) const [virtual]`

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

## Parameters

<i>parameter</i>	parameter value for the constant parameter (either u or v)
<i>pardir_is_u</i>	specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one.

## Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

**29.337.3.8** `virtual SplineSurface* Go::Plane::createSplineSurface ( ) const` [virtual]

Create a [SplineSurface](#) representation of the [Plane](#).

Implements [Go::ElementarySurface](#).

**29.337.3.9** `virtual int Go::Plane::dimension ( ) const` [virtual]

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

**29.337.3.10** `double Go::Plane::distance ( const Point & pnt ) const`

Distance between the point pnt and the plane.

**29.337.3.11** `virtual SplineSurface* Go::Plane::geometrySurface ( ) const` [virtual]

Create a [SplineSurface](#) representation of the [Plane](#).

Implements [Go::ElementarySurface](#).

**29.337.3.12** `void Go::Plane::getBoundaryInfo ( Point & pt1, Point & pt2, double epsilon, SplineCurve *& cv, SplineCurve *& crosscv, double knot_tol = 1e-05 ) const` [virtual]

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

## Parameters

<i>pt1</i>	the first point on the boundary, given by the user
<i>pt2</i>	the second point on the boundary, given by the user
<i>epsilon</i>	the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.
<i>cv</i>	upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.
<i>crosscv</i>	upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The

Implements [Go::ParamSurface](#).

**29.337.3.13** `virtual void Go::Plane::getDegenerateCorners ( std::vector< Point > & deg_corners, double tol ) const`  
`[virtual]`

Check for paralell and anti paralell partial derivatives in surface corners.

Implements [Go::ParamSurface](#).

**29.337.3.14** `Point Go::Plane::getNormal ( ) [inline]`

[Plane](#) normal. NB: This function returns the "defining normal" and does not take swapped parameter directions into account! To get the "oriented normal", use `Point::normal()`

Definition at line 180 of file `Plane.h`.

**29.337.3.15** `Point Go::Plane::getPoint ( ) [inline]`

[Point](#) in plane.

Definition at line 174 of file `Plane.h`.

**29.337.3.16** `void Go::Plane::getSpanningVectors ( Point & axis1, Point & axis2 ) [inline]`

Vectors in plane.

Definition at line 184 of file `Plane.h`.

**29.337.3.17** `virtual ClassType Go::Plane::instanceType ( ) const [virtual]`

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

**29.337.3.18** `Plane* Go::Plane::intersect ( const RotatedBox & bd_box ) const`

Return the result from intersecting the unbounded plane with a rotated bounding box (having `axis[0]=vec1_↔`, `axis[1]=vec2_`, `axis[2]=normal_`). Useful for visualizing the (unbounded) plane. If intersection is empty, the returned plane is the NULL pointer. The rotated box may be created from a boundingbox by defining the coordinate system and the 8 corner points of the `bd_box`.

**29.337.3.19** `bool Go::Plane::isBounded ( ) const [virtual]`

Query if parametrization is bounded. All four parameter bounds must be finite for this to be true.

Returns

*true* if bounded, *false* otherwise

Reimplemented from [Go::ElementarySurface](#).

29.337.3.20 `bool Go::Plane::isClosed ( bool & closed_dir_u, bool & closed_dir_v ) const` [virtual]

Check if the plane is closed. Virtual function - always false.

Reimplemented from [Go::ElementarySurface](#).

29.337.3.21 `bool Go::Plane::isDegenerate ( bool & b, bool & r, bool & t, bool & l, double tolerance ) const`  
[virtual]

The order of the edge indicators (bottom, right, top, left) matches the `edge_number` of `edgeCurve()`. Query whether any of the four boundary curves are degenerate (zero length) within a certain tolerance. In the below, we refer to 'u' as the first parameter and 'v' as the second.

#### Parameters

<i>b</i>	'true' upon return of function if the boundary ( $v = v_{\min}$ ) is degenerate
<i>r</i>	'true' upon return of function if the boundary ( $v = v_{\max}$ ) is degenerate
<i>t</i>	'true' upon return of function if the boundary ( $u = u_{\min}$ ) is degenerate
<i>l</i>	'true' upon return of function if the boundary ( $u = u_{\max}$ ) is degenerate
<i>tolerance</i>	boundaries are considered degenerate if their length is shorter than this value, given by the user

#### Returns

'true' if at least one boundary curve was found to be degenerate, 'false' otherwise.

Reimplemented from [Go::ParamSurface](#).

29.337.3.22 `virtual bool Go::Plane::isLinear ( Point & dir1, Point & dir2, double tol )` [virtual]

The surface is linear in all directions. Fetch the parameter directions

Reimplemented from [Go::ParamSurface](#).

29.337.3.23 `virtual bool Go::Plane::isPlanar ( Point & normal, double tol )` [virtual]

Confirm that the surface is a plane and return the plane normal.

Reimplemented from [Go::ParamSurface](#).

29.337.3.24 `double Go::Plane::nextSegmentVal ( int dir, double par, bool forward, double tol ) const` [virtual]

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

## Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0 or 1)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value

## Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

29.337.3.25 `void Go::Plane::normal ( Point & n, double upar, double vpar ) const [virtual]`

Evaluates the surface normal for a given parameter pair

## Parameters

<i>n</i>	the computed normal will be written to this variable
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

29.337.3.26 `DirectionCone Go::Plane::normalCone ( ) const [virtual]`

Creates a [DirectionCone](#) covering all normals to this surface.

## Returns

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

29.337.3.27 `const RectDomain& Go::Plane::parameterDomain ( ) const [virtual]`

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

## Returns

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

29.337.3.28 `void Go::Plane::point ( Point & pt, double upar, double vpar ) const [virtual]`

Evaluates the surface's position for a given parameter pair.

## Parameters

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

**29.337.3.29** `void Go::Plane::point ( std::vector< Point > & pts, double upar, double vpar, int derivs, bool u_from_right = true, bool v_from_right = true, double resolution = 1.0e-12 ) const [virtual]`

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

## Parameters

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives.
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implements [Go::ParamSurface](#).

**29.337.3.30** `Point Go::Plane::projectPoint ( const Point & pnt ) const`

Projection of the point pnt in the plane.

**29.337.3.31** `virtual void Go::Plane::read ( std::istream & is ) [virtual]`

read object from stream

## Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.337.3.32 `virtual void Go::Plane::setParameterBounds ( double from_upar, double from_vpar, double to_upar, double to_vpar ) [virtual]`

Restrict the plane by restricting the parameter domain. It is initially infinite

Implements [Go::ElementarySurface](#).

29.337.3.33 `void Go::Plane::setSpanningVectors ( ) [protected]`

29.337.3.34 `void Go::Plane::setSpanningVectorsSafe ( ) [protected]`

29.337.3.35 `Plane* Go::Plane::subSurface ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const`

Fetch a part of the plane.

29.337.3.36 `std::vector<shared_ptr<ParamSurface>> Go::Plane::subSurfaces ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [virtual]`

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

#### Parameters

<i>from_upar</i>	lower value for the first parameter in the subdomain
<i>from_vpar</i>	lower value for the second parameter in the subdomain
<i>to_upar</i>	upper value for the first parameter in the subdomain
<i>to_vpar</i>	upper value for the second parameter in the subdomain
<i>fuzzy</i>	tolerance used when determining intersection with interior boundaries

#### Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

29.337.3.37 `DirectionCone Go::Plane::tangentCone ( bool pardir_is_u ) const [virtual]`

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

#### Parameters

<i>pardir_is_u</i>	if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used.
--------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Returns**

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

**29.337.3.38** `virtual void Go::Plane::write ( std::ostream & os ) const` `[virtual]`

write object to stream

**Parameters**

<code>os</code>	stream to which object is written
-----------------	-----------------------------------

Implements [Go::Streamable](#).

**29.337.4 Member Data Documentation**

### 29.338.1 Detailed Description

Class representing planar algebraic intersection objects.

Definition at line 57 of file PlaneInt.h.

### 29.338.2 Constructor & Destructor Documentation

#### 29.338.2.1 Go::PlaneInt::PlaneInt ( )

Constructor. Used when reading from file.

#### 29.338.2.2 Go::PlaneInt::PlaneInt ( Point *point*, Point *normal* )

Constructor.

##### Parameters

<i>point</i>	reference point in the plane.
<i>normal</i>	normal to the plane.

#### 29.338.2.3 Go::PlaneInt::PlaneInt ( double *a*, double *b*, double *c*, double *d* )

Constructor. The plane is described by the expression  $ax + by + cz + d = 0$ .

##### Parameters

<i>a</i>	the x multiplier.
<i>b</i>	the y multiplier.
<i>c</i>	the z multiplier.
<i>d</i>	the constant.

#### 29.338.2.4 virtual Go::PlaneInt::~~PlaneInt ( ) [virtual]

Constructor.

### 29.338.3 Member Function Documentation

#### 29.338.3.1 double Go::PlaneInt::a ( ) const

Get the x multiplier.

**Returns**

a The x multiplier.

**29.338.3.2 double Go::PlaneInt::b ( ) const**

Get the y multiplier.

**Returns**

b The y multiplier.

**29.338.3.3 double Go::PlaneInt::c ( ) const**

Get the z multiplier.

**Returns**

c The z multiplier.

**29.338.3.4 double Go::PlaneInt::d ( ) const**

Get the constant.

**Returns**

d The constant.

**29.338.3.5 void Go::PlaneInt::read ( std::istream & *is* )**

Read a plane description from file.

**Parameters**

<i>is</i>	the stream containing the plane description.
-----------	----------------------------------------------

**29.338.3.6 shared\_ptr<SplineSurface> Go::PlaneInt::surface ( Point *mid\_pt*, double *length\_x*, double *length\_y* ) const**

Get a SplineSurface representing the plane. This can be used to visualize the object. Since the object is to be tessellated we make sure it is bounded.

**Parameters**

<i>mid_pt</i>	the intersection of the diagonals in a rectangle in the plane.
---------------	----------------------------------------------------------------

## Parameters

<i>length</i> ↔ _x	the length of the rectangle in the x direction.
<i>length</i> ↔ _y	the length of the rectangle in the y direction.

## Returns

The spline surface of the plane.

### 29.339.1 Detailed Description

Run-time sized point class. Encapsulates a point or vector with full value semantics, i.e. copying and assignment works as expected. The class has some vector algebra functionality, such as scalar product, multiplication by scalars etc, and objects will sometimes be called 'vectors' in the following. Based on double precision floating point numbers.

Definition at line 63 of file Point.h.

### 29.339.2 Constructor & Destructor Documentation

#### 29.339.2.1 `Go::Point::Point ( ) [inline]`

Default constructor, does not initialize elements. The only functions you are allowed to use with a default constructed (0-dim) `Point` are the assignment operator, `resize` and `setValue(...)`. This is not enforced.

Definition at line 75 of file Point.h.

#### 29.339.2.2 `Go::Point::Point ( int dim ) [inline],[explicit]`

Constructor taking a dimension argument. Resulting point is of the specified dimension, but not initialized.

Definition at line 81 of file Point.h.

#### 29.339.2.3 `Go::Point::Point ( double x, double y ) [inline]`

Constructor taking 2 arguments, makes the 2D-point (x,y).

Definition at line 86 of file Point.h.

#### 29.339.2.4 `Go::Point::Point ( double x, double y, double z ) [inline]`

Constructor taking 3 arguments, makes the 3D-point (x,y,z).

Definition at line 94 of file Point.h.

#### 29.339.2.5 `template<typename T , int Dim> Go::Point::Point ( const Array< T, Dim > & v ) [inline],[explicit]`

Constructor making a `Point` as a copy of an `Array`. The `Array` must have a value type convertible to double.

Definition at line 108 of file Point.h.

29.339.2.6 `template<typename RandomAccessIterator > Go::Point::Point ( RandomAccessIterator first, RandomAccessIterator last ) [inline]`

Constructor making a [Point](#) from an iterator range.

Definition at line 122 of file Point.h.

29.339.2.7 `Go::Point::Point ( double * begin, double * end, bool own ) [inline]`

Make a point from an existing range of doubles. If the own parameter is false, the [Point](#) will refer to the input data, and not own them. If it is true, it will act as a regular point, owning its data.

Definition at line 162 of file Point.h.

29.339.2.8 `Go::Point::Point ( const Point & v ) [inline]`

Copy constructor.

Definition at line 178 of file Point.h.

29.339.2.9 `Go::Point::~~Point ( ) [inline]`

Destructor.

Definition at line 198 of file Point.h.

### 29.339.3 Member Function Documentation

29.339.3.1 `double Go::Point::angle ( const Point & v ) const [inline]`

The angle between this and another vector. Range is [0.0, M\_PI].

Definition at line 505 of file Point.h.

29.339.3.2 `double Go::Point::angle2 ( const Point & v ) const [inline]`

The angle between this and another vector of dimension 2. Range is [0.0, 2\*M\_PI].

Definition at line 511 of file Point.h.

29.339.3.3 `double Go::Point::angle_smallest ( const Point & v ) const [inline]`

of orientation. Range is [0.0, 0.5\*M\_PI].

The smallest angle between this and another vector regardless

Definition at line 526 of file Point.h.

**29.339.3.4** `const double* Go::Point::begin ( ) const` `[inline]`

Get a read-only start iterator.

Definition at line 228 of file Point.h.

**29.339.3.5** `double* Go::Point::begin ( )` `[inline]`

Get a start iterator.

Definition at line 230 of file Point.h.

**29.339.3.6** `double Go::Point::cosAngle ( const Point & v ) const` `[inline]`

The cosine of the angle between this and another vector.

Definition at line 489 of file Point.h.

**29.339.3.7** `Point Go::Point::cross ( const Point & v ) const` `[inline]`

The cross product of two vectors. Throws if dimensions are not 3.

Definition at line 462 of file Point.h.

**29.339.3.8** `int Go::Point::dimension ( ) const` `[inline]`

Get the dimension of the [Point](#). Same as [size\(\)](#).

Definition at line 238 of file Point.h.

**29.339.3.9** `double Go::Point::dist ( const Point & v ) const` `[inline]`

Get the euclidian length of the difference between this vector and another vector.

Definition at line 333 of file Point.h.

**29.339.3.10** `double Go::Point::dist2 ( const Point & v ) const` `[inline]`

Get the square of the euclidian length of the difference between this vector and another vector.

Definition at line 320 of file Point.h.

**29.339.3.11** `double Go::Point::distInf ( const Point & v ) const` `[inline]`

Get the infinity-norm (or max-norm) length of the difference between this vector and another vector.

Definition at line 340 of file Point.h.

**29.339.3.12** `const double* Go::Point::end ( ) const` [inline]

Get a read-only end iterator.

Definition at line 232 of file Point.h.

**29.339.3.13** `double* Go::Point::end ( )` [inline]

Get a end iterator.

Definition at line 234 of file Point.h.

**29.339.3.14** `double Go::Point::length ( ) const` [inline]

Get the euclidian length of the vector.

Definition at line 303 of file Point.h.

**29.339.3.15** `double Go::Point::length2 ( ) const` [inline]

Get the square of the euclidian length of the vector.

Definition at line 294 of file Point.h.

**29.339.3.16** `double Go::Point::lengthInf ( ) const` [inline]

Get the infinity-norm (or max-norm) length of the vector.

Definition at line 309 of file Point.h.

**29.339.3.17** `void Go::Point::normalize ( )` [inline]

Normalize this vector, i.e. divide every element by [length\(\)](#).

Definition at line 352 of file Point.h.

**29.339.3.18** `double Go::Point::normalize_checked ( )` [inline]

Definition at line 359 of file Point.h.

**29.339.3.19** `Point Go::Point::operator%( const Point & v ) const` [inline]

The cross product of two vectors. Dimensions should be 3.

Definition at line 451 of file Point.h.

**29.339.3.20** `Point Go::Point::operator*( double d ) const` [inline]

The product of a vector and a scalar.

Definition at line 401 of file Point.h.

**29.339.3.21** `double Go::Point::operator*( const Point & v ) const` [inline]

The scalar product (or inner product, or dot product) of two vectors.

Definition at line 439 of file Point.h.

**29.339.3.22** `void Go::Point::operator*=( double d )` [inline]

Multiply this vector by a scalar.

Definition at line 408 of file Point.h.

**29.339.3.23** `Point Go::Point::operator+( const Point & v ) const` [inline]

The sum of two vectors.

Definition at line 370 of file Point.h.

**29.339.3.24** `void Go::Point::operator+=( const Point & v )` [inline]

Add a vector to this vector.

Definition at line 377 of file Point.h.

**29.339.3.25** `Point Go::Point::operator-( const Point & v ) const` [inline]

The difference between two vectors.

Definition at line 386 of file Point.h.

**29.339.3.26** `Point Go::Point::operator-( ) const` [inline]

The negation of a vector.

Definition at line 429 of file Point.h.

**29.339.3.27** `void Go::Point::operator-=( const Point & v )` [inline]

Subtract a vector from this vector.

Definition at line 393 of file Point.h.

**29.339.3.28** `Point Go::Point::operator/( double d ) const` `[inline]`

A vector divided by a scalar.

Definition at line 415 of file Point.h.

**29.339.3.29** `void Go::Point::operator/=( double d )` `[inline]`

Divide this vector with a scalar.

Definition at line 422 of file Point.h.

**29.339.3.30** `Point& Go::Point::operator=( const Point & v )` `[inline]`

Assignment operator.

Definition at line 190 of file Point.h.

**29.339.3.31** `const double& Go::Point::operator[]( int i ) const` `[inline]`

Read-only index access.

Definition at line 224 of file Point.h.

**29.339.3.32** `double& Go::Point::operator[]( int i )` `[inline]`

Index access.

Definition at line 226 of file Point.h.

**29.339.3.33** `void Go::Point::read ( std::istream & is )`

Reads a [Point](#) elementwise from a standard istream. The [Point](#) must already be initialized with the correct dimension.

**29.339.3.34** `void Go::Point::resetValue ( int idx, double val )` `[inline]`

Definition at line 285 of file Point.h.

**29.339.3.35** `void Go::Point::resize ( int d )` `[inline]`

Changing dimension. This loses all info in the point.

Definition at line 241 of file Point.h.

29.339.3.36 `void Go::Point::setToCrossProd ( const Point & u, const Point & v ) [inline]`

Set this [Point](#) to the cross product of two other Points.

Definition at line 468 of file Point.h.

29.339.3.37 `void Go::Point::setValue ( double x, double y ) [inline]`

Set function for 2D.

Definition at line 252 of file Point.h.

29.339.3.38 `void Go::Point::setValue ( double x, double y, double z ) [inline]`

Set function for 3D.

Definition at line 259 of file Point.h.

29.339.3.39 `void Go::Point::setValue ( const double * array ) [inline]`

Set function that copies values from an input array. Dimension must already be initialized!

Definition at line 269 of file Point.h.

29.339.3.40 `void Go::Point::setValue ( double val ) [inline]`

Set function that sets all elements equal to the input. Dimension must already be initialized!

Definition at line 278 of file Point.h.

29.339.3.41 `int Go::Point::size ( ) const [inline]`

Get the dimension of the [Point](#).

Definition at line 236 of file Point.h.

29.339.3.42 `void Go::Point::swap ( Point & other ) [inline]`

Swaps two [Point](#) instances. Never throws.

Definition at line 204 of file Point.h.

29.339.3.43 void Go::Point::write ( std::ostream & os ) const

Writes a [Point](#) elementwise to a standard ostream. Precision is set to 16 by this function. Dimension is not stored.

### 29.340.1 Detailed Description

```
template<int Dim>
class Go::PointCloud< Dim >
```

Represent a cloud of points in 'Dim'-dimensional space.

Definition at line 61 of file PointCloud.h.

### 29.340.2 Constructor & Destructor Documentation

29.340.2.1 `template<int Dim> Go::PointCloud< Dim >::PointCloud ( ) [inline]`

Constructor for an empty [PointCloud](#) that can only be assigned to or read(...) into.

Definition at line 65 of file PointCloud.h.

29.340.2.2 `template<int Dim> template<typename ForwardIterator > Go::PointCloud< Dim >::PointCloud ( ForwardIterator start, int numpoints ) [inline]`

start is supposed to point to the start of the array to be copied, its valuetype should be convertible to double  
 Constructor specifying a [PointCloud](#) from a number of predefined points.

## Parameters

<i>start</i>	iterator to the beginning of an array where the defining points are stored (these will be copied to the objects internal datastructure).
<i>numpoints</i>	number of points to be read into the <a href="#">PointCloud</a>

Definition at line 77 of file PointCloud.h.

```
29.340.2.3 template<int Dim> Go::PointCloud< Dim >::PointCloud (std::vector< Array< double, Dim > &
 points) [inline]
```

Constructor specifying a [PointCloud](#) from an [Array](#) of points.

Definition at line 88 of file PointCloud.h.

```
29.340.2.4 template<int Dim> virtual Go::PointCloud< Dim >::~~PointCloud () [inline],[virtual]
```

Virtual destructor, enables safe inheritance.

Definition at line 93 of file PointCloud.h.

### 29.340.3 Member Function Documentation

```
29.340.3.1 template<int Dim> virtual BoundingBox Go::PointCloud< Dim >::boundingBox () const [inline],
 [virtual]
```

Return the object's bounding box.

Implements [Go::GeomObject](#).

Definition at line 97 of file PointCloud.h.

```
29.340.3.2 template<int Dim> static ClassType Go::PointCloud< Dim >::classType () [inline],[static]
```

Definition at line 113 of file PointCloud.h.

```
29.340.3.3 template<int Dim> virtual PointCloud* Go::PointCloud< Dim >::clone () const [inline],
 [virtual]
```

Clone the [GeomObject](#) and return a pointer to the clone.

Implements [Go::GeomObject](#).

Definition at line 126 of file PointCloud.h.

```
29.340.3.4 template<int Dim> virtual int Go::PointCloud< Dim >::dimension () const [inline],[virtual]
```

Query the dimension of the space where the [PointCloud](#) lies.

Implements [Go::GeomObject](#).

Definition at line 105 of file PointCloud.h.

```
29.340.3.5 template<int Dim> virtual ClassType Go::PointCloud< Dim >::instanceType () const [inline],
 [virtual]
```

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

Definition at line 109 of file PointCloud.h.

```
29.340.3.6 template<int Dim> int Go::PointCloud< Dim >::numPoints () const [inline]
```

Query the number of points in the [PointCloud](#)

#### Returns

the number of points in the [PointCloud](#)

Definition at line 132 of file PointCloud.h.

```
29.340.3.7 template<int Dim> Array<double, Dim>& Go::PointCloud< Dim >::point (int i) [inline]
```

Get the coordinates of a point in the point cloud

#### Parameters

<i>i</i>	the index of the requested point
----------	----------------------------------

#### Returns

a reference to the [Array](#) containing the coordinates of the requested point

Definition at line 139 of file PointCloud.h.

```
29.340.3.8 template<int Dim> const Array<double, Dim>& Go::PointCloud< Dim >::point (int i) const
 [inline]
```

Get the coordinates of a point in the point cloud (const-version)

## Parameters

<i>i</i>	the index of the requested point
----------	----------------------------------

## Returns

a const reference to the [Array](#) containing the coordinates of the requested point

Definition at line 146 of file PointCloud.h.

```
29.340.3.9 template<int Dim> const std::vector<Array<double, Dim> >& Go::PointCloud< Dim >::pointVector ()
 [inline]
```

Get a reference to the vector where the points are stored

## Returns

a reference to the point coordinate vector

Definition at line 163 of file PointCloud.h.

```
29.340.3.10 template<int Dim> double* Go::PointCloud< Dim >::rawData () [inline]
```

Get a pointer to the memory area where the point coordinates are (consecutively) stored.

## Returns

a pointer to the coordinate storage area.

Definition at line 152 of file PointCloud.h.

```
29.340.3.11 template<int Dim> const double* Go::PointCloud< Dim >::rawData () const [inline]
```

Get a const pointer to the memory area where the point coordinates are (consecutively) stored.

## Returns

a constant pointer to the coordinate storage area

Definition at line 158 of file PointCloud.h.

```
29.340.3.12 template<int Dim> virtual void Go::PointCloud< Dim >::read (std::istream & is) [inline],
 [virtual]
```

read object from stream

## Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

Definition at line 192 of file PointCloud.h.

**29.340.3.13** `template<int Dim> void Go::PointCloud< Dim >::rotate ( const Vector3D & p, const Vector3D & q )`  
[inline]

Rotate by multiplying all points with a matrix that takes vector p to vector q Only for Dim == 3

Definition at line 177 of file PointCloud.h.

**29.340.3.14** `template<int Dim> void Go::PointCloud< Dim >::translate ( Array< double, Dim > vec )` [inline]

Definition at line 166 of file PointCloud.h.

**29.340.3.15** `template<int Dim> virtual void Go::PointCloud< Dim >::write ( std::ostream & os ) const` [inline],  
[virtual]

write object to stream

## Parameters

<i>os</i>	stream to which object is written
-----------	-----------------------------------

Implements [Go::Streamable](#).

Definition at line 228 of file PointCloud.h.

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/geometry/PointCloud.h](#)

## 29.341 PointCloudPropertySheet Class Reference

```
#include <PointCloudPropertySheet.h>
```

Inheritance diagram for PointCloudPropertySheet:

Collaboration diagram for PointCloudPropertySheet:

*The curve is evaluated including der derivatives.*
- [void setParInterval \(double start, double end\)](#)  
*Add limiting information to the current curve.*

### 29.342.1 Detailed Description

Represents a point on a curve. Lean functionality for the time being, but should be extended to cover for instance curvature computations

Definition at line 53 of file `PointOnCurve.h`.

## 29.342.2 Constructor & Destructor Documentation

### 29.342.2.1 `Go::PointOnCurve::PointOnCurve ( )`

Default constructor.

### 29.342.2.2 `Go::PointOnCurve::PointOnCurve ( shared_ptr< ParamCurve > curve, double par )`

Constructor taking a curve and a parameter value.

### 29.342.2.3 `Go::PointOnCurve::PointOnCurve ( shared_ptr< ParamCurve > curve, Point pnt )`

Constructor taking a curve and a point.

### 29.342.2.4 `Go::PointOnCurve::~~PointOnCurve ( )`

Destructor.

## 29.342.3 Member Function Documentation

### 29.342.3.1 `void Go::PointOnCurve::evaluate ( int der, std::vector< Point > & deriv ) const`

The curve is evaluated including der derivatives.

### 29.342.3.2 `shared_ptr<ParamCurve> Go::PointOnCurve::getCurve ( ) const [inline]`

Fetch the curve associated to the point.

Definition at line 74 of file `PointOnCurve.h`.

### 29.342.3.3 `double Go::PointOnCurve::getPar ( ) const [inline]`

Fetch the curve parameter associated to the point.

Definition at line 80 of file `PointOnCurve.h`.

### 29.342.3.4 `Point Go::PointOnCurve::getPos ( ) const`

Evaluate If an input point is given, this is the point that will be returned even if it does not lie exactly on the curve

29.342.3.5 void Go::PointOnCurve::setParInterval ( double start, double end )

Add limiting information to the current curve.

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/geometry/PointOnCurve.h](#)

## 29.343 Go::PointOnEdge Class Reference

*Destructor.*
- [const Point & position](#) () const  
*Point position.*
- [ftEdge \\* edge](#) () const  
*Associated edge.*
- [double par](#) () const  
*Associated edge parameter.*

### 29.343.1 Detailed Description

[PointOnEdge](#) - represents a point lying on an edge. Storage.

Definition at line 56 of file PointOnEdge.h.

### 29.343.2 Constructor & Destructor Documentation

29.343.2.1 Go::PointOnEdge::PointOnEdge ( ftEdge \* edge, double par )

Constructor

Parameters

<i>the</i>	edge on which the point lies
<i>par</i>	associated edge parameter

29.343.2.2 Go::PointOnEdge::~~PointOnEdge ( )

Destructor.

### 29.343.3 Member Function Documentation

29.343.3.1 `ftEdge* Go::PointOnEdge::edge ( ) const` `[inline]`

Associated edge.

Definition at line 71 of file PointOnEdge.h.

29.343.3.2 `double Go::PointOnEdge::par ( ) const` `[inline]`

Associated edge parameter.

Definition at line 73 of file PointOnEdge.h.

29.343.3.3 `const Point& Go::PointOnEdge::position ( ) const` `[inline]`

[Point](#) position.

Definition at line 69 of file PointOnEdge.h.

The documentation for this class was generated from the following file:

*Constant iterator to grid end.*

### 29.344.1 Detailed Description

Definition at line 64 of file PointSequence.h.

### 29.344.2 Constructor & Destructor Documentation

#### 29.344.2.1 Go::PointSequence::PointSequence ( ) [inline]

Default constructor.

Definition at line 70 of file PointSequence.h.

#### 29.344.2.2 `template<typename RandomIterator > Go::PointSequence::PointSequence ( int dim, int nmb_pts, RandomIterator coefs_start, PointSequenceType pst = PSTPoint ) [inline]`

Constructor given a sequence of points of a specified type.

Definition at line 78 of file PointSequence.h.

#### 29.344.2.3 `template<typename RandomIterator > Go::PointSequence::PointSequence ( int dim, int nmb_pts_1, int nmb_pts_2, RandomIterator coefs_start, PointSequenceType pst = PSTPoint ) [inline]`

Constructor given a number of sequences of points of a specified type, Each point sequence must contain the same number of points, i.e. two dimensional grid

Definition at line 105 of file PointSequence.h.

#### 29.344.2.4 `template<typename RandomIterator > Go::PointSequence::PointSequence ( int dim, int nmb_pts_1, int nmb_pts_2, int nmb_pts_3, RandomIterator coefs_start, PointSequenceType pst = PSTPoint ) [inline]`

Constructor given a 3 dimensional grid of points of a specified type.

Definition at line 132 of file PointSequence.h.

29.344.2.5 `virtual Go::PointSequence::~~PointSequence ( ) [inline],[virtual]`

Definition at line 160 of file PointSequence.h.

### 29.344.3 Member Function Documentation

29.344.3.1 `std::vector<double>::iterator Go::PointSequence::coefs_begin ( ) [inline]`

Iterator to grid start.

Definition at line 176 of file PointSequence.h.

29.344.3.2 `std::vector<double>::const_iterator Go::PointSequence::coefs_begin ( ) const [inline]`

Constant iterator to grid start.

Definition at line 184 of file PointSequence.h.

29.344.3.3 `std::vector<double>::iterator Go::PointSequence::coefs_end ( ) [inline]`

Iterator to grid end.

Definition at line 180 of file PointSequence.h.

29.344.3.4 `std::vector<double>::const_iterator Go::PointSequence::coefs_end ( ) const [inline]`

Constant iterator to grid end.

Definition at line 188 of file PointSequence.h.

29.344.3.5 `int Go::PointSequence::dimension ( ) const`

[Point](#) dimension.

29.344.3.6 `int Go::PointSequence::grid_dimension ( ) const`

Dimension of grid.

29.344.3.7 `int Go::PointSequence::grid_length ( int i ) const`

Length of grid in the given direction.

## 29.344.3.8 PointSequenceType Go::PointSequence::type ( ) const

[Point](#) type.

The documentation for this class was generated from the following file:

- [gtools-core/include/GoTools/geometry/PointSequence.h](#)

## 29.345 PrBiCGStab Class Reference

### 29.345.3 Member Function Documentation

#### 29.345.3.1 bool PrBiCGStab::converged ( ) [inline]

Check if the last call of ['solve\(\)'](#) managed to converge to a solution.

Definition at line 84 of file PrBiCGStab.h.

#### 29.345.3.2 double PrBiCGStab::getCPUTime ( ) [inline]

Get the CPU time spent for the last call of ['solve\(\)'](#).

Definition at line 81 of file PrBiCGStab.h.

#### 29.345.3.3 int PrBiCGStab::getItCount ( ) [inline]

Get the number of iterations spent for the last call of ['solve\(\)'](#).

Definition at line 78 of file PrBiCGStab.h.

29.345.3.4 void PrBiCGStab::setMaxIterations ( int *max\_iterations* ) [inline]

Set the maximum number of iterations.

Definition at line 72 of file PrBiCGStab.h.

29.345.3.5 void PrBiCGStab::setTolerance ( double *tolerance* = 1.0e-6 ) [inline]

Set the tolerance for the residual.

Definition at line 69 of file PrBiCGStab.h.

29.345.3.6 void PrBiCGStab::solve ( const PrMatrix & A, PrVec & x, const PrVec & b )

Solve the linear system, replacing the start vector with the solution.

### 29.346.1 Detailed Description

[PrCellStructure](#) - Represents a set of points in three dimensions and a cell structure: a 3D grid of cubical cells each with a local list of those points which lie inside it. This allows one to perform various queries, such as finding all points in a ball, very efficiently. Creating the cell structure requires only  $O(N)$  operations, where  $N$  is the number of points.

Definition at line 60 of file PrCellStructure.h.

### 29.346.2 Constructor & Destructor Documentation

#### 29.346.2.1 PrCellStructure::PrCellStructure ( ) [inline]

Default constructor.

Definition at line 77 of file PrCellStructure.h.

#### 29.346.2.2 PrCellStructure::PrCellStructure ( int *n*, double \* xyz\_points, int max\_no\_cells = 10 )

Constructor

## Parameters

<i>n</i>	total number of points
<i>xyz_points</i>	pointer to an array of points stored xyz-wise (The points will be copied to internal data structure.
<i>max_no_cells</i>	indicate maximum number of cells along the X, Y and Z axis.

29.346.2.3 virtual PrCellStructure::~~PrCellStructure ( ) [inline],[virtual]

Destructor.

Definition at line 87 of file PrCellStructure.h.

### 29.346.3 Member Function Documentation

29.346.3.1 void PrCellStructure::attach ( int *n*, const double \* *xyz\_points* )

Reset the [PrCellStructure](#) to a set of new points, deleting old content.

## Parameters

<i>n</i>	number of points
<i>xyz_points</i>	pointer to the array of stored points. (The points will be copied to internal data structure).

29.346.3.2 Vector3D PrCellStructure::get3dNode ( int *i* ) const [inline]

Get a specific point (node) in the [PrCellStructure](#) by its index.

Definition at line 108 of file PrCellStructure.h.

29.346.3.3 void PrCellStructure::getBall ( const Vector3D & *p*, double *radius*, vector< int > & *neighbours*, int *notP* = 0 ) const

Return all points within the ball of radius *radius* around the point *p*. Don't include *p* itself if *notP* = 1.

## Parameters

<i>p</i>	the center of the ball
<i>radius</i>	the radius of the ball

## Return values

<i>neighbours</i>	will be filled with the indexes of the neighbour points.
-------------------	----------------------------------------------------------

## Parameters

<i>notP</i>	if != 0, 'p' itself will not be included in the list of returned points.
-------------	--------------------------------------------------------------------------

**29.346.3.4** `int PrCellStructure::getI ( int i, int j, int k ) const` `[inline]`

Get the index of the cell positioned at 'i', 'j', 'k'.

Definition at line 139 of file PrCellStructure.h.

**29.346.3.5** `void PrCellStructure::getJK ( int ii, int & i, int & j, int & k ) const`

Get the 'i', 'j', 'k'-position of the cell indexed 'ii'.

**29.346.3.6** `void PrCellStructure::getKNearest ( const Vector3D & p, int k, vector< int > & neighbours, int notP = 0 ) const`

Return k nearest points to the point p. Don't include p itself if notP = 1.

## Parameters

<i>p</i>	the point for which we seek the k nearest neighbours
<i>k</i>	the number of neighbours we seek

## Return values

<i>neighbours</i>	will be filled with the indexes of the neighbour points.
-------------------	----------------------------------------------------------

## Parameters

<i>notP</i>	if != 0, 'p' itself will not be included in the list of returned points.
-------------	--------------------------------------------------------------------------

**29.346.3.7** `int PrCellStructure::getNumCells ( ) const` `[inline]`

Get the previously set limit for the maximum number of cells in the X, Y and Z direction.

Definition at line 102 of file PrCellStructure.h.

**29.346.3.8** `int PrCellStructure::getNumNodes ( ) const` `[inline]`

Get the number of points (nodes) stored in the cell structure.

Definition at line 105 of file PrCellStructure.h.

29.346.3.9 void PrCellStructure::print ( ostream & os )

write points to stream

29.346.3.10 void PrCellStructure::scan ( istream & is )

read points from stream and regenerate cell structure.

29.346.3.11 void PrCellStructure::set3dNode ( int *i*, const Vector3D & *p* ) [inline]

Change the coordinates of a specific point in the [PrCellStructure](#).

#### Parameters

<i>i</i>	index of node to change
<i>p</i>	the new coordinates

Definition at line 113 of file PrCellStructure.h.

29.346.3.12 void PrCellStructure::setNumCells ( int *max\_no\_cells* ) [inline]

Set the maximum number of cells in X, Y and Z direction to 'max\_no\_cells'. This must be set before the cells are generated (ie. before the ['attach\(\)'](#) command).

Definition at line 98 of file PrCellStructure.h.

29.346.3.13 void PrCellStructure::whichCell ( const Vector3D & xyz, int & *i*, int & *j*, int & *k* ) const

Locate the cell which contains the coordinate 'xyz'

#### Parameters

<i>xyz</i>	we want to find the cell containing these coordinates
------------	-------------------------------------------------------

#### Return values

<i>i</i>	i-position of the located cell
<i>j</i>	j-position of the located cell
<i>k</i>	k-position of the located cell

## Additional Inherited Members

### 29.350.1 Detailed Description

[PrExplicitConnectivity](#) - This class implements an interface to a planar graph embedded in  $R^2$  or  $R^3$ , where connectivity is explicitly defined. The two common examples are a triangulation and a topologically rectangular grid. What differentiates this class from [PrOrganizedPoints](#) is that for [PrExplicitConnectivity](#), it is possible to directly identify faces. The methods in this class are used by [PrParametrize](#).

Definition at line 55 of file [PrExplicitConnectivity.h](#).

### 29.350.2 Member Function Documentation

**29.350.2.1** void [PrExplicitConnectivity::findFace](#) ( int i, int j, std::vector< int > & neighbours, std::vector< int > & face ) const

Find the face of the graph which lies to the left of the directed edge whose end points are the node i and its j-th neighbour. The nodes of the face, starting with i, will be filled out in the list vector<int> face. The vector<int> neighbours is used for temporarily storing neighbours (for efficiency when calling this routine many times).

#### Parameters

<i>i</i>	the index of the node specifying the directed edge
<i>j</i>	the 'j'th neighbour of 'i' will be the second node specifying the edge

## Return values

<i>neighbours</i>	a temporary vector holding the neighbours of the last node examined by the implementation (might not always be needed; its presence in the parameter list is mainly an efficiency issue).
<i>face</i>	upon function return, will contain the indexes of the nodes in the requested face (anticlockwise order).

29.350.2.2 `int PrExplicitConnectivity::findGenus ( ) const`

Compute the genus of the planar graph.

29.350.2.3 `void PrExplicitConnectivity::findNextEdgeInFace ( int & i, int & j, std::vector< int > & neighbours ) const`

Find the next edge in the face which lies to the left of the directed edge whose end points are the node 'i' and its j-th neighbour.

## Parameters

<i>i</i>	the index of the node specifying the directed edge. Upon function return, it will contain the corresponding value for the next edge in the face.
<i>j</i>	the 'j'th neighbour of 'i' will be the second node specifying the edge. Upon function return, it will contain the corresponding value for the next edge in the face.
<i>neighbours</i>	when calling the function, this vector should contain the indexes of the neighbour nodes of node 'i'. Upon function return, it will contain the corresponding value for the next node in the face.

29.350.2.4 `virtual int PrExplicitConnectivity::findNumFaces ( ) const [virtual]`

count the number of faces in the graph

Reimplemented in [PrTriangulation\\_OP](#), and [PrLevelTriangulation\\_OP](#).

29.350.2.5 `bool PrExplicitConnectivity::isTriangulation ( ) const`

Check if the planar graph is a triangulation.

29.350.2.6 `virtual void PrExplicitConnectivity::printInfo ( std::ostream & os ) const [virtual]`

Print general information about this [PrOrganizedPoints](#) object (number of nodes, etc.)

Reimplemented from [PrOrganizedPoints](#).

29.350.2.7 `virtual void PrExplicitConnectivity::printTexture ( std::ostream & os ) const [virtual]`

29.350.2.8 `virtual void PrExplicitConnectivity::printUVFaces ( std::ostream & os ) const [virtual]`

Print out the faces of the parameterization.

29.350.2.9 `virtual void PrExplicitConnectivity::printXYZFaces ( std::ostream & os ) const` [virtual]

Print out the faces of the graph.

29.350.2.10 `virtual void PrExplicitConnectivity::printXYZFacesML ( std::ostream & os ) const` [virtual]

Print out the faces of the graph, ML format.

29.350.2.11 `virtual void PrExplicitConnectivity::printXYZFacesVRML ( std::ostream & os ) const` [virtual]

Print out the faces of the graph, VRML format.

### 29.351.3 Member Function Documentation

29.351.3.1 virtual void PrFaber\_F::compose ( int *jlev*, int *dim* = 1 ) [virtual]

The nodes in the triangulation belonging to  $V^j$  form a piecewise linear function  $f^j$  in the space  $S^j$ . This routines composes  $f^j$  from  $f^{j-1} + g^{j-1}$  where  $f^{j-1} \in S^{j-1}$  and  $g^{j-1} \in W^{j-1}$ . Use  $\text{dim} = 1$  for explicit triangulations and  $\text{dim} = 3$  for non-explicit. Default is  $\text{dim} = 1$ .

Implements [PrFilterbank](#).

29.351.3.2 virtual void PrFaber\_F::decompose ( int *jlev*, int *dim* = 1 ) [virtual]

The nodes in the triangulation belonging to  $V^j$  form a piecewise linear function  $f^j$  in the space  $S^j$  (where  $j$  = level). This routines decomposes  $f^j$  into  $f^{j-1} + g^{j-1}$  where  $f^{j-1} \in S^{j-1}$  and  $g^{j-1} \in W^{j-1}$ . Use  $\text{dim} = 1$  for explicit triangulations and  $\text{dim} = 3$  for non-explicit. Default is  $\text{dim} = 1$ .

Implements [PrFilterbank](#).

## Additional Inherited Members

### 29.352.1 Detailed Description

- [PrFastUnorganized\\_OP](#) represents a set of points in three dimensions. All we know about them is their boundary in sequence. No other topology is given. This kind of data can be parametrized by [PrParametrizeBdy](#) and [PrParametrizeInt](#). The major difference to the class [PrUnorganized\\_OP](#) is that this class stores the neighbours for each vertex. Note that this requires the call of "initNeighbours" first!

Definition at line 59 of file PrFastUnorganized\_OP.h.

### 29.352.2 Constructor & Destructor Documentation

#### 29.352.2.1 PrFastUnorganized\_OP::PrFastUnorganized\_OP ( int num\_cells = 10 )

Constructor.

#### 29.352.2.2 PrFastUnorganized\_OP::PrFastUnorganized\_OP ( int n, int n\_int, double \* xyz\_points, int num\_cells = 10 )

Constructor.

#### 29.352.2.3 PrFastUnorganized\_OP::~PrFastUnorganized\_OP ( ) [inline]

Destructor.

Definition at line 82 of file PrFastUnorganized\_OP.h.

### 29.352.3 Member Function Documentation

#### 29.352.3.1 virtual Vector3D PrFastUnorganized\_OP::get3dNode ( int i ) const [inline],[virtual]

Return the i-th node in the graph if the nodes are three-dimensional.

Implements [PrOrganizedPoints](#).

Definition at line 94 of file PrFastUnorganized\_OP.h.

#### 29.352.3.2 int PrFastUnorganized\_OP::getKNearest ( ) [inline]

get the specified number for defining neighbourhoods by a fixed number of neighbours

Definition at line 127 of file PrFastUnorganized\_OP.h.

#### 29.352.3.3 virtual void PrFastUnorganized\_OP::getNeighbours ( int i, vector< int > & neighbours ) const [virtual]

Return the indices of the neighbours of the i-th node. (here there is no ordering: it's not a planar graph.)

**29.352.3.4** `virtual int PrFastUnorganized_OP::getNumNodes ( ) const [inline],[virtual]`

Return the number of nodes in the graph.

Implements [PrOrganizedPoints](#).

Definition at line 92 of file PrFastUnorganized\_OP.h.

**29.352.3.5** `double PrFastUnorganized_OP::getRadius ( ) [inline]`

get the specified radius for defining neighbours by distance

Definition at line 115 of file PrFastUnorganized\_OP.h.

**29.352.3.6** `virtual double PrFastUnorganized_OP::getU ( int i ) const [inline],[virtual]`

return the u parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 109 of file PrFastUnorganized\_OP.h.

**29.352.3.7** `virtual double PrFastUnorganized_OP::getV ( int i ) const [inline],[virtual]`

return the v parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 110 of file PrFastUnorganized\_OP.h.

**29.352.3.8** `void PrFastUnorganized_OP::initNeighbours ( )`

Compute (and internally store) information about the neighbours of each point. Neighbours are defined either by the  $k$  nearest points or by all points within a specified radius. Use the member functions [useK\(\)](#) and [useRadius\(\)](#) to specify this.

**29.352.3.9** `virtual bool PrFastUnorganized_OP::isBoundary ( int i ) const [inline],[virtual]`

Is 'i' a boundary node or interior node?

Implements [PrOrganizedPoints](#).

Definition at line 107 of file PrFastUnorganized\_OP.h.

**29.352.3.10** `void PrFastUnorganized_OP::print ( ostream & os )`

Write contents to stream.

**29.352.3.11** `void PrFastUnorganized_OP::scanRawData ( istream & is, int num_cells = 10, double noise = 0.0 )`

Read in points from a stream and regenerate internal structures (no parameterization of the points).

## Parameters

<i>is</i>	The stream containing the points. The format of the stream must be: <ul style="list-style-type: none"> <li>• first: the total number of points</li> <li>• then: the number of interior points (not boundary points)</li> <li>• then: all internal point coordinates listed as xyz xyz, etc.</li> <li>• finally: the boundary point coordinates</li> </ul>
<i>num_cells</i>	number of cells in each spatial direction when dividing up the space containing the points.
<i>noise</i>	magnitude of noise added to the internal points. Zero by default.

**29.352.3.12** `virtual void PrFastUnorganized_OP::set3dNode ( int i, const Vector3D & p ) [inline],[virtual]`

This inherited member function does not apply to this derived class. As of now, it will throw if you try to run it.

Implements [PrOrganizedPoints](#).

Definition at line 97 of file PrFastUnorganized\_OP.h.

**29.352.3.13** `void PrFastUnorganized_OP::setKNearest ( int knearest ) [inline]`

specify a number for defining neighbourhoods by a fixed number of neighbours.

Definition at line 130 of file PrFastUnorganized\_OP.h.

**29.352.3.14** `void PrFastUnorganized_OP::setRadius ( double radius ) [inline]`

specify the radius for defining neighbourhood by distance

Definition at line 124 of file PrFastUnorganized\_OP.h.

**29.352.3.15** `virtual void PrFastUnorganized_OP::setU ( int i, double u ) [inline],[virtual]`

reset the u parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 111 of file PrFastUnorganized\_OP.h.

**29.352.3.16** `virtual void PrFastUnorganized_OP::setV ( int i, double v ) [inline],[virtual]`

reset the v parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 112 of file PrFastUnorganized\_OP.h.

29.352.3.17 `void PrFastUnorganized_OP::useK ( ) [inline]`

Use a fixed number of neighbours to define the neighbourhood of a point.

Definition at line 133 of file PrFastUnorganized\_OP.h.

29.352.3.18 `void PrFastUnorganized_OP::useRadius ( ) [inline]`

Use an euclidean distance to define the neighbourhood of a point.

Definition at line 135 of file PrFastUnorganized\_OP.h.

### 29.353.1 Detailed Description

[PrFilterbank](#) - implements an algorithm for decomposing a piecewise linear function  $f^k$  over a nested triangulation  $T^k$  into the sum  $f^0 + g^0 + g^1 + \dots + g^{k-1}$  where  $f^0 \in S^0$  and  $g^0 \in W^0, \dots, g^{k-1} \in W^{k-1}$ . Here the set of nodes  $V^k$  of  $T^k$  satisfy  $V^0 \subset V^1 \subset \dots \subset V^k$  and the corresponding spaces of piecewise linear  $S^0 \subset S^1 \subset \dots \subset S^k$ . The space  $W^{j-1}$  is a complement space of  $S^{j-1} \in S^j$ . Examples are prewavelet and Faber decomposition.

Definition at line 66 of file PrFilterbank.h.

### 29.353.2 Constructor & Destructor Documentation

29.353.2.1 virtual [PrFilterbank::~PrFilterbank](#) ( ) [virtual]

Destructor.

### 29.353.3 Member Function Documentation

29.353.3.1 void [PrFilterbank::attach](#) ( shared\_ptr< [PrNestedTriangulation](#) > t )

Set the graph.

29.353.3.2 virtual void [PrFilterbank::compose](#) ( int jlev, int dim = 1 ) [pure virtual]

The nodes in the triangulation belonging to  $V^j$  form a piecewise linear function  $f^j$  in the space  $S^j$ . This routines composes  $f^j$  from  $f^{j-1} + g^{j-1}$  where  $f^{j-1} \in S^{j-1}$  and  $g^{j-1} \in W^{j-1}$ . Use dim = 1 for explicit triangulations dim = 3 for non-explicit. Default is dim = 1.

Implemented in [PrPrewavelet\\_F](#), and [PrFaber\\_F](#).

**29.353.3.3** void PrFilterbank::composeAll ( int *dim* = 1 )

The coarsest triangulation is a piecewise linear function  $f^0$  in the space  $S^0$ . This routine composes  $f^k$  from  $f^0 + g^0 + g^1 + \dots + g^{k-1}$  where  $f^k \in S^k, g^0 \in W^0, \dots, g^{k-1} \in W^{k-1}$ . Use *dim* = 1 for explicit triangulations and *dim* = 3 for non-explicit. Default is *dim* = 1.

**29.353.3.4** void PrFilterbank::composeUpTo ( int *jlev*, int *dim* = 1 )

**29.353.3.5** virtual void PrFilterbank::decompose ( int *jlev*, int *dim* = 1 ) [pure virtual]

The nodes in the triangulation belonging to  $V^j$  form a piecewise linear function  $f^j$  in the space  $S^j$  (where *j* = level). This routine decomposes  $f^j$  into  $f^{j-1} + g^{j-1}$  where  $f^{j-1} \in S^{j-1}$  and  $g^{j-1} \in W^{j-1}$ . Use *dim* = 1 for explicit triangulations and *dim* = 3 for non-explicit. Default is *dim* = 1.

Implemented in [PrPrewavelet\\_F](#), and [PrFaber\\_F](#).

**29.353.3.6** void PrFilterbank::decomposeAll ( int *dim* = 1 )

The triangulation is a piecewise linear function  $f^k$  in the space  $S^k$ . This routine decomposes  $f^k$  into  $f^0 + g^0 + g^1 + \dots + g^{k-1}$  where  $f^0 \in S^0, g^0 \in W^0, \dots, g^{k-1} \in W^{k-1}$ . Use *dim* = 1 for explicit triangulations and *dim* = 3 for non-explicit. Default is *dim* = 1.

**29.353.3.7** void PrFilterbank::decomposeFrom ( int *jlev*, int *dim* = 1 )

*print to stream*

### 29.354.1 Detailed Description

[PrHeap](#) - This is a class for minimum heaps. The [PrHeap](#)'s functionality is to store prioritized elements. It has a function for adding elements, a function for returning (and removing from the heap) the element with the "best" priority (least key) and a function for modifying elements. These functions are implemented in a way making sure that they are very fast in run time. All functions run in  $O(\log n)$  time.

Definition at line 55 of file [PrHeap.h](#).

### 29.354.2 Constructor & Destructor Documentation

#### 29.354.2.1 [PrHeap::PrHeap](#) ( )

Default constructor.

#### 29.354.2.2 [PrHeap::PrHeap](#) ( int maxsize )

Constructor. Creates a heap wich is able to store maxsize elements. maxsize will typically be set to the total number of elements (here total number of vertices).

**29.354.2.3 PrHeap::PrHeap ( int \* *elms*, int *n* )**

Constructor. Not implemented.

**29.354.2.4 PrHeap::PrHeap ( const PrHeap & *heap* )**

Copy constructor. Not implemented, generates a warning.

**29.354.2.5 PrHeap::~PrHeap ( )**

Destructor. Deletes arrays.

**29.354.3 Member Function Documentation****29.354.3.1 void PrHeap::emptyHeap ( )**

Restarts the heap.

**29.354.3.2 int PrHeap::getMaxSize ( ) const [inline]**

return max. size for the heap.

Definition at line 86 of file PrHeap.h.

**29.354.3.3 int PrHeap::getSize ( ) const [inline]**

return size for the heap.

Definition at line 89 of file PrHeap.h.

**29.354.3.4 void PrHeap::modify ( double *new\_key*, int *element* )**

Modifies an elements key and restores the heap property.

**29.354.3.5 int PrHeap::pop ( )**

Extracts the best element from the heap.

**29.354.3.6 void PrHeap::pop ( double & *key*, int & *element* )**

Extracts the best element from the heap.

29.354.3.7 void PrHeap::print ( std::ostream & os ) const

print to stream

29.354.3.8 void PrHeap::push ( double key, int element )

Inserts an element with a key in the heap.

29.354.3.9 void PrHeap::redim ( int size )

**Additional Inherited Members****29.356.1 Detailed Description**

[PrLevelTriangulation\\_OP](#) - This class represents a triangulation of points in  $R^3$  with or without parameter points in  $R^2$ . It implements the virtual functions in [PrOrganizedPoints](#). This kind of triangulation can be parametrized by [PrParametrize](#).

Definition at line 55 of file [PrLevelTriangulation\\_OP.h](#).

**29.356.2 Constructor & Destructor Documentation****29.356.2.1 PrLevelTriangulation\_OP::PrLevelTriangulation\_OP ( ) [inline]**

Empty default constructor.

Definition at line 68 of file [PrLevelTriangulation\\_OP.h](#).

**29.356.2.2 PrLevelTriangulation\_OP::PrLevelTriangulation\_OP ( vector< PrNestedNode > \* node, vector< PrTriangle > & nt, int level = 0 )**

Constructor.

## Parameters

<i>node</i>	pointer to a vector of nodes. The vector will not be copied internally.
<i>nt</i>	vector of triangles. Will be copied internally
<i>level</i>	specify the level represented by this triangulation

**29.356.2.3** `PrLevelTriangulation_OP::~PrLevelTriangulation_OP ( ) [inline]`

Empty default destructor.

Definition at line 81 of file `PrLevelTriangulation_OP.h`.

### 29.356.3 Member Function Documentation

**29.356.3.1** `virtual int PrLevelTriangulation_OP::findNumFaces ( ) const [inline],[virtual]`

count the number of faces in the graph

Reimplemented from [PrExplicitConnectivity](#).

Definition at line 115 of file `PrLevelTriangulation_OP.h`.

**29.356.3.2** `virtual Vector3D PrLevelTriangulation_OP::get3dNode ( int i ) const [inline],[virtual]`

Return the i-th node in the graph.

Implements [PrOrganizedPoints](#).

Definition at line 90 of file `PrLevelTriangulation_OP.h`.

**29.356.3.3** `virtual void PrLevelTriangulation_OP::getNeighbours ( int i, vector< int > & neighbours ) const [virtual]`

Return the indices of the neighbours of the i-th node in:

1. any anticlockwise order if i is an interior node
2. the unique anticlockwise order if i is a boundary node.

**29.356.3.4** `virtual int PrLevelTriangulation_OP::getNumNodes ( ) const [inline],[virtual]`

Return the number of nodes in the graph.

Implements [PrOrganizedPoints](#).

Definition at line 87 of file `PrLevelTriangulation_OP.h`.

29.356.3.5 `PrNestedNode& PrLevelTriangulation_OP::getPrNestedNode ( int i ) [inline]`

Grab internal structure for doing thinning.

Definition at line 123 of file PrLevelTriangulation\_OP.h.

29.356.3.6 `PrTriangle& PrLevelTriangulation_OP::getPrTriangle ( int i ) [inline]`

Grab internal structure for doing thinning.

Definition at line 125 of file PrLevelTriangulation\_OP.h.

29.356.3.7 `virtual double PrLevelTriangulation_OP::getU ( int i ) const [inline],[virtual]`

return the u parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 104 of file PrLevelTriangulation\_OP.h.

29.356.3.8 `virtual double PrLevelTriangulation_OP::getV ( int i ) const [inline],[virtual]`

return the v parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 107 of file PrLevelTriangulation\_OP.h.

29.356.3.9 `virtual bool PrLevelTriangulation_OP::isBoundary ( int i ) const [virtual]`

Is i a boundary node or interior node?

Implements [PrOrganizedPoints](#).

29.356.3.10 `void PrLevelTriangulation_OP::print ( ostream & os )`

print whole class

29.356.3.11 `void PrLevelTriangulation_OP::printRawData ( ostream & os )`

print without neighbourhood information

29.356.3.12 `void PrLevelTriangulation_OP::printUV ( ostream & os )`

for converting uv to xyz with z=0

29.356.3.13 `void PrLevelTriangulation_OP::printUVTriangles ( ostream & os, bool num = false )`

Print out the uv triangles of the graph, useful for plotting. If num = 1, print first the number of triangles.

29.356.3.14 `void PrLevelTriangulation_OP::printXYZTriangles ( ostream & os, bool num = false )`

Print out the triangles of the graph, useful for plotting. If num = 1, print first the number of triangles.

29.356.3.15 `virtual void PrLevelTriangulation_OP::set3dNode ( int i, const Vector3D & p ) [inline],[virtual]`

set the coordinates of the i-th node in the graph if the nodes are three-dimensional.

Implements [PrOrganizedPoints](#).

Definition at line 91 of file PrLevelTriangulation\_OP.h.

29.356.3.16 `virtual void PrLevelTriangulation_OP::setU ( int i, double u ) [inline],[virtual]`

reset the u parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 110 of file PrLevelTriangulation\_OP.h.

29.356.3.17 `virtual void PrLevelTriangulation_OP::setV ( int i, double v ) [inline],[virtual]`

reset the v parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 113 of file PrLevelTriangulation\_OP.h.

The documentation for this class was generated from the following file:

Definition at line 49 of file PrMatSparse.h.

## 29.359.2 Constructor & Destructor Documentation

29.359.2.1 `virtual PrMatSparse::~~PrMatSparse ( ) [virtual]`

virtual destructor

29.359.2.2 `PrMatSparse::PrMatSparse ( ) [inline]`

constructor for a sparse matrix of zero size.

Definition at line 87 of file PrMatSparse.h.

29.359.2.3 `PrMatSparse::PrMatSparse ( int m, int n, int num_nonzero )`

constructor for an (m x n) matrix with 'num\_nonzero' nonzero elements

29.359.2.4 `PrMatSparse::PrMatSparse ( int m, int n, int num_nonzero, const int * irow, const int * jcol, const double * data )`

Set to sparse matrix given by irow, jcol and data.

## 29.359.3 Member Function Documentation

29.359.3.1 `virtual int PrMatSparse::columns ( ) const [virtual]`

Number of columns.

Implements [PrMatrix](#).

29.359.3.2 `int & PrMatSparse::irow ( int k ) [inline]`

$0 < k \leq m$  (last element is past-the-end index of `a_`)

Definition at line 134 of file PrMatSparse.h.

29.359.3.3 `const int & PrMatSparse::irow ( int k ) const [inline]`

$0 < k \leq m$  (last element is past-the-end index of `a_`)

Definition at line 127 of file PrMatSparse.h.

29.359.3.4 `int & PrMatSparse::jcol ( int k ) [inline]`

$0 < k \leq p-1$

Definition at line 148 of file PrMatSparse.h.

29.359.3.5 `const int & PrMatSparse::jcol ( int k ) const` `[inline]`

$0 < k \leq p_-1$

Definition at line 141 of file PrMatSparse.h.

29.359.3.6 `void PrMatSparse::matProd ( PrMatSparse & B, PrMatSparse & C ) const`

find  $C = A * B$ . Multiplies two sparse matrices, "A=(this)" times "B" and stores the result in "C"

29.359.3.7 `virtual double PrMatSparse::operator() ( int i, int j ) const` `[virtual]`

value of matrix element

Implements [PrMatrix](#).

29.359.3.8 `double & PrMatSparse::operator() ( int k )` `[inline]`

$0 < k \leq p_-1$

Definition at line 162 of file PrMatSparse.h.

29.359.3.9 `const double & PrMatSparse::operator() ( int k ) const` `[inline]`

$0 < k \leq p_-1$

Definition at line 155 of file PrMatSparse.h.

29.359.3.10 `virtual void PrMatSparse::print ( std::ostream & os )` `[virtual]`

print contents to stream

Reimplemented from [PrMatrix](#).

29.359.3.11 `void PrMatSparse::printFull ( std::ostream & os )`

print the matrix to stream in 'full' (not sparse) format

29.359.3.12 `virtual void PrMatSparse::prod ( const PrVec & x, PrVec & y ) const` `[virtual]`

Find  $y = Ax$ .

Implements [PrMatrix](#).

29.359.3.13 `virtual void PrMatSparse::read ( std::istream & is ) [virtual]`

read contents from stream

Implements [PrMatrix](#).

29.359.3.14 `void PrMatSparse::redim ( int m, int n, int num_nonzero )`

resize matrix to (m x n), with 'num\_nonzero' nonzero elements

29.359.3.15 `virtual int PrMatSparse::rows ( ) const [virtual]`

Number of rows.

Implements [PrMatrix](#).

29.359.3.16 `void PrMatSparse::scalProd ( double d ) [inline]`

multiply all elements with 'd'

Definition at line 117 of file `PrMatSparse.h`.

29.359.3.17 `void PrMatSparse::setToMatrix ( const PrMatrix & m, double tol = 0.0 )`

Set equal to another matrix, sparsify if entries  $\leq$  tol.

### 29.360.1 Detailed Description

This class represents a node for use in [PrLevelTriangulation\\_OP](#) and [PrNestedTriangulation](#). It has double x,y,z values and double u and v values (parameter values). It also has the index of its "first" incident triangle at each triangulation level. If the node is interior then tr[j] is any incident triangle. Otherwise the node is a boundary node, in which case tr[j] is the incident triangle which is the first one in the anticlockwise direction around the node (equivalently the only triangle containing the node whose right neighbour from the point of view of the node is 0).

Definition at line 64 of file PrNestedNode.h.

### 29.360.2 Constructor & Destructor Documentation

### 29.361.1 Detailed Description

This class implements a set of nested triangulations. The methods in this class are used by PrFilterBank.

Definition at line 51 of file PrNestedTriangulation.h.

### 29.361.2 Constructor & Destructor Documentation

29.361.2.1 virtual PrNestedTriangulation::~PrNestedTriangulation ( ) [inline],[virtual]

Empty virtual default destructor.

Definition at line 93 of file PrNestedTriangulation.h.

### 29.361.3 Member Function Documentation

29.361.3.1 virtual int PrNestedTriangulation::getFinestLevel ( ) [pure virtual]

Return the finest level in the hierarchy, i.e.  $k$  if the vertices are arranged  $V^0 \subset V^1 \subset \dots \subset V^k$ .

Implemented in [PrTriangulation\\_NT](#).

29.361.3.2 virtual void PrNestedTriangulation::getNeighbours ( int *i*, int *jlev*, vector< int > &neighbours ) [pure virtual]

Return the indices of the neighbours of the *i*-th node with respect to  $V^j$ . This routine assumes that node *i* also belongs to  $V^j$ . The order of the neighbours returned will be

1. any anticlockwise order if *i* is an interior node
2. the unique anticlockwise order if *i* is a boundary node.

Implemented in [PrTriangulation\\_NT](#).

29.361.3.3 `virtual int PrNestedTriangulation::getNumNodes ( int jlev ) [pure virtual]`

return the number of nodes in  $V^j, j = 0, 1, \dots, k$ .

Implemented in [PrTriangulation\\_NT](#).

29.361.3.4 `void PrNestedTriangulation::getParents ( int i, int jlev, int & p1, int & p2 )`

Assuming that node  $i$  belongs to  $V^j \setminus V^{j-1}$  and that  $jlev \geq 1$ , find  $i$ 's two parent nodes in  $V^{j-1}$   $p1$  and  $p2$ .

29.361.3.5 `virtual double PrNestedTriangulation::getX ( int i ) [pure virtual]`

return the x coeff. of the  $i$ -th node in the triangulation.

Implemented in [PrTriangulation\\_NT](#).

29.361.3.6 `virtual double PrNestedTriangulation::getY ( int i ) [pure virtual]`

return the y coeff. of the  $i$ -th node in the triangulation.

Implemented in [PrTriangulation\\_NT](#).

29.361.3.7 `virtual double PrNestedTriangulation::getZ ( int i ) [pure virtual]`

return the z coeff. of the  $i$ -th node in the triangulation.

Implemented in [PrTriangulation\\_NT](#).

29.361.3.8 `virtual bool PrNestedTriangulation::isBoundary ( int i ) [pure virtual]`

is the  $i$ -th node a boundary node or interior node?

Implemented in [PrTriangulation\\_NT](#).

29.361.3.9 `virtual void PrNestedTriangulation::setX ( int i, const double & x ) [pure virtual]`

set the x coeff. of the  $i$ -th node in the triangulation.

Implemented in [PrTriangulation\\_NT](#).

29.361.3.10 `virtual void PrNestedTriangulation::setY ( int i, const double & y ) [pure virtual]`

set the y coeff. of the  $i$ -th node in the triangulation.

Implemented in [PrTriangulation\\_NT](#).

29.361.3.11 `virtual void PrNestedTriangulation::setZ ( int i, const double & z ) [pure virtual]`

set the z coeff. of the i-th node in the triangulation.

Implemented in [PrTriangulation\\_NT](#).

The documentation for this class was generated from the following file:

- parametrization/include/GoTools/parametrization/[PrNestedTriangulation.h](#)

### 29.364.1 Detailed Description

This class represents the curve obtained by projecting a given 3D curve onto a given part of a given 3D surface.

Definition at line 58 of file ProjectCurve.h.

### 29.364.2 Constructor & Destructor Documentation

29.364.2.1 `Go::ProjectCurve::ProjectCurve ( shared_ptr< Go::ParamCurve > & space_crv, shared_ptr< Go::ParamSurface > & surf, shared_ptr< Go::Point > & start_par_pt, shared_ptr< Go::Point > & end_par_pt, double epsgeo1, const RectDomain * domain_of_interest = NULL )`

Constructor, taking one 3D curve and one 3D surface. The user may additionally provide explicit values for the start and end points of the curve (supposedly on the surface) as well as specifying the parameter domain of interest of the surface.

#### Parameters

<i>space_crv</i>	the 3D space curve that will be projected onto a surface
<i>surf</i>	the 3D surface that we will project the space curve onto. Assuming that the surface is k-regular.
<i>start_par_pt</i>	explicit position of start point (can be a zero pointer, in which case the start point will be evaluated by projection, just like any other point).
<i>end_par_pt</i>	explicit position of end point (can be a zero pointer, in which case the start point will be evaluated by projection, just like any other point).
<i>epsgeo1</i>	geometric tolerance to use when projecting curve onto surface, and when using the <a href="#">approximationOK()</a> function, max dist from exact proj.
<i>epsgeo2</i>	geometric tolerance when using the <a href="#">approximationOK()</a> function, max dist from space_crv. Negative = ignored.
<i>domain_of_interest</i>	if the user wants to limit the surface to a certain parametric domain, it can be specified here.

29.364.2.2 `virtual Go::ProjectCurve::~~ProjectCurve ( ) [virtual]`

virtual destructor ensures safe inheritance

### 29.364.3 Member Function Documentation

29.364.3.1 `virtual bool Go::ProjectCurve::approximationOK ( double par, Go::Point approxpos, double tol1, double tol2 ) const [virtual]`

Inherited from [EvalCurve::approximationOK\(\)](#). For this class, the specified tolerances are not used; the internally stored 'epsgeo' value is used as tolerance (this value was specified in the constructor).

#### Parameters

<i>par</i>	the parameter at which to check the curve
<i>approxpos</i>	the position we want to check whether or not the curve approximates for parameter 'par'.
<i>tol1</i>	unused
<i>tol2</i>	unused

**Returns**

'true' if the curve approximates the point at the parameter, 'false' otherwise.

Implements [Go::EvalCurve](#).

**29.364.3.2** `virtual int Go::ProjectCurve::dim ( ) const [virtual]`

Inherited from [EvalCurve::dim\(\)](#). For this class, the returned dimension will be that of the surface parameter domain, ie. 2, NOT that of the space curve.

Implements [Go::EvalCurve](#).

**29.364.3.3** `virtual double Go::ProjectCurve::end ( ) const [virtual]`

Get the end parameter of the curve.

**Returns**

the end parameter of the curve.

Implements [Go::EvalCurve](#).

**29.364.3.4** `virtual Go::Point Go::ProjectCurve::eval ( double t ) const [virtual]`

Evaluate a point on the curve for a given parameter

**Parameters**

<i>t</i>	the parameter for which to evaluate the curve.
----------	------------------------------------------------

**Returns**

the evaluated point

Implements [Go::EvalCurve](#).

**29.364.3.5** `Go::Point Go::ProjectCurve::eval ( double t, Go::Point seed ) const`

Evaluate point, given seed for the closest point iteration involved.

**29.364.3.6** `virtual void Go::ProjectCurve::eval ( double t, int n, Go::Point der[] ) const [virtual]`

Evaluate a point and a certain number of derivatives on the curve for a given parameter.

## Parameters

<i>t</i>	the parameter for which to evaluate the curve.
<i>n</i>	the number of derivatives (0 or more)

## Return values

<i>der</i>	pointer to an array of Points where the result will be written. The position will be stored first, then the first derivative (tangent), then the second, etc.. <b>NB:</b> For most (all) derived classes of 'EvalCurve', the implementation actually only supports the computation of one derivative, i.e. if $n > 1$ , only one derivative will be computed anyway.
------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Implements [Go::EvalCurve](#).

29.364.3.7 virtual double Go::ProjectCurve::start ( ) const [virtual]

Get the start parameter of the curve.

## Returns

the start parameter of the curve.

Implements [Go::EvalCurve](#).

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/creators/ProjectCurve.h](#)

### 29.365.1 Detailed Description

Evaluator class representing the projection and and tangent curve given a set of input curves. In total 3 points are computed: the parameter point of the projection on an input surface, the corresponding space pt and the projected cross tangent point.

Definition at line 60 of file ProjectCurveAndCrossTan.h.

### 29.365.2 Constructor & Destructor Documentation

**29.365.2.1** [Go::ProjectCurveAndCrossTan::ProjectCurveAndCrossTan](#) ( [const SplineCurve](#) & space\_crv, [const SplineCurve](#) & crosstan\_crv, [const SplineSurface](#) & surf, [const Point](#) \* start\_par\_pt, [const Point](#) \* end\_par\_pt, [double](#) epsgeo, [const RectDomain](#) \* domain\_of\_interest = NULL )

Constructor.

Parameters

<i>space_crv</i>	the input space curve to project.
------------------	-----------------------------------

## Parameters

<i>crosstan_crv</i>	the cross tangent curve associated with <i>space_crv</i> .
<i>surf</i>	the parametric surface onto which to project the two curves.
<i>start_par_pt</i>	We may require that the projected curve shall start in a specific point in the parameter domain (input pointer may be NULL).
<i>end_par_pt</i>	We may require that the projected curve shall end in a specific point in the parameter domain (input pointer may be NULL).
<i>epsgeo</i>	geometric tolerance for the projection.
<i>domain_of_interest</i>	if not null, specifies the part of the <a href="#">SplineSurface</a> s parametric domain that will be considered.

29.365.2.2 `virtual Go::ProjectCurveAndCrossTan::~~ProjectCurveAndCrossTan ( ) [virtual]`

Destructor.

## 29.365.3 Member Function Documentation

29.365.3.1 `virtual bool Go::ProjectCurveAndCrossTan::approximationOK ( double par, const std::vector< Go::Point > & approxpos, double tol1, double tol2 ) [virtual]`

Whether the approximation is within tolerances in input parameter.

## Parameters

<i>par</i>	parameter in which to evaluate.
<i>approxpos</i>	whether the input points are within tolerance from the evaluated points (as given by <a href="#">eval()</a> ).
<i>tol1</i>	tolerance used to decide approximation accuracy.
<i>tol2</i>	tolerance used to decide approximation accuracy.

## Returns

whether the approximation is within tolerances in input parameter.

29.365.3.2 `virtual int Go::ProjectCurveAndCrossTan::dim ( ) [virtual]`

Dimension of space (parameter domain, i.e. 2).

## Returns

geometric dimension of the space.

Implements [Go::EvalCurveSet](#).

29.365.3.3 `virtual double Go::ProjectCurveAndCrossTan::end ( ) [virtual]`

End parameter of domain.

#### Returns

end parameter of domain.

Implements [Go::EvalCurveSet](#).

29.365.3.4 `virtual std::vector<Go::Point> Go::ProjectCurveAndCrossTan::eval ( double t ) [virtual]`

Evaluate the curve set.

#### Parameters

<i>t</i>	parameter in which to evaluate.
----------	---------------------------------

#### Returns

the evaluated points in the input parameter, size of vector is 3.

Implements [Go::EvalCurveSet](#).

29.365.3.5 `virtual void Go::ProjectCurveAndCrossTan::eval ( double t, int n, std::vector< std::vector< Go::Point > > & ders ) [virtual]`

Evaluate derivatives in the curve set.

#### Parameters

<i>t</i>	parameter in which to evaluate.
<i>n</i>	the number of derivatives to evaluate.
<i>ders</i>	the evaluated points in the input parameter. Size of vector is 3, each holding 'n + 1' points.

29.365.3.6 `virtual int Go::ProjectCurveAndCrossTan::nmbCvs ( ) [virtual]`

The number of curves in the curve set.

#### Returns

the number of curves in the curve set, i.e. 3.

Implements [Go::EvalCurveSet](#).

29.365.3.7 virtual double Go::ProjectCurveAndCrossTan::start ( ) [virtual]

Start parameter of domain.

#### Returns

start parameter of domain.

Implements [Go::EvalCurveSet](#).

The documentation for this class was generated from the following file:

### 29.366.1 Detailed Description

This class provides an interface to a curve that can be evaluated. This evaluator based class computes the projected point in the first surface of the offset point defined by input.

Definition at line 58 of file [ProjectIntersectionCurve.h](#).

### 29.366.2 Constructor & Destructor Documentation

- 29.366.2.1 `Go::ProjectIntersectionCurve::ProjectIntersectionCurve ( shared_ptr< SplineCurve > & inters_crv, shared_ptr< SplineCurve > & p_crv, shared_ptr< SplineCurve > & other_p_crv, shared_ptr< ParamSurface > & surf, shared_ptr< ParamSurface > & other_surf, double offset_dist, double other_offset_dist, double epsgeo )`

Constructor.

#### Parameters

<i>inters_crv</i>	the space intersection curve between surf & other_surf.
<i>p_crv</i>	the corresponding parameter curve in surf.
<i>other_p_crv</i>	the corresponding parameter curve in other_surf.
<i>surf</i>	the first input surface.
<i>other_surf</i>	the second input surface.
<i>offset_dist</i>	the offset distance in surf.
<i>other_offset_dist</i>	the offset distance in other_surf.
<i>epsgeo</i>	the geometrical tolerance (for closes point evaluations).

- 29.366.2.2 `virtual Go::ProjectIntersectionCurve::~~ProjectIntersectionCurve ( ) [virtual]`

Destructor.

### 29.366.3 Member Function Documentation

29.366.3.1 `virtual bool Go::ProjectIntersectionCurve::approximationOK ( double par, Point approxpos, double tol1, double tol2 ) const` `[virtual]`

Whether the evaluated point in *par* is close enough to *approxpos*.

#### Parameters

<i>par</i>	the parameter in which to evaluate.
<i>approxpos</i>	position to check for accuracy.
<i>tol1</i>	currently not used.
<i>tol2</i>	currently not used.

#### Returns

whether *approxpos* is within satisfactory accuracy (i.e. `epsgeo_`).

Implements [Go::EvalCurve](#).

29.366.3.2 `virtual int Go::ProjectIntersectionCurve::dim ( ) const` `[virtual]`

Dimension of `inters_crv_`.

#### Returns

the dimension of the evaluator point.

Implements [Go::EvalCurve](#).

29.366.3.3 `virtual double Go::ProjectIntersectionCurve::end ( ) const` `[virtual]`

End parameter of curve.

#### Returns

the end parameter.

Implements [Go::EvalCurve](#).

29.366.3.4 `virtual Point Go::ProjectIntersectionCurve::eval ( double t ) const` `[virtual]`

The evaluator part of the class, returns the projected offset point in the first surface.

#### Parameters

<i>t</i>	the parameter in which to evaluate.
----------	-------------------------------------

Implements [Go::EvalCurve](#).

29.366.3.5 `virtual void Go::ProjectIntersectionCurve::eval ( double t, int n, Point der[] ) const [virtual]`

The evaluator part of the class, returns the projected offset point in the first surface. For  $n == 1$  the tangent in the projected offset curve is also computed.

#### Parameters

<i>t</i>	the parameter in which to evaluate.
<i>n</i>	the number of derivatives to compute (at most 1).
<i>der</i>	the evaluated point. Size of array is 'n + 1'.

Implements [Go::EvalCurve](#).

29.366.3.6 `virtual double Go::ProjectIntersectionCurve::start ( ) const [virtual]`

Start parameter of curve.

#### Returns

the start parameter.

Implements [Go::EvalCurve](#).

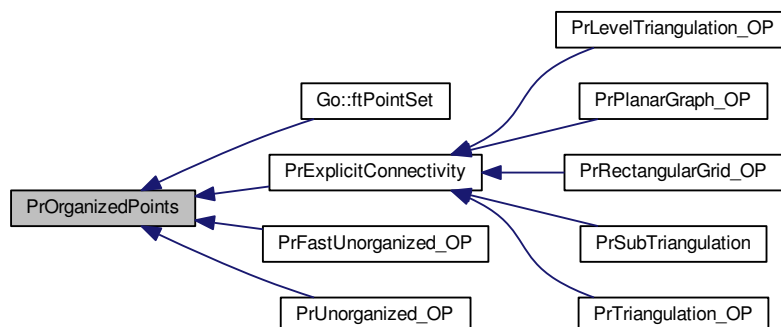

The documentation for this class was generated from the following file:

### 29.367.1 Detailed Description

[PrOrganizedPoints](#) - This class implements an interface to a planar graph embedded in  $R^2$  or  $R^3$ . The two common examples are a triangulation and a topologically rectangular grid, but it can also represent point clouds with no explicit connectivity, as long as the boundary is identified. The methods in this class are used by [PrParametrize](#).

Definition at line 60 of file [PrOrganizedPoints.h](#).

### 29.367.2 Constructor & Destructor Documentation

29.367.2.1 `virtual PrOrganizedPoints::~PrOrganizedPoints ( ) [virtual]`

Empty default destructor.

### 29.367.3 Member Function Documentation

29.367.3.1 `int PrOrganizedPoints::findIndex ( Vector3D & point ) const`

find the index of the node whose (x,y,z) point is exactly equal to the given point. This can be useful for relocating "corner" points after triangulating (if the graph is a triangulation).

29.367.3.2 `int PrOrganizedPoints::findNumBdyComponents ( ) const`

Compute the number of separate boundaries of the graph.

29.367.3.3 `virtual int PrOrganizedPoints::findNumBdyNodes ( ) const [virtual]`

count the number of boundary nodes in the graph.

Reimplemented in [PrSubTriangulation](#).

29.367.3.4 `int PrOrganizedPoints::findNumComponents ( ) const`

Compute the number of connected components of the graph.

29.367.3.5 `virtual int PrOrganizedPoints::findNumEdges ( ) const [virtual]`

count the number of edges in the graph

29.367.3.6 `void PrOrganizedPoints::get2Neighbours ( int i, std::vector< int > & neighbours ) const`

Get the 2-neighbours of the node 'i'.

29.367.3.7 `virtual Vector3D PrOrganizedPoints::get3dNode ( int i ) const [pure virtual]`

return the i-th node in the graph if the nodes are three-dimensional

Implemented in [Go::ftPointSet](#), [PrTriangulation\\_OP](#), [PrSubTriangulation](#), [PrPlanarGraph\\_OP](#), [PrFastUnorganized\\_OP](#), [PrRectangularGrid\\_OP](#), and [PrLevelTriangulation\\_OP](#).

29.367.3.8 `void PrOrganizedPoints::getCommonNeighbours ( int j, int k, std::vector< int > & neighbours ) const`

Return the common neighbours of the j-th and k-th node in some arbitrary order.

29.367.3.9 `virtual void PrOrganizedPoints::getNeighbours ( int i, std::vector< int > & neighbours ) const [pure virtual]`

Return the indices of the neighbours of the i-th node in:

1. Any anticlockwise order if i is an interior node.
2. The unique anticlockwise order if i is a boundary node. This routine should be implemented in any derived class by first calling `clear()` followed successively by `push_back()` on the neighbours vector.

Implemented in [Go::ftPointSet](#), and [PrTriangulation\\_OP](#).

29.367.3.10 `virtual int PrOrganizedPoints::getNumNodes ( ) const [pure virtual]`

return the number of nodes in the graph.

Implemented in [Go::ftPointSet](#), [PrTriangulation\\_OP](#), [PrSubTriangulation](#), [PrPlanarGraph\\_OP](#), [PrFastUnorganized\\_OP](#), [PrRectangularGrid\\_OP](#), and [PrLevelTriangulation\\_OP](#).

29.367.3.11 `virtual double PrOrganizedPoints::getU ( int i ) const [pure virtual]`

return the u parameter value of the i-th node.

Implemented in [Go::ftPointSet](#), [PrTriangulation\\_OP](#), [PrPlanarGraph\\_OP](#), [PrSubTriangulation](#), [PrFastUnorganized\\_OP](#), [PrLevelTriangulation\\_OP](#), and [PrRectangularGrid\\_OP](#).

29.367.3.12 `virtual double PrOrganizedPoints::getV ( int i ) const [pure virtual]`

return the v parameter value of the i-th node.

Implemented in [Go::ftPointSet](#), [PrPlanarGraph\\_OP](#), [PrTriangulation\\_OP](#), [PrSubTriangulation](#), [PrFastUnorganized\\_OP](#), [PrLevelTriangulation\\_OP](#), and [PrRectangularGrid\\_OP](#).

29.367.3.13 `int PrOrganizedPoints::indexComponents ( std::vector< int > & component, std::vector< int > & newIndex ) const`

Locate all connected components of the graph, give each of them an unique index (starting from 0), and giving all nodes of each component "local" indexes pertaining to that component.

## Return values

<i>component</i>	will be resized to number of nodes. Each entry will contain the index of the component in which the corresponding node is located
<i>newIndex</i>	will be resized to number of nodes. Each entry will contain the LOCAL index of the corresponding node in the component it belongs to.

**29.367.3.14** `virtual bool PrOrganizedPoints::isBoundary ( int i ) const [pure virtual]`

is the i-th node a boundary node or interior node?

Implemented in [Go::ftPointSet](#), [PrTriangulation\\_OP](#), [PrPlanarGraph\\_OP](#), [PrSubTriangulation](#), [PrFastUnorganizedOP](#), [PrLevelTriangulation\\_OP](#), and [PrRectangularGrid\\_OP](#).

**29.367.3.15** `static bool PrOrganizedPoints::isMinimum ( int i, std::vector< int > & face ) [static]`

Check if there are any elements of the vector 'face' that are inferior to the value of 'i'.

**29.367.3.16** `void PrOrganizedPoints::labelBdyNode ( int i, int ic, std::vector< int > & component ) const`

Locate all nodes on the same boundary as the node 'i' (supposedly a boundary node) and mark their corresponding entry in the vector 'component' with the value 'ic'.

## Parameters

<i>i</i>	index specifying a boundary node
<i>ic</i>	the 'label value' to write to the concerned entries in the 'component' vector

## Return values

<i>component</i>	the vector where the labels will be written. Its size should be equal to the number of nodes in the <a href="#">PrOrganizedPoints</a> object before calling this function.
------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**29.367.3.17** `void PrOrganizedPoints::labelNode ( int i, int ic, std::vector< int > & component ) const`

Locate all nodes connected to node 'i', and mark their corresponding entry in the vector 'component' with the value 'ic'.

## Parameters

<i>i</i>	index specifying the node
<i>ic</i>	the 'label value' to write to the concerned entries in the 'component' vector

## Return values

<i>component</i>	the vector where the labels will be written. Its size should be equal to the number of nodes in the <a href="#">PrOrganizedPoints</a> object before calling this function.
------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**29.367.3.18** void [PrOrganizedPoints::labelNode](#) ( int *i*, int *ic*, int & *index*, std::vector< int > & *component*, std::vector< int > & *newIndex* ) const

Locate all nodes in the same connected component as the node 'i', and label their corresponding entries in the vector 'component' with the value 'ic'. These nodes are also given "local" indexes for that component. These indexes will be written to the corresponding entries of the 'newIndex' vector.

## Parameters

<i>i</i>	the index of the node specifying the connected component to examine.
<i>ic</i>	the label to give to the entries in the 'component'-vector that correspond with nodes in the specified connected component.
<i>index</i>	start value for local indexing of nodes within the component.

## Return values

<i>component</i>	this vector is where the labeling is written. Before calling the function, the user should ensure that its size is equal to the total number of nodes in the graph.
<i>newIndex</i>	this vector is where the new local coordinates are written. Before calling the function, the user should ensure that its size is equal to the total number of nodes in the graph.

**29.367.3.19** virtual void [PrOrganizedPoints::printInfo](#) ( std::ostream & *os* ) const [virtual]

Print general information about this [PrOrganizedPoints](#) object (number of nodes, etc.)

Reimplemented in [PrExplicitConnectivity](#).

**29.367.3.20** virtual void [PrOrganizedPoints::printUVEEdges](#) ( std::ostream & *os* ) const [virtual]

Print out the edges of the parametrization.

**29.367.3.21** virtual void [PrOrganizedPoints::printUVNodes](#) ( std::ostream & *os*, bool *num* = 0 ) const [virtual]

Print out the UV nodes of the graph. If num = 1, print first the number of nodes.

**29.367.3.22** virtual void [PrOrganizedPoints::printUVXYZNodes](#) ( std::ostream & *os*, bool *num* = 0 ) const [virtual]

Print out the nodes of the graph. If num = 1, print first the number of nodes.

29.367.3.23 `virtual void PrOrganizedPoints::printXYZEdges ( std::ostream & os ) const` [virtual]

Print out the edges of the graph.

29.367.3.24 `virtual void PrOrganizedPoints::printXYZNodes ( std::ostream & os, bool num = 0 ) const` [virtual]

Print out the XYZ nodes of the graph. If num = true, print first the number of nodes.

29.367.3.25 `virtual void PrOrganizedPoints::set3dNode ( int i, const Vector3D & p )` [pure virtual]

set the coordinates of the i-th node in the graph if the nodes are three-dimensional.

Implemented in [PrTriangulation\\_OP](#), [PrPlanarGraph\\_OP](#), [PrSubTriangulation](#), [PrFastUnorganized\\_OP](#), [PrRectangularGrid\\_OP](#), [PrLevelTriangulation\\_OP](#), and [PrUnorganized\\_OP](#).

29.367.3.26 `virtual void PrOrganizedPoints::setU ( int i, double u )` [pure virtual]

reset the u parameter value of the i-th node.

Implemented in [Go::ftPointSet](#), [PrPlanarGraph\\_OP](#), [PrTriangulation\\_OP](#), [PrSubTriangulation](#), [PrFastUnorganized\\_OP](#), [PrLevelTriangulation\\_OP](#), [PrUnorganized\\_OP](#), and [PrRectangularGrid\\_OP](#).

29.367.3.27 `virtual void PrOrganizedPoints::setV ( int i, double v )` [pure virtual]

reset the v parameter value of the i-th node.

Implemented in [Go::ftPointSet](#), [PrPlanarGraph\\_OP](#), [PrTriangulation\\_OP](#), [PrSubTriangulation](#), [PrLevelTriangulation\\_OP](#), [PrFastUnorganized\\_OP](#), [PrUnorganized\\_OP](#), and [PrRectangularGrid\\_OP](#).

29.367.3.28 `void PrOrganizedPoints::topologicalDistToBdy ( std::vector< int > & label ) const`

Compute for each node the number of edges that must be traversed in order to reach the boundary (For boundary edges, this number is 0).

Return values

<i>label</i>	this vector will contain the computed number for each node. Its size will therefore be equal to the number of nodes.

### 29.368.1 Detailed Description

This class implements an algorithm for parametrizing the boundary of a planar graph in  $R^3$ . Typical choices are uniform and chord length, either round the whole boundary or along each "side".

Definition at line 60 of file PrParametrizeBdy.h.

### 29.368.2 Constructor & Destructor Documentation

#### 29.368.2.1 PrParametrizeBdy::PrParametrizeBdy ( )

Default constructor.

#### 29.368.2.2 virtual PrParametrizeBdy::~PrParametrizeBdy ( ) [virtual]

Empty default constructor.

### 29.368.3 Member Function Documentation

#### 29.368.3.1 virtual void PrParametrizeBdy::attach ( shared\_ptr< PrOrganizedPoints > graph ) [virtual]

Set the graph.

#### 29.368.3.2 double PrParametrizeBdy::boundaryLength ( int *i1*, int *i2* )

Calculate the "length" of the section of the xyz boundary between nodes boundary *i* and *j* according to the kind of parametrization specified by [setParamKind\(\)](#). Choices are PrCHORDLENGTHBDY, PrCENTRIPETAL and PrUN↔IFBDY.

#### 29.368.3.3 double PrParametrizeBdy::chord ( const Vector3D & *a*, const Vector3D & *b* ) [protected]

Return "length" of chord between two points in  $R^3$ .

#### 29.368.3.4 int PrParametrizeBdy::findBdyNode ( )

Find the boundary node with the least index.

#### 29.368.3.5 void PrParametrizeBdy::findCornersFromUV ( int \* *c* )

Find the indices *c*[0],*c*[1],*c*[2],*c*[3] of the four vertices of the graph whose (*u*,*v*) points are the furthest SW, SE, NE, and NW in that order. The array *c* should be allocated outside with length 4.

29.368.3.6 `void PrParametrizeBdy::findCornersFromXYZ ( int * c )`

Find four corner nodes `c[0],c[1],c[2],c[3]` by taking `c[0]` to be an arbitrary boundary node and choosing `c[1],c[2],c[3]` so that the lengths of four boundary curves delimited by `c[0],c[1],c[2],c[3]` are as equal in "chord" length (defined by [setParamKind\(\)](#)) as possible. The array `c` should be allocated outside with length 4.

29.368.3.7 `int PrParametrizeBdy::getNextBdyNode ( int i )`

Given a boundary node `i`, return the next boundary node in an anticlockwise direction around the boundary.

29.368.3.8 `bool PrParametrizeBdy::parametrize ( )`

Parametrize the boundary of the planar graph. The parameter domain will be the unit circle.

29.368.3.9 `bool PrParametrizeBdy::parametrize ( int c1, int c2, int c3, int c4, double umin = 0.0, double umax = 1.0, double vmin = 0.0, double vmax = 1.0 )`

Parametrize the boundary of the given planar graph. The parameter domain will be the rectangle `[umin,umax]*[vmin,vmax]`. Node `c1` will be mapped to `(umin,vmin)`, `c2` to `(umax,vmin)`, `c3` to `(umax,vmax)` and `c4` to `(umin,vmax)`. The nodes `c1,c2,c3,c4` should be boundary nodes and should be in anticlockwise sequence around the boundary. The kind of parametrization along the four sides of the square will be specified by [setParamKind\(\)](#).

29.368.3.10 `bool PrParametrizeBdy::parametrizeSide ( int i1, int i2 )`

Parametrize the boundary nodes between two boundary nodes `i1,i2` of a given planar graph by chord length. The two nodes `i1` and `i2` are assumed to be have `u` and `v` values. The boundary parameter points between `i1` and `i2`, starting from `i1` in an anticlockwise direction around the boundary, will be placed along the straight line between the two parameter points.

29.368.3.11 `void PrParametrizeBdy::setParamKind ( PrBdyParamKind bdyparamtype = PrCHORDLENGTHBDY )`  
`[inline]`

Set type of parametrization to be used along the boundary. Unless you have a strong reason to do so you should set the parametrization to "PrCHORDLENGTHBDY". (Other choices are PrCENTRIPETAL and PrUNIFBDY).

Definition at line 88 of file PrParametrizeBdy.h.

### 29.369.1 Detailed Description

This class implements an algorithm for creating a parametrization in  $R^2$  of the interior of a given embedding of a planar graph in  $R^3$ . The method is described in the paper: M. S. Floater, "Parametrization and smooth approximation of surface triangulations", CAGD 14 (1997), 231-250. The method sets u and v values to each interior node of the graph. The class [PrParametrizeInt](#) is an abstract base class. One must call one of its derived classes in order to choose a particular method of parametrization. We recommend the shape preserving parametrization implemented in [PrPrmShpPres](#).

Definition at line 67 of file [PrParametrizeInt.h](#).

### 29.369.2 Constructor & Destructor Documentation

#### 29.369.2.1 PrParametrizeInt::PrParametrizeInt ( )

Default constructor.

#### 29.369.2.2 virtual PrParametrizeInt::~~PrParametrizeInt ( ) [virtual]

Empty default destructor.

### 29.369.3 Member Function Documentation

#### 29.369.3.1 void PrParametrizeInt::attach ( shared\_ptr< PrOrganizedPoints > graph )

Set the graph.

#### 29.369.3.2 void PrParametrizeInt::computeWeights ( )

computes and stores the weights for each node

#### 29.369.3.3 void PrParametrizeInt::findBarycentre ( double & ucentre, double & vcentre ) [protected]

#### 29.369.3.4 void PrParametrizeInt::findFixedPntsFromXYZ ( vector< int > & fixedPnts )

This is a simple routine which finds the indices `fixedPnts [0...3]` of the four vertices of the graph whose (x,y,z) points are the furthest in the directions (-1/-1/1), (1/1/1), (-1/1/-1), and (1/-1/-1) in that order. The indices can be used as fixed points for parametrising in 3D.

29.369.3.5 `const vector< vector<int> >& PrParametrizeInt::getAllNeighbours ( ) const` [inline],[protected]

Definition at line 96 of file PrParametrizeInt.h.

29.369.3.6 `const vector< vector<double> >& PrParametrizeInt::getAllWeights ( ) const` [inline],[protected]

Definition at line 92 of file PrParametrizeInt.h.

29.369.3.7 `int PrParametrizeInt::getNumInt2Nghrs ( int i, vector< int > & )` [protected]

29.369.3.8 `int PrParametrizeInt::getNumIntNghrs ( int i )` [protected]

29.369.3.9 `bool PrParametrizeInt::isFixed ( int , vector< int > & )` [protected]

29.369.3.10 `virtual bool PrParametrizeInt::makeWeights ( int i )` [protected],[pure virtual]

Implemented in [PrPrmMeanValue](#), [PrPrmShpPres](#), [PrPrmLeastSquare](#), [PrPrmSymMeanValue](#), [PrPrmEDDHLS](#), [PrPrmExperimental](#), and [PrPrmWachspres](#).

29.369.3.11 `bool PrParametrizeInt::new_parametrize3d ( vector< int > & , vector< double > & )`

Parametrize the nodes of the 3D graph `g_` except those with indices in "fixedPnts". The parameterization is done in 3D and the result is returned as vector "uvw"

29.369.3.12 `bool PrParametrizeInt::parametrize ( )`

Parametrize the given planar graph.

29.369.3.13 `bool PrParametrizeInt::parametrize3d ( vector< int > & , vector< double > & )`

Parametrize the nodes of the 3D graph `g_` except those with indices in "fixedPnts". The parameterization is done in 3D and the result is returned as vector "uvw"

29.369.3.14 `void PrParametrizeInt::setBiCGTolerance ( double tolerance = 1.0e-6 )` [inline]

Set tolerance for Bi-CGSTAB.

Definition at line 116 of file PrParametrizeInt.h.

29.369.3.15 `void PrParametrizeInt::setStartVectorKind ( PrParamStartVector svtype = PrBARYCENTRE )`  
[inline]

Choose how to initialize the solution vector when running the internal solver. Choices are PrBARYCENTRE or PrFROMUV.

Definition at line 112 of file PrParametrizeInt.h.

29.369.3.16 `void PrParametrizeInt::smooth ( int nmb, vector< int > & fixedPnts )`

performs "nmb" Gauss-Seidel smoothing steps on the sphere

[PrParametrizeMesh](#) - Short description. Detailed description.

Definition at line 58 of file PrParametrizeMesh.h.

#### 29.370.2 Constructor & Destructor Documentation

##### 29.370.2.1 PrParametrizeMesh::PrParametrizeMesh ( )

Default constructor.

29.370.2.2 `virtual PrParametrizeMesh::~~PrParametrizeMesh ( ) [virtual]`

Default destructor.

### 29.370.3 Member Function Documentation

29.370.3.1 `void PrParametrizeMesh::attach ( PrTriangulation_OP * mesh, PrTriangulation_OP * basemesh ) [inline]`

Definition at line 76 of file PrParametrizeMesh.h.

29.370.3.2 `int PrParametrizeMesh::castRay ( PrTriangulation_OP & triangulation, int vs, double angle, double dMax, const std::set< int > & T, std::vector< int > & t_path, std::vector< Vector3D > & v_path )`

Casts a ray from the vertex "vs" into the direction of "angle". angle = 0 is the direction to the ccw node in vs's leading triangle (remark: that is also the first node in the result of the "getNeighbours" routine). The ray is cast as long as its length does not exceed "dMax" and no triangle in "T" is visited. The triangles visited are stored in "t\_path". If the path does not hit a triangle in "T", the return value is -1, otherwise it is the triangle index "v\_path" contains the vertices of the path.

29.370.3.3 `static void PrParametrizeMesh::convertAngle ( const PrTriangulation_OP & triangulation, double theta, int v, double & bc, int & t ) [static]`

Converts the direction indicated by "theta" around the node "v" into a (double,int) pair. The "int" value is the index of the triangle around "v" in direction "theta", the "double" value is the barycentric coordinate of the intersection point of a ray in direction "theta" with the edge opposite to "v" in the triangle w.r.t to the vertices of that edge.

29.370.3.4 `bool PrParametrizeMesh::edgeInPolygon ( int n1, int n2, const std::vector< int > & polygon )`

29.370.3.5 `bool PrParametrizeMesh::getConnectedNodes ( PrTriangulation_OP & triangulation, const std::vector< int > & polygon, std::set< int > & nodes )`

Assume the vertices in polygon is a closed oriented polygon on triangulation. Returns the indices of the vertices interior to polygon. If the orientation is reversed it returns the exterior. If the polygon is open and does not split triangulation all nodes will be found

29.370.3.6 `void PrParametrizeMesh::getInteriorNeighbours ( int v, const std::vector< int > & neighbours, const std::vector< int > & boundary, std::vector< int > & new_nbrs )`

29.370.3.7 `static double PrParametrizeMesh::getisoline ( const PrTriangulation_OP & triangulation, int vs, int vd, std::vector< int > & t_path, std::vector< Vector3D > & v_path ) [static]`

runs the [Dijkstra](#) algorithm from source point "vs" to destination point "vd" and determines the iso-distance-line of vd. The vertices of that isoline are stored in "v\_path", whereas the indices of the triangles visited by that line are stored in "t\_path". Return value is the distance from "vs" to "vd".

29.370.3.8 `int PrParametrizeMesh::getLeftNode ( PrTriangulation_OP & triangulation, int n1, int n2 )`

Find the third node of the triangle with nodes n1, n2 in anti-clockwise order (i.e. the triangle to the "left")

29.370.3.9 `bool PrParametrizeMesh::getNextV ( const Vector3D & p1, const Vector3D & p2, const Vector3D & p3, const Vector3D & p4, double a, double b, bool f, double & c )`

Determine barycentric coordinates (r,s,t) of p4 w.r.t (p1,p2,p3) after flattening

29.370.3.10 `bool PrParametrizeMesh::makePath ( PrTriangulation_OP & triangulation, int n1, int n2, std::vector< int > & path )`

29.370.3.11 `bool PrParametrizeMesh::makePolygon ( PrTriangulation_OP & triangulation, const std::vector< int > & nodes, std::vector< int > & polygon )`

Given a "triangulation" and a (ordered) set of "nodes", this routine returns a "polygon", consisting of those nodes (ordered) who form the shortest paths between the given nodes in the triangulation

i.e.: given a triangle (or arbitrary polygon) in the coarse mesh, this algorithm finds the corresponding triangle (polygon) in the original (fine) mesh

29.370.3.12 `bool PrParametrizeMesh::makeSubTriangulation ( PrTriangulation_OP & triangulation, const vector< int > & nodes, PrSubTriangulation & subtriangulation )`

Make a subtriangulation of triang along the polygon induced by the shortest paths between the nodes in nodes. Use the same nodeset ?

29.370.3.13 `void PrParametrizeMesh::makeSubTriangulationFromTriangle ( int i, PrSubTriangulation & subtri, std::vector< int > & corners )`

29.370.3.14 `bool PrParametrizeMesh::makeSubTriangulationInsidePolygon ( PrTriangulation_OP & triangulation, const std::vector< int > & polygon, PrSubTriangulation & subtriangulation )`

Make a subtriangulation of triang inside polygon. Assume polygon to be a closed ring of neighbouring nodes

29.370.3.15 `PrParamTriangulation* PrParametrizeMesh::parametrize ( )`

29.370.3.16 `void PrParametrizeMesh::parametrizeSubTriangulation ( shared_ptr< PrSubTriangulation > sub_tri, std::vector< int > & corners )`

### 29.371.3 Member Function Documentation

29.371.3.1 `void PrParamTriangulation::attach ( PrTriangulation_OP * mesh, PrTriangulation_OP * basemesh )`

Reset this objects to handle the fine/coarse triangulation pair represented by 'mesh' and 'basemesh'.

29.371.3.2 `static Vector3D PrParamTriangulation::evaluator ( PrTriangulation_OP & mesh, int idx, Vector3D & bc ) [static]`

Evaluate a point on a given mesh by specifying a triangle on the mesh and the barycentric coordinates within this triangle. The point is computed by linear interpolation of the triangle's corner nodes.

29.371.3.3 `void PrParamTriangulation::findTriangleContainingPoint ( int coarseT, const Vector3D & coarseBC, int & fineT, Vector3D & fineBC )`

Given a triangle on the coarse mesh and the barycentric coordinates of a point in this triangle, find the triangle on the fine mesh that contains this point.

#### Parameters

<i>coarseT</i>	index of the triangle on the coarse mesh
<i>coarseBC</i>	barycentric coordinates of the point with respect to the triangle on the coarse mesh

#### Return values

<i>fineT</i>	gives the index to the triangle on the fine mesh containing the specified point
<i>fineBC</i>	gives the barycentric coordinates of the point with respect to the triangle on the fine mesh.

29.371.3.4 `PrTriangulation_OP* PrParamTriangulation::getCoarseMesh ( ) [inline]`

Get a pointer to the coarse mesh.

Definition at line 78 of file PrParamTriangulation.h.

29.371.3.5 `PrTriangulation_OP* PrParamTriangulation::getFineMesh ( ) [inline]`

Get a pointer to the fine mesh.

Definition at line 75 of file PrParamTriangulation.h.

29.371.3.6 Vector3D PrParamTriangulation::getParamPoint ( int *i* )

Get the 'parameter point' of a certain node on the fine mesh. By this we mean to find its "corresponding" point on the coarse mesh.

## Parameters

<i>i</i>	index to the node on the fine mesh
----------	------------------------------------

## Returns

a 3D point on the coarse mesh that corresponds to this node

29.371.3.7 Vector3D PrParamTriangulation::getSurfPoint ( int *coarseTri*, const Vector3D & *coarseBC* )

Given a base triangle (triangle on the coarse mesh) and barycentric coordinates with respect to this triangle, compute the corresponding point on the fine mesh.

## Parameters

<i>coarseTri</i>	index of the base triangle in question
<i>coarseBC</i>	the barycentric coordinates

## Returns

a 3D point on the fine mesh corresponding to (parameterized by) the point on the coarse mesh specified by 'coarseTri' and 'coarseBC'.

29.371.3.8 void PrParamTriangulation::getUV ( int *node*, int *tri*, double & *u*, double & *v* )

Returns the barycentric coordinates of node with respect to a triangle on the fine mesh. Usually, these are the uv-values obtained by the parameterization, but the handling becomes more complicated on edges.

## Parameters

<i>node</i>	index to a node on the fine mesh, for which we want to determine the barycentric coordinates
<i>tri</i>	index to a base triangle (ie. triangle on the coarse mesh), for with we want to find the barycentric coordinates of the node given by 'node'.

## Return values

<i>u</i>	the u-coordinate of the node
<i>v</i>	the v-coordinate of the node (the w-coordinate is given by 1-u-v).

29.371.3.9 void PrParamTriangulation::makeCorrespondences ( int *idx*, PrSubTriangulation & *sub\_tri* )

Set all triangles contained in a sub-triangulation of the fine mesh to "correspond" to a certain triangle in the coarse mesh.

#### Parameters

<i>idx</i>	index to the triangle in the coarse mesh
<i>sub_↔_tri</i>	a sub-triangulation that represents those triangles in the fine mesh that are to be associated with the 'idx' triangle in the coarse mesh.

29.371.3.10 void PrParamTriangulation::open ( istream & *is* )

Read from stream.

29.371.3.11 void PrParamTriangulation::printBaseTriangles ( )

(Print out debug information)

29.371.3.12 void PrParamTriangulation::save ( ostream & *os* )

Write to stream.

29.371.3.13 bool PrParamTriangulation::triangleContainsPoint ( int *fineTri*, int *coarseTri*, const Vector3D & *coarseBC*, Vector3D & *fineBC* )

Determine whether a given triangle on the fine mesh contains a point specified by its barycentric coordinates on the underlying coarse triangle.

#### Parameters

<i>fineTri</i>	index of the triangle on the fine mesh
<i>coarseTri</i>	index of the triangle on the coarse mesh
<i>coarseBC</i>	barycentric coordinates of the point on the triangle in the coarse mesh

#### Return values

<i>fineBC</i>	if the triangle on the fine mesh was found to contain the point in question, its barycentric coordinates with respect to this triangle will be returned here
---------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

'true' if the specified point is contained n the triangle on the fine mesh, 'false' otherwise.

## Additional Inherited Members

### 29.373.1 Detailed Description

[PrPlanarGraph\\_OP](#) - This class represents a planar graph of points in  $R^3$  with or without parameter points in  $R^2$ . It implements the virtual functions in [PrOrganizedPoints](#). This kind of planar graph can be parametrized by [Pr↔Parametrize](#).

Definition at line 53 of file [PrPlanarGraph\\_OP.h](#).

### 29.373.2 Constructor & Destructor Documentation

#### 29.373.2.1 [PrPlanarGraph\\_OP::PrPlanarGraph\\_OP](#) ( ) [[inline](#)]

Empty default constructor.

Definition at line 64 of file [PrPlanarGraph\\_OP.h](#).

29.373.2.2 `PrPlanarGraph_OP::PrPlanarGraph_OP ( int npts, double * xyz_nodes, double * uv_nodes, int * end, int * adj )`

Constructor. Construct the [PrPlanarGraph\\_OP](#) from an array of nodes and an array of adjacency lists. The length of the arrays `xyz_nodes` and `uv_nodes` should be  $3*npts$  and  $2*npts$  respectively. The length of the array `end` should be `npts`. The length of the array `adj` should be `end[npts]`. If node 1 is an interior node, its neighbours are `adj[1],...,adj[end[1]]` in any anticlockwise sequence. If node 1 is a boundary node, its neighbours are `adj[1],...,adj[end[1]-1]` in the unique anticlockwise sequence. and `adj[end[1]] = 0` to indicate that node 1 is on the boundary. For  $i=2, \dots, n$ : If node  $i$  is an interior node, its neighbours are `adj[end[i-1]],...,adj[end[i]]` in any anticlockwise sequence. If node  $i$  is a boundary node, its neighbours are `adj[end[i-1]],...,adj[end[i]-1]` in the unique anticlockwise sequence. and `adj[end[i]] = 0` to indicate that node  $i$  is on the boundary. This is the data structure proposed by Cline and Renka.

29.373.2.3 `PrPlanarGraph_OP::PrPlanarGraph_OP ( int npts, double * xyz_nodes, int * end, int * adj )`

Constructor. Construct the [PrPlanarGraph\\_OP](#) from an array of nodes and an array of adjacency lists. Like the previous constructor, only we set the `uv`'s to zero.

29.373.2.4 `PrPlanarGraph_OP::PrPlanarGraph_OP ( PrOrganizedPoints & op )`

Constructor. Construct the [PrPlanarGraph\\_OP](#) from a [PrOrganizedPoints](#) class.

29.373.2.5 `PrPlanarGraph_OP::~~PrPlanarGraph_OP ( ) [inline]`

Empty destructor.

Definition at line 100 of file `PrPlanarGraph_OP.h`.

### 29.373.3 Member Function Documentation

29.373.3.1 `virtual Vector3D PrPlanarGraph_OP::get3dNode ( int i ) const [inline],[virtual]`

Return the  $i$ -th node in the graph.

Implements [PrOrganizedPoints](#).

Definition at line 108 of file `PrPlanarGraph_OP.h`.

29.373.3.2 `virtual void PrPlanarGraph_OP::getNeighbours ( int i, vector< int > & neighbours ) const [virtual]`

Return the indices of the neighbours of the  $i$ -th node in:

1. any anticlockwise order if  $i$  is an interior node
2. the unique anticlockwise order if  $i$  is a boundary node.

29.373.3.3 `virtual int PrPlanarGraph_OP::getNumNodes ( ) const [inline],[virtual]`

Return the number of nodes in the graph.

Implements [PrOrganizedPoints](#).

Definition at line 105 of file PrPlanarGraph\_OP.h.

29.373.3.4 `virtual double PrPlanarGraph_OP::getU ( int i ) const [inline],[virtual]`

Return the u parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 123 of file PrPlanarGraph\_OP.h.

29.373.3.5 `virtual double PrPlanarGraph_OP::getV ( int i ) const [inline],[virtual]`

Return the v parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 126 of file PrPlanarGraph\_OP.h.

29.373.3.6 `virtual bool PrPlanarGraph_OP::isBoundary ( int i ) const [virtual]`

Is i a boundary node or interior node?

Implements [PrOrganizedPoints](#).

29.373.3.7 `void PrPlanarGraph_OP::print ( std::ostream & os )`

29.373.3.8 `void PrPlanarGraph_OP::scan ( std::istream & is )`

29.373.3.9 `void PrPlanarGraph_OP::scan2 ( std::istream & is )`

alternative scan, reading the end array after points

29.373.3.10 `virtual void PrPlanarGraph_OP::set3dNode ( int i, const Vector3D & p ) [inline],[virtual]`

Doesn't really do anything. But needed anyway.

Implements [PrOrganizedPoints](#).

Definition at line 111 of file PrPlanarGraph\_OP.h.

29.373.3.11 `virtual void PrPlanarGraph_OP::setU ( int i, double u ) [inline],[virtual]`

Reset the *u* parameter value of the *i*-th node.

Implements [PrOrganizedPoints](#).

Definition at line 129 of file PrPlanarGraph\_OP.h.

29.373.3.12 `virtual void PrPlanarGraph_OP::setV ( int i, double v ) [inline],[virtual]`

Reset the *v* parameter value of the *i*-th node.

Implements [PrOrganizedPoints](#).

Definition at line 132 of file PrPlanarGraph\_OP.h.

### 29.374.1 Detailed Description

PrPrewavelet \_ This class implements algorithms for decomposing and decomposing piecewise linear functions over nested triangulations. The complemenet spaces are taken here to be wavelet spaces with the prewavelet basis constructed in

M. S. Floater and E. G. Quak, Piecewise Linear Prewavelets on Arbitrary Triangulations, Numer. Math. **82** (1999), 221–252.

Definition at line 60 of file PrPrewavelet\_F.h.

### 29.374.2 Constructor & Destructor Documentation

Default constructor.

Definition at line 77 of file PrPrewavelet\_F.h.

29.374.2.2 virtual PrPrewavelet\_F::~~PrPrewavelet\_F ( ) [virtual]

Empty destructor.

### 29.374.3 Member Function Documentation

29.374.3.1 virtual void PrPrewavelet\_F::compose ( int *jlev*, int *dim* = 1 ) [virtual]

The nodes in the triangulation belonging to  $V^j$  form a piecewise linear function  $f^j$  in the space  $S^j$ . This routine composes  $f^j$  from  $f^{j-1} + g^{j-1}$  where  $f^{j-1} \in S^{j-1}$  and  $g^{j-1} \in W^{j-1}$ . Use  $dim = 1$  for explicit triangulations and  $dim = 3$  for non-explicit. Default is  $dim = 1$ .

Implements [PrFilterbank](#).

29.374.3.2 virtual void PrPrewavelet\_F::decompose ( int *jlev*, int *dim* = 1 ) [virtual]

The nodes in the triangulation belonging to  $V^j$  form a piecewise linear function  $f^j$  in the space  $S^j$  (where  $j = \text{level}$ ). This routine decomposes  $f^j$  into  $f^{j-1} + g^{j-1}$  where  $f^{j-1} \in S^{j-1}$  and  $g^{j-1} \in W^{j-1}$ . Use  $dim = 1$  for explicit triangulations and  $dim = 3$  for non-explicit. Default is  $dim = 1$ .

Implements [PrFilterbank](#).

29.374.3.3 void PrPrewavelet\_F::setCGTolerance ( double *tolerance* = 1.0e-6 ) [inline]

Set the numerical tolerance used for internal computations with the conjugated gradient algorithm.

Definition at line 83 of file PrPrewavelet\_F.h.

## Additional Inherited Members

### 29.378.1 Detailed Description

[PrPrmMeanValue](#) - Implement the mean value parametrization by implementing the virtual function `makeWeights`. See preprint "Mean Value Coordinates", M.S. Floater. This method is now THE recommended method. The mapped points of the mean value parameterization depend infinitely smoothly on the original data points, unlike the shape-preserving parameterization. However, in many examples that have been tested, the two methods give similar results. (MF. August 2002).

## Additional Inherited Members

### 29.384.1 Detailed Description

`PrRectangularGrid_OP` - This class represents a (topologically) rectangular grid of points in  $R^3$  with or without parameter points in  $R^2$ . It implements the virtual functions in `PrOrganizedPoints` specific to a grid. This kind of grid can be parametrized by `PrParametrize`.

Definition at line 55 of file `PrRectangularGrid_OP.h`.

### 29.384.2 Constructor & Destructor Documentation

#### 29.384.2.1 `PrRectangularGrid_OP::PrRectangularGrid_OP ( ) [inline]`

Default constructor.

Definition at line 70 of file `PrRectangularGrid_OP.h`.

29.384.2.2 `PrRectangularGrid_OP::PrRectangularGrid_OP ( int numcols, int numRows, const double * grid )`

Constructor. Construct the [PrRectangularGrid\\_OP](#) from an array of nodes.

29.384.2.3 `PrRectangularGrid_OP::PrRectangularGrid_OP ( int numcols, int numRows, const double * grid, const double * uvgrid )`

Constructor. Construct the [PrRectangularGrid\\_OP](#) from an array of nodes.

29.384.2.4 `virtual PrRectangularGrid_OP::~~PrRectangularGrid_OP ( ) [virtual]`

Default destructor.

### 29.384.3 Member Function Documentation

29.384.3.1 `virtual Vector3D PrRectangularGrid_OP::get3dNode ( int i ) const [inline],[virtual]`

return the i-th node in the graph if the nodes are three-dimensional

Implements [PrOrganizedPoints](#).

Definition at line 92 of file `PrRectangularGrid_OP.h`.

29.384.3.2 `void PrRectangularGrid_OP::getCorners ( int & c1, int & c2, int & c3, int & c4 ) const`

Get the indices of the four corner nodes in an anticlockwise direction, starting with the bottom left hand corner.

29.384.3.3 `void PrRectangularGrid_OP::getDim ( int & numcols, int & numRows ) const [inline]`

Get the dimensions of the grid.

Definition at line 112 of file `PrRectangularGrid_OP.h`.

29.384.3.4 `virtual void PrRectangularGrid_OP::getNeighbours ( int i, vector< int > & neighbours ) const [virtual]`

29.384.3.5 `virtual int PrRectangularGrid_OP::getNumNodes ( ) const [inline],[virtual]`

return the number of nodes in the graph.

Implements [PrOrganizedPoints](#).

Definition at line 91 of file `PrRectangularGrid_OP.h`.

29.384.3.6 `bool PrRectangularGrid_OP::getTriangle ( double u, double v, int ii, int jj, bool & right, double & tau0, double & tau1, double & tau2 ) const`

Check if the parameter point (u,v) can be found in one of the two triangles specified by the nodes at indexes (ii, jj), (ii+1, jj), (ii, jj+1) and (ii+1, jj+1). In that case, return its barycentric coordinates with respect to that triangle

## Parameters

<i>u</i>	u-coordinate of the specified point
<i>v</i>	v-coordinate of the specified point
<i>ii</i>	row-index of the "lower left" node of the rectangle specifying the two triangles where we want to look for the point
<i>jj</i>	column-index of the "lower left" node of the rectangle specifying the two triangles where we want to look for the point

## Return values

<i>right</i>	if the point was found to be in the triangle specified by the nodes (ii,jj), (ii+1, jj) and (ii+1, jj+1), then the value of 'right' will be set to 'true'. If the point was found to be in the triangle specified by the nodes (ii, jj), (ii, jj+1) and (ii+1, jj+1), then the value of 'right' will be set to 'false'. Otherwise, the value of this parameter will remain unchanged
<i>tau0</i>	first barycentric coordinate of the point in the located triangle
<i>tau1</i>	second barycentric coordinate of the point in the located triangle
<i>tau2</i>	third barycentric coordinate of the point in the located triangle

## Returns

'true' if the parameter point was found to be within one of the two triangles.

**29.384.3.7** `virtual double PrRectangularGrid_OP::getU ( int i ) const [inline],[virtual]`

return the u parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 97 of file PrRectangularGrid\_OP.h.

**29.384.3.8** `double PrRectangularGrid_OP::getU ( int i, int j ) const [inline]`

Get U value for gridpoint (i,j)

Definition at line 116 of file PrRectangularGrid\_OP.h.

**29.384.3.9** `bool PrRectangularGrid_OP::getUVTriangle ( double u, double v, int & i, int & j, bool & right, double & tau0, double & tau1, double & tau2 ) const`

Locate the triangle in the parameter plane that contains the point (u,v). Report back the indexes of the "lower left" node of this triangle, as well as the point's barycentric coordinates in this triangle

## Parameters

<i>u</i>	u-coordinate of the specified point
<i>v</i>	v-coordinate of the specified point

## Return values

<i>i</i>	if triangle found, this will be the row index of the node in the "lower left" corner of the triangle.
<i>j</i>	if triangle found, this will be the column index of the node in the "lower left" corner of the triangle.
<i>right</i>	if the triangle was found, this variable reports whether the triangle consists of the "right" or "left" part of a quad in the grid. (Where the right part is defined as (i, j), (i+1, j) (i+1, j+1), whereas the left part is defined as (i, j), (i, j+1) (i+1, j+1).
<i>tau0</i>	if triangle found, this parameter is set to the first barycentric coordinate of the point (u,v) in the triangle.
<i>tau1</i>	if triangle found, this parameter is set to the second barycentric coordinate of the point (u,v) in the triangle.
<i>tau2</i>	if triangle found, this parameter is set to the third barycentric coordinate of the point (u,v) in the triangle.

## Returns

'true' if the triangle was located, 'false' otherwise

**29.384.3.10** `bool PrRectangularGrid_OP::getUVTriangle ( double & u, double & v, int llast, int jlast, int & i, int & j, bool & right, double & tau0, double & tau1, double & tau2 ) const`

This function behaves as the other [getUVTriangle\(\)](#) function, with the difference that the user can specify two additional parameters, '*l*last' and '*j*last' as a suggestion for where to start the search for a triangle.

**29.384.3.11** `virtual double PrRectangularGrid_OP::getV ( int i ) const [inline], [virtual]`

return the v parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 98 of file PrRectangularGrid\_OP.h.

**29.384.3.12** `double PrRectangularGrid_OP::getV ( int i, int j ) const [inline]`

Get V value for gridpoint (i,j)

Definition at line 118 of file PrRectangularGrid\_OP.h.

**29.384.3.13** `void PrRectangularGrid_OP::graphToGrid ( int index, int & col, int & row ) const [inline]`

Get the column and row position of the point indexed '*index*'.

Definition at line 86 of file PrRectangularGrid\_OP.h.

**29.384.3.14** `int PrRectangularGrid_OP::gridToGraph ( int col, int row ) const [inline]`

compute the index of the point located at column '*col*' and row '*row*'.

Definition at line 83 of file PrRectangularGrid\_OP.h.

29.384.3.15 `virtual bool PrRectangularGrid_OP::isBoundary ( int i ) const` [virtual]

is the *i*-th node a boundary node or interior node?

Implements [PrOrganizedPoints](#).

29.384.3.16 `void PrRectangularGrid_OP::print ( std::ostream & os )`

print object to stream

29.384.3.17 `void PrRectangularGrid_OP::printRawData ( std::ostream & os )`

print raw data to stream (no parameterization involved)

29.384.3.18 `void PrRectangularGrid_OP::scan ( std::istream & is )`

read object from stream

29.384.3.19 `void PrRectangularGrid_OP::scanRawData ( std::istream & is )`

scan raw data from stream (no parameterization involved)

29.384.3.20 `virtual void PrRectangularGrid_OP::set3dNode ( int i, const Vector3D & p )` [inline],[virtual]

set the coordinates of the *i*-th node in the graph if the nodes are three-dimensional.

Implements [PrOrganizedPoints](#).

Definition at line 93 of file `PrRectangularGrid_OP.h`.

29.384.3.21 `void PrRectangularGrid_OP::setDim ( int numcols, int numrows )`

Set the dimensions of the grid.

29.384.3.22 `virtual void PrRectangularGrid_OP::setU ( int i, double u )` [inline],[virtual]

reset the *u* parameter value of the *i*-th node.

Implements [PrOrganizedPoints](#).

Definition at line 99 of file `PrRectangularGrid_OP.h`.

29.384.3.23 void PrRectangularGrid\_OP::setUVVertices ( const double \* *grid* )

Reset all the uv points from an array.

29.384.3.24 virtual void PrRectangularGrid\_OP::setV ( int *i*, double *v* ) [inline], [virtual]

reset the v parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 100 of file PrRectangularGrid\_OP.h.

29.384.3.25 void PrRectangularGrid\_OP::setXYZVertices ( const double \* *grid* )

Reset all the xyz points from an array.

29.384.3.26 double\* PrRectangularGrid\_OP::uvData ( ) [inline]

Definition at line 195 of file PrRectangularGrid\_OP.h.

29.384.3.27 const double\* PrRectangularGrid\_OP::uvData ( ) const [inline]

Definition at line 203 of file PrRectangularGrid\_OP.h.

29.384.3.28 double\* PrRectangularGrid\_OP::xyzData ( ) [inline]

Definition at line 199 of file PrRectangularGrid\_OP.h.

29.384.3.29 const double\* PrRectangularGrid\_OP::xyzData ( ) const [inline]

Definition at line 207 of file PrRectangularGrid\_OP.h.

### 29.385.1 Detailed Description

[PrSubTriangulation](#) - This class represents a sub-triangulation of another triangulation, using a permutation vector to access the nodes and triangles of the other triangulation It implements the virtual functions in [PrOrganizedPoints](#). This kind of triangulation can be parametrized by [PrParametrize](#).

The internal indices of the vertices are  $[0..\text{numBdy\_}-1]$  for the boundary nodes and  $[\text{numBdy\_}..\text{numBdy\_}+\text{numInt\_}-1]$  for the interior nodes. They are referred to as "new" indices, whereas the indices in the associated [PrTriangulation\\_OP](#) are called "old" indices. Therefore, "new2old\_" provides a mapping from  $[0..\text{numBdy\_}+\text{numInt\_}-1]$  to the "old" indices and "old2new\_" is its inverse.

We assume the boundary vertices to be ordered anticlockwise.

Definition at line 71 of file [PrSubTriangulation.h](#).

## 29.385.2 Constructor & Destructor Documentation

### 29.385.2.1 `PrSubTriangulation::PrSubTriangulation ( )` `[inline]`

Default constructor.

Definition at line 82 of file `PrSubTriangulation.h`.

### 29.385.2.2 `PrSubTriangulation::PrSubTriangulation ( PrTriangulation_OP * graph, vector< int > boundary, vector< int > interior )`

Constructor. Construct the [PrSubTriangulation](#) from an array with the indices of the "boundary" nodes and another carrying the indices of the "interior" nodes. All indices are relative to the indexing in the associated [PrTriangulation\\_OP](#) "graph"

### 29.385.2.3 `PrSubTriangulation::~~PrSubTriangulation ( )` `[inline]`

Empty destructor.

Definition at line 92 of file `PrSubTriangulation.h`.

## 29.385.3 Member Function Documentation

### 29.385.3.1 `void PrSubTriangulation::attach ( PrTriangulation_OP * graph )` `[inline]`

Set the top-level triangulation to 'graph'.

Definition at line 95 of file `PrSubTriangulation.h`.

### 29.385.3.2 `virtual int PrSubTriangulation::findNumBdyNodes ( ) const` `[inline],[virtual]`

count the number of boundary nodes in the graph.

Reimplemented from [PrOrganizedPoints](#).

Definition at line 108 of file `PrSubTriangulation.h`.

### 29.385.3.3 `virtual Vector3D PrSubTriangulation::get3dNode ( int i ) const` `[inline],[virtual]`

return the i-th node in the graph if the nodes are three-dimensional

Implements [PrOrganizedPoints](#).

Definition at line 109 of file `PrSubTriangulation.h`.

**29.385.3.4** `int PrSubTriangulation::getGlobalIndex ( int i ) const` `[inline]`

get the global index of the node with local index '*i*'.

Definition at line 125 of file PrSubTriangulation.h.

**29.385.3.5** `int PrSubTriangulation::getLocalIndex ( int i ) const` `[inline]`

get the local index of the node with global index '*i*'.

Definition at line 127 of file PrSubTriangulation.h.

**29.385.3.6** `virtual void PrSubTriangulation::getNeighbours ( int i, vector< int > & neighbours ) const` `[virtual]`

**29.385.3.7** `void PrSubTriangulation::getNeighbourTriangles ( int i, vector< int > & neighbours ) const`

Get all the neighbour triangles in the global triangulation of a node '*i*'. (*i* is global index).

**29.385.3.8** `virtual int PrSubTriangulation::getNumNodes ( ) const` `[inline],[virtual]`

return the number of nodes in the graph.

Implements [PrOrganizedPoints](#).

Definition at line 107 of file PrSubTriangulation.h.

**29.385.3.9** `void PrSubTriangulation::getTriangleIndices ( vector< int > & indices ) const`

Get all indices of triangles made up of interior points in the global triangulation, as well as those made up of boundary/interior points and equally belong to the sub-triangulation.

**29.385.3.10** `virtual double PrSubTriangulation::getU ( int i ) const` `[inline],[virtual]`

return the u parameter value of the *i*-th node.

Implements [PrOrganizedPoints](#).

Definition at line 116 of file PrSubTriangulation.h.

**29.385.3.11** `virtual double PrSubTriangulation::getV ( int i ) const` `[inline],[virtual]`

return the v parameter value of the *i*-th node.

Implements [PrOrganizedPoints](#).

Definition at line 117 of file PrSubTriangulation.h.

29.385.3.12 `void PrSubTriangulation::initialize ( vector< int > boundary, vector< int > interior )`

Initialize the [PrSubTriangulation](#). The `attach()` function should already have been called in order to define the [PrTriangulation\\_OP](#) that constitutes the base triangulation. The 'boundary' vector specifies the indexes of the boundary nodes, and the 'interior' vector specifies the indexes of the interior nodes. All indices are relative to the indexing in the associated [PrTriangulation\\_OP](#).

29.385.3.13 `virtual bool PrSubTriangulation::isBoundary ( int i ) const [inline],[virtual]`

is the *i*-th node a boundary node or interior node?

Implements [PrOrganizedPoints](#).

Definition at line 114 of file `PrSubTriangulation.h`.

29.385.3.14 `virtual void PrSubTriangulation::set3dNode ( int i, const Vector3D & p ) [inline],[virtual]`

set the coordinates of the *i*-th node in the graph if the nodes are three-dimensional.

Implements [PrOrganizedPoints](#).

Definition at line 111 of file `PrSubTriangulation.h`.

29.385.3.15 `virtual void PrSubTriangulation::setU ( int i, double u ) [inline],[virtual]`

reset the *u* parameter value of the *i*-th node.

Implements [PrOrganizedPoints](#).

Definition at line 118 of file `PrSubTriangulation.h`.

29.385.3.16 `virtual void PrSubTriangulation::setV ( int i, double v ) [inline],[virtual]`

reset the *v* parameter value of the *i*-th node.

Implements [PrOrganizedPoints](#).

Definition at line 119 of file `PrSubTriangulation.h`.

29.385.3.17 `bool PrSubTriangulation::triangleInThis ( int i ) const`

Check if the triangle indexed '*i*' in the global triangulation also exists in this sub-triangulation. This is true if all three nodes of the triangle can be found in the sub-triangulation.

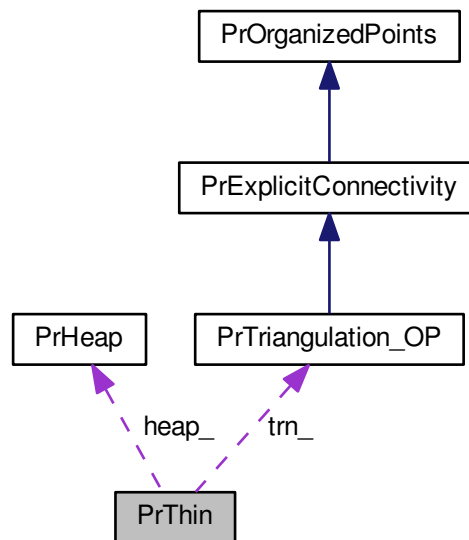

The documentation for this class was generated from the following file:

- parametrization/include/GoTools/parametrization/[PrSubTriangulation.h](#)

## 29.386 PrThin Class Reference

### 29.386.1 Detailed Description

`PrThin` - This class implements an algorithm for thinning a triangulation.

Definition at line 50 of file `PrThin.h`.

### 29.386.2 Constructor & Destructor Documentation

#### 29.386.2.1 `PrThin::PrThin( )` [`inline`]

Default constructor.

Definition at line 68 of file `PrThin.h`.

#### 29.386.2.2 `virtual PrThin::~~PrThin( )` [`virtual`]

Empty destructor.

### 29.386.3 Member Function Documentation

#### 29.386.3.1 `void PrThin::attach( PrTriangulation_OP * trn )`

Set the triangulation.

#### 29.386.3.2 `double PrThin::findError( int i )` [`protected`]

#### 29.386.3.3 `void PrThin::findNearestNeighbour( int i, int & tr )`

Find nearest neighbour `j` to an interior node `i` (in 3D) and return the triangle `tr` which is left of the directed edge `(i,j)`. Note that `j` is then `tr.getAnticlockwiseNode(i)`.

29.386.3.4 void PrThin::halfEdgeCollapse ( int *i* )

Remove the node *i* and retriangulate by collapsing one of its edges.

29.386.3.5 void PrThin::makeHeap ( ) [protected]

29.386.3.6 void PrThin::printHeap ( )

29.386.3.7 void PrThin::removePoint ( int *i* )

Remove the node *i* from the triangulation and update heap. It is assumed that *i* is not in the heap

29.386.3.8 void PrThin::setError ( double *error* ) [inline]

Set the tolerated error.

Definition at line 76 of file PrThin.h.

29.386.3.9 void PrThin::setStepNumber ( int *n* ) [inline]

Set number of steps used for thinning.

Definition at line 79 of file PrThin.h.

29.386.3.10 void PrThin::thin ( )

Thin the points, until the error of further removals is above the threshold `error_`.

## 29.386.4 Member Data Documentation

29.386.4.1 double PrThin::error\_ [protected]

Definition at line 60 of file PrThin.h.

29.386.4.2 PrHeap\* PrThin::heap\_ [protected]

Definition at line 58 of file PrThin.h.

29.386.4.3 std::vector<PrNode>\* PrThin::nlist\_ptr [protected]

Definition at line 55 of file PrThin.h.

29.386.4.4 `int PrThin::steps_` [protected]

Definition at line 61 of file PrThin.h.

29.386.4.5 `std::vector<PrTriangle>* PrThin::tlist_ptr` [protected]

Definition at line 56 of file PrThin.h.

29.386.4.6 `PrTriangulation_OP* PrThin::trn_` [protected]

Definition at line 54 of file PrThin.h.

The documentation for this class was generated from the following file:

## Protected Attributes

- shared\_ptr< [PrNestedTriangulation](#) > t\_
- double threshold\_

### 29.387.1 Detailed Description

[PrThreshold](#) - This class implements an algorithm for thresholding a linear combination of coarse nodal functions and wavelets over several levels.

Definition at line 54 of file PrThreshold.h.

### 29.387.2 Constructor & Destructor Documentation

#### 29.387.2.1 PrThreshold::PrThreshold ( )

Default constructor.

#### 29.387.2.2 virtual PrThreshold::~PrThreshold ( ) [inline],[virtual]

Empty destructor.

Definition at line 65 of file PrThreshold.h.

### 29.387.3 Member Function Documentation

#### 29.387.3.1 virtual void PrThreshold::attach ( shared\_ptr< PrNestedTriangulation > t ) [virtual]

#### 29.387.3.2 double PrThreshold::averageAbsValue ( )

Calculate the average absolute value.

**29.387.3.3** `double PrThreshold::findThreshold ( double & wavelet_comp_rate )`

Find a threshold which will give the given compression rate. E.g. if `wavelet_comp_rate = 0.05` and there are `n` wavelets then we want a threshold so that `m = int(0.05 * n)` are retained.

**29.387.3.4** `void PrThreshold::leaveLevel ( int jlev )`

Set all level zero coeffs to zero and all wavelet coeffs except those of level `j`.

**29.387.3.5** `double PrThreshold::maxNorm ( )`

Calculate the max norm.

**29.387.3.6** `void PrThreshold::setThreshold ( double threshold = 0.0 ) [inline]`

Definition at line 69 of file `PrThreshold.h`.

**29.387.3.7** `void PrThreshold::threshold ( double & comp_rate, double & wavelet_comp_rate, int error_out = 0 )`

Threshold the wavelet coefficients by setting those whose absolute value is less than the tolerance to 0. Return the compression rate: ratio of no. of coarse hats plus non-zero wavelets over no. of coarse hats plus all wavelets. Return the wavelet compression rate: ratio of no. of non-zero over no. of wavelets.

If `error_out = 1`, do the opposite of thresholding, i.e, retain only those wavelet coefficients which are smaller in absolute value than the tolerance. The resulting piecewise linear function represents the error after thresholding and can be used to find the  $l_2$  error, max error, etc.

**29.387.3.8** `void PrThreshold::thresholdByCompRate ( double & wavelet_comp_rate, int error_out = 0 )`

Threshold by given compression rate, e.g. 0.05.

**29.387.3.9** `double PrThreshold::triangleNorm ( int i, int j, int k )`

**29.387.3.10** `void PrThreshold::truncateLevel ( int jlev )`

Set all coeffs at level `jlev` to zero ( $0 \leq jlev \leq \text{getFinestLevel}$ ).

**29.387.3.11** `double PrThreshold::weightedL2Norm ( )`

## 29.387.4 Member Data Documentation

**29.387.4.1** `shared_ptr<PrNestedTriangulation> PrThreshold::t_ [protected]`

Definition at line 58 of file `PrThreshold.h`.

29.387.4.2 `double PrThreshold::threshold_ [protected]`

Definition at line 59 of file PrThreshold.h.

The documentation for this class was generated from the following file:

*read contents from stream*

### 29.388.1 Detailed Description

[PrTriangle](#) - This class represents a triangle for use in [PrTriangulation\\_OP](#). It has three indices of its three vertices in some anticlockwise order. Its three neighbouring triangles t1,t2,t3 are opposite to its vertices. Thus t1 is the triangle opposite n1, t2 is opposite n2 and t3 opposite n3. If any of the neighbouring triangles do not exist in the triangulation their index is -1 (which is out of range in the array of triangles in the triangulation).

Definition at line 57 of file PrTriangle.h.

### 29.388.2 Constructor & Destructor Documentation

#### 29.388.2.1 PrTriangle::PrTriangle ( ) [inline]

Default constructor.

Definition at line 66 of file PrTriangle.h.

#### 29.388.2.2 PrTriangle::PrTriangle ( int n1, int n2, int n3, int t1, int t2, int t3 ) [inline]

Constructor.

Definition at line 68 of file PrTriangle.h.

#### 29.388.2.3 PrTriangle::PrTriangle ( const PrTriangle & t ) [inline]

Constructor.

Definition at line 71 of file PrTriangle.h.

#### 29.388.2.4 PrTriangle::~PrTriangle ( ) [inline]

Empty destructor.

Definition at line 75 of file PrTriangle.h.

### 29.388.3 Member Function Documentation

#### 29.388.3.1 int PrTriangle::getAnticlockwiseNode ( int node ) const

Return the node following "node" in an anticlockwise direction around the triangle.

#### 29.388.3.2 int PrTriangle::getClockwiseNode ( int node ) const

Return the node following "node" in a clockwise direction around the triangle.

29.388.3.3 `int PrTriangle::getEdge ( int triangle, int & n1, int & n2 ) const`

if 'triangle' share an edge with this triangle, return the nodes on the shared edge.

29.388.3.4 `int PrTriangle::getLeftTriangle ( int node ) const`

Return the neighbouring triangle which lies to the left of the given node.

29.388.3.5 `int PrTriangle::getOppositeTriangle ( int node ) const`

Return the neighbouring triangle which lies opposite to the given node.

29.388.3.6 `int PrTriangle::getRightTriangle ( int node ) const`

Return the neighbouring triangle which lies to the right of the given node.

29.388.3.7 `void PrTriangle::init ( int n1, int n2, int n3, int t1, int t2, int t3 ) [inline]`

Definition at line 133 of file PrTriangle.h.

29.388.3.8 `bool PrTriangle::isVertex ( int node ) const`

Boolean routine: does "node" belong to the triangle?

29.388.3.9 `const int & PrTriangle::n1 ( ) const [inline]`

Definition at line 145 of file PrTriangle.h.

29.388.3.10 `int & PrTriangle::n1 ( ) [inline]`

Definition at line 187 of file PrTriangle.h.

### 29.389.1 Detailed Description

[PrTriangulation\\_NT](#) - This class represents a nested sequence of triangulations of points in  $R^3$ . It implements the virtual functions in [PrNestedTriangulations](#).

Definition at line 53 of file [PrTriangulation\\_NT.h](#).

### 29.389.2 Constructor & Destructor Documentation

#### 29.389.2.1 [PrTriangulation\\_NT::PrTriangulation\\_NT](#) ( ) `[inline]`

Default constructor.

Definition at line 66 of file [PrTriangulation\\_NT.h](#).

## 29.389.2.2 PrTriangulation\_NT::PrTriangulation\_NT ( PrTriangulation\_OP &amp; t )

Constructor. Construct the [PrTriangulation\\_NT](#) from a [PrTriangulation\\_OP](#), using just one level in the hierarchy. This can later be refined by [refine\(\)](#).

## 29.389.2.3 PrTriangulation\_NT::~~PrTriangulation\_NT ( ) [inline]

Empty destructor.

Definition at line 72 of file PrTriangulation\_NT.h.

## 29.389.3 Member Function Documentation

## 29.389.3.1 virtual int PrTriangulation\_NT::getFinestLevel ( ) [inline],[virtual]

Return the finest level in the hierarchy, i.e.  $k$  if the vertices are arranged  $V^0 \subset V^1 \subset \dots \subset V^k$ .

Implements [PrNestedTriangulation](#).

Definition at line 76 of file PrTriangulation\_NT.h.

## 29.389.3.2 PrLevelTriangulation\_OP\* PrTriangulation\_NT::getLevel ( int i ) [inline]

Get pointer to triangulation at level  $i$ .

Definition at line 105 of file PrTriangulation\_NT.h.

## 29.389.3.3 virtual void PrTriangulation\_NT::getNeighbours ( int i, int jlev, vector&lt; int &gt; &amp; neighbours ) [inline],[virtual]

Return the indices of the neighbours of the  $i$ -th node with respect to  $V^j$ . This routine assumes that node  $i$  also belongs to  $V^j$ . The order of the neighbours returned will be

1. any anticlockwise order if  $i$  is an interior node
2. the unique anticlockwise order if  $i$  is a boundary node.

Implements [PrNestedTriangulation](#).

Definition at line 85 of file PrTriangulation\_NT.h.

## 29.389.3.4 virtual int PrTriangulation\_NT::getNumNodes ( int jlev ) [inline],[virtual]

return the number of nodes in  $V^j, j = 0, 1, \dots, k$ .

Implements [PrNestedTriangulation](#).

Definition at line 77 of file PrTriangulation\_NT.h.

**29.389.3.5** `PrLevelTriangulation_OP* PrTriangulation_NT::getTopLevel ( )` [inline]

Get pointer to the finest triangulation.

Definition at line 108 of file PrTriangulation\_NT.h.

**29.389.3.6** `virtual double PrTriangulation_NT::getX ( int i )` [inline],[virtual]

return the x coeff. of the i-th node in the triangulation.

Implements [PrNestedTriangulation](#).

Definition at line 79 of file PrTriangulation\_NT.h.

**29.389.3.7** `virtual double PrTriangulation_NT::getY ( int i )` [inline],[virtual]

return the y coeff. of the i-th node in the triangulation.

Implements [PrNestedTriangulation](#).

Definition at line 80 of file PrTriangulation\_NT.h.

**29.389.3.8** `virtual double PrTriangulation_NT::getZ ( int i )` [inline],[virtual]

return the z coeff. of the i-th node in the triangulation.

Implements [PrNestedTriangulation](#).

Definition at line 81 of file PrTriangulation\_NT.h.

**29.389.3.9** `virtual bool PrTriangulation_NT::isBoundary ( int i )` [inline],[virtual]

is the i-th node a boundary node or interior node?

Implements [PrNestedTriangulation](#).

Definition at line 87 of file PrTriangulation\_NT.h.

**29.389.3.10** `void PrTriangulation_NT::lift ( PrParamTriangulation * pt )`

Lift the vertices of the nested triangulation to some surface, using the parameterization defined by pt

**29.389.3.11** `void PrTriangulation_NT::refine ( )`

Construct the [PrTriangulation\\_NT](#) from a [PrTriangulation\\_OP](#), using just one level in the hierarchy. This can later be refined by [refine\(\)](#).

29.389.3.12 `virtual void PrTriangulation_NT::setX ( int i, const double & x )` `[inline],[virtual]`

set the x coeff. of the i-th node in the triangulation.

Implements [PrNestedTriangulation](#).

Definition at line 82 of file PrTriangulation\_NT.h.

29.389.3.13 `virtual void PrTriangulation_NT::setY ( int i, const double & y )` `[inline],[virtual]`

set the y coeff. of the i-th node in the triangulation.

Implements [PrNestedTriangulation](#).

Definition at line 83 of file PrTriangulation\_NT.h.

29.389.3.14 `virtual void PrTriangulation_NT::setZ ( int i, const double & z )` `[inline],[virtual]`

set the z coeff. of the i-th node in the triangulation.

Implements [PrNestedTriangulation](#).

Definition at line 84 of file PrTriangulation\_NT.h.

The documentation for this class was generated from the following file:

- parametrization/include/GoTools/parametrization/[PrTriangulation\\_NT.h](#)

## Additional Inherited Members

### 29.390.1 Detailed Description

[PrTriangulation\\_OP](#) - This class represents a triangulation of points in  $R^3$  with or without parameter points in  $R^2$ . It implements the virtual functions in [PrOrganizedPoints](#). This kind of triangulation can be parametrized by [PrParametrize](#).

Definition at line 55 of file [PrTriangulation\\_OP.h](#).

### 29.390.2 Constructor & Destructor Documentation

#### 29.390.2.1 [PrTriangulation\\_OP::PrTriangulation\\_OP](#) ( ) [\[inline\]](#)

Default constructor.

Definition at line 66 of file [PrTriangulation\\_OP.h](#).

### 29.390.2.2 PrTriangulation\_OP::PrTriangulation\_OP ( const double \* xyz\_points, int np, const int \* triangles, int nt )

Constructor. Construct the [PrTriangulation\\_OP](#) from an array of nodes and an array of triangles. The nodes array should contain  $x_0, y_0, z_0, x_1, y_1, z_1, x_2, y_2, z_2, x_3, \dots$  and the triangle array  $i_0, j_0, k_0, i_1, j_1, k_1, i_2, j_2, k_2, i_3, j_3, \dots$  where the  $i$ -th node is the 3D point  $(x_i, y_i, z_i)$  and the  $r$ -th triangle has the three nodes indexed  $i_r, j_r,$  and  $k_r$  in the node array. These nodes must be ordered anticlockwise (consistently throughout the triangulation). The length of the array "xyz\_points" is  $3 * np$  and the length of the array "triangles" is  $3 * nt$ . The uv points for the nodes are set to zero.

The function buildTopology is called which finds the three neighbouring triangles of each triangle and the first triangle of each node.

### 29.390.2.3 PrTriangulation\_OP::PrTriangulation\_OP ( const double \* xyz\_points, const double \* uv\_points, int np, const int \* triangles, int nt )

Constructor. Construct the [PrTriangulation\\_OP](#) from an array of nodes and an array of triangles. The xyz\_points array should contain  $x_0, y_0, z_0, x_1, y_1, z_1, x_2, y_2, z_2, x_3, \dots$ . The uv\_points array should contain  $u_0, v_0, u_1, v_1, u_2, v_2, u_3, \dots$  and the triangle array  $i_0, j_0, k_0, i_1, j_1, k_1, i_2, j_2, k_2, i_3, j_3, \dots$  where the  $i$ -th node is the 3D point  $(x_i, y_i, z_i)$  and the  $r$ -th triangle has the three nodes indexed  $i_r, j_r,$  and  $k_r$  in the node array. These nodes must be ordered anticlockwise (consistently throughout the triangulation). The length of the array "xyzpoints" is  $3 * np$  and The length of the array "uv\_points" is  $2 * np$  and the length of the array "triangles" is  $3 * nt$ .

The function buildTopology is called which finds the three neighbouring triangles of each triangle and the first triangle of each node.

### 29.390.2.4 PrTriangulation\_OP::PrTriangulation\_OP ( PrExplicitConnectivity & op )

Constructor. Construct the [PrTriangulation\\_OP](#) from a [PrExplicitConnectivity](#) class ASSUMING the [PrOrganizedPoints](#) class is a triangulation (every face has three vertices).

### 29.390.2.5 PrTriangulation\_OP::~PrTriangulation\_OP ( ) [inline]

Definition at line 109 of file PrTriangulation\_OP.h.

## 29.390.3 Member Function Documentation

### 29.390.3.1 virtual int PrTriangulation\_OP::findNumFaces ( ) const [inline], [virtual]

count the number of faces in the graph

Reimplemented from [PrExplicitConnectivity](#).

Definition at line 124 of file PrTriangulation\_OP.h.

### 29.390.3.2 virtual Vector3D PrTriangulation\_OP::get3dNode ( int i ) const [inline], [virtual]

return the  $i$ -th node in the graph if the nodes are three-dimensional

Implements [PrOrganizedPoints](#).

Definition at line 114 of file PrTriangulation\_OP.h.

**29.390.3.3** virtual void PrTriangulation\_OP::getNeighbours ( int *i*, std::vector< int > & *neighbours* ) const [virtual]

Return the indices of the neighbours of the *i*-th node in:

1. any anticlockwise order if *i* is an interior node
2. the unique anticlockwise order if *i* is a boundary node.

Implements [PrOrganizedPoints](#).

**29.390.3.4** std::vector<PrNode>& PrTriangulation\_OP::getNodeArray ( ) [inline]

Get reference to all nodes in the triangulation.

Definition at line 161 of file PrTriangulation\_OP.h.

**29.390.3.5** virtual int PrTriangulation\_OP::getNumNodes ( ) const [inline],[virtual]

return the number of nodes in the graph.

Implements [PrOrganizedPoints](#).

Definition at line 113 of file PrTriangulation\_OP.h.

**29.390.3.6** PrNode& PrTriangulation\_OP::getPrNode ( int *i* ) [inline]

Get reference to node indexed '*i*'.

Definition at line 152 of file PrTriangulation\_OP.h.

**29.390.3.7** const PrNode& PrTriangulation\_OP::getPrNode ( int *i* ) const [inline]

Definition at line 153 of file PrTriangulation\_OP.h.

**29.390.3.8** const PrTriangle& PrTriangulation\_OP::getPrTriangle ( int *i* ) const [inline]

Get reference to triangle indexed '*i*'.

Definition at line 155 of file PrTriangulation\_OP.h.

**29.390.3.9** PrTriangle& PrTriangulation\_OP::getPrTriangle ( int *i* ) [inline]

Get reference to triangle indexed '*i*'.

Definition at line 157 of file PrTriangulation\_OP.h.

29.390.3.10 `std::vector<PrTriangle>& PrTriangulation_OP::getTriangleArray ( )` [inline]

Get reference to all triangles in the triangulation.

Definition at line 159 of file PrTriangulation\_OP.h.

29.390.3.11 `virtual void PrTriangulation_OP::getTriangles ( int i, Go::ScratchVect< int, 20 > & triangles ) const`  
[virtual]

Get all triangles that are incident with node 'i'.

29.390.3.12 `virtual double PrTriangulation_OP::getU ( int i ) const` [inline],[virtual]

return the u parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 125 of file PrTriangulation\_OP.h.

29.390.3.13 `virtual double PrTriangulation_OP::getV ( int i ) const` [inline],[virtual]

return the v parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 126 of file PrTriangulation\_OP.h.

29.390.3.14 `virtual bool PrTriangulation_OP::isBoundary ( int i ) const` [virtual]

is the i-th node a boundary node or interior node?

Implements [PrOrganizedPoints](#).

29.390.3.15 `void PrTriangulation_OP::print ( std::ostream & os ) const`

print whole class

29.390.3.16 `void PrTriangulation_OP::printRawData ( std::ostream & os ) const`

print minimum data

29.390.3.17 `void PrTriangulation_OP::printUV ( std::ostream & os ) const`

for converting uv to xyz with z=0

29.390.3.18 `void PrTriangulation_OP::printUVTriangles ( std::ostream & os, bool num = false ) const`

Print out the uv triangles of the graph, useful for plotting If num = 1, print first the number of triangles.

29.390.3.19 `void PrTriangulation_OP::printXYZTriangles ( std::ostream & os, bool num = false ) const`

Print out the triangles of the graph, useful for plotting If num = 1, print first the number of triangles.

29.390.3.20 `void PrTriangulation_OP::scan ( std::istream & is )`

scan whole class

29.390.3.21 `void PrTriangulation_OP::scanRawData ( std::istream & is )`

scan minimum data

29.390.3.22 `virtual void PrTriangulation_OP::set3dNode ( int i, const Vector3D & p ) [inline],[virtual]`

set the coordinates of the i-th node in the graph if the nodes are three-dimensional.

Implements [PrOrganizedPoints](#).

Definition at line 115 of file PrTriangulation\_OP.h.

29.390.3.23 `virtual void PrTriangulation_OP::setU ( int i, double u ) [inline],[virtual]`

reset the u parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 127 of file PrTriangulation\_OP.h.

29.390.3.24 `virtual void PrTriangulation_OP::setV ( int i, double v ) [inline],[virtual]`

reset the v parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 128 of file PrTriangulation\_OP.h.

29.390.3.25 `bool PrTriangulation_OP::splitTriangles ( int t1, int t2, Vector3D & v )`

splits the common edge of triangles t1 and t2 and inserts the new vertex v there.

29.390.3.26 `bool PrTriangulation_OP::splitVertex ( int i, int j, std::vector< int > & new_nodes )`

Split the boundary vertex indexed 'i' into two, and replace the edge between 'i' and 'j' with two boundary edges. The requirements are that node 'i' should be on the boundary, and 'j' should share an edge with 'i'.

29.390.3.27 `void PrTriangulation_OP::swapNodes ( int n1, int n2 )`

swap node n1 and n2

29.390.3.28 `bool PrTriangulation_OP::swapTriangles ( int t1, int t2 )`

swap triangle t1 and t2

## Additional Inherited Members

### 29.391.1 Detailed Description

[PrUnorganized\\_OP](#) - This class represents a set of points in three dimensions. All we know about them is their boundary in sequence. No other topology is given. This kind of data can be parametrized by [PrParametrizeBdy](#) and [PrParametrizeInt](#).

Definition at line 54 of file [PrUnorganized\\_OP.h](#).

## 29.391.2 Constructor & Destructor Documentation

### 29.391.2.1 PrUnorganized\_OP::PrUnorganized\_OP ( int num\_cells = 10 )

Constructor.

### 29.391.2.2 PrUnorganized\_OP::PrUnorganized\_OP ( int n, int n\_int, double \* xyz\_points, int num\_cells = 10 )

Constructor.

### 29.391.2.3 PrUnorganized\_OP::~~PrUnorganized\_OP ( ) [inline]

Empty destructor.

Definition at line 73 of file PrUnorganized\_OP.h.

## 29.391.3 Member Function Documentation

### 29.391.3.1 virtual Vector3D PrUnorganized\_OP::get3dNode ( int i ) [inline],[virtual]

return the i-th node in the graph if the nodes are three-dimensional

Definition at line 82 of file PrUnorganized\_OP.h.

### 29.391.3.2 virtual void PrUnorganized\_OP::getNeighbours ( int i, vector< int > & neighbours ) [virtual]

Return the indices of the neighbours of the i-th node. (here there is no ordering: it's not a planar graph).

### 29.391.3.3 virtual int PrUnorganized\_OP::getNumNodes ( ) [inline],[virtual]

return the number of nodes in the graph.

Definition at line 79 of file PrUnorganized\_OP.h.

### 29.391.3.4 double PrUnorganized\_OP::getRadius ( ) [inline]

get the specified radius for defining neighbours by distance

Definition at line 110 of file PrUnorganized\_OP.h.

### 29.391.3.5 virtual double PrUnorganized\_OP::getU ( int i ) [inline],[virtual]

return the u parameter value of the i-th node.

Definition at line 94 of file PrUnorganized\_OP.h.

29.391.3.6 `virtual double PrUnorganized_OP::getV ( int i ) [inline],[virtual]`

return the *v* parameter value of the *i*-th node.

Definition at line 97 of file PrUnorganized\_OP.h.

29.391.3.7 `virtual bool PrUnorganized_OP::isBoundary ( int i ) [inline],[virtual]`

is the *i*-th node a boundary node or interior node?

Definition at line 91 of file PrUnorganized\_OP.h.

29.391.3.8 `void PrUnorganized_OP::print ( std::ostream & os )`

Write contents to stream.

29.391.3.9 `void PrUnorganized_OP::printRawData ( std::ostream & os )`

print raw data (no parameterization)

29.391.3.10 `void PrUnorganized_OP::scan ( std::istream & is )`

read contents from stream

29.391.3.11 `void PrUnorganized_OP::scanRawData ( std::istream & is, int num_cells, double noise )`

scan raw data (no parameterization)

29.391.3.12 `virtual void PrUnorganized_OP::set3dNode ( int i, const Vector3D & p ) [inline],[virtual]`

set the coordinates of the *i*-th node in the graph if the nodes are three-dimensional.

Implements [PrOrganizedPoints](#).

Definition at line 84 of file PrUnorganized\_OP.h.

29.391.3.13 `void PrUnorganized_OP::setKNearest ( int knearest ) [inline]`

specify a number for defining neighbourhoods by a fixed number of neighbours.

Definition at line 122 of file PrUnorganized\_OP.h.

29.391.3.14 `void PrUnorganized_OP::setRadius ( double radius ) [inline]`

specify the radius for defining neighbourhood by distance

Definition at line 119 of file PrUnorganized\_OP.h.

29.391.3.15 `virtual void PrUnorganized_OP::setU ( int i, double u ) [inline],[virtual]`

reset the u parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 100 of file PrUnorganized\_OP.h.

29.391.3.16 `virtual void PrUnorganized_OP::setV ( int i, double v ) [inline],[virtual]`

reset the v parameter value of the i-th node.

Implements [PrOrganizedPoints](#).

Definition at line 103 of file PrUnorganized\_OP.h.

29.391.3.17 `void PrUnorganized_OP::useK ( ) [inline]`

Use a fixed number of neighbours to define the neighbourhood of a point.

Definition at line 125 of file PrUnorganized\_OP.h.

29.391.3.18 `void PrUnorganized_OP::useRadius ( ) [inline]`

Use an euclidean distance to define the neighbourhood of a point.

Definition at line 127 of file PrUnorganized\_OP.h.

### 29.393.1 Detailed Description

This class performs intersection between two points.

Definition at line 52 of file PtPtIntersector.h.

### 29.393.2 Constructor & Destructor Documentation

29.393.2.1 `Go::PtPtIntersector::PtPtIntersector` (`shared_ptr< ParamGeomInt > point1`, `shared_ptr< ParamGeomInt > point2`, `shared_ptr< GeoTol > epsge`, `Intersector * prev = 0`, `int eliminated_parameter = -1`, `double eliminated_value = 0` )

Constructor. The last two variables are relevant only if the parent has one more parameter than the `Intersector` to be constructed.

## Parameters

<i>point1</i>	of type <a href="#">ParamPointInt</a> .
<i>point2</i>	of type <a href="#">ParamPointInt</a> .
<i>epsge</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).
<i>eliminated_parameter</i>	the index (0) of the parameter that was removed from the parent <i>prev</i> .
<i>eliminated_value</i>	the value of the parameter that was removed from the parent <i>prev</i> .

29.393.2.2 `Go::PtPtIntersector::PtPtIntersector ( shared_ptr< ParamGeomInt > point1, shared_ptr< ParamGeomInt > point2, double epsge, Intersector * prev = 0, int eliminated_parameter = -1, double eliminated_value = 0 )`

Constructor. The last two variables are relevant only if the parent has one more parameter than the [Intersector](#) to be constructed.

## Parameters

<i>point1</i>	of type <a href="#">ParamPointInt</a> .
<i>point2</i>	of type <a href="#">ParamPointInt</a> .
<i>epsge</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).
<i>eliminated_parameter</i>	the index (0) of the parameter that was removed from the parent <i>prev</i> .
<i>eliminated_value</i>	the value of the parameter that was removed from the parent <i>prev</i> .

29.393.2.3 `virtual Go::PtPtIntersector::~~PtPtIntersector ( ) [virtual]`

Destructor.

## 29.393.3 Member Function Documentation

29.393.3.1 `virtual int Go::PtPtIntersector::checkCoincidence ( ) [protected],[virtual]`

Implements [Go::Intersector2Obj](#).

## Additional Inherited Members

### 29.394.1 Detailed Description

Based on `gvGenericTriMesh`, designed to store data for GL visualizing.

Definition at line 52 of file `QuadMesh.h`.

### 29.394.2 Constructor & Destructor Documentation

**29.394.2.1** `Go::QuadMesh::QuadMesh ( int num_vert = 0, int num_quads = 0, bool use_normals = true, bool use_texcoords = false ) [inline]`

Constructor. Give mesh size. Set whether or not normals and texture coordinates should be computed

Definition at line 57 of file `QuadMesh.h`.

### 29.394.3 Member Function Documentation

**29.394.3.1** `virtual int Go::QuadMesh::atBoundary ( int idx ) [inline],[virtual]`

Check if a given node lies at the boundary.

Implements [Go::GeneralMesh](#).

Definition at line 106 of file `QuadMesh.h`.

**29.394.3.2** `double* Go::QuadMesh::normalArray ( ) [inline]`

Normal information.

Definition at line 98 of file `QuadMesh.h`.

29.394.3.3 `int Go::QuadMesh::numQuads ( ) [inline]`

The total number of quads.

Definition at line 75 of file QuadMesh.h.

29.394.3.4 `virtual int Go::QuadMesh::numTriangles ( ) [inline],[virtual]`

The total number of triangles. Not used in this context.

Reimplemented from [Go::GeneralMesh](#).

Definition at line 79 of file QuadMesh.h.

29.394.3.5 `virtual int Go::QuadMesh::numVertices ( ) [inline],[virtual]`

Number of nodes in mesh.

Implements [Go::GeneralMesh](#).

Definition at line 82 of file QuadMesh.h.

29.394.3.6 `virtual double* Go::QuadMesh::paramArray ( ) [inline],[virtual]`

Fetch parameter values corresponding to the nodes.

Implements [Go::GeneralMesh](#).

Definition at line 105 of file QuadMesh.h.

29.394.3.7 `unsigned int* Go::QuadMesh::quadIndexArray ( ) [inline]`

Indices to quads.

Definition at line 102 of file QuadMesh.h.

29.394.3.8 `void Go::QuadMesh::resize ( int num_vert, int num_quads ) [inline]`

Change mesh size.

Definition at line 86 of file QuadMesh.h.

29.394.3.9 `double* Go::QuadMesh::texcoordArray ( ) [inline]`

Texture coordinate information.

Definition at line 100 of file QuadMesh.h.

**29.394.3.10** `virtual unsigned int* Go::QuadMesh::triangleIndexArray ( ) [inline],[virtual]`

Indices to triangle. Not used in this context.

Implements [Go::GeneralMesh](#).

Definition at line 104 of file QuadMesh.h.

**29.394.3.11** `bool Go::QuadMesh::useNormals ( ) [inline]`

Check if normals will be computed.

Definition at line 67 of file QuadMesh.h.

**29.394.3.12** `bool Go::QuadMesh::useTexCoords ( ) [inline]`

Check if texture coordinates will be computed.

Definition at line 71 of file QuadMesh.h.

**29.394.3.13** `virtual double* Go::QuadMesh::vertexArray ( ) [inline],[virtual]`

Fetch all nodes.

Implements [Go::GeneralMesh](#).

Definition at line 96 of file QuadMesh.h.

### 29.400.1 Detailed Description

Class representing rational numbers

Definition at line 53 of file Rational.h.

### 29.400.2 Constructor & Destructor Documentation

#### 29.400.2.1 [Go::Rational::Rational](#) ( ) [inline]

Construct a rational number whose value is 0.

Definition at line 58 of file Rational.h.

#### 29.400.2.2 [Go::Rational::Rational](#) ( int p ) [inline]

Construct a rational number whose value is 'p' (integer)

Definition at line 61 of file Rational.h.

**29.400.2.3** `Go::Rational::Rational ( int p, int q ) [inline]`

Construct a rational number whose value is 'p/q' (fraction)

Definition at line 64 of file Rational.h.

### 29.400.3 Member Function Documentation

**29.400.3.1** `bool Go::Rational::operator!=( const Rational r ) [inline]`

Test this rational number for difference with another rational number.

Definition at line 114 of file Rational.h.

**29.400.3.2** `Rational& Go::Rational::operator*=( const Rational & other ) [inline]`

Multiply this rational number with a different rational number.

Definition at line 84 of file Rational.h.

**29.400.3.3** `Rational& Go::Rational::operator+=( const Rational & other ) [inline]`

Add a different rational number to this rational number.

Definition at line 67 of file Rational.h.

**29.400.3.4** `Rational Go::Rational::operator-( ) const [inline]`

Return the additive inverse of this rational number.

Definition at line 102 of file Rational.h.

**29.400.3.5** `Rational& Go::Rational::operator-=( const Rational & other ) [inline]`

Subtract a different rational number from this rational number.

Definition at line 76 of file Rational.h.

**29.400.3.6** `Rational& Go::Rational::operator/=( const Rational & other ) [inline]`

Divide this rational number by a different rational number.

Definition at line 93 of file Rational.h.

29.400.3.7 `bool Go::Rational::operator==( const Rational r ) [inline]`

Test this rational number for equality with another rational number.

Definition at line 108 of file Rational.h.

29.400.3.8 `void Go::Rational::simplify( ) [inline]`

Simplify the internal fractional expression of this rational number.

Definition at line 126 of file Rational.h.

29.400.3.9 `void Go::Rational::write( std::ostream & os ) const [inline]`

Write this rational number to a stream.

Definition at line 120 of file Rational.h.

The documentation for this class was generated from the following file:

### 29.403.1 Detailed Description

[RectangularSurfaceTesselator](#): create a mesh for a boundary trimmed parametric surface. Visualization purposes.

Definition at line 56 of file `RectangularSurfaceTesselator.h`.

## 29.403.2 Constructor & Destructor Documentation

29.403.2.1 `Go::RectangularSurfaceTesselator::RectangularSurfaceTesselator ( const ParamSurface & surf, int ures = 20, int vres = 20, bool iso = false, int uiso = 15, int viso = 15, int isoires = 300 ) [inline]`

Constructor. Surface and mesh size are given. The tesselator can be set to compute also iso parametric curves with a specified mesh size.

Definition at line 61 of file RectangularSurfaceTesselator.h.

29.403.2.2 `virtual Go::RectangularSurfaceTesselator::~~RectangularSurfaceTesselator ( ) [virtual]`

Destructor.

## 29.403.3 Member Function Documentation

29.403.3.1 `void Go::RectangularSurfaceTesselator::changelineNumRes ( int m, int n, int res ) [inline]`

Change the number of iso parametric curves to compute.

Definition at line 133 of file RectangularSurfaceTesselator.h.

29.403.3.2 `void Go::RectangularSurfaceTesselator::changelines ( bool isolines ) [inline]`

Retesselate iso parametric curves.

Definition at line 118 of file RectangularSurfaceTesselator.h.

29.403.3.3 `void Go::RectangularSurfaceTesselator::changeRes ( int m, int n ) [inline]`

Change mesh size.

Definition at line 100 of file RectangularSurfaceTesselator.h.

29.403.3.4 `void Go::RectangularSurfaceTesselator::getIsolineNumRes ( int & m, int & n, int & res ) [inline]`

Fetch the number of iso parametric curves to compute.

Definition at line 141 of file RectangularSurfaceTesselator.h.

29.403.3.5 `void Go::RectangularSurfaceTesselator::getIsolines ( bool & isolines ) [inline]`

Fetch mesh of iso parametric curves.

Definition at line 127 of file RectangularSurfaceTesselator.h.

29.403.3.6 `std::vector<LineStrip>& Go::RectangularSurfaceTesselator::getIsoLineStrips ( ) [inline]`

Fetch tessellation of iso parametric curves.

Definition at line 86 of file RectangularSurfaceTesselator.h.

29.403.3.7 `shared_ptr<RegularMesh> Go::RectangularSurfaceTesselator::getMesh ( ) [inline]`

Fetch the computed mesh.

Definition at line 80 of file RectangularSurfaceTesselator.h.

29.403.3.8 `void Go::RectangularSurfaceTesselator::getRes ( int & m, int & n ) [inline]`

Fetch mesh size.

Definition at line 111 of file RectangularSurfaceTesselator.h.

29.403.3.9 `virtual void Go::RectangularSurfaceTesselator::tesselate ( ) [virtual]`

Perform tessellation.

Implements [Go::Tesselator](#).

The documentation for this class was generated from the following file:

### 29.406.1 Detailed Description

Represents a rectangular parameter domain

Definition at line 54 of file RectDomain.h.

### 29.406.2 Constructor & Destructor Documentation

#### 29.406.2.1 Go::RectDomain::RectDomain ( ) [inline]

Constructs an uninitialized domain.

Definition at line 58 of file RectDomain.h.

#### 29.406.2.2 Go::RectDomain::RectDomain ( const Array< double, 2 > &corner1, const Array< double, 2 > &corner2 )

Constructs and defines a rectangular domain by two of its opposing corners.

##### Parameters

<i>corner1</i>	the first corner
<i>corner2</i>	the opposing corner to 'corner1'

#### 29.406.2.3 virtual Go::RectDomain::~~RectDomain ( ) [virtual]

Virtual destructor, enables safe inheritance.

### 29.406.3 Member Function Documentation

#### 29.406.3.1 void Go::RectDomain::addUnionWith ( const RectDomain & rd )

Expand the [RectDomain](#) just enough to cover the [RectDomain](#) given as argument.

## Parameters

<i>rd</i>	the <a href="#">RectDomain</a> that we want to be covered by 'this' <a href="#">RectDomain</a> .
-----------	--------------------------------------------------------------------------------------------------

29.406.3.2 `virtual void Go::RectDomain::closestInDomain ( const Array< double, 2 > & point, Array< double, 2 > & clo_pt, double tolerance ) const [virtual]`

Find the (u, v) point in the [Domain](#) that is closest (using Euclidean distance in  $R^2$ ) to a given (u, v) point. If the given point is in the domain, then the answer is obviously the same point.

Implements [Go::Domain](#).

29.406.3.3 `virtual void Go::RectDomain::closestOnBoundary ( const Array< double, 2 > & point, Array< double, 2 > & clo_bd_pt, double tolerance ) const [virtual]`

Find the (u, v) point on the boundary of the [Domain](#) that is closest (using Euclidean distance in  $R^2$ ) to a given (u, v) point. If the point is already considered *on* the boundary, then the answer is obviously the same point.

Implements [Go::Domain](#).

29.406.3.4 `double Go::RectDomain::diagLength ( ) [inline]`

Length of diagonal.

Definition at line 138 of file RectDomain.h.

29.406.3.5 `void Go::RectDomain::intersectWith ( const RectDomain & rd )`

Set 'this' [RectDomain](#) to be the intersection of its current extent and that of the argument [RectDomain](#).

## Parameters

<i>rd</i>	the <a href="#">RectDomain</a> that we want to intersect with 'this' one.
-----------	---------------------------------------------------------------------------

29.406.3.6 `virtual bool Go::RectDomain::isInDomain ( const Array< double, 2 > & point, double tolerance ) const [virtual]`

check whether a given parameter pair is located inside the domain

## Parameters

<i>point</i>	the (u,v)-pair that we want to test.
<i>tolerance</i>	the tolerance used (ruling what to do when 'point' is located very near the edge of the domain).

**Returns**

'true' if 'point' is inside the domain, or within 'tolerance' from being inside the domain, 'false' otherwise'.

Implements [Go::Domain](#).

```
29.406.3.7 virtual int Go::RectDomain::isInDomain2 (const Array< double, 2 > & point, double tolerance) const
 [virtual]
```

Query whether a given parameter pair is inside the domain or not.

**Parameters**

<i>point</i>	array containing the parameter pair
<i>tolerance</i>	the tolerance to be used. In order to be considered 'inside', the point must be located inside one of the defining <a href="#">CurveLoop</a> s, as well as being at a distance more than 'tolerance' from any point on that <a href="#">CurveLoop</a> .

**Returns**

'1' if the point is found to be inside the domain, '2' if it is found to be on the boundary '0' otherwise.

Implements [Go::Domain](#).

```
29.406.3.8 virtual bool Go::RectDomain::isOnBoundary (const Array< double, 2 > & point, double tolerance) const
 [virtual]
```

check whether a given parameter pair is located on the domain boundary

**Parameters**

<i>point</i>	the (u,v)-pair that we want to test
<i>tolerance</i>	the tolerance used (how 'far' from the boundary our (u,v) pair can be and still be considered 'on' the boundary.

**Returns**

'true' if the point is considered to be on the boundary (within 'tolerance', 'false' otherwise).

Implements [Go::Domain](#).

```
29.406.3.9 bool Go::RectDomain::isOnCorner (const Array< double, 2 > & point, double tolerance) const
```

Check if a given parameter pair lies on a corner in the domain within the given tolerance

29.406.3.10 **Array<double, 2> Go::RectDomain::lowerLeft ( ) const** [inline]

Get the 'lower left' corner of this [RectDomain](#).

**Returns**

a 2D array containing the 'lower left' corner of this [RectDomain](#)

Definition at line 145 of file RectDomain.h.

29.406.3.11 **double Go::RectDomain::umax ( ) const** [inline]

Get the [RectDomain](#)'s largest value for the first parameter

**Returns**

the [RectDomain](#)'s largest value for the first parameter

Definition at line 127 of file RectDomain.h.

29.406.3.12 **double Go::RectDomain::umin ( ) const** [inline]

Get the [RectDomain](#)'s smallest value for the first parameter

**Returns**

the [RectDomain](#)'s smallest value for the first parameter

Definition at line 123 of file RectDomain.h.

29.406.3.13 **Array<double, 2> Go::RectDomain::upperRight ( ) const** [inline]

Get the 'upper right' corner of this [RectDomain](#)

**Returns**

a 2D array containing the 'upper right' corner of this [RectDomain](#)

Definition at line 149 of file RectDomain.h.

29.406.3.14 **double Go::RectDomain::vmax ( ) const** [inline]

Get the [RectDomain](#)'s largest value for the second parameter

**Returns**

the [RectDomain](#)'s largest value for the second parameter

Definition at line 135 of file RectDomain.h.

29.406.3.15 `double Go::RectDomain::vmin ( ) const [inline]`

Get the [RectDomain](#)'s smallest value for the second parameter

#### Returns

the [RectDomain](#)'s smallest value for the second parameter

Definition at line 131 of file [RectDomain.h](#).

29.406.3.16 `int Go::RectDomain::whichBoundary ( const Array< double, 2 > & point1, const Array< double, 2 > & point2, double tolerance ) const`

Given two parameter pairs, check if they specify a domain boundary return value: -1=no boundary, 0=u<sub>min</sub>, 1=u<sub>max</sub>, 2=v<sub>min</sub>, 3=v<sub>max</sub>

### 29.407.1 Detailed Description

This class represent the simplest of all quadrangulations: a rectangular grid.

Definition at line 50 of file RectGrid.h.

### 29.407.2 Constructor & Destructor Documentation

#### 29.407.2.1 Go::RectGrid::RectGrid ( ) `[inline]`

Constructor that defines an empty grid, which can only be assigned or [read\(\)](#) into.

Definition at line 56 of file RectGrid.h.

#### 29.407.2.2 Go::RectGrid::RectGrid ( int *numu*, int *numv*, int *dim*, double \* *pts* ) `[inline]`

Constructor explicitly specifying a [RectGrid](#)

##### Parameters

<i>numu</i>	number of points along the first grid direction
<i>numv</i>	number of points along the second grid direction
<i>dim</i>	dimension of the points (usually 2 or 3)
<i>pts</i>	pointer to the array where the points are stored. The points should be stored so that the first grid has lowest stride (ie., coefficients are stored (u1v1, u2v1,... unv1, u1v2, u2v2, ...unv2,... unvm)

Definition at line 69 of file RectGrid.h.

#### 29.407.2.3 virtual Go::RectGrid::~~RectGrid ( ) `[virtual]`

virtual destructor assures safe inheritacne

### 29.407.3 Member Function Documentation

#### 29.407.3.1 virtual BoundingBox Go::RectGrid::boundingBox ( ) const `[virtual]`

Return the object's bounding box.

Implements [Go::GeomObject](#).

#### 29.407.3.2 static ClassType Go::RectGrid::classType ( ) `[inline], [static]`

Definition at line 87 of file RectGrid.h.

**29.407.3.3** `virtual GeomObject* Go::RectGrid::clone ( ) const [inline],[virtual]`

Clone the [GeomObject](#) and return a pointer to the clone.

Implements [Go::GeomObject](#).

Definition at line 93 of file RectGrid.h.

**29.407.3.4** `virtual int Go::RectGrid::dimension ( ) const [virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

**29.407.3.5** `virtual ClassType Go::RectGrid::instanceType ( ) const [virtual]`

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

**29.407.3.6** `int Go::RectGrid::numCoefs_u ( ) const [inline]`

Get number of points along the first grid direction

**Returns**

the number of points along the first grid direction

Definition at line 123 of file RectGrid.h.

**29.407.3.7** `int Go::RectGrid::numCoefs_v ( ) const [inline]`

Get number of points along the second grid direction

**Returns**

the number of points along the second grid direction

Definition at line 130 of file RectGrid.h.

**29.407.3.8** `double* Go::RectGrid::rawData ( ) [inline]`

Get a pointer to the start of the array where grid point coordinates are stored.

**Returns**

a pointer to the storage array for grid points.

Definition at line 138 of file RectGrid.h.

29.407.3.9 `const double* Go::RectGrid::rawData ( ) const` `[inline]`

Get a const pointer to the start of the array where grid point coordinates are stored.

#### Returns

a const pointer to the storage array for grid points.

Definition at line 146 of file RectGrid.h.

29.407.3.10 `void Go::RectGrid::read ( std::istream & is )` `[virtual]`

read object from stream

#### Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.407.3.11 `void Go::RectGrid::setGrid ( int numu, int numv, int dim, const double * pts )` `[inline]`

Set grid according to the user-supplied data

#### Parameters

<i>numu</i>	number of points along the first grid direction
<i>numv</i>	number of points along the second grid direction
<i>dim</i>	dimension of the points (usually 2 or 3)
<i>pts</i>	pointer to the array where the points are stored. The points should be stored so that the first grid has lowest stride (ie., coefficients are stored (u1v1, u2v1,... unv1, u1v2, u2v2, ...unv2,... unvm)

Definition at line 112 of file RectGrid.h.

29.407.3.12 `void Go::RectGrid::swapDirections ( )`

Swap grid directions.

29.407.3.13 `void Go::RectGrid::write ( std::ostream & os ) const` `[virtual]`

write object to stream

#### Parameters

<i>os</i>	stream to which object is written
-----------	-----------------------------------

Implements [Go::Streamable](#).

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/geometry/RectGrid.h](#)

## 29.408 Go::RectGridTesselator Class Reference

- `newmat/src/newmatrm.cpp`

## 29.413 Go::LRSplineSurface::Refinement2D Struct Reference

```
#include <LRSplineSurface.h>
```

### Public Member Functions

- void `setVal` (`double val`, `double st`, `double e`, `Direction2D dir`, `int mult`)

### Public Attributes

- `double kval`
- `double start`
- `double end`
- `Direction2D d`
- `int multiplicity`

### 29.413.1 Detailed Description

Definition at line 71 of file `LRSplineSurface.h`.

### 29.413.2 Member Function Documentation

29.413.2.1 `void Go::LRSplineSurface::Refinement2D::setVal ( double val, double st, double e, Direction2D dir, int mult )` [inline]

Definition at line 78 of file `LRSplineSurface.h`.

### 29.413.3 Member Data Documentation

29.413.3.1 `Direction2D Go::LRSplineSurface::Refinement2D::d`

Definition at line 75 of file `LRSplineSurface.h`.

29.413.3.2 **double** Go::LRSplineSurface::Refinement2D::end

Definition at line 74 of file LRSplineSurface.h.

29.413.3.3 **double** Go::LRSplineSurface::Refinement2D::kval

Definition at line 72 of file LRSplineSurface.h.

29.413.3.4 **int** Go::LRSplineSurface::Refinement2D::multiplicity

Definition at line 76 of file LRSplineSurface.h.

29.413.3.5 **double** Go::LRSplineSurface::Refinement2D::start

Definition at line 73 of file LRSplineSurface.h.

The documentation for this struct was generated from the following file:

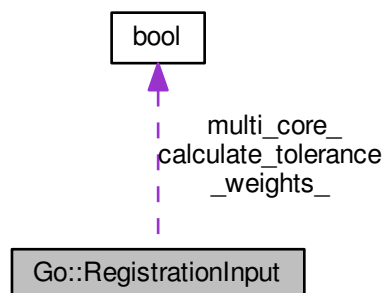

- [Irsplines2D/include/GoTools/Irsplines2D/LRSplineSurface.h](#)

## 29.414 Go::RegistrationInput Struct Reference

Struct for input to registration, either raw, fine or combined.

```
#include <RegistrationUtils.h>
```

Collaboration diagram for Go::RegistrationInput:

## Public Member Functions

- [RegistrationInput](#) ()
- void [setToleranceWeights](#) (double w\_rotation, double w\_translation, double w\_rescaling)  
*Set the tolerance weights used in Newtons method.*

## Public Attributes

- double [area\\_tolerance\\_sq\\_](#)
- int [max\\_newton\\_iterations\\_](#)  
*Maximum number of iterations in newton approach method.*
- double [newton\\_tolerance\\_](#)  
*Upper limit for when weighed sum of squares of changes in Newton's method requires us to break out of the loop.*
- bool [calculate\\_tolerance\\_weights\\_](#)
- double [tolerance\\_weight\\_rotation\\_](#)  
*The weight of the square of the change in the rotation vector, used in the Newtons method.*
- double [tolerance\\_weight\\_translation\\_](#)  
*The weight of the square of the change in the translation vector, used in the Newtons method.*
- double [tolerance\\_weight\\_rescale\\_](#)  
*The weight of the square of the change in the rescaling, used in the Newtons method.*
- int [max\\_solve\\_iterations\\_](#)  
*The maximum number of iterations used when solving the linear system in each iteration in Newtons method.*
- double [solve\\_tolerance\\_](#)  
*The tolerance used when solving the linear system in each iteration in Newtons method.*
- bool [multi\\_core\\_](#)  
*If true, and if OPENMP is included, run the fine registration in multicore.*

### 29.414.1 Detailed Description

Struct for input to registration, either raw, fine or combined.

Definition at line 60 of file RegistrationUtils.h.

### 29.414.2 Constructor & Destructor Documentation

29.414.2.1 `Go::RegistrationInput::RegistrationInput( )` `[inline]`

Definition at line 63 of file RegistrationUtils.h.

### 29.414.3 Member Function Documentation

29.414.3.1 `void Go::RegistrationInput::setToleranceWeights( double w_rotation, double w_translation, double w_rescaling )` `[inline]`

Set the tolerance weights used in Newtons method.

Definition at line 113 of file RegistrationUtils.h.

#### 29.414.4 Member Data Documentation

##### 29.414.4.1 `double Go::RegistrationInput::area_tolerance_sq_`

The lower limit of the square of the sine value of the smallest angle in a triangle, to accept the triangle as good enough for a raw registration

Definition at line 80 of file RegistrationUtils.h.

##### 29.414.4.2 `bool Go::RegistrationInput::calculate_tolerance_weights_`

If true, the result of the first iteration of Newtons method will set the weights for the calculation of the squares of changes used to check if we have reached a satisfactory result and should break out of Newtons method. The weights will be set relatively according to the changes, with 1.0 as the weight for the translation vector

Definition at line 92 of file RegistrationUtils.h.

##### 29.414.4.3 `int Go::RegistrationInput::max_newton_iterations_`

Maximum number of iterations in newton approach method.

Definition at line 83 of file RegistrationUtils.h.

##### 29.414.4.4 `int Go::RegistrationInput::max_solve_iterations_`

The maximum number of iterations used when solving the linear system in each iteration in Newtons method.

Definition at line 104 of file RegistrationUtils.h.

##### 29.414.4.5 `bool Go::RegistrationInput::multi_core_`

If true, and if OPENMP is included, run the fine registration in multicore.

Definition at line 110 of file RegistrationUtils.h.

##### 29.414.4.6 `double Go::RegistrationInput::newton_tolerance_`

Upper limit for when weighed sum of squares of changes in Newton's method requires us to break out of the loop.

Definition at line 86 of file RegistrationUtils.h.

##### 29.414.4.7 `double Go::RegistrationInput::solve_tolerance_`

The tolerance used when solving the linear system in each iteration in Newtons method.

Definition at line 107 of file RegistrationUtils.h.

29.414.4.8 `double Go::RegistrationInput::tolerance_weight_rescale_`

The weight of the square of the change in the rescaling, used in the Newtons method.

Definition at line 101 of file RegistrationUtils.h.

29.414.4.9 `double Go::RegistrationInput::tolerance_weight_rotation_`

The weight of the square of the change in the rotation vector, used in the Newtons method.

Definition at line 95 of file RegistrationUtils.h.

29.414.4.10 `double Go::RegistrationInput::tolerance_weight_translation_`

The weight of the square of the change in the translation vector, used in the Newtons method.

Definition at line 98 of file RegistrationUtils.h.

The documentation for this struct was generated from the following file:

- [gotools-core/include/GoTools/Utils/RegistrationUtils.h](#)

## 29.415 Go::RegistrationResult Struct Reference

Struct for result from registration process, either raw, fine or combined.

```
#include <RegistrationUtils.h>
```

Collaboration diagram for Go::RegistrationResult:

### Public Member Functions

- `bool ok ()`

*Return wether the result of the registration was RegistrationOK.*

## Public Attributes

- [RegistrationReturnType result\\_type\\_](#)  
*The result type of the registration process, either OK or an error code.*
- `std::vector< std::vector< double > >` [rotation\\_matrix\\_](#)  
*The rotation matrix of the registration.*
- [Point translation\\_](#)  
*The translation of the registration (to be performed after rescaling and rotation)*
- [double rescaling\\_](#)  
*The rescaling factor of the registration;.*
- `int` [last\\_newton\\_iteration\\_](#)
- `double` [last\\_change\\_](#)
- `int` [solve\\_result\\_](#)

### 29.415.1 Detailed Description

Struct for result from registration process, either raw, fine or combined.

Definition at line 123 of file RegistrationUtils.h.

### 29.415.2 Member Function Documentation

#### 29.415.2.1 `bool Go::RegistrationResult::ok ( )` `[inline]`

Return wether the result of the registration was RegistrationOK.

Definition at line 154 of file RegistrationUtils.h.

### 29.415.3 Member Data Documentation

#### 29.415.3.1 `double Go::RegistrationResult::last_change_`

The last weighed sum of squares of changes in Newton's method Only used for fine registration

Definition at line 147 of file RegistrationUtils.h.

#### 29.415.3.2 `int Go::RegistrationResult::last_newton_iteration_`

The iteration number (starting at 0) of the last newton iteration, or the maximum number of iterations if the weighed sum of squares of changes never became smaller than the tolerance limit. Only used for fine registration

Definition at line 143 of file RegistrationUtils.h.

#### 29.415.3.3 `double Go::RegistrationResult::rescaling_`

The rescaling factor of the registration;.

Definition at line 137 of file RegistrationUtils.h.

**29.415.3.4 RegistrationReturnType Go::RegistrationResult::result\_type\_**

The result type of the registration process, either OK or an error code.

Definition at line 128 of file RegistrationUtils.h.

**29.415.3.5 std::vector<std::vector<double> > Go::RegistrationResult::rotation\_matrix\_**

The rotation matrix of the registration.

Definition at line 131 of file RegistrationUtils.h.

**29.415.3.6 int Go::RegistrationResult::solve\_result\_**

The return value of the last attempt to solve the linear system in the Newtons method iterations Only used for fine registration

Definition at line 151 of file RegistrationUtils.h.

**29.415.3.7 Point Go::RegistrationResult::translation\_**

The translation of the registration (to be performed after rescaling and rotation)

Definition at line 134 of file RegistrationUtils.h.

The documentation for this struct was generated from the following file:

- [gtools-core/include/GoTools/Utils/RegistrationUtils.h](#)

**29.416 Go::Registrator< T > Class Template Reference**

```
#include <Factory.h>
```

**Public Member Functions**

- [Registrator \(\)](#)

**29.416.1 Detailed Description**

```
template<class T>
class Go::Registrator< T >
```

Work around for compilation problems. On some compilers (ie., VS6), the [Register\(\)](#) function cannot be used directly. To work around this, we wrap it in the constructor of a dummy class, which we call [registrator](#). With other words, in order to register the class 'DerivedClass' (supposedly inheriting from [GeomObject](#)), we type:

```
Registrator<DerivedClass> r
```

```
.
```

Definition at line 174 of file Factory.h.

## 29.416.2 Constructor & Destructor Documentation

### 29.416.2.1 `template<class T> Go::Registrator< T >::Registrator ( ) [inline]`

Definition at line 177 of file `Factory.h`.

The documentation for this class was generated from the following file:

- `gotools-core/include/GoTools/geometry/Factory.h`

## 29.417 Go::RegularizeFace Class Reference

Split one face into a number of 4-sided domains without inner trimming. This class is intended for use in block structuring. One face with possible inner and outer trimming is split according to certain rules to result in a face set with 4 sided faces although faces with less than 4 sides can occur. A side is defined as a piece of the face boundary between two corners or between vertices where there are more than one adjacent face. The trimmed surfaces being output from this class can later be approximated by spline surfaces. The splitting procedure is recursive.

```
#include <RegularizeFace.h>
```

### Public Member Functions

- `RegularizeFace` (`shared_ptr< ftSurface > face`, `double epsge`, `double angtol`, `double tol2`, `bool split_in_↔ cand=false`)  
*Constructor.*
- `RegularizeFace` (`shared_ptr< ftSurface > face`, `double epsge`, `double angtol`, `double tol2`, `double bend`, `bool split_in_cand=false`)

*Fetch result.*
- `std::vector< Point >` `getSeamJointInfo` () `const`  
*Fetch info about removed seams.*
- void `setDivideInT` (`bool divideInT`)  
*Decides whether T-joint splitting should be performed at face level.*
- `std::vector< std::pair< Point, Point > >` `fetchVxPntCorr` ()  
*Fetch info about point correspondance.*

### 29.417.1 Detailed Description

Split one face into a number of 4-sided domains without inner trimming. This class is intended for use in block structuring. One face with possible inner and outer trimming is split according to certain rules to result in a face set with 4 sided faces although faces with less than 4 sides can occur. A side is defined as a piece of the face boundary between two corners or between vertices where there are more than one adjacent face. The trimmed surfaces being output from this class can later be approximated by spline surfaces. The splitting procedure is recursive.

Definition at line 58 of file RegularizeFace.h.

### 29.417.2 Constructor & Destructor Documentation

29.417.2.1 `Go::RegularizeFace::RegularizeFace ( shared_ptr< ftSurface > face, double epsge, double angtol, double tol2, bool split_in_cand = false )`

Constructor.

29.417.2.2 `Go::RegularizeFace::RegularizeFace ( shared_ptr< ftSurface > face, double epsge, double angtol, double tol2, double bend, bool split_in_cand = false )`

Constructor.

29.417.2.3 `Go::RegularizeFace::RegularizeFace ( shared_ptr< ftSurface > face, shared_ptr< SurfaceModel > model, bool split_in_cand = false )`

Constructor.

29.417.2.4 `Go::RegularizeFace::~~RegularizeFace ( )`

Destructor.

### 29.417.3 Member Function Documentation

29.417.3.1 `void Go::RegularizeFace::classifyVertices ( )`

Classify vertices according to significance. Mark vertices that should not trigger splitting

29.417.3.2 `std::vector<std::pair<Point, Point> > Go::RegularizeFace::fetchVxPntCorr ( )` `[inline]`

Fetch info about point corrspondance.

Definition at line 124 of file RegularizeFace.h.

29.417.3.3 `std::vector<shared_ptr<ftSurface>> Go::RegularizeFace::getRegularFaces ( )`

Fetch result.

29.417.3.4 `std::vector<Point> Go::RegularizeFace::getSeamJointInfo ( ) const` `[inline]`

Fetch info about removed seams.

Definition at line 112 of file RegularizeFace.h.

29.417.3.5 `void Go::RegularizeFace::setAxis ( Point & centre, Point & axis )`

Set information about the centre of the current face to the regularization of sub faces

29.417.3.6 `void Go::RegularizeFace::setCandSplit ( std::vector< std::pair< std::pair< Point, int >, std::pair< Point, int >>> cand_split )` `[inline]`

Set info about splitting performed in opposite faces in a body. Used from [RegularizeFaceSet](#).

Definition at line 87 of file RegularizeFace.h.

29.417.3.7 `void Go::RegularizeFace::setDivideInT ( bool divideInT )` `[inline]`

Decides whether T-joint splitting should be performed at face level.

Definition at line 118 of file RegularizeFace.h.

29.417.3.8 `void Go::RegularizeFace::setNonTjointFaces ( std::vector< shared_ptr< ftSurface >> & faces )` `[inline]`

Set information about faces not to be the cause of T-joint splitting.

Definition at line 94 of file RegularizeFace.h.

29.417.3.9 `void Go::RegularizeFace::setSplitMode ( int split_mode )` `[inline]`

Definition at line 99 of file RegularizeFace.h.

29.417.3.10 `void Go::RegularizeFace::unsetAxis ( )`

The documentation for this class was generated from the following file:

- `compositemodel/include/GoTools/compositemodel/RegularizeFace.h`

## 29.418 Go::RegularizeFaceSet Class Reference

```

### 29.418.1 Detailed Description

Split a set of faces into a number of 4-sided domains without inner trimming. This class is intended for use in block structuring. A set of faces with possible inner and outer trimming is split according to certain rules to result in a face set with 4 sided faces although faces with less than 4 sides can occur. A side is defined as a piece of the face boundary between two corners or between vertices where there are more than one adjacent face. The trimmed surfaces being output from this class can later be approximated by spline surfaces.

Definition at line 61 of file RegularizeFaceSet.h.

### 29.418.2 Constructor & Destructor Documentation

29.418.2.1 [Go::RegularizeFaceSet::RegularizeFaceSet](#) ( std::vector< shared\_ptr< [ftSurface](#) > > faces, double epsge, double angtol, bool split\_in\_cand = false )

Constructor.

29.418.2.2 [Go::RegularizeFaceSet::RegularizeFaceSet](#) ( std::vector< shared\_ptr< [ftSurface](#) > > faces, double gap, double neighbour, double kink, double bend, bool split\_in\_cand = false )

29.418.2.3 [Go::RegularizeFaceSet::RegularizeFaceSet](#) ( shared\_ptr< [SurfaceModel](#) > model, bool split\_in\_cand = false )

Constructor.

29.418.2.4 `Go::RegularizeFaceSet::~~RegularizeFaceSet ( )`

Destructor.

### 29.418.3 Member Function Documentation

29.418.3.1 `std::vector<std::pair<Point, Point> > Go::RegularizeFaceSet::fetchVxPntCorr ( ) [inline]`

Fetch info about point correspondance.

Definition at line 93 of file RegularizeFaceSet.h.

29.418.3.2 `std::vector<SurfaceModel*> Go::RegularizeFaceSet::getModifiedAdjacentModels ( ) [inline]`

Fetch info about adjacent surface models that are modified due to changes in the current model

Definition at line 100 of file RegularizeFaceSet.h.

29.418.3.3 `std::vector<shared_ptr<ftSurface> > Go::RegularizeFaceSet::getRegularFaces ( bool reverse_sequence = false )`

Fetch result.

29.418.3.4 `shared_ptr<SurfaceModel> Go::RegularizeFaceSet::getRegularModel ( bool reverse_sequence = false )`

Return the resulting face set as a surface model.

29.418.3.5 `void Go::RegularizeFaceSet::setFaceCorrespondance ( int idx1, int idx2 )`

Set information.

29.418.3.6 `void Go::RegularizeFaceSet::setSplitMode ( int split_mode ) [inline]`

Definition at line 78 of file RegularizeFaceSet.h.

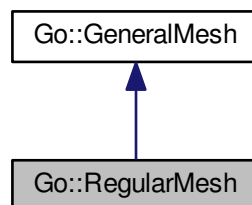

The documentation for this class was generated from the following file:

## Additional Inherited Members

### 29.419.1 Detailed Description

Simple triangulation class, designed to store data for GL visualizing with triangle strips. Vertices are stored in x1 y1 z1 x2 y2 z2... format. Triangles are stored as startindices into the stripe array. Based on earlier work.

Definition at line 68 of file RegularMesh.h.

### 29.419.2 Constructor & Destructor Documentation

**29.419.2.1** `Go::RegularMesh::RegularMesh ( int m = 20, int n = 20, bool use_normals = true, bool use_texcoords = false )`

Constructor. Give mesh size. Set whether or not normals and texture coordinates should be computed 010613: To me it seems that 'm' and 'n' is the dimension of the (rectangular) grid of vertices, i.e., that in total there will be (m-1)\*(n-1)\*2 triangles. Trying to fix things using this assumption... (jon)

**29.419.2.2** `virtual Go::RegularMesh::~~RegularMesh ( ) [virtual]`

Destructor.

### 29.419.3 Member Function Documentation

**29.419.3.1** `virtual RegularMesh* Go::RegularMesh::asRegularMesh ( ) [virtual]`

Casting. Return as regular mesh.

Reimplemented from [Go::GeneralMesh](#).

29.419.3.2 `virtual int Go::RegularMesh::atBoundary ( int idx ) [virtual]`

Check if a given node lies at the boundary.

Implements [Go::GeneralMesh](#).

29.419.3.3 `double* Go::RegularMesh::normalArray ( ) [inline]`

Normal information.

Definition at line 119 of file RegularMesh.h.

29.419.3.4 `int Go::RegularMesh::numStrips ( ) [inline]`

Number of strips.

Definition at line 95 of file RegularMesh.h.

29.419.3.5 `virtual int Go::RegularMesh::numTriangles ( ) [inline],[virtual]`

The total number of triangles.

Reimplemented from [Go::GeneralMesh](#).

Definition at line 104 of file RegularMesh.h.

29.419.3.6 `virtual int Go::RegularMesh::numVertices ( ) [inline],[virtual]`

Number of vertices.

Implements [Go::GeneralMesh](#).

Definition at line 108 of file RegularMesh.h.

29.419.3.7 `virtual double* Go::RegularMesh::paramArray ( ) [inline],[virtual]`

Fetch parameter values corresponding to the nodes.

Implements [Go::GeneralMesh](#).

Definition at line 116 of file RegularMesh.h.

29.419.3.8 `void Go::RegularMesh::resize ( int m, int n )`

Change mesh size.

29.419.3.9 `unsigned int* Go::RegularMesh::stripArray ( ) [inline]`

Definition at line 122 of file RegularMesh.h.

29.419.3.10 `int Go::RegularMesh::stripLength ( ) [inline]`

The number of vertices in a strip (i.e the number of triangles in a strip+ 2).

Definition at line 100 of file RegularMesh.h.

29.419.3.11 `double* Go::RegularMesh::texcoordArray ( ) [inline]`

Texture coordinate information.

Definition at line 121 of file RegularMesh.h.

29.419.3.12 `void Go::RegularMesh::translate ( const std::vector< double > & vert_translation )`

Translate all vertices by `vert_translation`, wrt the geometry.

29.419.3.13 `Triangle* Go::RegularMesh::triangleArray ( ) [inline]`

Definition at line 123 of file RegularMesh.h.

29.419.3.14 `virtual unsigned int* Go::RegularMesh::triangleIndexArray ( ) [inline],[virtual]`

Indices of nodes belonging to each triangle.

Implements [Go::GeneralMesh](#).

Definition at line 124 of file RegularMesh.h.

29.419.3.15 `bool Go::RegularMesh::useNormals ( ) [inline]`

Check if normals will be computed.

Definition at line 87 of file RegularMesh.h.

29.419.3.16 `bool Go::RegularMesh::useTexCoords ( ) [inline]`

Check if texture coordinates will be computed.

Definition at line 91 of file RegularMesh.h.

29.419.3.17 `virtual double* Go::RegularMesh::vertexArray( ) [inline],[virtual]`

Fetch all nodes.

Implements [Go::GeneralMesh](#).

Definition at line 115 of file RegularMesh.h.

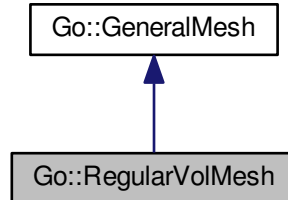

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/tesselator/RegularMesh.h](#)

### 29.420.1 Detailed Description

Simple triangulation class, designed to store data for GL visualizing with triangle strips. Vertices are stored in x1 y1 z1 x2 y2 z2... format. Triangles are stored as startindices into the stripe array. Based on earlier work.

Definition at line 56 of file RegularVolMesh.h.

### 29.420.2 Constructor & Destructor Documentation

#### 29.420.2.1 Go::RegularVolMesh::RegularVolMesh ( int m = 20, bool use\_normals = true, bool use\_texcoords = false )

Constructor. Give mesh size. Set whether or not normals and texture coordinates should be computed 010613: To me it seems that 'm' and 'n' is the dimension of the (rectangular) grid of vertices, i.e., that in total there will be (m-1)\*(n-1)\*2 triangles. Trying to fix things using this assumption... (jon)

29.420.2.2 `virtual Go::RegularVolMesh::~~RegularVolMesh ( ) [virtual]`

Destructor.

### 29.420.3 Member Function Documentation

29.420.3.1 `virtual RegularMesh* Go::RegularVolMesh::asRegularMesh ( ) [virtual]`

Casting. Return as regular mesh.

Reimplemented from [Go::GeneralMesh](#).

29.420.3.2 `virtual int Go::RegularVolMesh::atBoundary ( int idx ) [virtual]`

Check if a given node lies at the boundary.

Implements [Go::GeneralMesh](#).

29.420.3.3 `double* Go::RegularVolMesh::normalArray ( ) [inline]`

Normal information.

Definition at line 107 of file RegularVolMesh.h.

29.420.3.4 `int Go::RegularVolMesh::numStrips ( ) [inline]`

Number of strips.

Definition at line 83 of file RegularVolMesh.h.

29.420.3.5 `virtual int Go::RegularVolMesh::numTriangles ( ) [inline],[virtual]`

The total number of triangles.

Reimplemented from [Go::GeneralMesh](#).

Definition at line 92 of file RegularVolMesh.h.

29.420.3.6 `virtual int Go::RegularVolMesh::numVertices ( ) [inline],[virtual]`

Number of vertices.

Implements [Go::GeneralMesh](#).

Definition at line 96 of file RegularVolMesh.h.

**29.420.3.7** `virtual double* Go::RegularVolMesh::paramArray ( ) [inline],[virtual]`

Fetch parameter values corresponding to the nodes.

Implements [Go::GeneralMesh](#).

Definition at line 104 of file RegularVolMesh.h.

**29.420.3.8** `void Go::RegularVolMesh::resize ( int m )`

Change mesh size.

**29.420.3.9** `unsigned int* Go::RegularVolMesh::stripArray ( ) [inline]`

Definition at line 110 of file RegularVolMesh.h.

**29.420.3.10** `int Go::RegularVolMesh::stripLength ( ) [inline]`

The number of vertices in a strip (i.e the number of triangles in a strip+ 2).

Definition at line 88 of file RegularVolMesh.h.

**29.420.3.11** `double* Go::RegularVolMesh::texcoordArray ( ) [inline]`

Texture coordinate information.

Definition at line 109 of file RegularVolMesh.h.

**29.420.3.12** `Triangle* Go::RegularVolMesh::triangleArray ( ) [inline]`

Definition at line 111 of file RegularVolMesh.h.

**29.420.3.13** `virtual unsigned int* Go::RegularVolMesh::triangleIndexArray ( ) [inline],[virtual]`

Indices of nodes belonging to each triangle.

Implements [Go::GeneralMesh](#).

Definition at line 112 of file RegularVolMesh.h.

**29.420.3.14** `bool Go::RegularVolMesh::useNormals ( ) [inline]`

Check if normals will be computed.

Definition at line 75 of file RegularVolMesh.h.

29.420.3.15 `bool Go::RegularVolMesh::useTexCoords ( ) [inline]`

Check if texture coordinates will be computed.

Definition at line 79 of file RegularVolMesh.h.

29.420.3.16 `virtual double* Go::RegularVolMesh::vertexArray ( ) [inline],[virtual]`

Fetch all nodes.

Implements [Go::GeneralMesh](#).

Definition at line 103 of file RegularVolMesh.h.

- `bool containsBox` (`const RotatedBox &box`, `double toli=0.0`, `double tole=0.0`) `const`

### 29.423.1 Detailed Description

A rotated version of [CompositeBox](#). It works in the same way, except that the boxes are aligned with an arbitrary (given) coordinate system.

Definition at line 57 of file `RotatedBox.h`.

### 29.423.2 Constructor & Destructor Documentation

29.423.2.1 `template<typename RandomAccessIterator > Go::RotatedBox::RotatedBox ( RandomAccessIterator start, int dim, int num_u, int num_v, const Point * axis ) [inline]`

Given an array of `dim`-dimensional points and a coordinate system given by (`axis[0]`, `axis[1]`, `axis[0] x axis[1]`), construct a rotated box containing all points. If in 2D, coordinate system is (`axis[0]`, `Rot(Pi/2)*axis[0]`)

Definition at line 65 of file `RotatedBox.h`.

29.423.2.2 `Go::RotatedBox::RotatedBox ( const Point & low, const Point & high, const Point * axis ) [inline]`

Creates a [RotatedBox](#) with the [Point](#) `low` specifying the lower bound in all dimensions and `high` specifying the upper bound. The inner and edge boxes are equal.

Definition at line 80 of file `RotatedBox.h`.

29.423.2.3 `Go::RotatedBox::~~RotatedBox ( ) [inline]`

Do not inherit from this class – nonvirtual destructor.

Definition at line 90 of file `RotatedBox.h`.

### 29.423.3 Member Function Documentation

**29.423.3.1** `const CompositeBox& Go::RotatedBox::box ( ) const [inline]`

The composite box. WARNING: The coordinates of this box must be interpreted in the coordinate system given by `coordsystem()`.

Definition at line 211 of file `RotatedBox.h`.

**29.423.3.2** `bool Go::RotatedBox::containsBox ( const RotatedBox & box, double toli = 0.0, double tole = 0.0 ) const [inline]`

Returns true if this box contain the box passed as a parameter, up to tolerances. Tolerances may be specified separately for inner and edge boxes.

Definition at line 258 of file `RotatedBox.h`.

**29.423.3.3** `bool Go::RotatedBox::containsPoint ( const Point & pt, double toli = 0.0, double tole = 0.0 ) const [inline]`

Returns true if the point `pt` is inside the box, up to tolerances. Tolerances may be specified separately for inner and edge boxes.

Definition at line 219 of file `RotatedBox.h`.

**29.423.3.4** `int Go::RotatedBox::dimension ( ) const [inline]`

The dimension of the rotated box.

Definition at line 156 of file `RotatedBox.h`.

**29.423.3.5** `const Point& Go::RotatedBox::high ( ) const [inline]`

The upper bound of the bounding box, in coordinate system of rotated box.

Definition at line 170 of file `RotatedBox.h`.

**29.423.3.6** `const Point Go::RotatedBox::high_rot ( ) const [inline]`

The upper bound of the bounding box, in standard coordinate system.

Definition at line 194 of file `RotatedBox.h`.

**29.423.3.7** `const Point& Go::RotatedBox::low ( ) const [inline]`

The lower bound of the bounding box, in coordinate system of rotated box.

Definition at line 163 of file `RotatedBox.h`.

29.423.3.8 `const Point Go::RotatedBox::low_rot ( ) const` [inline]

The lower bound of the bounding box, in standard coordinate system.

Definition at line 177 of file RotatedBox.h.

29.423.3.9 `bool Go::RotatedBox::overlaps ( const RotatedBox & box, double toli = 0.0, double tole = 0.0 ) const` [inline]

Returns true if the two boxes overlap, up to tolerances. Tolerances may be specified separately for inner and edge boxes.

Definition at line 238 of file RotatedBox.h.

29.423.3.10 `template<typename RandomAccessIterator > void Go::RotatedBox::setFromArray ( RandomAccessIterator start, int dim, int num_u, int num_v )` [inline]

Given an array of dim-dimensional points stored as doubles or floats, makes the smallest composite box containing all points in the array. The array must be like a control point grid, with num\_u points in the fastest running direction, and num\_v points in the other direction. For curves, use num\_v = 1.

Definition at line 101 of file RotatedBox.h.

29.423.3.11 `void Go::RotatedBox::setFromPoints ( const Point & low, const Point & high )` [inline]

Makes the bounding box have lower bounds as specified in low and upper bounds as specified in high.

Definition at line 136 of file RotatedBox.h.

## 29.430 Go::ScratchVect< T, N > Class Template Reference

```
#include <ScratchVect.h>
```

### Public Types

- typedef `T * iterator`
- typedef `const T * const_iterator`

### Public Member Functions

- `ScratchVect ()`  
*Create a new, empty ScratchVect.*
- `ScratchVect (size_t size)`  
*Create a new ScratchVect with 'size' (uninitialized) elements.*
- `ScratchVect (size_t size, T elem)`
- `ScratchVect (const std::vector< T > &vec)`
- `template<typename RAlter >`  
`ScratchVect (RAlter beg, RAlter end)`
- `template<int M>`  
`ScratchVect (const ScratchVect< T, M > &orig)`
- `ScratchVect & operator= (const ScratchVect &orig)`  
*Assignment operator.*
- `void resize (size_t new_size)`  
*resize the ScratchVect*
- `template<typename RAlter >`  
`void assign (RAlter beg, RAlter end)`
- `iterator begin ()`  
*Get iterator to beginning of range.*
- `const_iterator begin () const`  
*Get constant iterator to beginning of range.*
- `iterator end ()`  
*Get iterator to one-past-end of range.*
- `const_iterator end () const`  
*Get constant iterator to one-past-end of range.*
- `size_t size () const`  
*Get the number of elements in the ScratchVect.*
- `const T & operator[] (int i) const`  
*Element access operators (const and not-const)*
- `T & operator[] (int i)`
- `void push_back (const T &e)`  
*Add an element to the back of the range.*
- `void clear ()`  
*Clear ScratchVect.*

### 29.430.1 Detailed Description

```
template<typename T, size_t N>
class Go::ScratchVect< T, N >
```

A template Vector class that behaves much like the `std::vector` template, but stores its elements on the stack rather than on the heap as long as the total size stays less than 'N' (template argument).

Definition at line 56 of file `ScratchVect.h`.

### 29.430.2 Member Typedef Documentation

29.430.2.1 `template<typename T, size_t N> typedef const T* Go::ScratchVect< T, N >::const_iterator`

Definition at line 66 of file `ScratchVect.h`.

29.430.2.2 `template<typename T, size_t N> typedef T* Go::ScratchVect< T, N >::iterator`

Definition at line 65 of file `ScratchVect.h`.

### 29.430.3 Constructor & Destructor Documentation

29.430.3.1 `template<typename T, size_t N> Go::ScratchVect< T, N >::ScratchVect ( ) [inline]`

Create a new, empty [ScratchVect](#).

Definition at line 69 of file `ScratchVect.h`.

29.430.3.2 `template<typename T, size_t N> Go::ScratchVect< T, N >::ScratchVect ( size_t size ) [inline]`

Create a new [ScratchVect](#) with 'size' (uninitialized) elements.

Definition at line 75 of file `ScratchVect.h`.

29.430.3.3 `template<typename T, size_t N> Go::ScratchVect< T, N >::ScratchVect ( size_t size, T elem ) [inline]`

Create a new [ScratchVect](#) with 'size' elements initialized to the value 'elem'.

Definition at line 88 of file `ScratchVect.h`.

29.430.3.4 `template<typename T, size_t N> Go::ScratchVect< T, N >::ScratchVect ( const std::vector< T > & vec ) [inline]`

Set the contents of this [ScratchVect](#) to be equal to that of the STL vector 'vec'.

Definition at line 104 of file `ScratchVect.h`.

29.430.3.5 `template<typename T, size_t N> template<typename RAlter > Go::ScratchVect< T, N >::ScratchVect ( RAlter beg, RAlter end ) [inline]`

Set the contents of this [ScratchVect](#) to be equal to the contents of the range specified by 'beg' and 'end'.

Definition at line 111 of file ScratchVect.h.

29.430.3.6 `template<typename T, size_t N> template<int M> Go::ScratchVect< T, N >::ScratchVect ( const ScratchVect< T, M > & orig ) [inline]`

Set the contents of this ScratchVector to be equal to that of the ScratchVector 'orig'. (A templated copy constructor, if you like).

Definition at line 119 of file ScratchVect.h.

#### 29.430.4 Member Function Documentation

29.430.4.1 `template<typename T, size_t N> template<typename RAlter > void Go::ScratchVect< T, N >::assign ( RAlter beg, RAlter end ) [inline]`

Set the contents of this [ScratchVect](#) to be equal to the contents of the range specified by 'beg' and 'end'.

Definition at line 161 of file ScratchVect.h.

29.430.4.2 `template<typename T, size_t N> iterator Go::ScratchVect< T, N >::begin ( ) [inline]`

Get iterator to beginning of range.

Definition at line 176 of file ScratchVect.h.

29.430.4.3 `template<typename T, size_t N> const_iterator Go::ScratchVect< T, N >::begin ( ) const [inline]`

Get constant iterator to beginning of range.

Definition at line 179 of file ScratchVect.h.

29.430.4.4 `template<typename T, size_t N> void Go::ScratchVect< T, N >::clear ( ) [inline]`

Clear [ScratchVect](#).

Definition at line 217 of file ScratchVect.h.

29.430.4.5 `template<typename T, size_t N> iterator Go::ScratchVect< T, N >::end ( ) [inline]`

Get iterator to one-past-end of range.

Definition at line 182 of file ScratchVect.h.

29.430.4.6 `template<typename T, size_t N> const_iterator Go::ScratchVect< T, N >::end ( ) const [inline]`

Get constant iterator to one-past-end of range.

Definition at line 185 of file ScratchVect.h.

29.430.4.7 `template<typename T, size_t N> ScratchVect& Go::ScratchVect< T, N >::operator= ( const ScratchVect< T, N > & orig ) [inline]`

Assignment operator.

Definition at line 124 of file ScratchVect.h.

29.430.4.8 `template<typename T, size_t N> const T& Go::ScratchVect< T, N >::operator[]( int i ) const [inline]`

Element access operators (const and not-const)

Definition at line 191 of file ScratchVect.h.

29.430.4.9 `template<typename T, size_t N> T& Go::ScratchVect< T, N >::operator[]( int i ) [inline]`

Definition at line 192 of file ScratchVect.h.

29.430.4.10 `template<typename T, size_t N> void Go::ScratchVect< T, N >::push_back ( const T & e ) [inline]`

Add an element to the back of the range.

Definition at line 195 of file ScratchVect.h.

29.430.4.11 `template<typename T, size_t N> void Go::ScratchVect< T, N >::resize ( size_t new_size ) [inline]`

resize the [ScratchVect](#)

Definition at line 130 of file ScratchVect.h.

29.430.4.12 `template<typename T, size_t N> size_t Go::ScratchVect< T, N >::size ( ) const [inline]`

Get the number of elements in the [ScratchVect](#).

Definition at line 188 of file ScratchVect.h.

### 29.434.1 Detailed Description

This class performs intersection between a parametric surface and a parametric curve.

Definition at line 53 of file [SfCvIntersector.h](#).

### 29.434.2 Constructor & Destructor Documentation

29.434.2.1 `Go::SfCvIntersector::SfCvIntersector ( shared_ptr< ParamGeomInt > obj1, shared_ptr< ParamGeomInt > obj2, double epsge, Intersector * prev = 0, int eliminated_parameter = -1, double eliminated_value = 0 )`

Constructor. One of the objects should refer to a surface, the other a curve (this is not checked compile-time, so we rely on the user to obey this rule). The last two variables are relevant only if the parent has one more parameter than the [Intersector](#) to be constructed.

#### Parameters

<i>obj1</i>	either of type <a href="#">ParamSurfaceInt</a> or <a href="#">ParamCurveInt</a> .
<i>obj2</i>	either of type <a href="#">ParamCurveInt</a> or <a href="#">ParamSurfaceInt</a> (not the same type as <i>obj1</i> ).
<i>epsgge</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).
<i>eliminated_parameter</i>	the index of the parameter that was removed from the parent <i>prev</i> .
<i>eliminated_value</i>	the value of the parameter that was removed from the parent <i>prev</i> .

29.434.2.2 `Go::SfCvIntersector::SfCvIntersector ( shared_ptr< ParamGeomInt > obj1, shared_ptr< ParamGeomInt > obj2, shared_ptr< GeoTol > epsge, Intersector * prev = 0, int eliminated_parameter = -1, double eliminated_value = 0 )`

Constructor. One of the objects should refer to a surface, the other a curve (this is not checked compile-time, so we rely on the user to obey this rule). The last two variables are relevant only if the parent has one more parameter than the [Intersector](#) to be constructed.

#### Parameters

<i>obj1</i>	either of type <a href="#">ParamSurfaceInt</a> or <a href="#">ParamCurveInt</a> .
<i>obj2</i>	either of type <a href="#">ParamCurveInt</a> or <a href="#">ParamSurfaceInt</a> (not the same type as <i>obj1</i> ).
<i>epsg</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).
<i>eliminated_parameter</i>	the index of the parameter that was removed from the parent <i>prev</i> .
<i>eliminated_value</i>	the value of the parameter that was removed from the parent <i>prev</i> .

29.434.2.3 `virtual Go::SfCvIntersector::~~SfCvIntersector ( ) [virtual]`

Destructor.

### 29.436.1 Detailed Description

This class performs intersection between a parametric surface and a point

Definition at line 53 of file SfPtIntersector.h.

### 29.436.2 Constructor & Destructor Documentation

**29.436.2.1** `Go::SfPtIntersector::SfPtIntersector ( shared_ptr< ParamGeomInt > obj1, shared_ptr< ParamGeomInt > obj2, shared_ptr< GeoTol > epsge, Intersector * prev = 0, int eliminated_parameter = -1, double eliminated_value = 0 )`

Constructor. One of the objects should refer to a surface, the other a point (this is not checked compile-time, so we rely on the user to obey this rule). The last two variables are relevant only if the parent has one more parameter than the [Intersector](#) to be constructed.

#### Parameters

<i>obj1</i>	either of type <a href="#">ParamSurfaceInt</a> or <a href="#">ParamPointInt</a> .
<i>obj2</i>	either of type <a href="#">ParamPointInt</a> or <a href="#">ParamSurfaceInt</a> (not the same type as <i>obj1</i> ).
<i>epsge</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).
<i>eliminated_parameter</i>	the index of the parameter that was removed from the parent <i>prev</i> .
<i>eliminated_value</i>	the value of the parameter that was removed from the parent <i>prev</i> .

**29.436.2.2** `virtual Go::SfPtIntersector::~~SfPtIntersector ( ) [virtual]`

Destructor.

### 29.436.3 Member Function Documentation

**29.436.3.1** `virtual int Go::SfPtIntersector::checkCoincidence ( ) [protected],[virtual]`

### 29.437.1 Detailed Description

This class finds self-intersections for a parametric surface.

Definition at line 96 of file SfSelfIntersector.h.

### 29.437.2 Constructor & Destructor Documentation

**29.437.2.1** `Go::SfSelfIntersector::SfSelfIntersector ( shared_ptr< ParamSurfaceInt > surf, double epsge, Intersector * prev = NULL )`

Constructor.

#### Parameters

<i>surf</i>	the parametric surface.
<i>epsge</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).

**29.437.2.2** `Go::SfSelfIntersector::SfSelfIntersector ( shared_ptr< ParamSurfaceInt > surf, shared_ptr< GeoTol > epsge, Intersector * prev = NULL )`

Constructor.

## Parameters

<i>surf</i>	the parametric surface.
<i>epsge</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).

29.437.2.3 `virtual Go::SfSelfIntersector::~~SfSelfIntersector ( ) [virtual]`

Destructor.

### 29.437.3 Member Function Documentation

29.437.3.1 `virtual void Go::SfSelfIntersector::addComplexDomain ( RectDomain dom ) [inline],[protected],[virtual]`

Reimplemented from [Go::Intersector](#).

Definition at line 190 of file `SfSelfIntersector.h`.

29.437.3.2 `virtual int Go::SfSelfIntersector::checkCoincidence ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 172 of file `SfSelfIntersector.h`.

29.437.3.3 `virtual bool Go::SfSelfIntersector::complexityReduced ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 167 of file `SfSelfIntersector.h`.

29.437.3.4 `virtual void Go::SfSelfIntersector::compute ( bool compute_at_boundary = true ) [virtual]`

Compute topology of self-intersection.

## Parameters

<i>compute_at_boundary</i>	indicate if we want to compute at the boundary
----------------------------	------------------------------------------------

Reimplemented from [Go::Intersector](#).

29.437.3.5 `bool Go::SfSelfIntersector::computeG1 ( ) [protected]`

29.437.3.6 `virtual int Go::SfSelfIntersector::doSubdivide ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 185 of file SfSelfIntersector.h.

29.437.3.7 `virtual int Go::SfSelfIntersector::getBoundaryIntersections ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 155 of file SfSelfIntersector.h.

29.437.3.8 `int Go::SfSelfIntersector::getNmbComplexDomain ( ) [inline]`

Count the number of complex domains in the object.

#### Returns

The number of complex domains in the object.

Definition at line 134 of file SfSelfIntersector.h.

29.437.3.9 `std::vector<shared_ptr<ParamSurfaceInt>> Go::SfSelfIntersector::getNonSelfintersecting ( ) [inline],[protected]`

Definition at line 150 of file SfSelfIntersector.h.

29.437.3.10 `virtual void Go::SfSelfIntersector::handleComplexity ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 170 of file SfSelfIntersector.h.

29.437.3.11 `virtual bool Go::SfSelfIntersector::isLinear ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 164 of file SfSelfIntersector.h.

29.437.3.12 `virtual bool Go::SfSelfIntersector::isSelfIntersection ( ) [inline],[virtual]`

Verifies that this computation is a self intersection problem.

Reimplemented from [Go::Intersector](#).

Definition at line 138 of file SfSelfIntersector.h.

29.437.3.13 `virtual int Go::SfSelfIntersector::linearCase ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 182 of file SfSelfIntersector.h.

29.437.3.14 `virtual void Go::SfSelfIntersector::microCase ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 175 of file SfSelfIntersector.h.

29.437.3.15 `virtual int Go::SfSelfIntersector::numParams ( ) const [inline],[virtual]`

Get the number of parameter directions for the object.

Returns

the number of parameter directions (i.e. 2)

Implements [Go::Intersector](#).

Definition at line 124 of file SfSelfIntersector.h.

29.437.3.16 `virtual int Go::SfSelfIntersector::performInterception ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 158 of file SfSelfIntersector.h.

29.437.3.17 `virtual void Go::SfSelfIntersector::print_objs ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 153 of file SfSelfIntersector.h.

29.437.3.18 `virtual void Go::SfSelfIntersector::printDebugInfo ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 188 of file SfSelfIntersector.h.

29.437.3.19 `virtual int Go::SfSelfIntersector::repairIntersections ( ) [protected],[virtual]`

Implements [Go::Intersector](#).

29.437.3.20 `void Go::SfSelfIntersector::setMaxRec ( int max_rec ) [inline]`

Set the maximum number of recursion levels.

## Parameters

<code>max_rec</code>	the number of levels
----------------------	----------------------

Definition at line 129 of file SfSelfIntersector.h.

**29.437.3.21** `virtual int Go::SfSelfIntersector::simpleCase ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 161 of file SfSelfIntersector.h.

**29.437.3.22** `virtual int Go::SfSelfIntersector::updateIntersections ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 177 of file SfSelfIntersector.h.

### 29.438.1 Detailed Description

This class performs intersection between two parametric surfaces.

Definition at line 57 of file `SfSfIntersector.h`.

### 29.438.2 Constructor & Destructor Documentation

#### 29.438.2.1 Go::SfSfIntersector::SfSfIntersector ( ) [inline]

Default constructor.

Definition at line 63 of file `SfSfIntersector.h`.

#### 29.438.2.2 Go::SfSfIntersector::SfSfIntersector ( shared\_ptr< ParamGeomInt > obj1, shared\_ptr< ParamGeomInt > obj2, shared\_ptr< GeoTol > epsge, Intersector \* prev = 0 )

Constructor. Both objects should refer to surfaces (this is not checked compile-time, so we rely on the user to obey this rule).

#### Parameters

<i>obj1</i>	of type <code>ParamSurfaceInt</code> .
<i>obj2</i>	of type <code>ParamSurfaceInt</code> .
<i>epsg</i>	the associated tolerance.
<i>prev</i>	the "parent" <code>Intersector</code> (0 if there is no parent).

#### 29.438.2.3 Go::SfSfIntersector::SfSfIntersector ( shared\_ptr< ParamGeomInt > obj1, shared\_ptr< ParamGeomInt > obj2, double epsge, Intersector \* prev = 0 )

Constructor. Both objects should refer to surfaces (this is not checked compile-time, so we rely on the user to obey this rule).

## Parameters

<i>obj1</i>	of type <a href="#">ParamSurfaceInt</a> .
<i>obj2</i>	of type <a href="#">ParamSurfaceInt</a> .
<i>epsge</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).

29.438.2.4 `virtual Go::SfSfIntersector::~~SfSfIntersector ( ) [virtual]`

Destructor.

### 29.438.3 Member Function Documentation

## 29.441 Go::sideConstraint Struct Reference

```
#include <ConstraintDefinitions.h>
```

### Public Attributes

- int [dim\\_](#)  
*Dimension of coefficient (max 3).*
- `std::vector< std::pair< int, double > >` [factor\\_](#)
- `double` [constant\\_term\\_](#) [3]  
*The constant term in the current equation.*

### 29.441.1 Detailed Description

Struct defining linear side constraints between control points in a surface. The elements of `factor_` correspond to a linear combination of control points on the left side of the equation, whilst `constant_term_` denotes the right side of the equation.

Definition at line 54 of file `ConstraintDefinitions.h`.

### 29.441.2 Member Data Documentation

#### 29.441.2.1 `double` `Go::sideConstraint::constant_term_` [3]

The constant term in the current equation.

Definition at line 63 of file `ConstraintDefinitions.h`.

#### 29.441.2.2 `int` `Go::sideConstraint::dim_`

Dimension of coefficient (max 3).

Definition at line 57 of file `ConstraintDefinitions.h`.

#### 29.441.2.3 `std::vector<std::pair<int, double> >` `Go::sideConstraint::factor_`

For each coefficient involved in the constraint, the index of the coefficient is given and the factor corresponding to the coefficient in the equation.

Definition at line 61 of file `ConstraintDefinitions.h`.

The documentation for this struct was generated from the following file:

- `gotools-core/include/GoTools/creators/ConstraintDefinitions.h`

## 29.442 Go::sideConstraintSet Struct Reference

```
#include <ConstraintDefinitions.h>
```

### Public Member Functions

- [sideConstraintSet](#) ()  
*Default constructor.*
- [sideConstraintSet](#) (int *dim*)

### Public Attributes

- int *dim\_*  
*Dimension of coefficient (max 3).*
- `std::vector< std::pair< std::pair< int, int >, double > >` *factor\_*
- `double` *constant\_term\_* [3]

### 29.442.1 Detailed Description

Struct defining linear side constraints between control points in a set of surfaces. The elements of *factor\_* correspond to a linear combination of control points on the left side of the equation, whilst *constant\_term\_* denotes the right side of the equation.

Definition at line 72 of file `ConstraintDefinitions.h`.

### 29.442.2 Constructor & Destructor Documentation

**29.442.2.1** `Go::sideConstraintSet::sideConstraintSet ( )` [*inline*]

Default constructor.

Definition at line 84 of file `ConstraintDefinitions.h`.

**29.442.2.2** `Go::sideConstraintSet::sideConstraintSet ( int dim )` [*inline*]

Constructor.

#### Parameters

<i>dim</i>	dimension of geometric space.
------------	-------------------------------

Definition at line 92 of file `ConstraintDefinitions.h`.

### 29.442.3 Member Data Documentation

### 29.442.3.1 `double Go::sideConstraintSet::constant_term_[3]`

The constant term in the current equation, on the right side of the equation. For  $\text{dim} < 3$  not all elements are used.

Definition at line 82 of file `ConstraintDefinitions.h`.

### 29.442.3.2 `int Go::sideConstraintSet::dim_`

Dimension of coefficient (max 3).

Definition at line 75 of file `ConstraintDefinitions.h`.

### 29.442.3.3 `std::vector<std::pair<std::pair<int,int>, double> > Go::sideConstraintSet::factor_`

For each coefficient involved in the constraint, the index of the surface, the index of the coefficient and the factor corresponding to the coefficient in the equation is given.

Definition at line 79 of file `ConstraintDefinitions.h`.

The documentation for this struct was generated from the following file:

- [gotools-core/include/GoTools/creators/ConstraintDefinitions.h](#)

## 29.443 NEWMAT::SimpleIntArray Class Reference

### 29.446.1 Detailed Description

This class contains information about singularities in an intersection problem

Definition at line 55 of file SingularityInfo.h.

### 29.446.2 Constructor & Destructor Documentation

#### 29.446.2.1 Go::SingularityInfo::SingularityInfo ( )

Default constructor.

#### 29.446.2.2 Go::SingularityInfo::SingularityInfo ( shared\_ptr< SingularityInfo > previous, bool use\_previous = false )

Inheritance constructor

## Parameters

<i>previous</i>	shared pointer to a <a href="#">SingularityInfo</a> object
<i>use_previous</i>	flag indicating if <i>previous</i> comes from a previous intersection problem

29.446.2.3 `Go::SingularityInfo::SingularityInfo ( shared_ptr< SingularityInfo > previous, int missing_dir )`

Inheritance constructor

## Parameters

<i>previous</i>	shared pointer to a <a href="#">SingularityInfo</a> object
<i>missing_dir</i>	if the dimension of the intersection problem has been reduced from previous, the index tells us which parameter direction that was removed. Indexing starts at 0.

## 29.446.3 Member Function Documentation

29.446.3.1 `void Go::SingularityInfo::addIterationCount ( ) [inline]`

Increment the iteration count.

Definition at line 94 of file SingularityInfo.h.

29.446.3.2 `void Go::SingularityInfo::addSimpleCount ( bool simple1, bool simple2 ) [inline]`

Increment the number of times the intersection objects are characterized as simple.

## Parameters

<i>simple1</i>	if <code>true</code> , increment for the first intersection object
<i>simple2</i>	if <code>true</code> , increment for the second intersection object

Definition at line 106 of file SingularityInfo.h.

29.446.3.3 `void Go::SingularityInfo::addSingularPoint ( double * par, int nmb_par )`

Add a singular point

## Parameters

<i>par</i>	parameter array of the singular point
<i>nmb_par</i>	number of parameters in <i>par</i>

29.446.3.4 `void Go::SingularityInfo::cleanUp ( std::vector< double > start, std::vector< double > end, double tol )`

29.446.3.5 `double Go::SingularityInfo::getHighPriSing ( int idx )` `[inline]`

Get the high priority singularity

#### Parameters

<i>idx</i>	index specifying a parameter of the singular point
------------	----------------------------------------------------

#### Returns

the parameter of the singular point in the *idx* direction

Definition at line 171 of file SingularityInfo.h.

29.446.3.6 `std::vector<double> Go::SingularityInfo::getHighPriSing ( )` `[inline]`

Get the high priority singularity

#### Returns

the vector of parameters of the singular point

Definition at line 176 of file SingularityInfo.h.

29.446.3.7 `int Go::SingularityInfo::getNmbPoints ( int nmb_par )` `[inline]`

Get number of singular points

#### Parameters

<i>nmb_par</i>	the number of parameters
----------------	--------------------------

#### Returns

the number of singular points

Definition at line 85 of file SingularityInfo.h.

29.446.3.8 `double Go::SingularityInfo::getParam ( int dir )`

Get a parameter for the last found singularity or closest point

## Parameters

<i>dir</i>	the index of the parameter direction
------------	--------------------------------------

## Returns

the parameter value in the *dir* direction

29.446.3.9 Point Go::SingularityInfo::getPoint ( int *idx*, int *nmb\_par* )

Get a singular point

## Parameters

<i>idx</i>	index to the singular point in question
<i>nmb_par</i>	number of parameters

## Returns

the singular [Point](#)

## 29.446.3.10 SingularityClassification Go::SingularityInfo::hasHighPriSing ( ) [inline]

Get info on high priority singularities

## Returns

the singularity classification

Definition at line 164 of file SingularityInfo.h.

## 29.446.3.11 bool Go::SingularityInfo::hasPoint ( ) [inline]

Check if singular point has been found

## Returns

`true` if a singular point has been found, `false` otherwise

Definition at line 79 of file SingularityInfo.h.

## 29.446.3.12 bool Go::SingularityInfo::iterationDone ( ) [inline]

Check if the iteration is done

## Returns

`true` if the iteration is done, `false` otherwise

Definition at line 132 of file SingularityInfo.h.

29.446.3.13 `bool Go::SingularityInfo::iterationSucceed ( ) [inline]`

Check if the iteration succeeded

#### Returns

`true` if the iteration succeeded, `false` otherwise

Definition at line 137 of file SingularityInfo.h.

29.446.3.14 `int Go::SingularityInfo::nmbSimple1 ( ) [inline]`

Get the number of times the first intersection object has been characterized as simple.

#### Returns

the number of times

Definition at line 143 of file SingularityInfo.h.

29.446.3.15 `int Go::SingularityInfo::nmbSimple2 ( ) [inline]`

Get the number of times the second intersection object has been characterized as simple.

#### Returns

the number of times

Definition at line 149 of file SingularityInfo.h.

29.446.3.16 `void Go::SingularityInfo::setHighPriSing ( double * par, int nmb_par )`

Set a high priority singular point

#### Parameters

<i>par</i>	parameter array of the singular point
<i>nmb_par</i>	number of parameters in <i>par</i>

29.446.3.17 `void Go::SingularityInfo::setHighPriSingType ( SingularityClassification type ) [inline]`

Set the high priority singular point type

#### Parameters

<i>type</i>	the type of the singular point
-------------	--------------------------------

Definition at line 159 of file SingularityInfo.h.

29.446.3.18 void Go::SingularityInfo::setSingularPoint ( double \* *par*, int *nmb\_par* )

Set a singular point

#### Parameters

<i>par</i>	parameter array of the singular point
<i>nmb_par</i>	number of parameters in <i>par</i>

The documentation for this class was generated from the following file:

- [intersections/include/GoTools/intersections/SingularityInfo.h](#)

## 29.447 Go::SingUnion Struct Reference

```
#include <SfSelfIntersector.h>
```

### Public Member Functions

- [SingUnion](#) (double box[], std::vector< int > *idx*)
- [bool isInside](#) (double \**mima*)

### Public Attributes

- [double limit\\_](#) [4]
- [std::vector< int > singbox\\_idx\\_](#)

### 29.447.1 Detailed Description

Definition at line 67 of file SfSelfIntersector.h.

### 29.447.2 Constructor & Destructor Documentation

29.447.2.1 Go::SingUnion::SingUnion ( double *box*[], std::vector< int > *idx* ) [inline]

Definition at line 72 of file SfSelfIntersector.h.

### 29.447.3 Member Function Documentation

29.447.3.1 bool Go::SingUnion::isInside ( double \* *mima* ) [inline]

Definition at line 79 of file SfSelfIntersector.h.

## 29.447.4 Member Data Documentation

### 29.447.4.1 `double` `Go::SingUnion::limit_[4]`

Definition at line 69 of file `SfSelfIntersector.h`.

### 29.447.4.2 `std::vector<int>` `Go::SingUnion::singbox_idx_`

Definition at line 70 of file `SfSelfIntersector.h`.

The documentation for this struct was generated from the following file:

### 29.463.1 Detailed Description

This class is used to generate a spline curve from a given spline space that approximates a set of weighed data points. In addition, user can set other conditions on things like curve smoothness or periodicity. To use this object, you must first instantiate it, then run the '[attach\(\)](#)' function, the '[setOptim\(\)](#)' function, the '[setLeastSquares\(\)](#)' function and finally the '[equationSolve\(\)](#)' function. Optionally, the functions '[setPeriodicity\(\)](#)' and '[setSideConstraints\(\)](#)' can be run before '[equationSolve\(\)](#)', if the corresponding conditions should be specified.

Definition at line 87 of file [SmoothCurve.h](#).

### 29.463.2 Constructor & Destructor Documentation

#### 29.463.2.1 Go::SmoothCurve::SmoothCurve ( int *dim* = 3 )

Constructor. Initialises the object with a given spatial dimension (default is 3).

##### Parameters

<i>dim</i>	dimension of the geometry space.
------------	----------------------------------

#### 29.463.2.2 Go::SmoothCurve::~~SmoothCurve ( )

Destructor.

### 29.463.3 Member Function Documentation

#### 29.463.3.1 int Go::SmoothCurve::attach ( const shared\_ptr< [SplineCurve](#) > & *incurve*, int *coef\_known*[], int *numSideConstraints* = 0 )

Specify the spline space we want to use,.

Initializes data given by an intermediate curve.

## Parameters

<i>incurve</i>	curve defining the initial spline curve.
<i>coef_known</i>	array defining the free coefficients. Size equal to the number of coefficients in <i>incurve</i> . Value 0 = not known, value 1 = known.
<i>numSideConstraints</i>	the number of linear side constraints for the approximation.

## Returns

status value: 0 = OK, negative not OK.

29.463.3.2 void Go::SmoothCurve::equationSolve ( shared\_ptr< SplineCurve > & curve )

Solve equation system, and produce output curve.

## Parameters

<i>curve</i>	the curve resulting from the smoothing process.
--------------	-------------------------------------------------

29.463.3.3 void Go::SmoothCurve::setLeastSquares ( const std::vector< double > & pnts, const std::vector< double > & param\_pnts, const std::vector< double > & pnt\_weights, double weight )

Compute matrices for least squares approximation.

## Parameters

<i>pnts</i>	the input points (for 3D: (x0, y0, z0, x1, y1, z1, ...)) defining the approximation part of the smoothing problem.
<i>param_pnts</i>	the parameters for the input pnts.
<i>pnt_weights</i>	weight attached to each point to be approximated. Should lie in the unit interval. Typically they are all 1.0.
<i>weight</i>	multiplier of all weights in the pnt_weights vector

29.463.3.4 void Go::SmoothCurve::setOptim ( const double weight1, const double weight2, const double weight3 )

Compute the smoothing part of the equation system. The sum of the weights should lie in the unit interval.

## Parameters

<i>weight1</i>	weight for smoothing with respect to the 1st derivative.
<i>weight2</i>	weight for smoothing with respect to the 2nd derivative.
<i>weight3</i>	weight for smoothing with respect to the 3rd derivative.

29.463.3.5 void Go::SmoothCurve::setPeriodicity ( int *cont*, double *weight* )

Set periodicity constraints in one par. dir.

#### Parameters

<i>cont</i>	the wanted continuity across the seam.
<i>weight</i>	weight given to approximative continuity conditions. Should lie inside the unit interval.

29.463.3.6 void Go::SmoothCurve::setSideConstraints ( std::vector< sideConstraint > & *constraints* )

Set linear side constraints (linear equation involving the free coefficients) to the minimization problem. The problem is solved using the method of Lagrange multipliers.

#### Parameters

<i>constraints</i>	the linear side constraints.
--------------------	------------------------------

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/creators/SmoothCurve.h](#)

## 29.464 Go::SmoothCurveSet Class Reference

### 29.464.1 Detailed Description

Smoothing, point interpolation and point approximation applied to a set of curves while maintaining a set of continuity conditions between the curves, exact or approximative.

Definition at line 84 of file SmoothCurveSet.h.

### 29.464.2 Constructor & Destructor Documentation

#### 29.464.2.1 Go::SmoothCurveSet::SmoothCurveSet ( )

Default constructor to the class.

#### 29.464.2.2 Go::SmoothCurveSet::~~SmoothCurveSet ( )

Destructor.

### 29.464.3 Member Function Documentation

#### 29.464.3.1 int Go::SmoothCurveSet::attach ( std::vector< shared\_ptr< SplineCurve > > & incvs, std::vector< int > & seem, std::vector< std::vector< int > > & coef\_known, int numSideConstraints = 0 )

Initializes data given by an intermediate set of curves. For each curve there exists a vector coef\_known (of size equal to the number of coefficients in the curve) Input is array of iterators to first element.

#### 29.464.3.2 int Go::SmoothCurveSet::equationSolve ( std::vector< shared\_ptr< SplineCurve > > & curves )

Solve equation system, and produce output curves.

#### 29.464.3.3 void Go::SmoothCurveSet::setApproxOrig ( double weight )

Add term for approximation of the original curves.

#### 29.464.3.4 int Go::SmoothCurveSet::setApproxSideConstraints ( std::vector< shared\_ptr< sideConstraintSet > > & constraints, double weight )

We may have side constraints which are not suitable for exact equality as spline solution space may not be large enough. We therefore allow using least squares to minimize the error. This applies in particular to constraint involving higher order derivatives. Assuming input is preprocessed (all coefs in constraints are free).

#### 29.464.3.5 int Go::SmoothCurveSet::setCvSetConstraints ( const std::vector< shared\_ptr< cvSetConstraint > > & cv\_set\_constraints, bool appr\_constraints, double appr\_wgt )

Set linear side constraints between the coefs in (possibly different) input cvs.

29.464.3.6 void Go::SmoothCurveSet::setInterpolationConditions ( const std::vector< std::vector< double > > & *pnts*, const std::vector< std::vector< double > > & *param\_pnts*, const std::vector< std::vector< int > > & *der*, bool *appr\_constraints*, double *appr\_wgt*, int \* *jstat* )

We add the interpolation conditions as linear side constraints. Assuming the degrees of freedom are sufficient (i.e. that the input curve provided by the user has enough knots).

29.464.3.7 int Go::SmoothCurveSet::setLeastSquares ( const std::vector< std::vector< double > > & *pnts*, const std::vector< std::vector< double > > & *param\_pnts*, const std::vector< std::vector< double > > & *pnt\_weights*, double *weight* )

Compute matrices for least squares approximation. Each curve is assigned a number of data points with corresponding parameter values and weights

29.464.3.8 int Go::SmoothCurveSet::setOptimize ( double *weight1*, double *weight2*, double *weight3* )

Compute the smoothing part of the equation system.

29.464.3.9 int Go::SmoothCurveSet::setOrthCond ( const std::vector< std::vector< double > > & *pnts*, const std::vector< std::vector< double > > & *param\_pnts*, double *weight* )

The contribution to the equation system from the approximation of normal directions.

29.464.3.10 void Go::SmoothCurveSet::setSideConstraints ( std::vector< shared\_ptr< sideConstraintSet > > & *constraints*, bool *replace\_constraints* )

Add side constraints to the functional (Lagrange multiplier). Assuming input is preprocessed (all coefs in constraints are free). If `replace_constraints==true` the old constraints are removed prior to adding new constraints.

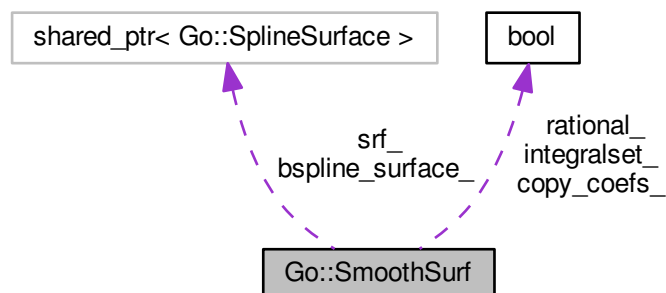

The documentation for this class was generated from the following file:

- [gtools-core/include/GoTools/creators/SmoothCurveSet.h](#)

### 29.465.1 Detailed Description

This class modifies a tensor product B-spline surface with respect to conditions on smoothness, editing constraints and boundary conditions.

Definition at line 74 of file SmoothSurf.h.

### 29.465.2 Constructor & Destructor Documentation

#### 29.465.2.1 Go::SmoothSurf::SmoothSurf ( )

Default constructor. Initializes class variable.

#### 29.465.2.2 Go::SmoothSurf::SmoothSurf ( bool copy\_coefs )

Constructor. Initializes class variable.

Parameters

<code>copy_coefs</code>	true if coefficients on attached surface are not to be modified.
-------------------------	------------------------------------------------------------------

#### 29.465.2.3 virtual Go::SmoothSurf::~SmoothSurf ( ) [virtual]

Destructor.

### 29.465.3 Member Function Documentation

29.465.3.1 `virtual int Go::SmoothSurf::adjustAtSeem ( ) [protected], [virtual]`

Ensure that the expected C1 or C2 continuity at the seem is satisfied. Only applicable if `seem_[0] > 1 || seem_[1] > 1`.

29.465.3.2 `void Go::SmoothSurf::approxOrig ( double weight )`

Compute the contribution to the equation system from the approximation of an original surface, i.e. the contribution of the original coefficients.

#### Parameters

<i>weight</i>	the relative contribution of the original coefs. Should lie in the unit interval.
---------------	-----------------------------------------------------------------------------------

29.465.3.3 `void Go::SmoothSurf::approxOrigNonrational ( double weight ) [protected]`

Compute the contribution to the equation system from the approximation of an original surface, i.e. the contribution of the original coefficients for the non-rational case

#### Parameters

<i>weight</i>	the relative contribution of the original coefs. Should lie in the unit interval.
---------------	-----------------------------------------------------------------------------------

29.465.3.4 `void Go::SmoothSurf::approxOrigRational ( double weight ) [protected]`

Compute the contribution to the equation system from the approximation of an original surface, i.e. the contribution of the original coefficients for the rational case

#### Parameters

<i>weight</i>	the relative contribution of the original coefs. Should lie in the unit interval.
---------------	-----------------------------------------------------------------------------------

29.465.3.5 `void Go::SmoothSurf::attach ( shared_ptr< SplineSurface > & insf, int seem[], int coef_known[], int num_side_constraints = 0, int has_normal_cond = 0 )`

Initializes data given by an intermediate surface.

#### Parameters

<i>insf</i>	the initial surface.
<i>seem</i>	continuity across opposite edges. 0 not specified, 1 = C0, 2 = C1, 3 = C2.
<i>coef_known</i>	whether the coefs are free to be altered. 0: not known, 1: known $\geq$ <code>kpointer_ = 3</code> : the coefficients indexed by <code>ki</code> & <code>coef_known[ki]</code> - <code>kpointer_</code> should be equal.
<i>num_side_constraints</i>	the number of linear side constraints in the system.
<i>has_normal_cond</i>	whether the system must fulfill normal conditions.

29.465.3.6 `int Go::SmoothSurf::equationSolve ( shared_ptr< SplineSurface > & surf )`

Solve equation system, and produce output surface. If failing to solve the routine may throw an exception.

#### Parameters

<i>surf</i>	the output surface.
-------------	---------------------

#### Returns

0 = OK, negative = failed solving system.

29.465.3.7 `virtual void Go::SmoothSurf::getBasis ( const double * sb1, const double * sb2, int kleft1, int kleft2, int ider, double * sbasis )` [protected],[virtual]

Given the value of non-zero B-spline functions, compute the value of the corresponding surface basis function (i.e. the products of the u- and v-basis functions).

#### Parameters

<i>sb1</i>	the basis values in the first parameter direction (u).
<i>sb2</i>	the basis values in the second parameter direction (v).
<i>kleft1</i>	index of the first knot interval in u-dir.
<i>kleft2</i>	index of the first knot interval in v-dir.
<i>ider</i>	the number of derivatives to compute.
<i>sbasis</i>	the computed basis values in sf. size = order_u()*order_v()*(ider + 1)*(ider + 1). The space must be allocated on the outside.

29.465.3.8 `virtual void Go::SmoothSurf::prepareIntegral ( )` [protected],[virtual]

Prepare storage for integrals of inner products of basis functions.

29.465.3.9 `void Go::SmoothSurf::preparePeriodicity ( int seem[] )` [protected]

Set pointers between identical coefficients at a periodic seem. If possible, update fixed coefficients at the seem.

#### Parameters

<i>seem</i>	continuity across the seem. <a href="#">Array</a> size = 2.
-------------	-------------------------------------------------------------

29.465.3.10 `virtual void Go::SmoothSurf::releaseScratch ( )` [protected],[virtual]

Free all memory allocated for class members.

29.465.3.11 void Go::SmoothSurf::setC1AtSeem ( int *parDir*, double *weight* ) [protected]

Set constraints on C1-continuity across a seem and add these to the equation system.

29.465.3.12 void Go::SmoothSurf::setC2AtSeem ( int *parDir*, double *weight* ) [protected]

Set constraints on C2-continuity across a seem and add these to the equation system.

29.465.3.13 void Go::SmoothSurf::setLeastSquares ( const std::vector< double > & *pnts*, const std::vector< double > & *param\_pnts*, const std::vector< double > & *pnt\_weights*, const double *weight* )

Compute matrices for least squares approximation.

#### Parameters

<i>pnts</i>	points on surface to be approximated. Stored as (for 3D): (x0, y0, z0, x1, y1, z1, ...)
<i>param_pnts</i>	the corresponding 2-dimensional parametric points. Stored as: (u0, v0, u1, v1, ...)
<i>pnt_weights</i>	each of the pnts is assigned a weight lying in the unit interval. 1.0 if all pnts are equally important.
<i>weight</i>	the contribution of the approximation of the pnts in the system. weight should lie in the unit interval.

29.465.3.14 int Go::SmoothSurf::setNormalCond ( const std::vector< double > & *pnts*, const std::vector< double > & *param\_pnts*, const std::vector< double > & *pnt\_weights*, const double *weight* )

Compute matrices for approximation of normal directions.

#### Parameters

<i>pnts</i>	normals in sf to be approximated. Stored as (for 3D): (x0, y0, z0, x1, y1, z1, ...)
<i>param_pnts</i>	the corresponding 2-dimensional parametric points. Stored as: (u0, v0, u1, v1, ...)
<i>pnt_weights</i>	each of the pnts is assigned a weight lying in the unit interval. 1.0 if all pnts are equally important.
<i>weight</i>	the contribution of the approximation of the normals in the system. weight should lie in the unit interval.

#### Returns

status value: 0 = OK, 1 = warning (system not prepared for normal conditions).

29.465.3.15 virtual void Go::SmoothSurf::setOptimize ( const double *weight1*, const double *weight2*, const double *weight3* ) [virtual]

Compute the smoothing part of the equation system.

#### Parameters

<i>weight1</i>	contribution weight with respect to the 1st derivative.
<i>weight2</i>	contribution weight with respect to the 2nd derivative.
<i>weight3</i>	contribution weight with respect to the 3rd derivative.

29.465.3.16 void Go::SmoothSurf::setOptimizeNonrational ( const double *weight1*, const double *weight2*, const double *weight3* ) [protected]

Compute the smoothing part of the equation system, non-rational case.

Parameters

<i>weight1</i>	contribution weight with respect to the 1st derivative.
<i>weight2</i>	contribution weight with respect to the 2nd derivative.
<i>weight3</i>	contribution weight with respect to the 3rd derivative.

29.465.3.17 void Go::SmoothSurf::setOptimizeRational ( const double *weight1*, const double *weight2*, const double *weight3* ) [protected]

Compute the smoothing part of the equation system, rational case.

Parameters

<i>weight1</i>	contribution weight with respect to the 1st derivative.
<i>weight2</i>	contribution weight with respect to the 2nd derivative.
<i>weight3</i>	contribution weight with respect to the 3rd derivative.

29.465.3.18 virtual void Go::SmoothSurf::setPeriodicity ( int *pardir*, int *cont*, double *weight1*, double *weight2* ) [virtual]

Set periodicity constraints in one par. dir.

Parameters

<i>pardir</i>	the direction of the periodicity, 1 == udir && 2 == vdir.
<i>cont</i>	the continuity across the seem, 0 = C0, 1 = C1, 2 = C2.
<i>weight1</i>	C1 continuity contribution used in approximation.
<i>weight2</i>	C2 continuity contribution used in approximation.

29.465.3.19 void Go::SmoothSurf::setRationalCnAtSeem ( int *pardir*, int *cn*, double *weight1*, double *weight2* ) [protected]

Set constraints on C1- and C2-continuity across a seem and add these to the equation system when surface is rational.

29.465.3.20 void Go::SmoothSurf::setRelaxParam ( double *omega* )

Set the relaxation parameter for the RILU preconditioner.

29.465.3.21 void Go::SmoothSurf::setSideConstraints ( std::vector< sideConstraint > & constraints )

Add linear side constraints to the system equation.

## Parameters

<i>constraints</i>	the linear side constraints between surface coefficients.
--------------------	-----------------------------------------------------------

#### 29.466.1 Detailed Description

This class modifies a set of tensor product B-spline surfaces with respect to conditions on smoothness, editing constraints and boundary conditions.

Definition at line 70 of file SmoothSurfSet.h.

## 29.466.2 Constructor & Destructor Documentation

### 29.466.2.1 Go::SmoothSurfSet::SmoothSurfSet ( )

Default constructor. Initializes class variable.

### 29.466.2.2 Go::SmoothSurfSet::SmoothSurfSet ( bool *copy\_coefs* )

Constructor. Initializes class variable.

#### Parameters

<i>copy_coefs</i>	whether to copy coefs in input surface or work directly on them.
-------------------	------------------------------------------------------------------

### 29.466.2.3 virtual Go::SmoothSurfSet::~~SmoothSurfSet ( ) [virtual]

Destructor.

## 29.466.3 Member Function Documentation

### 29.466.3.1 void Go::SmoothSurfSet::approxOrig ( double *weight* )

Compute the contribution to the equation system from the approximation of an original surface, i.e. the contribution of the original coefficients.

#### Parameters

<i>weight</i>	the relative contribution of the original coefs. Should lie in the unit interval.
---------------	-----------------------------------------------------------------------------------

### 29.466.3.2 void Go::SmoothSurfSet::attach ( std::vector< shared\_ptr< SplineSurface > > & *insf*, std::vector< std::vector< int > > & *coef\_known*, int *num\_side\_constraints* = 0, int *has\_normal\_cond* = 0 )

Initializes data given by an intermediate surface.

#### Parameters

<i>insf</i>	input set of surfaces to be smoothed.
<i>coef_known</i>	whether the coefs are free to be altered. 0: not known, 1: known $\geq$ <i>kpointer_</i> = 3: the coefficients indexed by <i>ki</i> & <i>coef_known</i> [ <i>ki</i> ] - <i>kpointer_</i> should be equal. Size of <i>coef_known</i> equal to that of <i>insf</i> , size of <i>coef_known</i> [ <i>ki</i> ] equals the number of control points in <i>insf</i> [ <i>ki</i> ].
<i>num_side_constraints</i>	number of side constraints to the minimization problem
<i>has_normal_cond</i>	indicates if normal conditions will be given

29.466.3.3 `int Go::SmoothSurfSet::equationSolve ( std::vector< shared_ptr< SplineSurface > > & surfaces )`

Solve equation system, and produce output surfaces. If failing to solve the routine may throw an exception.

#### Parameters

<i>surfaces</i>	the output surface.
-----------------	---------------------

#### Returns

0 = OK, negative = failed solving system.

29.466.3.4 `virtual void Go::SmoothSurfSet::getBasis ( double * sb1, double * sb2, int kk1, int kk2, int kleft1, int kleft2, int nder, double * sbasis ) [protected], [virtual]`

Given the value of non-zero B-spline functions, compute the value of the corresponding surface basis function (i.e. the products of the u and v basis functions).

#### Parameters

<i>sb1</i>	the basis values in the first parameter direction (u).
<i>sb2</i>	the basis values in the second parameter direction (v).
<i>kk1</i>	order in the first (u) direction.
<i>kk2</i>	order in the second (v) direction.
<i>kleft1</i>	index of the first knot interval in u-dir.
<i>kleft2</i>	index of the first knot interval in v-dir.
<i>nder</i>	the number of derivatives to compute.
<i>sbasis</i>	the computed basis values in sf. size = order_u()*order_v()*(nder + 1)*(nder + 1). The space must be allocated on the outside.

29.466.3.5 `void Go::SmoothSurfSet::setApproxSideConstraints ( std::vector< sideConstraintSet > & constraints, double weight )`

Use least squares to minimize the error given by the constraints.

29.466.3.6 `void Go::SmoothSurfSet::setLeastSquares ( std::vector< std::vector< double > > & pnts, std::vector< std::vector< double > > & param_pnts, std::vector< std::vector< double > > & pnt_weights, double weight )`

Compute matrices for least squares approximation. First index of all vectors corresponds to the indexing of the attached surfaces.

#### Parameters

<i>pnts</i>	points on surfaces to be approximated. Stored as (for 3D): (x0, y0, z0, x1, y1, z1, ...)
<i>param_pnts</i>	the corresponding 2-dimensional parametric points. Stored as: (u0, v0, u1, v1, ...)
<i>pnt_weights</i>	each of the pnts is assigned a weight lying in the unit interval. 1.0 if all pnts are equally important.
<i>weight</i>	the contribution of the approximation of the pnts in the system. weight should lie in the unit interval.

29.466.3.7 `int Go::SmoothSurfSet::setNormalCond ( std::vector< std::vector< double > > & pnts, std::vector< std::vector< double > > & param_pnts, std::vector< std::vector< double > > & pnt_weights, double weight )`

Compute matrices for approximation of normal directions.

#### Parameters

<i>pnts</i>	normals in sf to be approximated. Stored as (for 3D): (x0, y0, z0, x1, y1, z1, ...)
<i>param_pnts</i>	the corresponding 2-dimensional parametric points. Stored as: (u0, v0, u1, v1, ...)
<i>pnt_weights</i>	each of the pnts is assigned a weight lying in the unit interval. 1.0 if all pnts are equally important.
<i>weight</i>	the contribution of the approximation of the normals in the system. weight should lie in the unit interval.

#### Returns

status value: 0 = OK, 1 = warning (system not prepared for normal conditions).

29.466.3.8 `virtual void Go::SmoothSurfSet::setOptimize ( double weight1, double weight2, double weight3 )`  
[virtual]

Compute the smoothing part of the equation system. All weights should be positive, and their sum not exceed 1.0.

#### Parameters

<i>weight1</i>	smoothing weight w.r.t. the 1st derivative.
<i>weight2</i>	smoothing weight w.r.t. the 2nd derivative.
<i>weight3</i>	smoothing weight w.r.t. the 3rd derivative.

29.466.3.9 `void Go::SmoothSurfSet::setSideConstraints ( std::vector< sideConstraintSet > & constraints )`

Add linear side constraints to the system equation.

#### Parameters

<i>constraints</i>	the linear side constraints between surface coefficients.
--------------------	-----------------------------------------------------------

### 29.467.1 Detailed Description

This abstract class provides an interface to a curve that can be evaluated. Given input of curve lying on two surfaces, we create a smooth transition surface by offsetting both surfaces, approximating intersecting curve, continue with projection of intersection curve on the two surfaces. Resulting projected curves and cross tangent curves may then be lofted. We're thus computing four points in [eval\(\)](#).

Definition at line 61 of file SmoothTransition.h.

### 29.467.2 Constructor & Destructor Documentation

**29.467.2.1** `Go::SmoothTransition::SmoothTransition ( shared_ptr< const SplineCurve > &inters_crv, shared_ptr< const SplineCurve > &p_crv1, shared_ptr< const SplineCurve > &p_crv2, shared_ptr< const ParamSurface > surf1, shared_ptr< const ParamSurface > surf2, double offset_dist1, double offset_dist2, double epsgeo )`

Constructor.

#### Parameters

<i>inters_crv</i>	intersection curve between two surfaces
<i>p_crv1</i>	associated parameter curve in first surface
<i>p_crv2</i>	associated parameter curve in second surface
<i>surf1</i>	first surface
<i>surf2</i>	second surface
<i>offset_dist1</i>	offset distance related to first surface
<i>offset_dist2</i>	offset distance related to second surface
<i>epsgeo</i>	approximation tolerance and tolerance used in intersection computations

**29.467.2.2** `virtual Go::SmoothTransition::~~SmoothTransition ( ) [virtual]`

Empty destructor.

### 29.467.3 Member Function Documentation

29.467.3.1 `virtual bool Go::SmoothTransition::approximationOK ( double par, const std::vector< Point > & approxpos, double tol1, double tol2 )` [virtual]

Whether the approximation is within tolerances in input parameter.

#### Parameters

<i>par</i>	parameter in which to evaluate.
<i>approxpos</i>	whether the input points are within tolerance from the evaluated points (as given by <a href="#">eval()</a> ).
<i>tol1</i>	tolerance used to decide approximation accuracy.
<i>tol2</i>	tolerance used to decide approximation accuracy.

#### Returns

whether the approximation is within tolerances in input parameter.

Implements [Go::EvalCurveSet](#).

29.467.3.2 `virtual int Go::SmoothTransition::dim ( )` [virtual]

The geometric dimension of the spline curves.

#### Returns

geometric dimension of the space.

Implements [Go::EvalCurveSet](#).

29.467.3.3 `virtual double Go::SmoothTransition::end ( )` [virtual]

End parameter of domain.

#### Returns

end parameter of the spline space.

Implements [Go::EvalCurveSet](#).

29.467.3.4 `virtual std::vector<Point> Go::SmoothTransition::eval ( double t )` [virtual]

Evaluate the curves.

#### Parameters

<i>t</i>	parameter in which to evaluate.
----------	---------------------------------

**Returns**

the evaluated points for the curve set.

Implements [Go::EvalCurveSet](#).

```
29.467.3.5 virtual void Go::SmoothTransition::eval (double t, int n, std::vector< std::vector< Point > > & der)
 [virtual]
```

Evaluate the curve derivatives.

**Parameters**

<i>t</i>	parameter in which to evaluate.
<i>n</i>	number of derivatives to compute.
<i>der</i>	the evaluated points up to the n'th derivative for the curve set.

Implements [Go::EvalCurveSet](#).

```
29.467.3.6 virtual int Go::SmoothTransition::nmbCvs () [inline],[virtual]
```

The number of curves in the curve set.

**Returns**

the number of curves in the curve set.

Implements [Go::EvalCurveSet](#).

Definition at line 96 of file SmoothTransition.h.

```
29.467.3.7 virtual double Go::SmoothTransition::start () [virtual]
```

Start parameter of domain.

**Returns**

start parameter of the spline space.

Implements [Go::EvalCurveSet](#).

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/creators/SmoothTransition.h](#)

## 29.468 Go::SmoothVolume Class Reference

This class modifies a NURBS volume with respect to smoothness, editing constraints and boundary conditions. Specified coefficients are adjusted to minimize a functional combining the different modification conditions.

```
#include <SmoothVolume.h>
```

### Public Member Functions

- [SmoothVolume](#) ()  
*Default constructor. Initializes class variable.*

### 29.468.1 Detailed Description

This class modifies a NURBS volume with respect to smoothness, editing constraints and boundary conditions. Specified coefficients are adjusted to minimize a functional combining the different modification conditions.

Definition at line 68 of file SmoothVolume.h.

### 29.468.2 Constructor & Destructor Documentation

#### 29.468.2.1 Go::SmoothVolume::SmoothVolume ( )

Default constructor. Initializes class variable.

#### 29.468.2.2 Go::SmoothVolume::SmoothVolume ( bool copy\_coefs )

Constructor. Initializes class variable.

#### Parameters

<i>copy_coefs</i>	true if coefficients on attached volume are not to be modified.
-------------------	-----------------------------------------------------------------

#### 29.468.2.3 virtual Go::SmoothVolume::~~SmoothVolume ( ) [virtual]

### 29.468.3 Member Function Documentation

29.468.3.1 `void Go::SmoothVolume::attach ( shared_ptr< SplineVolume > & in_vol, std::vector< CoefStatus > status )`

Initializes data given by an intermediate volume.

#### Parameters

<i>in_vol</i>	the initial volume.
<i>status</i>	array with the freedom for each coefficient of the volume CoefFree: Not known, CoefKnown: Known, CoefAvoid: Not of interest

29.468.3.2 `int Go::SmoothVolume::equationSolve ( shared_ptr< SplineVolume > & vol )`

Set up and solve equation system, and produce output volume. If failing to solve the routine may throw an exception.

#### Parameters

<i>vol</i>	the output surface.
------------	---------------------

#### Returns

0 = OK, negative = failed solving system.

29.468.3.3 `void Go::SmoothVolume::reset ( )`

Reset all smoothing parameters, but keep the input volume.

29.468.3.4 `void Go::SmoothVolume::setLeastSquares ( std::vector< double > & pnts, std::vector< double > & param_pnts, std::vector< double > & pnt_weights, const double weight )`

Add data for the least squares approximation.

#### Parameters

<i>pnts</i>	points in volume to be approximated. Stored as (for 3D): (x0, y0, z0, x1, y1, z1, ...)
<i>param_pnts</i>	the corresponding 3-dimensional parametric points. Stored as: (u0, v0, w0, u1, v1, w1, ...)
<i>pnt_weights</i>	each of the pnts is assigned a weight lying in the unit interval. 1.0 if all pnts are equally important.
<i>weight</i>	the contribution of the approximation of the pnts in the system. weight should lie in the unit interval.

29.468.3.5 `void Go::SmoothVolume::setOptimize ( const double weight1, const double weight2, const double weight3 )`

Add weights for the smoothing part of the equation system.

## Parameters

<i>weight1</i>	contribution weight with respect to the 1st derivative.
<i>weight2</i>	contribution weight with respect to the 2nd derivative.
<i>weight3</i>	contribution weight with respect to the 3rd derivative.

29.468.3.6 void Go::SmoothVolume::setPeriodicity ( int *parDir*, int *cont*, double *weight1*, double *weight2* )

Add periodicity constraints in one par. dir.

## Parameters

<i>parDir</i>	the direction of the periodicity, 0, 1 or 2
<i>cont</i>	the continuity across the seam, 0 = C0, 1 = C1, 2 = C2.
<i>weight1</i>	C1 continuity contribution used in approximation.
<i>weight2</i>	C2 continuity contribution used in approximation.

Default constructor.

29.471.2.2 virtual Go::SolveCG::~~SolveCG ( ) [virtual]

Destructor.

### 29.471.3 Member Function Documentation

29.471.3.1 void Go::SolveCG::attachMatrix ( double \* *gmat*, int *nn* )

Attach the left side of the equation system to the current object and represent the matrix as a sparse matrix. No test is applied on whether the matrix really is symmetric and positive definite.

#### Parameters

<i>gmat</i>	the system matrix for the linear equations. Size is $nn \times nn$ , stored columnwise.
<i>nn</i>	the number of unknowns in the system.

29.471.3.2 void Go::SolveCG::forwBack ( double \* *r*, double \* *s* ) [protected]

Apply preconditioning matrix, i.e. solve the equation system  $M_*s = r$ , where  $M_*$  stores an LU-factorized matrix.

#### Parameters

<i>r</i>	the input (right side) vector.
<i>s</i>	the output (unknown) vector.

29.471.3.3 int Go::SolveCG::getIndex ( int *ki*, int *kj* ) [protected]

Given an index in the full equation system, get the index in  $A_*$ .

29.471.3.4 template<typename Randomlterator1 , typename Randomlterator2 > void Go::SolveCG::matrixProduct ( Randomlterator1 *sx*, Randomlterator2 *sy* ) [inline], [protected]

Compute the matrix product  $sy = A_* * sx$ .

#### Parameters

<i>sx</i>	the vector to be multiplied by the matrix.
<i>sy</i>	the resulting vector.

Definition at line 130 of file SolveCG.h.

29.471.3.5 virtual void Go::SolveCG::precondRILU ( double *relaxfac* ) [virtual]

Prepare for preconditioning.

## Parameters

<i>relaxfac</i>	relaxation parameter. Range: [0,0, 1.0].
-----------------	------------------------------------------

Reimplemented in [Go::SolveCGCO](#).

29.471.3.6 void Go::SolveCG::printPrecond ( ) [protected]

Print to file ("fM.m") the preconditioning matrix.

29.471.3.7 void Go::SolveCG::setMaxIterations ( int *max\_iterations* ) [inline]

Set the maximal number of iterations to be used by the solver.

## Parameters

<i>max_iterations</i>	the maximal number of iterations.
-----------------------	-----------------------------------

Definition at line 101 of file SolveCG.h.

29.471.3.8 void Go::SolveCG::setTolerance ( double *tolerance* = 1.0e-6 ) [inline]

Set numerical tolerance used by the solver.

## Parameters

<i>tolerance</i>	numerical tolerance.
------------------	----------------------

Definition at line 96 of file SolveCG.h.

29.471.3.9 int Go::SolveCG::solve ( double \* *ex*, double \* *eb*, int *nn* )

Solve the equation system by conjugate gradient method.

## Parameters

<i>ex</i>	the solution vector. The input should be the initial guess. Size is equal to nn.
<i>eb</i>	the right side of the equation. Size is equal to nn.
<i>nn</i>	the number of unknowns in the system.

## Returns

0: success, 1: iterationcount exceeded, < 0: error.

29.471.3.10 `int Go::SolveCG::solveRILU ( double * ex, double * eb, int nn )` [protected]

Solve the equation system by conjugate gradient method using a given RILU (Relaxed Incomplete LU) preconditioner

#### Parameters

<i>ex</i>	the solution vector. The input should be the initial guess. Size is equal to <i>nn</i> .
<i>eb</i>	the right side of the equation. Size is equal to <i>nn</i> .
<i>nn</i>	the number of unknowns in the system.

#### Returns

0: success, 1: iterationcount exceeded, < 0: error.

29.471.3.11 `int Go::SolveCG::solveStd ( double * ex, double * eb, int nn )` [protected]

#### Parameters

<i>ex</i>	the solution vector. The input should be the initial guess. Size is equal to <i>nn</i> .
<i>eb</i>	the right side of the equation. Size is equal to <i>nn</i> .
<i>nn</i>	the number of unknowns in the system.

#### Returns

0: success, 1: iterationcount exceeded, < 0: error.

29.471.3.12 `void Go::SolveCG::transposedMatrixProduct ( double * sx, double * sy )` [protected]

### 29.474.1 Detailed Description

This class represents an intersection curve approximated by two curve on surface instances

Definition at line 52 of file SpaceIntCrv.h.

### 29.474.2 Constructor & Destructor Documentation

29.474.2.1 `Go::SpaceIntCrv::SpaceIntCrv ( shared_ptr< ParamCurve > init_crv, int pardir, std::vector< shared_ptr< CurveOnSurface > > & sfcv1, std::vector< double > start1, std::vector< double > end1, std::vector< shared_ptr< CurveOnSurface > > & sfcv2, std::vector< double > start2, std::vector< double > end2, std::vector< bool > opposite, bool same_orient )`

Constructor

Parameters

<i>init_crv</i>	approximation to true intersection curve
<i>pardir</i>	assumes monotonicity of intersection curve in this parameter direction
<i>sfcv1</i>	set of curves joining into the intersection curve representation related to first surface
<i>start1</i>	startparameter of the curves sfcv1. May restrict the extent of each curve.
<i>end1</i>	endparameter of the curves sfcv1. May restrict the extent of each curve.
<i>sfcv2</i>	set of curves joining into intersection curve representation related to second surface
<i>start2</i>	startparameter of the curves sfcv2. May restrict the extent of each curve.
<i>end2</i>	endparameter of the curves sfcv2. May restrict the extent of each curve.
<i>opposite</i>	pairwise comparisment of orientation from the curves in sfcv1 and sfcv2
<i>same_orient</i>	whether the curves in sfcv1 have the same orientation as the underlying surface

29.474.2.2 `virtual Go::SpaceIntCrv::~SpaceIntCrv ( ) [virtual]`

Destructor.

### 29.474.3 Member Function Documentation

29.474.3.1 `virtual bool Go::SpaceIntCrv::approximationOK ( double par, Point approxpos, double tol1, double tol2 ) const [virtual]`

Whether the approximation is within tolerances in input parameter.

Parameters

<i>par</i>	parameter in which to evaluate.
<i>approxpos</i>	whether the input point are within tolerance from the evaluated points (as given by <a href="#">eval()</a> ).
<i>tol1</i>	tolerance used to decide approximation accuracy.
<i>tol2</i>	tolerance used to decide approximation accuracy.

**Returns**

whether the approximation is within tolerances in input parameter.

Implements [Go::EvalCurve](#).

29.474.3.2 `virtual int Go::SpaceIntCrv::dim ( ) const [virtual]`

The geometric dimension of the spline curves.

Implements [Go::EvalCurve](#).

29.474.3.3 `virtual double Go::SpaceIntCrv::end ( ) const [virtual]`

End parameter of domain.

**Returns**

end parameter of the spline space.

Implements [Go::EvalCurve](#).

29.474.3.4 `virtual Point Go::SpaceIntCrv::eval ( double t ) const [virtual]`

Evaluate the curves.

**Parameters**

<i>t</i>	parameter in which to evaluate.
----------	---------------------------------

**Returns**

the evaluated point for the curve.

Implements [Go::EvalCurve](#).

29.474.3.5 `virtual void Go::SpaceIntCrv::eval ( double t, int n, Point der[] ) const [virtual]`

Evaluate the curve derivatives.

**Parameters**

<i>t</i>	parameter in which to evaluate.
<i>n</i>	number of derivatives to compute.
<i>der</i>	the evaluated points up to the n'th derivative for the curve.

Implements [Go::EvalCurve](#).

29.474.3.6 `virtual double Go::SpaceIntCrv::start ( ) const [virtual]`

Start parameter of domain.

#### Returns

start parameter of the spline space.

Implements [Go::EvalCurve](#).

The documentation for this class was generated from the following file:

### 29.475.1 Detailed Description

Class that represents a sphere. It is a subclass of [ElementarySurface](#), and thus has a parametrization and is non-selfintersecting.

A [Sphere](#) has a natural parametrization in terms of the angles  $u$  and  $v$ :  $\mathbf{p}(u, v) = \mathbf{C} + R \cos v(\cos u) \mathbf{x} + \sin(u) \mathbf{y} + R(\sin v) \mathbf{z}$ , where  $\mathbf{C}$  is a position vector,  $R$  is the radius, and  $\mathbf{x}$ ,  $\mathbf{y}$  and  $\mathbf{z}$  are the (local) axes. The parametrization is bounded by:  $0 \leq u \leq 2\pi$ ,  $-\frac{\pi}{2} < v < \frac{\pi}{2}$ . The dimension is 3.

Definition at line 67 of file Sphere.h.

### 29.475.2 Constructor & Destructor Documentation

#### 29.475.2.1 `Go::Sphere::Sphere( ) [inline]`

Default constructor. Constructs an uninitialized [Sphere](#) which can only be assigned to or read into.

Definition at line 72 of file Sphere.h.

#### 29.475.2.2 `Go::Sphere::Sphere( double radius, Point location, Point z_axis, Point x_axis, bool isSwapped = false )`

Constructor. Input is the radius, the location, the direction of the z-axis and the (possibly approximate) x-axis. The local coordinate axes are normalized even if `z_axis` and/or `x_axis` are not unit vectors.

#### 29.475.2.3 `virtual Go::Sphere::~Sphere( ) [virtual]`

Virtual destructor - ensures safe inheritance.

### 29.475.3 Member Function Documentation

#### 29.475.3.1 `std::vector<CurveLoop> Go::Sphere::allBoundaryLoops( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [virtual]`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

#### Parameters

<code>degenerate_epsilon</code>	edges whose length is smaller than this value are ignored.
---------------------------------	------------------------------------------------------------

#### Returns

a vector containing `CurveLoops`. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

29.475.3.2 virtual **BoundingBox** Go::Sphere::boundingBox ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.475.3.3 static **ClassType** Go::Sphere::classType ( ) [inline],[static]

Definition at line 99 of file Sphere.h.

29.475.3.4 virtual **Sphere\*** Go::Sphere::clone ( ) const [virtual]

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

Returns

pointer to cloned object

Implements [Go::ElementarySurface](#).

29.475.3.5 void Go::Sphere::closestBoundaryPoint ( const **Point** & *pt*, double & *clo\_u*, double & *clo\_v*, **Point** & *clo\_pt*, double & *clo\_dist*, double *epsilon*, const **RectDomain** \* *rd* = NULL, double \* *seed* = 0 ) const [virtual]

Iterates to the closest point to *pt* on the boundary of the surface.

See also

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

29.475.3.6 void Go::Sphere::closestPoint ( const **Point** & *pt*, double & *clo\_u*, double & *clo\_v*, **Point** & *clo\_pt*, double & *clo\_dist*, double *epsilon*, const **RectDomain** \* *domain\_of\_interest* = NULL, double \* *seed* = 0 ) const [virtual]

Iterates to the closest point to *pt* on the surface.

Parameters

<i>pt</i>	the point to find the closest point to
<i>clo_u</i>	u parameter of the closest point
<i>clo_v</i>	v parameter of the closest point
<i>clo_pt</i>	the geometric position of the closest point
<i>clo_dist</i>	the distance between <i>pt</i> and <i>clo_pt</i>
<i>epsilon</i>	parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)
<i>domain_of_interest</i>	pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched.
<b>Generated by Doxygen</b>	
<i>seed</i>	pointer to parameter values where iteration starts.

Reimplemented from [Go::ParamSurface](#).

```
29.475.3.7 std::vector<shared_ptr<ParamCurve>> Go::Sphere::constParamCurves (double parameter, bool
 pardir_is_u) const [virtual]
```

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

#### Parameters

<i>parameter</i>	parameter value for the constant parameter (either u or v)
<i>pardir_is_u</i>	specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one.

#### Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

```
29.475.3.8 virtual SplineSurface* Go::Sphere::createSplineSurface () const [virtual]
```

Create a [SplineSurface](#) representation of the sphere.

Implements [Go::ElementarySurface](#).

```
29.475.3.9 virtual int Go::Sphere::dimension () const [virtual]
```

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

```
29.475.3.10 virtual SplineSurface* Go::Sphere::geometrySurface () const [virtual]
```

A [SplineSurface](#) representation of the sphere.

Implements [Go::ElementarySurface](#).

```
29.475.3.11 void Go::Sphere::getBoundaryInfo (Point & pt1, Point & pt2, double epsilon, SplineCurve *& cv,
 SplineCurve *& crosscv, double knot_tol = 1e-05) const [virtual]
```

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

## Parameters

<i>pt1</i>	the first point on the boundary, given by the user
<i>pt2</i>	the second point on the boundary, given by the user
<i>epsilon</i>	the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.
<i>cv</i>	upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.
<i>crosscv</i>	upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary.
<i>knot_tol</i>	tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.

Implements [Go::ParamSurface](#).

```
29.475.3.12 void Go::Sphere::getCoordinateAxes (Point & x_axis, Point & y_axis, Point & z_axis) const [inline]
```

Local coordinate axes.

Definition at line 194 of file Sphere.h.

```
29.475.3.13 virtual void Go::Sphere::getDegenerateCorners (std::vector< Point > & deg_corners, double tol) const [virtual]
```

Check for paralell and anti paralell partial derivatives in surface corners.

Implements [Go::ParamSurface](#).

```
29.475.3.14 virtual shared_ptr<ElementaryCurve> Go::Sphere::getElementaryParamCurve (ElementaryCurve * space_crv, double tol, const Point * start_par_pt = NULL, const Point * end_par_pt = NULL) const [virtual]
```

Fetch the parameter curve in the domain of the elementary surface corresponding to a given elementary curve in geometry space if this curve has a simpler elementary representation. Otherwise, nothing is returned

Reimplemented from [Go::ElementarySurface](#).

```
29.475.3.15 shared_ptr<Circle> Go::Sphere::getLatitudinalCircle (double vpar) const
```

Get the circle along the latitude for a given v parameter.

## Parameters

<i>vpar</i>	v parameter
-------------	-------------

**Returns**

A circle for the corresponding *v* parameter. If the *v* parameter is bounded, only a segment of a full circle is returned.

29.475.3.16 **Point** Go::Sphere::getLocation ( ) const [inline]

[Sphere](#) centre.

Definition at line 190 of file Sphere.h.

29.475.3.17 **shared\_ptr<Circle>** Go::Sphere::getLongitudinalCircle ( **double** *upar* ) const

Get the circle along a longitude for a given *u* parameter.

**Parameters**

<i>upar</i>	<i>u</i> parameter
-------------	--------------------

**Returns**

A circle for the corresponding *u* parameter. If the *u* parameter is bounded, only a segment of a full circle is returned.

29.475.3.18 **double** Go::Sphere::getRadius ( ) const [inline]

[Sphere](#) radius.

Definition at line 186 of file Sphere.h.

29.475.3.19 **virtual ClassType** Go::Sphere::instanceType ( ) const [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.475.3.20 **virtual bool** Go::Sphere::isAxisRotational ( **Point & centre**, **Point & axis**, **Point & vec**, **double & angle** )  
[virtual]

Check if the surface is axis rotational. Only true if a connection to an axis rotational elementary surface exist The axis and rotational angle is only specified if the surface is actually rotational

Reimplemented from [Go::ParamSurface](#).

29.475.3.21 `bool Go::Sphere::isBounded ( ) const [virtual]`

Query if parametrization is bounded. All four parameter bounds must be finite for this to be true.

#### Returns

*true* if bounded, *false* otherwise

Reimplemented from [Go::ElementarySurface](#).

29.475.3.22 `bool Go::Sphere::isClosed ( bool & closed_dir_u, bool & closed_dir_v ) const [virtual]`

Check if the sphere is closed.

Reimplemented from [Go::ElementarySurface](#).

29.475.3.23 `bool Go::Sphere::isDegenerate ( bool & b, bool & r, bool & t, bool & l, double tolerance ) const [virtual]`

The order of the edge indicators (bottom, right, top, left) matches the `edge_number` of `edgeCurve()`. Query whether any of the four boundary curves are degenerate (zero length) within a certain tolerance. In the below, we refer to 'u' as the first parameter and 'v' as the second.

#### Parameters

<i>b</i>	'true' upon return of function if the boundary ( $v = v_{\min}$ ) is degenerate
<i>r</i>	'true' upon return of function if the boundary ( $v = v_{\max}$ ) is degenerate
<i>t</i>	'true' upon return of function if the boundary ( $u = u_{\min}$ ) is degenerate
<i>l</i>	'true' upon return of function if the boundary ( $u = u_{\max}$ ) is degenerate
<i>tolerance</i>	boundaries are considered degenerate if their length is shorter than this value, given by the user

#### Returns

'true' if at least one boundary curve was found to be degenerate, 'false' otherwise.

Reimplemented from [Go::ParamSurface](#).

29.475.3.24 `double Go::Sphere::nextSegmentVal ( int dir, double par, bool forward, double tol ) const [virtual]`

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0 or 1)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tolerance</i>	tolerance used for determining whether the 'par' is already located on the next segment value

**Returns**

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

29.475.3.25 `void Go::Sphere::normal ( Point & n, double upar, double vpar ) const` [virtual]

Evaluates the surface normal for a given parameter pair

**Parameters**

<i>n</i>	the computed normal will be written to this variable
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

29.475.3.26 `DirectionCone Go::Sphere::normalCone ( ) const` [virtual]

Creates a [DirectionCone](#) covering all normals to this surface.

**Returns**

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

29.475.3.27 `const RectDomain& Go::Sphere::parameterDomain ( ) const` [virtual]

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

**Returns**

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

29.475.3.28 `void Go::Sphere::point ( Point & pt, double upar, double vpar ) const` [virtual]

Evaluates the surface's position for a given parameter pair.

**Parameters**

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

**29.475.3.29** `void Go::Sphere::point ( std::vector< Point > & pts, double upar, double vpar, int derivs, bool u_from_right = true, bool v_from_right = true, double resolution = 1.0e-12 ) const` [virtual]

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

#### Parameters

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives.
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implements [Go::ParamSurface](#).

**29.475.3.30** `virtual void Go::Sphere::read ( std::istream & is )` [virtual]

read object from stream

#### Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

**29.475.3.31** `void Go::Sphere::setCoordinateAxes ( )` [protected]

**29.475.3.32** `virtual void Go::Sphere::setParameterBounds ( double from_upar, double from_vpar, double to_upar, double to_vpar )` [virtual]

Limit the surface by limiting the parameter domain.

Implements [Go::ElementarySurface](#).

29.475.3.33 **Sphere\*** `Go::Sphere::subSurface ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const`

Pick part of sphere limited by parameter domain information.

29.475.3.34 `std::vector<shared_ptr<ParamSurface> > Go::Sphere::subSurfaces ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const`  
[virtual]

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

#### Parameters

<i>from_upar</i>	lower value for the first parameter in the subdomain
<i>from_vpar</i>	lower value for the second parameter in the subdomain
<i>to_upar</i>	upper value for the first parameter in the subdomain
<i>to_vpar</i>	upper value for the second parameter in the subdomain
<i>fuzzy</i>	tolerance used when determining intersection with interior boundaries

#### Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

29.475.3.35 **DirectionCone** `Go::Sphere::tangentCone ( bool pardir_is_u ) const` [virtual]

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

#### Parameters

<i>pardir_is_u</i>	if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used.
--------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

29.475.3.36 `virtual void Go::Sphere::write ( std::ostream & os ) const` [virtual]

write object to stream

## Parameters

<i>os</i>	stream to which object is written
-----------	-----------------------------------

Implements [Go::Streamable](#).

### 29.476.1 Detailed Description

Class representing spherical algebraic intersection objects.

Definition at line 56 of file SphereInt.h.

### 29.476.2 Constructor & Destructor Documentation

#### 29.476.2.1 Go::SphereInt::SphereInt ( )

Constructor. Used when reading from file.

#### 29.476.2.2 Go::SphereInt::SphereInt ( Point center, double radius )

Constructor.

##### Parameters

<i>center</i>	the center point of the sphere.
<i>radius</i>	the radius of the sphere.

#### 29.476.2.3 virtual Go::SphereInt::~~SphereInt ( ) [virtual]

Destructor.

### 29.476.3 Member Function Documentation

#### 29.476.3.1 Point Go::SphereInt::center ( ) const

Get center point of the sphere.

##### Returns

The center point of the sphere.

#### 29.476.3.2 double Go::SphereInt::radius ( ) const

Get the radius of the sphere.

##### Returns

The radius of the sphere.

#### 29.476.3.3 void Go::SphereInt::read ( std::istream & is )

Read a sphere description from file.

**Parameters**

<i>is</i>	the stream containing the sphere description.
-----------	-----------------------------------------------

**29.476.3.4 SplineSurface\* Go::SphereInt::surface ( ) const**

Get a SplineSurface representing the sphere. This can be used to visualize the object.

**Returns**

The spline surface of the sphere.

- static [ClassType](#) [classType](#) ()

### 29.477.1 Detailed Description

Class that represents a solid sphere. It is a subclass of [ElementaryVolume](#), and thus has a parametrization.

A [SphereVolume](#) has a natural parametrization by spherical coordinates in terms the distance  $u$  from the centre, the elevation angle  $v$  and the azimuth angle  $w$ :  $\mathbf{p}(u, v, w) = \mathbf{C} + u \cos w(\cos v) \mathbf{x} + \sin(v) \mathbf{y} + u (\sin w) \mathbf{z}$ , where  $\mathbf{C}$  is a position vector, and  $\mathbf{x}$ ,  $\mathbf{y}$  and  $\mathbf{z}$  are the (local) axes. The parametrization is bounded by:  $0 \leq u \leq R$ ,  $0 \leq v \leq 2\pi$ ,  $-\frac{\pi}{2} < w < \frac{\pi}{2}$ , where  $R$  is the radius. The dimension is 3.

Definition at line 67 of file [SphereVolume.h](#).

### 29.477.2 Constructor & Destructor Documentation

#### 29.477.2.1 [Go::SphereVolume::SphereVolume](#) ( ) [inline]

Default constructor. Constructs an uninitialized [SphereVolume](#) which can only be assigned to or read into.

Definition at line 72 of file [SphereVolume.h](#).

#### 29.477.2.2 [Go::SphereVolume::SphereVolume](#) ( double *radius*, [Point](#) *location*, [Point](#) *z\_axis*, [Point](#) *x\_axis* )

Constructor. Input is the radius, the location, the direction of the z-axis and the (possibly approximate) x-axis.

#### 29.477.2.3 virtual [Go::SphereVolume::~~SphereVolume](#) ( ) [virtual]

Virtual destructor - ensures safe inheritance.

### 29.477.3 Member Function Documentation

#### 29.477.3.1 virtual [BoundingBox](#) [Go::SphereVolume::boundingBox](#) ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.477.3.2 `static ClassType Go::SphereVolume::classType ( ) [inline],[static]`

Definition at line 96 of file SphereVolume.h.

29.477.3.3 `virtual SphereVolume* Go::SphereVolume::clone ( ) const [inline],[virtual]`

make a clone of this volume and return a pointer to it (user is responsible for clearing up memory afterwards).

Returns

pointer to cloned object

Implements [Go::ElementaryVolume](#).

Definition at line 103 of file SphereVolume.h.

29.477.3.4 `void Go::SphereVolume::closestPoint ( const Point & pt, double & clo_u, double & clo_v, double & clo_w, Point & clo_pt, double & clo_dist, double epsilon, double * seed = 0 ) const [virtual]`

Iterates to the closest point to pt on the volume.

Parameters

<i>pt</i>	the point to find the closest point to
<i>clo_u</i>	u parameter of the closest point
<i>clo_v</i>	v parameter of the closest point
<i>clo_w</i>	w parameter of the closest point
<i>clo_pt</i>	the geometric position of the closest point
<i>clo_dist</i>	the distance between pt and clo_pt
<i>epsilon</i>	parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)
<i>seed</i>	pointer to parameter values where iteration starts.

Implements [Go::ParamVolume](#).

29.477.3.5 `virtual int Go::SphereVolume::dimension ( ) const [virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.477.3.6 `SplineVolume* Go::SphereVolume::geometryVolume ( ) const [virtual]`

Make a NURBS representation of the object.

Implements [Go::ElementaryVolume](#).

29.477.3.7 `virtual std::vector<shared_ptr<ParamSurface>> Go::SphereVolume::getAllBoundarySurfaces ( ) const` [virtual]

Fetch all boundary surfaces corresponding to the volume.

Implements [Go::ParamVolume](#).

29.477.3.8 `virtual ClassType Go::SphereVolume::instanceType ( ) const` [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.477.3.9 `double Go::SphereVolume::nextSegmentVal ( int dir, double par, bool forward, double tol ) const` [virtual]

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0, 1 or 2)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value

#### Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamVolume](#).

29.477.3.10 `const Array<double,6> Go::SphereVolume::parameterSpan ( ) const` [virtual]

Return the parameter domain of the volume. This is an array containing the start and end parameter values. The spline's parameter *i* has its start value at the array position (2*i*) and its end parameter value at the array position (2*i*+1)

#### Returns

An array describing the parametric domain of the volume

Implements [Go::ParamVolume](#).

29.477.3.11 `void Go::SphereVolume::point ( Point & pt, double upar, double vpar, double wpar ) const` [virtual]

Evaluates the volume's position for a given parameter triple.

## Parameters

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>wpar</i>	the third parameter

Implements [Go::ParamVolume](#).

```
29.477.3.12 void Go::SphereVolume::point (std::vector< Point > & pts, double upar, double vpar, double wpar, int
 derivs, bool u_from_right = true, bool v_from_right = true, bool w_from_right = true, double resolution =
 1.0e-12) const [virtual]
```

Evaluates the volume's position and a certain number of derivatives for a given parameter triple.

## Parameters

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function. Upon completion of the function, its first entry is the volume's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the volume tangents along the first, second and third parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dudw, dv2, dvdw, dw2), and similar for even higher derivatives.
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>wpar</i>	the third parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>w_from_right</i>	specify whether derivatives along the third parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implements [Go::ParamVolume](#).

```
29.477.3.13 virtual void Go::SphereVolume::read (std::istream & is) [virtual]
```

read object from stream

## Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.477.3.14 `void Go::SphereVolume::reverseParameterDirection ( int pardir ) [virtual]`

Reverses the direction of the basis in input direction.

#### Parameters

<i>pardir</i>	which parameter direction to reverse
---------------	--------------------------------------

Implements [Go::ParamVolume](#).

29.477.3.15 `void Go::SphereVolume::swapParameterDirection ( int pardir1, int pardir2 ) [virtual]`

Swaps two parameter directions

#### Parameters

<i>pardir1</i>	One of the parameter directions (0, 1 or 2) to be swapped
<i>pardir2</i>	The other parameter direction (0, 1 or 2) to be swapped

Implements [Go::ParamVolume](#).

29.477.3.16 `DirectionCone Go::SphereVolume::tangentCone ( int pardir ) const [virtual]`

Creates a [DirectionCone](#) covering all tangents to this volume along a given parameter direction.

#### Parameters

<i>pardir</i>	if 1, the <a href="#">DirectionCone</a> will be defined on basis of the volume's tangents along the first parameter direction. If 2, the second parameter direction will be used. If 3, the third parameter direction will be used.
---------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this volume along the specified parameter direction.

Implements [Go::ParamVolume](#).

29.477.3.17 `virtual void Go::SphereVolume::translate ( const Point & vec ) [virtual]`

Translate.

Implements [Go::ParamVolume](#).

29.477.3.18 `virtual void Go::SphereVolume::write ( std::ostream & os ) const [virtual]`

write object to stream

## Parameters

<i>os</i>	stream to which object is written
-----------	-----------------------------------

Implements [Go::Streamable](#).

### 29.478.1 Detailed Description

Class that represents the "intersection object" of a spline curve of dimension 1.

Definition at line 56 of file [Spline1FunctionInt.h](#).

### 29.478.2 Constructor & Destructor Documentation

**29.478.2.1** [Go::Spline1FunctionInt::Spline1FunctionInt](#) ( shared\_ptr< [ParamCurve](#) > curve ) [*explicit*]

Constructor. Input curve must be of type [SplineCurve](#). This is not checked run-time, so we rely on the user to obey this rule.

## Parameters

<i>curve</i>	the parametric 1-dimensional curve defining the object.
--------------	---------------------------------------------------------

**29.478.2.2** `Go::Spline1FunctionInt::Spline1FunctionInt ( shared_ptr< ParamCurve > curve, ParamFunctionInt * parent ) [explicit]`

Constructor. Input curve must be of type [SplineCurve](#). This is not checked run-time, so we rely on the user to obey this rule.

## Parameters

<i>curve</i>	the parametric 1-dimensional curve defining the object. Can be either a curve or a surface.
<i>parent</i>	the parent object to this object.

**29.478.2.3** `virtual Go::Spline1FunctionInt::~~Spline1FunctionInt ( ) [inline],[virtual]`

Destructor.

Definition at line 75 of file Spline1FunctionInt.h.

**29.478.3 Member Function Documentation**

**29.478.3.1** `virtual std::vector<double> Go::Spline1FunctionInt::getCriticalValsAndKnots ( int pdir ) const [virtual]`

Return the critical parameter values and inner knots for object.

## Parameters

<i>pdir</i>	the parameter direction in question. Indexing starts at 0.
-------------	------------------------------------------------------------

Reimplemented from [Go::Param1FunctionInt](#).

**29.478.3.2** `virtual std::vector<double> Go::Spline1FunctionInt::getInnerKnotVals ( int pdir, bool sort = false ) const [virtual]`

Return the inner knot values in the specified direction.

## Parameters

<i>pdir</i>	the parameter direction in question. Indexing starts at 0.
<i>sort</i>	the returned values may be sorted by the function.

Reimplemented from [Go::Param1FunctionInt](#).

29.478.3.3 `virtual std::vector<double>::iterator Go::Spline1FunctionInt::getMesh ( ) [virtual]`

Return the geometric sample mesh for the spline function.

#### Returns

The geometric sample mesh for the spline function.

Reimplemented from [Go::Param1FunctionInt](#).

29.478.3.4 `virtual int Go::Spline1FunctionInt::getMeshSize ( int dir ) [virtual]`

Return the size of the geometric sample mesh in the specified direction.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
------------	------------------------------------------------------------

Reimplemented from [Go::Param1FunctionInt](#).

29.478.3.5 `virtual bool Go::Spline1FunctionInt::hasCriticalValsOrKnots ( int pardir ) const [virtual]`

Return true if the object has any critical parameter values or inner knots.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Reimplemented from [Go::Param1FunctionInt](#).

29.478.3.6 `virtual bool Go::Spline1FunctionInt::hasInnerKnots ( int pardir ) const [virtual]`

Return true if the object has any inner knots in the specified parameter direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Reimplemented from [Go::Param1FunctionInt](#).

29.478.3.7 `virtual int Go::Spline1FunctionInt::knotIntervalFuzzy ( double & t, double tol ) const [virtual]`

Return the knot interval for which *t* lies inside, moving the value *t* if it lies close to a knot.

## Parameters

<i>t</i>	the parameter value
<i>tol</i>	the parametric tolerance deciding if the input parameter <i>t</i> should be moved.

Reimplemented from [Go::Param1FunctionInt](#).

29.478.3.8 `virtual shared_ptr<Param1FunctionInt> Go::Spline1FunctionInt::makeIntFunction ( shared_ptr<ParamCurve > curve ) [virtual]`

Return an intersection object for the input curve. Input curve must be of type [SplineCurve](#). This is not checked run-time, so we rely on the user to obey this rule. This object is used as the parent for the intersection object.

## Parameters

<i>curve</i>	the parametric curve defining the intersection object.
--------------	--------------------------------------------------------

Reimplemented from [Go::Param1FunctionInt](#).

29.478.3.9 `virtual bool Go::Spline1FunctionInt::monotone ( Point & dir, double tol = 1.0e-15 ) const [virtual]`

Return true if the curve is monotone.

## Parameters

<i>dir</i>	the direction in which the object is monotone. Is not of interest here as the curve has only 1 parameter direction.
------------	---------------------------------------------------------------------------------------------------------------------

## Returns

Whether or not the curve is monotone.

Reimplemented from [Go::Param1FunctionInt](#).

29.478.3.10 `virtual double Go::Spline1FunctionInt::nextSegmentVal ( double par, bool forward ) const [virtual]`

Return the value of the knot next to the input parameter *par*.

## Parameters

<i>par</i>	the parameter value
<i>forward</i>	if true we return the closest knot to the right, otherwise the closest knot to the left.

## Returns

The knot closest to the input parameter.

Reimplemented from [Go::Param1FunctionInt](#).

**29.478.3.11** `virtual double Go::Spline1FunctionInt::paramFromMesh ( int dir, int idx )` [virtual]

Return the corresponding mesh parameter.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>idx</i>	the mesh idx in the specified direction. Indexing starts at 0.

Reimplemented from [Go::Param1FunctionInt](#).

#### 29.479.1 Detailed Description

This class represents the "intersection object" of a spline surface of dimension 1.

Definition at line 53 of file Spline2FunctionInt.h.

#### 29.479.2 Constructor & Destructor Documentation

29.479.2.1 `Go::Spline2FunctionInt::Spline2FunctionInt ( shared_ptr< SplineSurface > surf ) [explicit]`

Constructor.

##### Parameters

<i>surf</i>	the parametric 1-dimensional surface defining the object.
-------------	-----------------------------------------------------------

29.479.2.2 `Go::Spline2FunctionInt::Spline2FunctionInt ( shared_ptr< SplineSurface > surf, Param2FunctionInt * parent ) [explicit]`

Constructor.

##### Parameters

<i>surf</i>	the parametric 1-dimensional surface defining the object.
<i>parent</i>	the parent object to this object.

29.479.2.3 `virtual Go::Spline2FunctionInt::~~Spline2FunctionInt ( ) [inline],[virtual]`

Destructor.

Definition at line 68 of file Spline2FunctionInt.h.

### 29.479.3 Member Function Documentation

29.479.3.1 `shared_ptr<SplineSurface> Go::Spline2FunctionInt::createGradSurface ( ) const`

Return the gradient of the function S as a two-dimensional spline surface: (dS/du, dS/dv).

#### Returns

Pointer to the gradient spline surface

29.479.3.2 `virtual double Go::Spline2FunctionInt::endParam ( int parDir ) const [virtual]`

Return the end parameter in the specified direction.

#### Parameters

<i>parDir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

#### Returns

The end parameter in the specified direction.

Reimplemented from [Go::Param2FunctionInt](#).

29.479.3.3 `virtual void Go::Spline2FunctionInt::getBoundaryObjects ( std::vector< shared_ptr< BoundaryFunctionInt > & bd_objs ) [virtual]`

Return the boundary objects of this object.

#### Parameters

<i>bd_objs</i>	the boundary objects of this object.
----------------	--------------------------------------

Reimplemented from [Go::Param2FunctionInt](#).

29.479.3.4 `virtual std::vector<double> Go::Spline2FunctionInt::getCriticalValsAndKnots ( int parDir ) const [virtual]`

Return the critical parameter values and inner knots for object.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Reimplemented from [Go::Param2FunctionInt](#).

29.479.3.5 `virtual std::vector<double> Go::Spline2FunctionInt::getInnerKnotVals ( int pardir, bool sort = false ) const` [virtual]

Return the inner knot values in the specified direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
<i>sort</i>	the returned values may be sorted by the function.

Reimplemented from [Go::Param2FunctionInt](#).

29.479.3.6 `virtual bool Go::Spline2FunctionInt::hasCriticalValsOrKnots ( int pardir ) const` [virtual]

Return true if the object has any critical parameter values or inner knots in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Reimplemented from [Go::Param2FunctionInt](#).

29.479.3.7 `virtual bool Go::Spline2FunctionInt::hasInnerKnots ( int pardir ) const` [virtual]

Return true if the object has any inner knots in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Reimplemented from [Go::Param2FunctionInt](#).

29.479.3.8 `virtual int Go::Spline2FunctionInt::knotIntervalFuzzy ( int pardir, double & t, double tol ) const` [virtual]

Return the knot interval for which *t* lies inside, moving the value *t* if it lies close to a knot.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
<i>t</i>	the parameter value
<i>tol</i>	the parametric tolerance deciding if the input parameter <i>t</i> should be moved.

Reimplemented from [Go::Param2FunctionInt](#).

29.479.3.9 `virtual shared_ptr<Param2FunctionInt> Go::Spline2FunctionInt::makeIntFunction ( shared_ptr<ParamSurface > surf ) [virtual]`

Return an intersection object for the input surface. This object is used as the parent for the intersection object.

#### Parameters

<i>surf</i>	the parametric surface defining the intersection object.
-------------	----------------------------------------------------------

Reimplemented from [Go::Param2FunctionInt](#).

29.479.3.10 `virtual bool Go::Spline2FunctionInt::monotone ( Point & dir, double tol = 1.0e-15 ) const [virtual]`

Return true if the surface is monotone in any direction.

#### Parameters

<i>dir</i>	the direction in which the surface is monotone. Pertains only if surface is monotone.
------------	---------------------------------------------------------------------------------------

#### Returns

Whether or not the surface is monotone.

Reimplemented from [Go::Param2FunctionInt](#).

29.479.3.11 `virtual double Go::Spline2FunctionInt::nextSegmentVal ( int paddir, double par, bool forward ) const [virtual]`

Return the value of the knot next to the input parameter par.

#### Parameters

<i>paddir</i>	the parameter direction in question. Indexing starts at 0.
<i>par</i>	the parameter value
<i>forward</i>	if true we return the closest knot to the right, otherwise the closest knot to the left.

#### Returns

The knot closest to the input parameter.

Reimplemented from [Go::Param2FunctionInt](#).

29.479.3.12 `virtual double Go::Spline2FunctionInt::startParam ( int paddir ) const [virtual]`

Return the start parameter value in the specified direction.

## Parameters

<i>parDir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

## Returns

The start parameter in the specified direction.

Reimplemented from [Go::Param2FunctionInt](#).

29.479.3.13 `shared_ptr<SplineSurface> Go::Spline2FunctionInt::surface3D ( )`

Return a 3-dimensional visualization spline surface.

## Returns

The pointer to the 3-dimensional spline surface (u, v, surf\_(u, v)).

## 29.479.4 Member Data Documentation

29.479.4.1 `shared_ptr<SplineSurface> Go::Spline2FunctionInt::spsf_ [protected]`

Definition at line 168 of file Spline2FunctionInt.h.

The documentation for this class was generated from the following file:

- void [setNumCoefs](#) (int num)
- void [setSplineSpace](#) ([const BsplineBasis &basis](#))

### 29.480.1 Detailed Description

An [Interpolator](#) that generates a spline curve approximating the given dataset in the least squares sense.

Definition at line 54 of file `SplineApproximator.h`.

### 29.480.2 Constructor & Destructor Documentation

#### 29.480.2.1 `Go::SplineApproximator::SplineApproximator ( )` [`inline`]

Constructor takes no arguments.

Definition at line 58 of file `SplineApproximator.h`.

#### 29.480.2.2 `virtual Go::SplineApproximator::~~SplineApproximator ( )` [`virtual`]

Virtual destructor ensures safe inheritance.

### 29.480.3 Member Function Documentation

29.480.3.1 `virtual const BsplineBasis& Go::SplineApproximator::basis ( )` [virtual]

after the function [interpolate\(\)](#) has been successfully run, this function can be called to get the [BsplineBasis](#) of the generated curve.

#### Returns

a constant reference to the [BsplineBasis](#) of the curve previously generated by [interpolate\(\)](#).

Implements [Go::Interpolator](#).

29.480.3.2 `virtual void Go::SplineApproximator::interpolate ( int num_points, int dimension, const double * param_start, const double * data_start, std::vector< double > & coefs )` [virtual]

The interpolating function, as inherited by [Interpolator](#). Prior to calling this function, the user must have specified:

- *either* the number of control points to use in the approximating curve by [setNumCoefs\(\)](#).
- *or/and* directly specified the [BsplineBasis](#) to use by [setSplineSpace\(\)](#). A default [BsplineBasis](#) will be generated if the user has only set the number of control points prior to calling [interpolate\(\)](#). For parameter list, see [Interpolator](#).

Implements [Go::Interpolator](#).

29.480.3.3 `void Go::SplineApproximator::setNumCoefs ( int num )` [inline]

Specify the number of basis functions / control points to use in the approximating curve.

Definition at line 86 of file [SplineApproximator.h](#).

29.480.3.4 `void Go::SplineApproximator::setSplineSpace ( const BsplineBasis & basis )` [inline]

Directly specify the spline space in which to search for the approximating function.

Definition at line 92 of file [SplineApproximator.h](#).

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/geometry/SplineApproximator.h](#)

## 29.481 Go::SplineCurve Class Reference

[SplineCurve](#) provides methods for storing, reading and manipulating rational and non-rational B-spline curves.

## Static Public Member Functions

- `static ClassType classType ()`

## Additional Inherited Members

### 29.481.1 Detailed Description

[SplineCurve](#) provides methods for storing, reading and manipulating rational and non-rational B-spline curves.

Definition at line 57 of file [SplineCurve.h](#).

### 29.481.2 Constructor & Destructor Documentation

#### 29.481.2.1 `Go::SplineCurve::SplineCurve( )` `[inline]`

Creates an uninitialized [SplineCurve](#), which can only be assigned to or [read\(\)](#) into.

Definition at line 63 of file [SplineCurve.h](#).

#### 29.481.2.2 `template<typename RandomIterator1 , typename RandomIterator2 > Go::SplineCurve::SplineCurve ( int number, int order, RandomIterator1 knotstart, RandomIterator2 coefsstart, int dim, bool rational = false )` `[inline]`

Create a [SplineCurve](#) by explicitly providing all spline-related information.

##### Parameters

<i>number</i>	number of control points
<i>order</i>	order of b-spline basis
<i>knotstart</i>	pointer to the array describing the knotvector
<i>coefsstart</i>	pointer to the array where the control points are consecutively stored.
<i>dim</i>	dimension of the space in which the curve lies (usually 2 or 3).
<i>rational</i>	Specify whether the curve is rational or not. If the curve is rational, coefficients must be in the following format: wP1 wP2 .... wPdim w. I.e., a (dim+1)-dimensional form. (This is the same form that is used within SISL).

Definition at line 83 of file [SplineCurve.h](#).

#### 29.481.2.3 `template<typename RandomIterator > Go::SplineCurve::SplineCurve ( const BsplineBasis & basis, RandomIterator coefsstart, int dim, bool rational = false )` `[inline]`

Create a [SplineCurve](#) by explicitly providing all spline-related information.

##### Parameters

<i>basis</i>	the <a href="#">BsplineBasis</a> to be used along the u-direction
<i>basis_v</i>	the <a href="#">BsplineBasis</a> to be used along the v-direction
<i>coefsstart</i>	pointer to the array where the control points are consecutively stored. The storage order is such that control points along the u-parameter have the shortest stride (stored right after each other). If the surface is rational, pay attention to the comments below.
<i>dim</i>	dimension of the space in which the surface lies (usually 3).

## Parameters

<i>rational</i>	Specify whether the surface is rational or not. If the surface is rational, coefficients must be in the following format: wP1 wP2 .... wPdim w. I.e. a (dim+1)-dimensional form. (This is the same form that is used within SISL).
-----------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Definition at line 123 of file SplineCurve.h.

#### 29.481.2.4 Go::SplineCurve::SplineCurve ( const Point & *pt1*, const Point & *pt2* )

Construct a straight curve between two points (order 2 - linear). The parameter span will be from 0 to T, where T is the euclidean distance between the two points.

## Parameters

<i>pt1</i>	first of the two points defining the straight curve
<i>pt2</i>	second of the two points defining the straight curve

#### 29.481.2.5 Go::SplineCurve::SplineCurve ( const Point & *pt1*, double *startpar*, const Point & *pt2*, double *endpar* )

Make a straight curve between two points (order 2 - linear). The parameter span is also given by the user.

## Parameters

<i>pt1</i>	first of the two points defining the straight curve
<i>startpar</i>	start parameter of curve
<i>pt2</i>	second of the two points defining the straight curve
<i>endpar</i>	end parameter of curve

#### 29.481.2.6 virtual Go::SplineCurve::~~SplineCurve ( ) [virtual]

Virtual destructor, enables safe inheritance.

### 29.481.3 Member Function Documentation

#### 29.481.3.1 virtual void Go::SplineCurve::appendCurve ( ParamCurve \* *other\_curve*, int *continuity*, double & *dist*, bool *repar = true* ) [virtual]

Inherited from [ParamCurve](#). Appends a curve to end of this curve. The knotvector and control point vector of 'this' curve will be extended, and the degree will be raised if necessary. Note that there *will* be side-effects on the 'other↔\_curve' (its order might be raised, its knotvector will become k-regular and evt. reparametrized, its start point will be moved to coincide with the end point of 'this' curve, etc.)

## Parameters

<i>other_curve</i>	the curve to append to this curve
<i>continuity</i>	which level of continuity we demand at the transition between the two curves (can be from -1 to <a href="#">order()</a> ), but the higher the value the more the curves will have to be locally modified.
<i>dist</i>	upon function return, this variable will hold the estimated maximum distortion after 'smoothing' of joined curve to achieve the desired continuity.
<i>repar</i>	The parametrization of the 'other_curve' will <i>always</i> be shifted so that it starts where the parametrization of 'this' curve ends. However, if 'repar' is set to 'true', it will also be <i>scaled</i> as a function of position of control points close to the transition.

Implements [Go::ParamCurve](#).

29.481.3.2 `virtual void Go::SplineCurve::appendCurve ( ParamCurve * cv, bool repar = true ) [virtual]`

Inherited from [ParamCurve](#). Short hand function to call [appendCurve](#) with C<sup>1</sup> continuity.

## Parameters

<i>cv</i>	the curve to append to this curve
<i>repar</i>	The parametrization of the 'other_curve' will <i>always</i> be shifted so that it starts where the parametrization of 'this' curve ends. However, if 'repar' is set to 'true', it will also be <i>scaled</i> as a function of position of control points close to the transition.

Implements [Go::ParamCurve](#).

29.481.3.3 `const BsplineBasis& Go::SplineCurve::basis ( ) const [inline]`

Get a const reference to the [BsplineBasis](#) of the curve

## Returns

const reference to the curve's [BsplineBasis](#).

Definition at line 325 of file SplineCurve.h.

29.481.3.4 `BsplineBasis& Go::SplineCurve::basis ( ) [inline]`

Get a reference to the [BsplineBasis](#) of the curve

## Returns

reference to the curve's [BsplineBasis](#).

Definition at line 330 of file SplineCurve.h.

29.481.3.5 virtual **BoundingBox** Go::SplineCurve::boundingBox ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.481.3.6 **bool** Go::SplineCurve::checkElementaryCurve ( )

Check to see if `this` corresponds to the [ElementaryCurve](#) set by `setElementaryCurve()`. NOTE: Not yet implemented!

29.481.3.7 **static ClassType** Go::SplineCurve::classType ( ) [inline],[static]

Definition at line 183 of file SplineCurve.h.

29.481.3.8 virtual **SplineCurve\*** Go::SplineCurve::clone ( ) const [inline],[virtual]

The clone-function is herited from [GeomObject](#), but overridden here to get a covariant return type (for those compilers that allow this).

Implements [Go::ParamCurve](#).

Definition at line 190 of file SplineCurve.h.

29.481.3.9 virtual void Go::SplineCurve::closestPoint ( **const Point & pt, double tmin, double tmax, double & clo\_t, Point & clo\_pt, double & clo\_dist, double const \* seed = 0** ) const [virtual]

Compute the closest point from an interval of this curve to a specified point.

#### Parameters

<i>pt</i>	point we want to find the closest point to
<i>tmin</i>	start parameter of search interval
<i>tmax</i>	end parameter of search interval
<i>clo_t</i>	upon function return, 'clo_t' will contain the parameter value of the closest point found.
<i>clo_pt</i>	upon function return, 'clo_pt' will contain the position of the closest point found.
<i>clo_dist</i>	upon function return, 'clo_dist' will contain the distance between 'pt' and the closest point found.
<i>seed</i>	pointer to initial guess value, provided by the user (can be 0, for which the algorithm will determine a (hopefully) reasonable choice).

Implements [Go::ParamCurve](#).

29.481.3.10 **std::vector<double>::iterator** Go::SplineCurve::coefs\_begin ( ) [inline]

Get an iterator to the start of the curve's internal, non-rational control point array

**Returns**

an iterator to the start of the curves non-rational control point array

Definition at line 376 of file SplineCurve.h.

**29.481.3.11** `std::vector<double>::const_iterator Go::SplineCurve::coefs_begin ( ) const` `[inline]`

Get a const iterator to the start of the curve's non-rational, internal control point array

**Returns**

a const iterator to the start of the curve's non-rational control point array.

Definition at line 388 of file SplineCurve.h.

**29.481.3.12** `std::vector<double>::iterator Go::SplineCurve::coefs_end ( )` `[inline]`

Get a one-past-end iterator to the curve's non-rational, internal control point array

**Returns**

an iterator to one-past-end of the curve's non-rational, internal control point array

Definition at line 382 of file SplineCurve.h.

**29.481.3.13** `std::vector<double>::const_iterator Go::SplineCurve::coefs_end ( ) const` `[inline]`

Get a one-past-end const iterator to the curve's non-rational, internal control point array

**Returns**

a const iterator to one-past-end of the curve's non-rational, internal control point array

Definition at line 394 of file SplineCurve.h.

**29.481.3.14** `virtual CompositeBox Go::SplineCurve::compositeBox ( ) const` `[virtual]`

Creates a composite box enclosing the curve. The composite box consists of an inner and an edge box. The inner box is supposed to be made from the interior of the curve, while the edge box is made from the start and end points. The default implementation simply makes both boxes identical to the regular bounding box.

**Returns**

the [CompositeBox](#) enclosing the curve.

Reimplemented from [Go::ParamCurve](#).

**29.481.3.15** `void Go::SplineCurve::computeBasis ( double param, std::vector< double > & basisValues, std::vector< double > & basisDerivs ) const`

Evaluate positions and first derivatives of all basis values in a given parameter For non-rationals this is an interface to [BsplineBasis::computeBasisValues](#), for rationals the routine evaluates the rational basis functions, i.e. the basis functions are divided by the denominator of the curve

## Parameters

<i>param</i>	the parameter in which to compute
<i>basisValues</i>	the value of all basis functions, size equal to (degree_u+1)
<i>basisDerivs</i>	the derivative of all basis functions, same size as previous

29.481.3.16 `void Go::SplineCurve::deform ( const std::vector< double > & vec, int vdim = 0 )`

Adds the given deformation vector to the coefficients.

29.481.3.17 `SplineCurve* Go::SplineCurve::derivCurve ( int ider ) const`

Make a curve expressing the i'th derivative of 'this' curve, and return a pointer to it.

## Parameters

<i>ider</i>	the number of the derivative of which we want to make a curve
-------------	---------------------------------------------------------------

## Returns

a pointer to the newly generated curve. User assumes ownership and is responsible for deletion.

29.481.3.18 `virtual int Go::SplineCurve::dimension ( ) const` [virtual]

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.481.3.19 `virtual DirectionCone Go::SplineCurve::directionCone ( ) const` [virtual]

Creates a [DirectionCone](#) which covers all tangent directions of this curve.

## Returns

the smallest [DirectionCone](#) containing all tangent directions of this curve.

Implements [Go::ParamCurve](#).

29.481.3.20 `virtual double Go::SplineCurve::endparam ( ) const` [virtual]

Query the end parameter of the curve

## Returns

the curve's end parameter

Implements [Go::ParamCurve](#).

29.481.3.21 void Go::SplineCurve::equalBdWeights ( bool *at\_start* )

Update this curve to ensure equality of weights at one end of the curve. This is a reparametrization

29.481.3.22 virtual SplineCurve\* Go::SplineCurve::geometryCurve ( ) [virtual]

If the definition of this [ParamCurve](#) contains a [SplineCurve](#) describing its spatial shape, then this function will return a pointer to this [SplineCurve](#). Otherwise it will return a null pointer. The returned curve is NEWed, so the user is responsible for deleting it. This function may have side-effects.

#### Returns

a pointer to a [SplineCurve](#) representation of the [ParamCurve](#), if it exists. Null pointer otherwise.

Implements [Go::ParamCurve](#).

29.481.3.23 shared\_ptr<ElementaryCurve> Go::SplineCurve::getElementaryCurve ( )

Get shared pointer to [ElementaryCurve](#), if it exists. If not, return empty shared pointer.

NOTE: The [ElementaryCurve](#) returned by this function should ideally be the one corresponding to the current [SplineCurve](#). However, there is no guarantee for this. One may check to see if this is the case by using [checkElementaryCurve\(\)](#).

29.481.3.24 void Go::SplineCurve::getWeights ( std::vector< double > & *weights* ) const

Return all weights corresponding to this curve, a non-rational volume has all weights equal to one

29.481.3.25 void Go::SplineCurve::gridEvaluator ( std::vector< double > & *points*, const std::vector< double > & *par* ) const

Evaluation in a number of points Does not gain effectivity compared to evaluating the points one at the time, but provides a unified interface

29.481.3.26 void Go::SplineCurve::insertKnot ( double *apar* )

Insert a new knot into the curve's knotvector

#### Parameters

<i>apar</i>	parameter value of the new knot
-------------	---------------------------------

29.481.3.27 void Go::SplineCurve::insertKnot ( const std::vector< double > & *new\_knots* )

Insert several knots into the curve's knotvector

## Parameters

<i>new_knots</i>	vector containing the parameter values of the new knots to be inserted into the knotvector.
------------------	---------------------------------------------------------------------------------------------

29.481.3.28 `virtual ClassType Go::SplineCurve::instanceType ( ) const [virtual]`

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.481.3.29 `void Go::SplineCurve::interpolate ( Interpolator & interpolator, int num_points, int dim, const double * param_start, const double * data_start )`

Remake 'this' [SplineCurve](#) to interpolate (or approximate) a given sequence of data points.

## Parameters

<i>interpolator</i>	reference to the <a href="#">Interpolator</a> object specifying the interpolation method to use
<i>num_points</i>	number of points to interpolate
<i>dim</i>	dimension of the Euclidean space in which the points lie (usually 2 or 3)
<i>param_start</i>	pointer to the start of an array expressing the parameter values of the given data points.
<i>data_start</i>	pointer to the array where the coordinates of the data points are stored.

29.481.3.30 `virtual bool Go::SplineCurve::isAxisRotational ( Point & centre, Point & axis, Point & vec, double & angle ) [virtual]`

Check if the curve is axis rotational. Only true if a connection to an axis rotational elementary curve exist The axis and rotational angle is only specified if the curve is actually rotational

Reimplemented from [Go::ParamCurve](#).

29.481.3.31 `virtual bool Go::SplineCurve::isDegenerate ( double degenerate_epsilon ) [virtual]`

Query whether the curve is degenerate (collapsed into a single point).

## Parameters

<i>degenerate_epsilon</i>	the tolerance used in determine whether the curve is degenerate. A curve is considered degenerate if its total length is shorter than this value.
---------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

`true` if the curve is degenerate, `false` otherwise.

Implements [Go::ParamCurve](#).

29.481.3.32 `bool Go::SplineCurve::isElementaryCurve ( ) [inline]`

Query if the curve was generated from an [ElementaryCurve](#).

Definition at line 521 of file `SplineCurve.h`.

29.481.3.33 `virtual bool Go::SplineCurve::isInPlane ( const Point & loc, const Point & axis, double eps, Point & normal ) const [virtual]`

Check if the curve lies in a plane passing through a given axis.

Reimplemented from [Go::ParamCurve](#).

29.481.3.34 `virtual bool Go::SplineCurve::isInPlane ( const Point & norm, double eps, Point & pos ) const [virtual]`

Check if the curve lies in a plane with a given normal.

Reimplemented from [Go::ParamCurve](#).

29.481.3.35 `virtual bool Go::SplineCurve::isLinear ( Point & dir, double tol ) [virtual]`

Check if the curve is linear.

Reimplemented from [Go::ParamCurve](#).

29.481.3.36 `std::vector<double>::iterator Go::SplineCurve::knotsBegin ( ) [inline]`

Get an iterator to the beginning of the knot vector

#### Returns

an iterator to the beginning of the knot vector

Definition at line 356 of file `SplineCurve.h`.

29.481.3.37 `std::vector<double>::const_iterator Go::SplineCurve::knotsBegin ( ) const [inline]`

Get a const iterator to the beginning of the knot vector

#### Returns

a const iterator to the beginning of the knot vector

Definition at line 364 of file `SplineCurve.h`.

29.481.3.38 `std::vector<double>::iterator Go::SplineCurve::knotsEnd ( ) [inline]`

Get a one-past-end iterator to the knot vector

**Returns**

an iterator to one-past-end of the knot vector

Definition at line 360 of file SplineCurve.h.

29.481.3.39 `std::vector<double>::const_iterator Go::SplineCurve::knotsEnd ( ) const [inline]`

Get a one-past-end const iterator to the knot vector

**Returns**

a const iterator to one-past-end of the knot vector

Definition at line 368 of file SplineCurve.h.

29.481.3.40 `virtual double Go::SplineCurve::length ( double tol ) [virtual]`

Inherited from [ParamCurve](#) Compute the total length of this curve

Implements [Go::ParamCurve](#).

29.481.3.41 `void Go::SplineCurve::makeBernsteinKnots ( )`

Insert knots into the knotvector such that all knots get multiplicity equal to the order of the b-spline basis.

29.481.3.42 `void Go::SplineCurve::makeKnotEndRegular ( )`

Make the knotvector k-regular at end. Useful when k-regularity of a knotvector is to be assumed.

29.481.3.43 `void Go::SplineCurve::makeKnotStartRegular ( )`

Make the knotvector k-regular at start. Useful when k-regularity of a knotvector is to be assumed.

29.481.3.44 `virtual double Go::SplineCurve::nextSegmentVal ( double par, bool forward, double tol ) const [virtual]`

Inherited from [ParamCurve](#). Returns the value of the next knot.

## Parameters

<i>par</i>	the parameter from which we will look for the start of the next interval.
<i>forward</i>	specify whether we will look forwards or backwards.
<i>tol</i>	a tolerance specifying how close 'par' has to be to a knot to be considered 'on' the knot.

Reimplemented from [Go::ParamCurve](#).

29.481.3.45 `int Go::SplineCurve::numCoefs ( ) const [inline]`

Query the number of control points of the curve

## Returns

the number of control points of the curve.

Definition at line 335 of file SplineCurve.h.

29.481.3.46 `int Go::SplineCurve::numElem ( ) const [inline]`

Query the number of elements in the [SplineCurve](#).

Definition at line 339 of file SplineCurve.h.

29.481.3.47 `int Go::SplineCurve::order ( ) const [inline]`

Query the order of the spline space in which the curve lies

## Returns

the order of the curve's spline space

Definition at line 346 of file SplineCurve.h.

29.481.3.48 `virtual void Go::SplineCurve::point ( Point & pt, double tpar ) const [virtual]`

Evaluate the curve's position at a given parameter

## Parameters

<i>pt</i>	the evaluated position will be written to this <a href="#">Point</a>
<i>tpar</i>	the parameter for which we wish to evaluate the curve

Implements [Go::ParamCurve](#).

29.481.3.49 `virtual void Go::SplineCurve::point ( std::vector< Point > & pts, double tpar, int derivs, bool from_right = true ) const [virtual]`

Evaluate the curve's position and a certain number of derivatives at a given parameter.

#### Parameters

<i>pts</i>	the evaluated position and derivatives (tangent, curvature vector, etc.) will be written to this vector. The first entry will be the position, the second entry will be the first derivative, etc. The size of this vector must be set to 'derivs'+ 1 prior to calling this function.
<i>tpar</i>	the parameter for which we want to evaluate the curve
<i>derivs</i>	the number of derivatives we want to have calculated
<i>from_right</i>	specify whether we should calculate derivatives 'from the right' or 'from the left' (default is from the right). This matters only when the curve presents discontinuities in its derivatives.

Implements [Go::ParamCurve](#).

29.481.3.50 `void Go::SplineCurve::raiseOrder ( int i = 1 )`

Raise the order of the curve's b-spline basis without changing the shape of the curve

#### Parameters

<i>i</i>	specifies how many times the order will be raised.
----------	----------------------------------------------------

29.481.3.51 `bool Go::SplineCurve::rational ( ) const [inline]`

Query whether or not the curve is rational.

#### Returns

'true' if the curve is rational, 'false' otherwise.

Definition at line 351 of file SplineCurve.h.

29.481.3.52 `std::vector<double>::iterator Go::SplineCurve::rcoefs_begin ( ) [inline]`

Get an iterator to the start of the curve's internal, rational control point array

#### Returns

an iterator to the start of the curves rational control point array

Definition at line 400 of file SplineCurve.h.

29.481.3.53 `std::vector<double>::const_iterator Go::SplineCurve::rcoefs_begin ( ) const` [inline]

Get a const iterator to the start of the curve's rational, internal control point array

**Returns**

a const iterator to the start of the curve's rational control point array.

Definition at line 412 of file SplineCurve.h.

29.481.3.54 `std::vector<double>::iterator Go::SplineCurve::rcoefs_end ( )` [inline]

Get a one-past-end iterator to the curve's rational, internal control point array

**Returns**

an iterator to one-past-end of the curve's rational, internal control point array

Definition at line 406 of file SplineCurve.h.

29.481.3.55 `std::vector<double>::const_iterator Go::SplineCurve::rcoefs_end ( ) const` [inline]

Get a one-past-end const iterator to the curve's rational, internal control point array

**Returns**

a const iterator to one-past-end of the curve's rational, internal control point array

Definition at line 418 of file SplineCurve.h.

29.481.3.56 `virtual void Go::SplineCurve::read ( std::istream & is )` [virtual]

read object from stream

**Parameters**

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.481.3.57 `void Go::SplineCurve::removeKnot ( double tpar )`

Remove a knot from the knotvector

## Parameters

<i>tpar</i>	the parameter value of the knot to be removed.
-------------	------------------------------------------------

29.481.3.58 void Go::SplineCurve::replaceEndPoint ( Point *pnt*, bool *at\_start* )

Modify the curve by changing on endpoint

## Parameters

<i>pnt</i>	new end point
<i>at_start</i>	whether or not the start coefficient should be changed

29.481.3.59 void Go::SplineCurve::representAsRational ( )

Ensure that the current curve is represented as a rational curve.

29.481.3.60 virtual void Go::SplineCurve::reverseParameterDirection ( bool *switchparam = false* ) [virtual]

Set the parameter direction of the curve. The curve's parameter interval will always remain constant, but by flipping the parameter direction, the curve will be traced the opposite way when moving a parameter over the parameter interval.

## Parameters

<i>switchparam</i>	if true, and the curve is 2D, the x and y coordinates should be swapped. This is used when turning the orientation of bounded (trimmed) surfaces.
--------------------	---------------------------------------------------------------------------------------------------------------------------------------------------

Implements [Go::ParamCurve](#).

29.481.3.61 void Go::SplineCurve::setBdWeight ( double *wgt*, bool *at\_start* )

Set the weight in one endpoint of this curve (if rational)

29.481.3.62 void Go::SplineCurve::setElementaryCurve ( shared\_ptr< ElementaryCurve > *elcurve* )

Set shared pointer to the [ElementaryCurve](#) that is represented by *this*.

NOTE: The current [SplineCurve](#) (i.e. *this*), must be created from the argument [ElementaryCurve](#) by [ElementaryCurve::createSplineCurve\(\)](#), otherwise undefined behaviour may occur. One may check to see if this is the case by using [checkElementaryCurve\(\)](#).

29.481.3.63 virtual void Go::SplineCurve::setParameterInterval ( double *t1*, double *t2* ) [virtual]

Rescale the knotvector so that the total parameter span now ranges from 't1' to 't2'.

## Parameters

<i>t1</i>	new start value of the spline's parameter span
<i>t2</i>	new end value of the spline's parameter span

Implements [Go::ParamCurve](#).

29.481.3.64 `std::vector<shared_ptr<SplineCurve>> Go::SplineCurve::split ( std::vector< double > & param, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const`

Split curve in specified parameter values.

29.481.3.65 `virtual std::vector<shared_ptr<ParamCurve>> Go::SplineCurve::split ( double param, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [virtual]`

Split curve in a specified parameter value.

Reimplemented from [Go::ParamCurve](#).

29.481.3.66 `virtual double Go::SplineCurve::startparam ( ) const [virtual]`

Query the start parameter of the curve

## Returns

the curve's start parameter

Implements [Go::ParamCurve](#).

29.481.3.67 `virtual SplineCurve* Go::SplineCurve::subCurve ( double from_par, double to_par, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [virtual]`

Returns a curve which is a part of this curve. The result is NEWed, so the user is responsible for deleting it. NB: It is not guaranteed that the [ParamCurve](#) that is returned is of the same type as the curve itself. Thus, the returned curve might be a [SplineCurve](#).

## Parameters

<i>from_par</i>	start value of parameter interval that will define the subcurve
<i>to_par</i>	end value of parameter interval that will define the subcurve
<i>fuzzy</i>	since subCurve works on those curves who are spline-based, this tolerance defines how close the start and end parameter must be to an existing knot in order to be considered <i>on</i> the knot.

**Returns**

a pointer to a new subcurve which represents the part of the curve between 'from\_par' and 'to\_par'. It will be spline-based and have a k-regular knotvector. The user is responsible for deleting this subcurve when it is no longer needed.

Implements [Go::ParamCurve](#).

**29.481.3.68** void Go::SplineCurve::swap ( SplineCurve & *other* )

quick swap of 'this' [SplineCurve](#) with the 'other' one.

**Parameters**

<i>other</i>	the <a href="#">SplineCurve</a> to swap with 'this' one.
--------------	----------------------------------------------------------

**29.481.3.69** void Go::SplineCurve::translateCurve ( const Point & *dir* )

**29.481.3.70** void Go::SplineCurve::translateSwapCurve ( const Point & *dir*, double *sgn*, int *pdir* )

Modify in 1. (*pdir* == 1), 2. (*pdir* == 2) or both (*pdir* == 3) parameter directions

**29.481.3.71** void Go::SplineCurve::updateCoefsFromRcoefs ( )

Given the rational coefficients of the curve (*hx*, *hy*, *hz*, *h*), set the coefficient array where the weight is divided out (*x*, *y*, *z*).

**29.481.3.72** virtual void Go::SplineCurve::write ( std::ostream & *os* ) const [virtual]

write object to stream

**Parameters**

<i>os</i>	stream to which object is written
-----------	-----------------------------------

Implements [Go::Streamable](#).

### 29.482.1 Detailed Description

Class representing the "intersection object" of a spline curve.

Definition at line 55 of file [SplineCurveInt.h](#).

### 29.482.2 Constructor & Destructor Documentation

29.482.2.1 [Go::SplineCurveInt::SplineCurveInt](#) ( shared\_ptr< [ParamCurve](#) > *curve* ) [\[explicit\]](#)

Constructor.

Parameters

<i>curve</i>	the parametric curve defining the intersection object.
--------------	--------------------------------------------------------

29.482.2.2 [Go::SplineCurveInt::SplineCurveInt](#) ( shared\_ptr< [ParamCurve](#) > *curve*, [ParamGeomInt](#) \* *parent* ) [\[explicit\]](#)

Constructor.

## Parameters

<i>curve</i>	the parametric curve defining the intersection object.
<i>parent</i>	the parent object to this object. Can be either a curve or a surface.

29.482.2.3 virtual Go::SplineCurveInt::~~SplineCurveInt ( ) [inline],[virtual]

Destructor.

Definition at line 71 of file SplineCurveInt.h.

### 29.482.3 Member Function Documentation

29.482.3.1 virtual int Go::SplineCurveInt::checkPeriodicity ( int *pardir* = 0 ) const [virtual]

Check if the object is periodic. Analyze periodicity of curve based on number of repeating knots and control points. The return value is -1 if the curve ends are disjoint, otherwise k if cv is  $C^k$  continuous. These are sufficient but not necessary conditions for periodicity, so it is possible that a higher degree of periodicity exists. Should not be called on this layer, should be overruled by inherited class.

## Parameters

<i>pardir</i>	the parameter direction in question. Does not pertain to for a curve.
---------------	-----------------------------------------------------------------------

## Returns

-1 if the curve ends are disjoint, or k if the curve is proven to be  $C^k$  continuous.

Reimplemented from [Go::ParamCurveInt](#).

29.482.3.2 virtual std::vector<double> Go::SplineCurveInt::getCriticalValsAndKnots ( int *pardir* ) const [virtual]

Return the critical parameter values and inner knots for object.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Reimplemented from [Go::ParamCurveInt](#).

29.482.3.3 virtual std::vector<double> Go::SplineCurveInt::getInnerKnotVals ( int *pardir*, bool *sort* = false ) const [virtual]

Return the inner knot values in the specified direction.

## Parameters

<i>parDir</i>	the parameter direction in question. Indexing starts at 0.
<i>sort</i>	the returned values may be sorted by the function.

Reimplemented from [Go::ParamCurveInt](#).

29.482.3.4 `virtual std::vector<double>::iterator Go::SplineCurveInt::getMesh ( ) [virtual]`

Return the geometric sample mesh for the parametric function.

Reimplemented from [Go::ParamCurveInt](#).

29.482.3.5 `virtual int Go::SplineCurveInt::getMeshSize ( int dir ) [virtual]`

Return the size of the geometric sample mesh in the specified direction.

## Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
------------	------------------------------------------------------------

Reimplemented from [Go::ParamCurveInt](#).

29.482.3.6 `virtual double Go::SplineCurveInt::getOptimizedConeAngle ( Point & axis1, Point & axis2 ) [virtual]`

We try to treat problems which will never result in a simple case by shrinking the domain slightly, resulting in smaller cones. This is useful for scenarios where the normals are parallel in a boundary point.

## Parameters

<i>axis1</i>	first vector defining a projection plane
<i>axis2</i>	second vector defining a projection plane

## Returns

The optimized cone angle

Reimplemented from [Go::ParamCurveInt](#).

29.482.3.7 `virtual RotatedBox Go::SplineCurveInt::getRotatedBox ( std::vector< Point > & axis ) const [virtual]`

Create a box containing the geometric sample mesh in the input coordinate system.

## Parameters

<i>axis</i>	the axis defining the coordinate system. The size of vector <i>axis</i> is 2, the last point is given as the cross product <i>axis</i> [0] <i>axis</i> [1].
-------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

The rotated box

Reimplemented from [Go::ParamCurveInt](#).

**29.482.3.8** `virtual const SplineCurve* Go::SplineCurveInt::getSpline ( ) [inline],[virtual]`

Reimplemented from [Go::ParamCurveInt](#).

Definition at line 154 of file *SplineCurveInt.h*.

**29.482.3.9** `virtual bool Go::SplineCurveInt::hasCriticalValsOrKnots ( int pardir ) const [virtual]`

Return true if the object has any critical parameter values or inner knots in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Reimplemented from [Go::ParamCurveInt](#).

**29.482.3.10** `virtual bool Go::SplineCurveInt::hasInnerKnots ( int pardir ) const [virtual]`

Return true if the object has any inner knots in the specified parameter direction.

## Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Reimplemented from [Go::ParamCurveInt](#).

**29.482.3.11** `virtual bool Go::SplineCurveInt::isSpline ( ) [virtual]`

Verify whether the object is a spline.

## Returns

True if the object is a spline.

Reimplemented from [Go::ParamCurveInt](#).

29.482.3.12 `virtual int Go::SplineCurveInt::knotIntervalFuzzy ( double & t, double tol ) const` [virtual]

Find the knot interval for which t lies inside, moving the value t if it lies close to a knot.

#### Parameters

<i>t</i>	the parameter value
<i>tol</i>	the parametric tolerance deciding if the input parameter t should be moved.

Reimplemented from [Go::ParamCurveInt](#).

29.482.3.13 `virtual shared_ptr<ParamCurveInt> Go::SplineCurveInt::makeIntObject ( shared_ptr< ParamCurve > curve )` [virtual]

Return an intersection object for the input curve. This object is used as the parent for the intersection object.

#### Parameters

<i>curve</i>	the parametric curve defining the intersection object.
--------------	--------------------------------------------------------

Reimplemented from [Go::ParamCurveInt](#).

29.482.3.14 `virtual double Go::SplineCurveInt::nextSegmentVal ( double par, bool forward, double tol ) const` [virtual]

Return the value of the knot next to the input parameter par.

#### Parameters

<i>par</i>	the parameter value
<i>forward</i>	if true we return the closest knot to the right, otherwise the closest knot to the left.
<i>tol</i>	the tolerance to determine if <i>par</i> is already located on the start of the next segment.

#### Returns

The knot closest to the input parameter.

Reimplemented from [Go::ParamCurveInt](#).

29.482.3.15 `virtual double Go::SplineCurveInt::paramFromMesh ( int dir, int idx )` [virtual]

Return the corresponding mesh parameter.

#### Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>idx</i>	the mesh idx in the specified direction. Indexing starts at 0.

Reimplemented from [Go::ParamCurveInt](#).

#### 29.482.4 Member Data Documentation

##### 29.482.4.1 `shared_ptr<SplineCurve> Go::SplineCurveInt::spcv_` `[protected]`

Definition at line 178 of file `SplineCurveInt.h`.

The documentation for this class was generated from the following file:

### 29.484.1 Detailed Description

An [Interpolator](#) that generates a spline curve interpolating the given dataset.

Definition at line 56 of file `SplineInterpolator.h`.

### 29.484.2 Member Enumeration Documentation

#### 29.484.2.1 enum Go::SplineInterpolator::CondType

CondType Enumerator specifying possible boundary conditions.

```

/// None boundary conditions have not been specified yet. This will lead
/// to an error if the virtual interpolate() function is called. (The
/// other two interpolate() functions do not care about end conditions.
/// Hermite The tangents are imposed at the start and end of the curve.
/// Natural No imposed tangents, but curvature is imposed to be zero at the
/// start and end of the curve.
/// Free No imposed conditions, neither at start nor end of curve.
/// NaturalAtStart Curvature imposed to be zero at start of curve. End of curve
/// will either have no conditions at all, or have an imposed
/// tangent (depending on whether the latter has been specified or not.
/// NaturalAtEnd Curvature imposed to be zero at end of curve. Start of curve
/// will either have no conditions, or have an imposed tangent
/// (depending on whether the latter has been specified or not).
///

```

Enumerator

***None***  
***Hermite***  
***Natural***  
***Free***  
***NaturalAtStart***  
***NaturalAtEnd***

Definition at line 141 of file `SplineInterpolator.h`.

### 29.484.3 Constructor & Destructor Documentation

#### 29.484.3.1 `Go::SplineInterpolator::SplineInterpolator ( )` [inline]

Constructor takes no arguments.

Definition at line 60 of file `SplineInterpolator.h`.

#### 29.484.3.2 `virtual Go::SplineInterpolator::~~SplineInterpolator ( )` [virtual]

Virtual destructor ensures safe inheritance.

### 29.484.4 Member Function Documentation

#### 29.484.4.1 `virtual const BsplineBasis& Go::SplineInterpolator::basis ( )` [virtual]

after the function `interpolate()` has been successfully run, this function can be called to get the `BsplineBasis` of the generated curve.

##### Returns

a constant reference to the `BsplineBasis` of the curve previously generated by `interpolate()`.

Implements `Go::Interpolator`.

#### 29.484.4.2 `CondType Go::SplineInterpolator::getCondType ( )` [inline]

Query the type of endpoint conditions currently specified.

##### Returns

the currently specified `CondType`.

Definition at line 201 of file `SplineInterpolator.h`.

#### 29.484.4.3 `void Go::SplineInterpolator::interpolate ( const std::vector< double > & params, const std::vector< double > & points, const std::vector< int > & tangent_index, const std::vector< double > & tangent_points, int order, std::vector< double > & coefs )`

This interpolating function also takes user-specified tangent information into account, but does *not* rely on the previously specified end conditions. It constructs its own basis based on the given parametrization and order, so neither does it care about any basis previously set by the user. It carries out order-1 spline interpolation.

##### Parameters

<i>params</i>	vector containing the parameters for the data points. Its size is equal to the total number of datapoints.
<i>points</i>	vector containing the coordinates of the data points. Its size is equal to the total number of datapoints multiplied with the spatial dimension. (NB: This is how the algorithm deduces the spatial dimension to use: divide the size of 'points' with the size of 'params').
<i>tangent_index</i>	a vector containing the indexes of those data points that has tangents associated with them.
<i>tangent points</i>	a vector containing the tangents associated with those data points that are referred to in

29.484.4.4 void Go::SplineInterpolator::interpolate ( const std::vector< double > & *params*, const std::vector< double > & *points*, const std::vector< int > & *tangent\_index*, const std::vector< double > & *tangent\_points*, std::vector< double > & *coefs* )

Does the same as the [interpolate\(\)](#) function above, but expects the basis to have been specified in advance (by [makeBasis\(\)](#) or [setBasis\(\)](#)). If the basis is not consistent with the given data set, an exception will be thrown. (The number of point must at least be equal to the basis' order, and the number of basis functions must be equal to the number of points plus the number of tangents). For a description of the parameter list, see [interpolate\(\)](#).

29.484.4.5 virtual void Go::SplineInterpolator::interpolate ( int *num\_points*, int *dimension*, const double \* *param\_start*, const double \* *data\_start*, std::vector< double > & *coefs* ) [virtual]

The interpolating function, as inherited by [Interpolator](#). Does cubic spline interpolation of points (does not care about tangents). It constructs its own basis based on the given parametrization, so it does not care about any basis previously set by the user. Previously specified end conditions will be taken into account. For parameter list, see [Interpolator](#).

Implements [Go::Interpolator](#).

29.484.4.6 void Go::SplineInterpolator::makeBasis ( const std::vector< double > & *params*, const std::vector< int > & *tangent\_index*, int *order* )

Given a set of interpolation conditions (currently position and tangent information) and order, specify a fitting [BsplineBasis](#) (stored internally).

#### Parameters

<i>params</i>	vector containing the parametrization of the expected datapoints (one parameter per point).
<i>tangent_index</i>	vector containing indexes of those datapoints where tangent conditions will be imposed as well.
<i>order</i>	Order of the requested <a href="#">BsplineBasis</a> .

29.484.4.7 void Go::SplineInterpolator::setBasis ( const [BsplineBasis](#) & *basis* ) [inline]

WARNING! basis must be suited to interpolation conditions! If there is no need to end up with a specific basis, [makeBasis\(\)](#) is safer. Specify a user-defined [BsplineBasis](#) to be used for interpolation.

#### Parameters

<i>basis</i>	the specified basis. NB: it must be suited to the interpolation conditions that are going to be used! If there is no need to end up with a specific basis, <a href="#">makeBasis()</a> is safer.
--------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Definition at line 221 of file [SplineInterpolator.h](#).

29.484.4.8 void Go::SplineInterpolator::setEndTangents ( shared\_ptr< [Point](#) > & *start\_tangent*, shared\_ptr< [Point](#) > & *end\_tangent* ) [inline]

Specify tangents for endpoints of curve. One or both of the shared pointers may be zero, which means that the corresponding endpoint condition will be set to 'Natural'; otherwise it will be set to 'Hermite'. **Note:** endpoint conditions are considered by the *virtual* [interpolate\(\)](#) function. The other interpolate functions disregard this setting.

Definition at line 184 of file SplineInterpolator.h.

29.484.4.9 `void Go::SplineInterpolator::setFreeConditions ( ) [inline]`

Set the endpoint conditions to 'Free' (meaning no conditions at all). **Note:** endpoint conditions are considered by the *virtual interpolate()* function. The other interpolate functions disregard this setting.

Definition at line 177 of file SplineInterpolator.h.

29.484.4.10 `void Go::SplineInterpolator::setHermiteConditions ( const Point & start_tangent, const Point & end_tangent ) [inline]`

Set the endpoint conditions to 'Hermite'; impose tangents at start and end of curve. **Note:** endpoint conditions are considered by the *virtual interpolate()* function. The other interpolate functions disregard this setting.

#### Parameters

<i>start_tangent</i>	the imposed tangent at the start of the curve
<i>end_tangent</i>	the imposed tangent at the end of the curve.

Definition at line 148 of file SplineInterpolator.h.

29.484.4.11 `void Go::SplineInterpolator::setNaturalConditions ( ) [inline]`

Set the endpoint conditions to 'Natural'; zero curvature at start and end of curve. **Note:** endpoint conditions are considered by the *virtual interpolate()* function. The other interpolate functions disregard this setting.

Definition at line 158 of file SplineInterpolator.h.

29.484.4.12 `void Go::SplineInterpolator::setNaturalEndCondition ( ) [inline]`

Set the endpoint condition at end of curve to 'Natural'. (Condition at start of curve will be 'Hermite' if a tangent has been previously specified, or 'Free' otherwise). **Note:** endpoint conditions are considered by the *virtual interpolate()* function. The other interpolate functions disregard this setting.

Definition at line 172 of file SplineInterpolator.h.

29.484.4.13 `void Go::SplineInterpolator::setNaturalStartCondition ( ) [inline]`

Set the endpoint condition at start of curve to 'Natural'. (Condition at end of curve will be 'Hermite' if a tangent has been previously specified, or 'Free' otherwise). **Note:** endpoint conditions are considered by the *virtual interpolate()* function. The other interpolate functions disregard this setting.

Definition at line 165 of file SplineInterpolator.h.

### 29.485.1 Detailed Description

`SplineSurface` provides methods for storing, reading and manipulating rational and non-rational B-spline surfaces.

Non-rational B-spline surfaces represented on the form

$$\sum_{i=1}^{n_1} \sum_{j=1}^{n_2} P_{i,j} B_{i,o_1}(u) B_{j,o_2}(v),$$

where the B-spline coefficients are stored in a vector called `coefs`. The `coefs` are stored as

$$P_{0,0}, P_{1,0}, \dots, P_{n_1,n_2},$$

where  $P_{i,j}$  is represented as `dim doubles`.

NURBS surfaces are represented on the form

$$\frac{\sum_{i=1}^{n_1} \sum_{j=1}^{n_2} w_{i,j} P_{i,j} B_{i,o_1}(u) B_{j,o_2}(v)}{\sum_{i=1}^{n_1} \sum_{j=1}^{n_2} w_{i,j} B_{i,o_1}(u) B_{j,o_2}(v)}$$

where  $B_{i,o}$  is the  $i$ 'th non-rational B-spline of order  $o$ . The Projected coefficients are stored in the `coefs` vector, i.e.

$$w_{0,0} \cdot P_{0,0}, w_{1,0} \cdot P_{1,0}, \dots, w_{n_1,n_2} \cdot P_{n_1,n_2}.$$

In addition the coefficients for the surface in projective space are kept, i.e

$$P_{0,0}, w_{0,0}, P_{1,0}, w_{1,0}, \dots, P_{n_1,n_2}, w_{n_1,n_2}.$$

With this representation surface is in the convex hull of the coefficients stored in `coefs` both for rational and non rational surfaces.

Definition at line 174 of file `SplineSurface.h`.

## 29.485.2 Member Typedef Documentation

### 29.485.2.1 typedef std::vector<Dvector> Go::SplineSurface::Dmatrix

Convenience to be used in computations of basis grids.

Definition at line 1103 of file SplineSurface.h.

### 29.485.2.2 typedef std::vector<double> Go::SplineSurface::Dvector

Convenience to be used in computations of basis grids.

Definition at line 1101 of file SplineSurface.h.

## 29.485.3 Member Enumeration Documentation

### 29.485.3.1 enum Go::SplineSurface::NormalConeMethod

Enumerates the method for computing the normal cone.

Enumerator

***SederbergMeyers***

***SMCornersFirst***

***sislBased***

Definition at line 400 of file SplineSurface.h.

## 29.485.4 Constructor & Destructor Documentation

### 29.485.4.1 Go::SplineSurface::SplineSurface ( ) `[inline]`

Creates an uninitialized [SplineSurface](#), which can only be assigned to or read(...) into.

Definition at line 179 of file SplineSurface.h.

### 29.485.4.2 template<typename Randomlterator1 , typename Randomlterator2 , typename Randomlterator3 > Go::SplineSurface::SplineSurface ( int *number1*, int *number2*, int *order1*, int *order2*, Randomlterator1 *knot1start*, Randomlterator2 *knot2start*, Randomlterator3 *coefsstart*, int *dim*, bool *rational* = false ) `[inline]`

Create a [SplineSurface](#) by explicitly providing all spline-related information.

Parameters

<i>number1</i>	number of control points along the u-parameter
<i>number2</i>	number of control points along the v-parameter
<i>order1</i>	<a href="#">BsplineBasis</a> order along the u-parameter
<i>order2</i>	<a href="#">BsplineBasis</a> order along the v-parameter
<i>knot1start</i>	pointer to the array describing the knotvector for the u-parameter
<i>knot2start</i>	pointer to the array describing the knotvector for the v-parameter
<i>coefsstart</i>	pointer to the array where the control points are consecutively stored. The storage order is such

Definition at line 210 of file SplineSurface.h.

```
29.485.4.3 template<typename RandomIterator > Go::SplineSurface::SplineSurface (const BsplineBasis & basis_u,
const BsplineBasis & basis_v, RandomIterator coefsstart, int dim, bool rational = false) [inline]
```

Create a [SplineSurface](#) by explicitly providing all spline-related information.

#### Parameters

<i>basis_u</i>	the <a href="#">BsplineBasis</a> to be used along the u-direction
<i>basis_v</i>	the <a href="#">BsplineBasis</a> to be used along the v-direction
<i>coefsstart</i>	pointer to the array where the control points are consecutively stored. The storage order is such that control points along the u-parameter have the shortest stride (stored right after each other). If the surface is rational, pay attention to the comments below.
<i>dim</i>	dimension of the space in which the surface lies (usually 3).
<i>rational</i>	Specify whether the surface is rational or not. If the surface is rational, coefficients must be in the following format: wP1 wP2 .... wPdim w. I.e. a (dim+1)-dimensional form. (This is the same form that is used within SISL).

Definition at line 254 of file SplineSurface.h.

```
29.485.4.4 virtual Go::SplineSurface::~~SplineSurface () [virtual]
```

Virtual destructor, enables safe inheritance.

## 29.485.5 Member Function Documentation

```
29.485.5.1 void Go::SplineSurface::add (const SplineSurface * other, double tol = 1.0e-10)
```

Add coefficients from another surface. Weights are not summed for rational cases Nothing is done and exception is raised if

- Spline spaces are different in any parameter direction (order or knot vectors are not identical)
- The geometry spaces of the surfaces have different dimension
- One surface is rational while the other is not
- The weights are not equal within a given tolerance (only if surfaces are rational)

#### Parameters

<i>other</i>	The other spline surface with coefficients to be added into this surface
<i>tol</i>	tolerance used to test if weights are considered equal in rational case

29.485.5.2 `virtual std::vector<CurveLoop> Go::SplineSurface::allBoundaryLoops ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const` [virtual]

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

#### Parameters

<i>degenerate_epsilon</i>	edges whose length is smaller than this value are ignored.
---------------------------	------------------------------------------------------------

#### Returns

a vector containing CurveLoops. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

29.485.5.3 `double Go::SplineSurface::appendSurface ( ParamSurface * sf, int join_dir, int continuity, double & dist, bool repar = true )`

Appends a surface to the end of 'this' surface along a specified parameter direction. The knotvector and control point grid of 'this' surface will be extended, and the degree will be raised if necessary. Note that there *will* be side-effects on the other surface; its order might be raised, its knotvector will become k-regular and reparametrized, one of its edges will be moved to coincide with an edge of 'this' surface, etc.

#### Parameters

<i>sf</i>	the surface to append to 'this' surface
<i>join_dir</i>	the parameter direction along which to extend 'this' surface by appending the 'sf' surface. If it is equal to 1, we will extend the surface along the u-parameter; if it equals 2, we will extend the surface along the v-parameter.
<i>continuity</i>	the desired level of continuity at the transition between the two surfaces (can be from -1 to order()). The higher the value, the more the surfaces will have to be locally modified around the seam.
<i>dist</i>	upon function return, this variable will hold the estimated maximum distortion after the 'smoothing' of the seam in order to achieve the desired continuity.
<i>repar</i>	The parametrization of the concerned parameter in the other surface will <i>always</i> be shifted so that it starts where the parametrization of 'this' surface ends. However, if 'repar' is set to 'true', it will also be <i>scaled</i> as a function of position of control points close to the transition.
<i>return</i>	Set in the rational case. Maximum adjustment of input weight

29.485.5.4 `void Go::SplineSurface::appendSurface ( ParamSurface * sf, int join_dir, bool repar = true )`

Short hand function to call [appendSurface](#) with  $C^1$  continuity.

#### Parameters

<i>sf</i>	the surface to append to 'this' surface
<i>join_dir</i>	the parameter direction along which to extend 'this' surface by appending the 'sf' surface. If it is equal to 1, we will extend the surface along the u-parameter; if it equals 2, we will extend the surface along the v-parameter.

## Parameters

<i>repar</i>	The parametrization of the concerned parameter in the other surface will <i>always</i> be shifted so that it starts where the parametrization of 'this' surface ends. However, if 'repar' is set to 'true', it will also be <i>scaled</i> as a function of position of control points close to the transition.
--------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

29.485.5.5 `virtual double Go::SplineSurface::area ( double tol ) const [virtual]`

Compute the total area of this surface up to some tolerance

## Parameters

<i>tol</i>	the relative tolerance when approximating the area, i.e. stop iteration when error becomes smaller than $tol/(surface\ area)$
------------	-------------------------------------------------------------------------------------------------------------------------------

## Returns

the area calculated

Implements [Go::ParamSurface](#).

29.485.5.6 `virtual SplineSurface* Go::SplineSurface::asSplineSurface ( ) [inline],[virtual]`

Return the spline surface represented by this surface, if any.

Reimplemented from [Go::ParamSurface](#).

Definition at line 312 of file SplineSurface.h.

29.485.5.7 `const BsplineBasis& Go::SplineSurface::basis ( int i ) const [inline]`

get one of the BsplineBasises of the surface

## Parameters

<i>i</i>	specify whether to return the <a href="#">BsplineBasis</a> for the first parameter (0), or for the second parameter (1).
----------	--------------------------------------------------------------------------------------------------------------------------

## Returns

const reference to the requested [BsplineBasis](#).

Definition at line 659 of file SplineSurface.h.

29.485.5.8 `const BsplineBasis& Go::SplineSurface::basis_u ( ) const [inline]`

get a const reference to the [BsplineBasis](#) for the first parameter

**Returns**

const reference to the [BsplineBasis](#) for the first parameter

Definition at line 637 of file SplineSurface.h.

**29.485.5.9 BsplineBasis& Go::SplineSurface::basis\_u( ) [inline]**

get a reference to the [BsplineBasis](#) for the first parameter

**Returns**

reference to the [BsplineBasis](#) for the first parameter

Definition at line 647 of file SplineSurface.h.

**29.485.5.10 const BsplineBasis& Go::SplineSurface::basis\_v( ) const [inline]**

get a const reference to the [BsplineBasis](#) for the second parameter

**Returns**

const reference to the [BsplineBasis](#) for the second parameter

Definition at line 642 of file SplineSurface.h.

**29.485.5.11 BsplineBasis& Go::SplineSurface::basis\_v( ) [inline]**

get a reference to the [BsplineBasis](#) for the second parameter

**Returns**

reference to the [BsplineBasis](#) for the second parameter

Definition at line 652 of file SplineSurface.h.

**29.485.5.12 int Go::SplineSurface::boundaryIndex ( Point & param\_pt1, Point & param\_pt2 ) const**

If the two points pt1 and pt2 are on the same edge the edge index is returned, otherwise -1 is returned. Edges are counted anticlockwise, and starts with the edge (upar, 0). find whether two points are lying on the same surface boundary; if this is the case, return the index of the boundary (as specified in [getBoundaryIdx\(\)](#)), else return 1

**Returns**

The boundary index on which the points lie, if they are found to both lie on the same boundary. In the opposite case, -1 is returned.

29.485.5.13 `virtual BoundingBox Go::SplineSurface::boundingBox ( ) const [virtual]`

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.485.5.14 `bool Go::SplineSurface::checkElementarySurface ( )`

Check to see if `this` corresponds to the [ElementarySurface](#) set by [setElementarySurface\(\)](#). NOTE: Not yet implemented!

29.485.5.15 `static ClassType Go::SplineSurface::classType ( ) [inline],[static]`

Definition at line 301 of file `SplineSurface.h`.

29.485.5.16 `virtual SplineSurface* Go::SplineSurface::clone ( ) const [inline],[virtual]`

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

Returns

pointer to cloned object

Implements [Go::ParamSurface](#).

Definition at line 307 of file `SplineSurface.h`.

29.485.5.17 `virtual void Go::SplineSurface::closestBoundaryPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * rd = NULL, double * seed = 0 ) const [virtual]`

Iterates to the closest point to `pt` on the boundary of the surface.

See also

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

29.485.5.18 `virtual Point Go::SplineSurface::closestInDomain ( double u, double v ) const [virtual]`

Fetch the parameter value in the parameter domain of the surface closest to the parameter pair (u,v)

Implements [Go::ParamSurface](#).

29.485.5.19 `virtual void Go::SplineSurface::closestPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * domain_of_interest = NULL, double * seed = 0 ) const [virtual]`

Iterates to the closest point to `pt` on the surface.

## Parameters

<i>pt</i>	the point to find the closest point to
<i>clo_u</i>	u parameter of the closest point
<i>clo_v</i>	v parameter of the closest point
<i>clo_pt</i>	the geometric position of the closest point
<i>clo_dist</i>	the distance between pt and clo_pt
<i>epsilon</i>	parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)
<i>domain_of_interest</i>	pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched.
<i>seed</i>	pointer to parameter values where iteration starts.

Reimplemented from [Go::ParamSurface](#).

**29.485.5.20** `std::vector<double>::iterator Go::SplineSurface::coefs_begin ( ) [inline]`

Get an iterator to the start of the internal array of non-rational control points.

## Returns

an (nonconst) iterator to the start of the internal array of non-rational control points

Definition at line 705 of file SplineSurface.h.

**29.485.5.21** `std::vector<double>::const_iterator Go::SplineSurface::coefs_begin ( ) const [inline]`

Get a const iterator to the start of the internal array of non-rational control points.

## Returns

a const iterator to the start of the internal array of non-rational control points.

Definition at line 719 of file SplineSurface.h.

**29.485.5.22** `std::vector<double>::iterator Go::SplineSurface::coefs_end ( ) [inline]`

Get an iterator to the one-past-end position of the internal array of non-rational control points

## Returns

an (nonconst) iterator to the one-past-end position of the internal array of non-rational control points

Definition at line 712 of file SplineSurface.h.

29.485.5.23 `std::vector<double>::const_iterator Go::SplineSurface::coefs_end ( ) const` `[inline]`

Get a const iterator to the one-past-end position of the internal array of non-rational control points.

#### Returns

a const iterator to the one-past-end position of the internal array of non-rational control points.

Definition at line 726 of file SplineSurface.h.

29.485.5.24 `virtual CompositeBox Go::SplineSurface::compositeBox ( ) const` `[virtual]`

Creates a composite box enclosing the surface. The composite box consists of an inner and an edge box. The inner box is supposed to be made from the interior of the surface, while the edge box is made from the boundary curves. The default implementation simply makes both boxes identical to the regular bounding box.

#### Returns

the [CompositeBox](#) of the surface, as specified above

Reimplemented from [Go::ParamSurface](#).

29.485.5.25 `void Go::SplineSurface::computeBasis ( double param[], std::vector< double > & basisValues, std::vector< double > & basisDerivs_u, std::vector< double > & basisDerivs_v, bool evaluate_from_right = true ) const`

Evaluate positions and first derivatives of all basis values in a given parameter pair For non-rationals this is an interface to [BsplineBasis::computeBasisValues](#) where the basis values in each parameter direction are multiplied to compute  $B_i(u) \cdot B_j(v)$ , for rationals the routine evaluates the rational basis functions, i.e. the basis functions are divided by the denominator of the surface in the given parameter direction

#### Parameters

<i>param</i>	the parameter pair in which to compute
<i>basisValues</i>	the value of all basis functions, size equal to $(\text{degree}_u+1) \cdot (\text{degree}_v+1)$
<i>basisDerivs</i>	the derivative of all basis functions, same size as previous
<i>evaluate_from_right</i>	specifies directional derivatives, true=right, false=left, same behaviour for both parameter directions

29.485.5.26 `void Go::SplineSurface::computeBasis ( const std::vector< double >::const_iterator & bas_vals_u, const std::vector< double >::const_iterator & bas_vals_v, int left_u, int left_v, std::vector< double > & basisValues, std::vector< double > & basisDerivs_u, std::vector< double > & basisDerivs_v ) const`

Evaluate positions and first derivatives of all basis values, when the B-splines and their derivatives have all been precalculated and are given as input

## Parameters

<i>bas_vals</i> <sub>↔</sub> <i>_u</i>	the basis values and derivatives in first parameter direction
<i>bas_vals</i> <sub>↔</sub> <i>_v</i>	the basis values and derivatives in second parameter direction
<i>left_u</i>	index of first non-zero interval in first parameter direction
<i>left_v</i>	index of first non-zero interval in second parameter direction
<i>basisValues</i>	the value of all basis functions, size equal to (degree_u+1)*(degree_v+1)
<i>basisDerivs</i>	the derivative of all basis functions, same size as previous

29.485.5.27 void Go::SplineSurface::computeBasis ( double *param\_u*, double *param\_v*, BasisPtsSf & *result* ) const

Compute basis values (position) in the parameter (*param\_u*,*param\_v*). Store result in a [BasisPtsSf](#) entity

29.485.5.28 void Go::SplineSurface::computeBasis ( double *param\_u*, double *param\_v*, BasisDerivsSf & *result*, bool *evaluate\_from\_right* = true ) const

Compute basis values (position and 1. derivatives) in the parameter (*param\_u*,*param\_v*). Store result in a [BasisDerivsSf](#) entity

29.485.5.29 void Go::SplineSurface::computeBasis ( double *param\_u*, double *param\_v*, BasisDerivsSf2 & *result*, bool *evaluate\_from\_right* = true ) const

Compute basis values (position and 1. and 2. derivatives) in the parameter (*param\_u*,*param\_v*). Store result in a [BasisDerivsSf2](#) entity

29.485.5.30 void Go::SplineSurface::computeBasisGrid ( const Dvector & *param\_u*, const Dvector & *param\_v*, Dmatrix & *basisValues* ) const

Evaluate positions of all basis values in a specified grid. For non-rationals this is an interface to [BsplineBasis::computeBasisValues](#) where the basis values in each parameter direction are multiplied to compute  $B_i(u)*B_j(v)$ , for rationals the routine evaluates the rational basis functions, i.e. the basis functions are divided by the denominator of the surface in the given parameter direction

## Parameters

<i>param_u</i>	this vector holds all the numerical values for the first parameter where evaluation will take place
<i>param_v</i>	this vector holds all the numerical values for the second parameter where evaluation will take place
<i>basisValues</i>	the value of all basis functions. The first matrix dimension will correspond to all evaluation parameters, i.e. the size is <i>param_u</i> .size()* <i>param_v</i> .size(). The second dimension correspond to all coefficients, i.e. <i>nmb_coef_u</i> * <i>nmb_coef_v</i> . Most entries in the matrix will be zero

29.485.5.31 `void Go::SplineSurface::computeBasisGrid ( const Dvector & param_u, const Dvector & param_v, std::vector< BasisPtsSf > & result ) const`

Compute basis grid (position) in the parameter pairs combined from param\_u and param\_v. Store result in a vector of [BasisPtsSf](#).

29.485.5.32 `void Go::SplineSurface::computeBasisGrid ( const Dvector & param_u, const Dvector & param_v, Dmatrix & basisValues, Dmatrix & basisDerivs_u, Dmatrix & basisDerivs_v, bool evaluate_from_right = true ) const`

Evaluate positions and first derivatives of all basis values in a specified grid. For non-rationals this is an interface to [BsplineBasis::computeBasisValues](#) where the basis values in each parameter direction are multiplied to compute  $B_i(u) \cdot B_j(v)$ , for rationals the routine evaluates the rational basis functions, i.e. the basis functions are divided by the denominator of the surface in the given parameter direction

#### Parameters

<i>param_u</i>	this vector holds all the numerical values for the first parameter where evaluation will take place
<i>param_v</i>	this vector holds all the numerical values for the second parameter where evaluation will take place
<i>basisValues</i>	the value of all basis functions. The first matrix dimension will correspond to all evaluation parameters, i.e. the size is <code>param_u.size()*param_v.size()</code> . The second dimension correspond to all coefficients, i.e. <code>nmb_coef_u*nmb_coef_v</code> . Most entries in the matrix will be zero
<i>basisDerivs_u</i>	the derivative of all basis functions, size as above
<i>basisDerivs_v</i>	the derivative of all basis functions
<i>evaluate_from_right</i>	specifies directional derivatives, true=right, false=left

29.485.5.33 `void Go::SplineSurface::computeBasisGrid ( const Dvector & param_u, const Dvector & param_v, std::vector< BasisDerivsSf > & result, bool evaluate_from_right = true ) const`

Compute basis grid (position and 1. derivatives) in the parameter pairs combined from param\_u and param\_v. Store result in a vector of [BasisDerivSf](#).

29.485.5.34 `void Go::SplineSurface::computeBasisGrid ( const Dvector & param_u, const Dvector & param_v, std::vector< BasisDerivsSf2 > & result, bool evaluate_from_right = true ) const`

Compute basis grid (position and 1. and 2. derivatives) in the parameter pairs combined from param\_u and param\_v. Store result in a vector of [BasisDerivSf2](#).

29.485.5.35 `SplineCurve* Go::SplineSurface::constParamCurve ( double parameter, bool pardir_is_u ) const`

Generate and return a [SplineCurve](#) that represents a constant parameter curve on the surface

#### Parameters

<i>parameter</i>	value of the fixed parameter
<i>pardir_is_u</i>	'true' if the first parameter is the running parameter, 'false' otherwise.

## Returns

pointer to a newly constructed [SplineCurve](#) representing the specified constant parameter curve. It is the user's responsibility to delete it when it is no longer needed.

```
29.485.5.36 void Go::SplineSurface::constParamCurve (double parameter, bool pdir_is_u, SplineCurve *& cv, SplineCurve *& crosscv) const
```

Generate and return two SplineCurves, representing a constant parameter curve on the surface as well as its cross-tangent curve.

## Parameters

<i>parameter</i>	value of the fixed parameter
<i>pdir_is_u</i>	'true' if the first parameter is the running parameter, 'false' otherwise.
<i>cv</i>	upon function completion, 'cv' will point to a newly constructed <a href="#">SplineCurve</a> representing the specified constant parameter curve. It is the user's responsibility to delete it when it is no longer needed.
<i>crosscv</i>	upon function completion, 'crosscv' will point to a newly constructed <a href="#">SplineCurve</a> representing the cross-tangent curve of the specified constant parameter curve. It is the user's responsibility to delete it when it is no longer needed.

```
29.485.5.37 virtual std::vector< shared_ptr<ParamCurve> > Go::SplineSurface::constParamCurves (double parameter, bool pdir_is_u) const [virtual]
```

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

## Parameters

<i>parameter</i>	parameter value for the constant parameter (either u or v)
<i>pdir_is_u</i>	specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one.

## Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

```
29.485.5.38 virtual RectDomain Go::SplineSurface::containingDomain () const [virtual]
```

Get a rectangular parameter domain that is guaranteed to contain the surface's [parameterDomain\(\)](#). It may be the same. There is no guarantee that this is the smallest domain containing the actual domain.

## Returns

a [RectDomain](#) that is guaranteed to include the surface's total parameter domain.

Implements [Go::ParamSurface](#).

29.485.5.39 `std::vector<double>::iterator Go::SplineSurface::ctrl_begin ( )` [inline]

Get an iterator to the start of the internal array of active control points.

**Returns**

an (nonconst) iterator to the start of the internal array of rational or non-rational control points

Definition at line 761 of file SplineSurface.h.

29.485.5.40 `std::vector<double>::const_iterator Go::SplineSurface::ctrl_begin ( ) const` [inline]

Get a const iterator to the start of the internal array of active control points.

**Returns**

a const iterator to the start of the internal array of rational or non-rational control points.

Definition at line 775 of file SplineSurface.h.

29.485.5.41 `std::vector<double>::iterator Go::SplineSurface::ctrl_end ( )` [inline]

Get an iterator to the one-past-end position of the internal array of active control points

**Returns**

an (nonconst) iterator to the one-past-end position of the internal array of rational or non-rational control points

Definition at line 768 of file SplineSurface.h.

29.485.5.42 `std::vector<double>::const_iterator Go::SplineSurface::ctrl_end ( ) const` [inline]

Get a const iterator to the one-past-end position of the internal array of active control points.

**Returns**

a const iterator to the one-past-end position of the internal array of rational or non-rational control points.

Definition at line 782 of file SplineSurface.h.

29.485.5.43 `void Go::SplineSurface::deform ( const std::vector< double > & vec, int vdim = 0 )`

Adds the given deformation vector to the coefficients.

29.485.5.44 `SplineSurface* Go::SplineSurface::derivSurface ( int ider1, int ider2 ) const`

Get the derivative surface. Expresses the i,j-th derivative of a spline surface as a spline surface. Ported from sisl routine s1386.

## Parameters

<i>ider1</i>	what derivative to use along the u parameter
<i>ider2</i>	what derivative to use along the v parameter

## Returns

pointer to a newly constructed [SplineSurface](#) which is the derivative surface. User assumes ownership of this object, and is responsible for destroying it.

**29.485.5.45** `virtual int Go::SplineSurface::dimension ( ) const` `[virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

**29.485.5.46** `SplineCurve* Go::SplineSurface::edgeCurve ( int ccw_edge_number ) const`

Here `edge_number` means: 0 -> bottom edge, 1 -> right edge, 2 -> top edge and 3 -> left edge. The returned pointer is new'ed and the responsibility of the caller. You should either delete it, or manage it with a smart pointer. Generate and return a [SplineCurve](#) representing one of the surface's four edges.

## Parameters

<i>ccw_edge_number</i>	indicates which edge the user requests.
------------------------	-----------------------------------------

## Returns

A pointer to a newly constructed [SplineCurve](#) representing the requested edge. It is the user's responsibility to delete it when it is no longer needed.

**29.485.5.47** `virtual int Go::SplineSurface::ElementBoundaryStatus ( int elem_ix, double eps )` `[inline],[virtual]`

Check if a polynomial element (for spline surfaces) intersects the (trimming) boundaries of this [ftSurface](#), is inside or outside

## Parameters

<i>elem_ix</i>	Element index counted according to distinct knot values. Sequence of coordinates: x runs fastest, then y
<i>eps</i>	Intersection tolerance

## Returns

-1: Not a spline surface or element index out of range 0: Outside trimmed volume 1: On boundary (intersection with boundary found) 2: Internal to trimmed surfaces Note that a touch with the boundaries of the underlying surface is not considered a boundary intersection while touching a trimming curve is seen as an intersection

Reimplemented from [Go::ParamSurface](#).

Definition at line 1274 of file SplineSurface.h.

**29.485.5.48** `virtual int Go::SplineSurface::ElementOnBoundary ( int elem_ix, double eps ) [inline], [virtual]`

Check if a polynomial element (for spline surfaces) intersects the (trimming) boundaries of this surface

#### Parameters

<i>elem_ix</i>	Element index counted according to distinct knot values. Sequence of coordinates: x runs fastest, then y
<i>eps</i>	Intersection tolerance

#### Returns

-1: Not a spline surface or element index out of range  
 0: Not on boundary or touching a boundary curve  
 1: On boundary (intersection with boundary found)  
 Note that a touch with the boundaries of the underlying surfaces is not considered a boundary intersection while touching a trimming curve is seen as an intersection

Reimplemented from [Go::ParamSurface](#).

Definition at line 1257 of file SplineSurface.h.

**29.485.5.49** `double Go::SplineSurface::endparam ( int idx ) const [inline]`

Get the end parameter value for the parameter direction *idx*.

Definition at line 388 of file SplineSurface.h.

**29.485.5.50** `virtual double Go::SplineSurface::endparam_u ( ) const [virtual]`

Get the end value for the u-parameter

#### Returns

the end value for the u-parameter

**29.485.5.51** `virtual double Go::SplineSurface::endparam_v ( ) const [virtual]`

Get the end value for the v-parameter

#### Returns

the end value for the v-parameter

29.485.552 virtual void Go::SplineSurface::evalGrid ( int num\_u, int num\_v, double umin, double umax, double vmin, double vmax, std::vector< double > & points, double nodata\_val = -9999 ) const [virtual]

Evaluate points in a grid The nodata value is applicable for bounded surfaces and will not be used in this context

Reimplemented from [Go::ParamSurface](#).

29.485.553 void Go::SplineSurface::getBoundaryIdx ( Point & pt1, Point & pt2, double epsilon, int & bindex, double & par1, double & par2, double knot\_tol = 1e-05 ) const

Given two points on the surface boundary, find the number of the corresponding boundary and the curve parameter of the closest points on this surface boundary.

Ordering of boundaries:

**Parameters**

pt1	point in geometry space
pt2	point in geometry space
epsilon	geometric tolerance
bindex	if the two points are on a common boundary, the index of the boundary, otherwise -1.
par1	if bindex is 0 or 1, the u parameter of pt1, otherwise the v parameter.
par2	if bindex is 0 or 1, the u parameter of pt2, otherwise the v parameter.
knot_tol	tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.

29.485.554 void Go::SplineSurface::getBoundaryIdx ( Point & pt1, double epsilon, int & bindex, double knot\_tol = 1e-05 ) const

Given one point on the surface boundary, find the index number of the.

**Parameters**

pt1	the point we want to find the boundary for
epsilon	the geometric distance the point can have from a boundary and still be considered as laying on the boundary.
bindex	the index of the boundary on which the point lies. If the point was found not to lie on any boundary, the value will be -1.
knot_tol	tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.

29.485.555 `virtual void Go::SplineSurface::getBoundaryInfo ( Point & pt1, Point & pt2, double epsilon, SplineCurve *& cv, SplineCurve *& crosscv, double knot_tol = 1e-05 ) const` [virtual]

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

#### Parameters

<i>pt1</i>	the first point on the boundary, given by the user
<i>pt2</i>	the second point on the boundary, given by the user
<i>epsilon</i>	the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.
<i>cv</i>	upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.
<i>crosscv</i>	upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary.
<i>knot_tol</i>	tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.

Implements [Go::ParamSurface](#).

29.485.556 `void Go::SplineSurface::getBoundaryInfo ( double par1, double par2, int bdindex, SplineCurve *& cv, SplineCurve *& crosscv, double knot_tol = 1e-05 ) const`

Get the boundary curve and the outward cross tangent curve between two parameter values on a given boundary.

#### Parameters

<i>par1</i>	first parameter along the boundary
<i>par2</i>	second parameter along the boundary
<i>bdindex</i>	index of the boundary in question. The boundaries are indexed as in <a href="#">getBoundaryIdx()</a> .
<i>cv</i>	returns a pointer to a generated <a href="#">SplineCurve</a> representing the boundary between the given parameters. The user assumes ownership and is responsible for deletion.
<i>crosscv</i>	returns a pointer to a generated <a href="#">SplineCurve</a> representing the cross tangent curve between the given parameters on the boundary. The direction is outwards from the surface. The user assumes ownership and is responsible for deletion.
<i>knot_tol</i>	tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.

29.485.557 `void Go::SplineSurface::getConstParamCurves ( const std::vector< double > & params_u, const std::vector< double > & params_v, std::vector< shared_ptr< SplineCurve > > & curves_u, std::vector< shared_ptr< SplineCurve > > & curves_v )`

Generate SplineCurves that represents constant parameter curves on the surface. Do this for both directions

## Parameters

<i>parameter</i>	params_u the parameter values in u-directions for curves running along the v-direction
<i>parameter</i>	params_v the parameter values in v-directions for curves running along the u-direction
<i>curves_u</i>	upon function return, holds constant parameter curves for the u-direction parameters, the curves are running along the v-direction
<i>curves_v</i>	upon function return, holds constant parameter curves for the v-direction parameters, the curves are running along the u-direction

29.485.5.58 `virtual void Go::SplineSurface::getCornerPoints ( std::vector< std::pair< Point, Point > > & corners ) const`  
[virtual]

Return surface corners, geometric and parametric points in that sequence

Implements [Go::ParamSurface](#).

29.485.5.59 `virtual void Go::SplineSurface::getDegenerateCorners ( std::vector< Point > & deg_corners, double tol ) const`  
[virtual]

Check for paralell and anti paralell partial derivatives in surface corners.

Implements [Go::ParamSurface](#).

29.485.5.60 `shared_ptr<ElementarySurface> Go::SplineSurface::getElementarySurface ( )`

Get shared pointer to [ElementarySurface](#), if it exists. If not, return empty shared pointer.

NOTE: The [ElementarySurface](#) returned by this function should ideally be the one corresponding to the current [SplineSurface](#). However, there is no guarantee for this. One may check to see if this is the case by using [checkElementarySurface\(\)](#).

29.485.5.61 `std::vector<shared_ptr<SplineCurve> > Go::SplineSurface::getElementBdParCvs ( int elem_ix, double elem_par[] )`

Fetch curves in the parameter domain surrounding the specified element elem\_par - parameter values of element boundaries, sequence umin, umax, vmin, vmax

29.485.5.62 `void Go::SplineSurface::getWeights ( std::vector< double > & weights ) const`

Return all weights corresponding to this surface, a non-rational volume has all weights equal to one

29.485.5.63 `void Go::SplineSurface::gridEvaluator ( int num_u, int num_v, std::vector< double > & points, std::vector< double > & normals, std::vector< double > & param_u, std::vector< double > & param_v, bool normalize = true ) const`

Evaluate points and normals on an entire grid, taking computational advantage over calculating all these values simultaneously rather than one-by-one.

## Parameters

<i>num_u</i>	number of values to evaluate along first parameter direction
<i>num_v</i>	number of values to evaluate along second parameter direction
<i>points</i>	upon function return, this vector holds all the evaluated points
<i>normals</i>	upon function return, this vector holds all the evaluated normals
<i>param</i> <sub>↔</sub> <i>_u</i>	upon function return, this vector holds all the numerical values for the first parameter where evaluation has taken place
<i>param</i> <sub>↔</sub> <i>_v</i>	upon function return, this vector holds all the numerical values for the second parameter where evaluation has taken place.
<i>normalize</i>	tells whether the normal vectors should be normalized

```
29.485.5.64 void Go::SplineSurface::gridEvaluator (int num_u, int num_v, std::vector< double > & points, std::vector< double > & param_u, std::vector< double > & param_v) const [inline]
```

Evaluate points on an entire grid, taking computational advantage over calculating all these values simultaneously rather than one-by-one.

## Parameters

<i>num_u</i>	number of values to evaluate along first parameter direction
<i>num_v</i>	number of values to evaluate along second parameter direction
<i>points</i>	upon function return, this vector holds all the evaluated points
<i>param</i> <sub>↔</sub> <i>_u</i>	upon function return, this vector holds all the numerical values for the first parameter where evaluation has taken place
<i>param</i> <sub>↔</sub> <i>_v</i>	upon function return, this vector holds all the numerical values for the second parameter where evaluation has taken place.

Definition at line 1003 of file SplineSurface.h.

```
29.485.5.65 void Go::SplineSurface::gridEvaluator (int num_u, int num_v, std::vector< double > & points, std::vector< double > & param_u, std::vector< double > & param_v, double start_u, double end_u, double start_v, double end_v) const
```

Evaluate points on an entire grid, taking computational advantage over calculating all these values simultaneously rather than one-by-one.

## Parameters

<i>num_u</i>	number of values to evaluate along first parameter direction
<i>num_v</i>	number of values to evaluate along second parameter direction
<i>points</i>	upon function return, this vector holds all the evaluated points
<i>param</i> <sub>↔</sub> <i>_u</i>	upon function return, this vector holds all the numerical values for the first parameter where evaluation has taken place
<i>param</i> <sub>↔</sub> <i>_v</i>	upon function return, this vector holds all the numerical values for the second parameter where evaluation has taken place.
<i>start_u</i>	start value of first parameter range
<i>end_u</i>	end value of first parameter range
<i>start_v</i>	start value of second parameter range
<i>end_v</i>	end value of second parameter range

29.485.5.66 `void Go::SplineSurface::gridEvaluator ( std::vector< double > & points, const std::vector< double > & param_u, const std::vector< double > & param_v ) const`

Evaluate points on an entire grid, taking computational advantage over calculating all these values simultaneously rather than one-by-one.

#### Parameters

<i>points</i>	upon function return, this vector holds all the evaluated points
<i>param_u</i>	this vector holds all the numerical values for the first parameter where evaluation should take place
<i>param_v</i>	this vector holds all the numerical values for the second parameter where evaluation should take place

29.485.5.67 `void Go::SplineSurface::gridEvaluator ( const std::vector< double > & params_u, const std::vector< double > & params_v, std::vector< double > & points, std::vector< double > & derivs_u, std::vector< double > & derivs_v, bool evaluate_from_right = true ) const`

Evaluate points and derivatives on an entire grid, taking computational advantage over calculating all these values simultaneously rather than one-by-one.

#### Parameters

<i>params_u</i>	the values for the first parameter where evaluation takes place
<i>params_v</i>	the values for the second parameter where evaluation takes place
<i>points</i>	upon function return, this vector holds all the evaluated points
<i>derivs_u</i>	upon function return, this vector holds all derivations w.r.t. u
<i>derivs_v</i>	upon function return, this vector holds all derivations w.r.t. v
<i>evaluate_from_right</i>	specifies directional derivatives, true=right, false=left, same behaviour for both parameter directions

29.485.5.68 `virtual bool Go::SplineSurface::inDomain ( double u, double v, double eps = 1.0e-4 ) const`  
[virtual]

Check if a parameter pair lies inside the domain of this surface.

Implements [Go::ParamSurface](#).

29.485.5.69 `virtual int Go::SplineSurface::inDomain2 ( double u, double v, double eps = 1.0e-4 ) const`  
[virtual]

Check if a parameter pair lies inside the domain of this surface return value = 0: outside = 1: internal = 2: at the boundary

Implements [Go::ParamSurface](#).

29.485.5.70 `void Go::SplineSurface::insertKnot_u ( double apar )`

Insert a new knot in the knotvector of the first parameter

## Parameters

<i>apar</i>	the parameter value at which a new knot will be inserted
-------------	----------------------------------------------------------

29.485.5.71 void Go::SplineSurface::insertKnot\_u ( const std::vector< double > & new\_knots )

Insert new knots in the knotvector of the first parameter

## Parameters

<i>new_knots</i>	a vector containing the parameter values of the new knots to insert.
------------------	----------------------------------------------------------------------

29.485.5.72 void Go::SplineSurface::insertKnot\_v ( double apar )

Insert a new knot in the knotvector of the second parameter

## Parameters

<i>apar</i>	the parameter value at which a new knot will be inserted
-------------	----------------------------------------------------------

29.485.5.73 void Go::SplineSurface::insertKnot\_v ( const std::vector< double > & new\_knots )

Insert new knots in the knotvector of the second parameter

## Parameters

<i>new_knots</i>	a vector containing the parameter values of the new knots to insert.
------------------	----------------------------------------------------------------------

29.485.5.74 virtual **ClassType** Go::SplineSurface::instanceType ( ) const [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.485.5.75 void Go::SplineSurface::interpolate ( Interpolator & interpolator1, Interpolator & interpolator2, int num\_points1, int num\_points2, int dim, const double \* param1\_start, const double \* param2\_start, const double \* data\_start )

Remake 'this'surface to interpolate (or approximate) a given point grid.

## Parameters

<i>interpolator1</i>	<a href="#">Interpolator</a> to apply to the first parameter direction
----------------------	------------------------------------------------------------------------

## Parameters

<i>interpolator2</i>	<a href="#">Interpolator</a> to apply to the second parameter direction
<i>num_points1</i>	number of points to interpolate along the first parameter direction
<i>num_points2</i>	number of points to interpolate along the second parameter direction
<i>dim</i>	dimension of the points to interpolate (usually 3)
<i>param1_start</i>	pointer to the start of the input grid's parametrization along the first parameter
<i>param2_start</i>	pointer to the start of the input grid's parametrization along the second parameter
<i>data_start</i>	pointer to the start of the storage array for the data point grid to interpolate

29.485.5.76 `virtual bool Go::SplineSurface::isAxisRotational ( Point & centre, Point & axis, Point & vec, double & angle )`  
`[virtual]`

Check if the surface is axis rotational. Only true if a connection to an axis rotational elementary surface exist

Reimplemented from [Go::ParamSurface](#).

29.485.5.77 `virtual bool Go::SplineSurface::isDegenerate ( bool & b, bool & r, bool & t, bool & l, double tolerance )`  
`const [virtual]`

The order of the edge indicators (bottom, right, top, left) matches the `edge_number` of [edgeCurve\(\)](#). Query whether any of the four boundary curves are degenerate (zero length) within a certain tolerance. In the below, we refer to 'u' as the first parameter and 'v' as the second.

## Parameters

<i>b</i>	'true' upon return of function if the boundary ( $v = v_{\min}$ ) is degenerate
<i>r</i>	'true' upon return of function if the boundary ( $v = v_{\max}$ ) is degenerate
<i>t</i>	'true' upon return of function if the boundary ( $u = u_{\min}$ ) is degenerate
<i>l</i>	'true' upon return of function if the boundary ( $u = u_{\max}$ ) is degenerate
<i>tolerance</i>	boundaries are considered degenerate if their length is shorter than this value, given by the user

## Returns

'true' if at least one boundary curve was found to be degenerate, 'false' otherwise.

Reimplemented from [Go::ParamSurface](#).

29.485.5.78 `bool Go::SplineSurface::isElementarySurface ( )` `[inline]`

Query if the surface was generated from an [ElementarySurface](#).

Definition at line 1286 of file `SplineSurface.h`.

29.485.5.79 `virtual bool Go::SplineSurface::isPlanar ( Point & normal, double tol )` `[virtual]`

This surface is planar if it represents a plane or the spline surface is linear in both parameter direction and planar

Reimplemented from [Go::ParamSurface](#).

29.485.5.80 `virtual bool Go::SplineSurface::isSpline ( ) const [inline],[virtual]`

Check if the surface is of type spline.

Reimplemented from [Go::ParamSurface](#).

Definition at line 1210 of file SplineSurface.h.

29.485.5.81 `double Go::SplineSurface::knotSpan ( int pardir, int iknot ) const`

Returns the size of the knot interval (knot[*iknot*],knot[*iknot*+1]) in the specified direction. An index outside the legal range will result in a zero knot span

29.485.5.82 `void Go::SplineSurface::makeBernsteinKnotsU ( )`

Inserts knots in the u knot vector, such that all knots have multiplicity order

29.485.5.83 `void Go::SplineSurface::makeBernsteinKnotsV ( )`

Inserts knots in the v knot vector, such that all knots have multiplicity order

29.485.5.84 `void Go::SplineSurface::makeSurfaceKRegular ( )`

Ensure k-regularity of this surface in both parameter directions.

29.485.5.85 `virtual SplineSurface* Go::SplineSurface::mirrorSurface ( const Point & pos, const Point & norm ) const [virtual]`

Mirror a surface around a specified plane.

Reimplemented from [Go::ParamSurface](#).

29.485.5.86 `virtual double Go::SplineSurface::nextSegmentVal ( int dir, double par, bool forward, double tol ) const [virtual]`

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0 or 1)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the ' <i>par</i> ' is already located <i>on</i> the next segment value

**Returns**

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

29.485.5.87 `virtual void Go::SplineSurface::normal ( Point & n, double upar, double vpar ) const` [virtual]

Evaluates the surface normal for a given parameter pair

**Parameters**

<i>n</i>	the computed normal will be written to this variable
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

29.485.5.88 `SplineSurface* Go::SplineSurface::normal ( ) const`

Not yet implemented.

29.485.5.89 `DirectionCone Go::SplineSurface::normalCone ( NormalConeMethod method ) const`

Returns a cone that contains the convex hull of all normalized tangents of the surface. Note: It is an overestimate.

**Returns**

the normal cone of the surface

29.485.5.90 `virtual DirectionCone Go::SplineSurface::normalCone ( ) const` [virtual]

Function that calls `normalCone(NormalConeMethod)` with `method = SederbergMeyers`. Needed because `normalCone()` is virtual! (Inherited from [ParamSurface](#)).

**Returns**

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

**29.485.5.91 SplineSurface\* Go::SplineSurface::normalSurface ( ) const**

Returns the normal surface corresponding to this surface, as described in:  
Computing normal vector Bezier patches, Przemyslaw Kiciak, Computer Aided Design 18 (2001), 699–710.

**Returns**

pointer to a newly created [SplineSurface](#) which is the normal surface. User assumes ownership of this object, and is responsible for destroying it.

**29.485.5.92 int Go::SplineSurface::numberOfPatches\_u ( ) const**

Returns the number of knot intervals in u knot vector.

**Returns**

the number of knot intervals in the knotvector for the first parameter

**29.485.5.93 int Go::SplineSurface::numberOfPatches\_v ( ) const**

Returns the number of knot intervals in v knot vector.

**Returns**

the number of knot intervals in the knotvector for the second parameter

**29.485.5.94 int Go::SplineSurface::numCoefs\_u ( ) const [inline]**

Query the number of control points along the first parameter direction

**Returns**

the number of control points along the first parameter direction

Definition at line 664 of file SplineSurface.h.

**29.485.5.95 int Go::SplineSurface::numCoefs\_v ( ) const [inline]**

Query the number of control points along the second parameter direction

**Returns**

the number of control points along the second parameter direction

Definition at line 669 of file SplineSurface.h.

29.485.5.96 `int Go::SplineSurface::numElem ( ) const [inline]`

Query the number of elements in the [SplineSurface](#).

Definition at line 673 of file `SplineSurface.h`.

29.485.5.97 `int Go::SplineSurface::numElem ( int parDir ) const [inline]`

Query the number of elements in one parameter direction of the [SplineSurface](#)

Definition at line 680 of file `SplineSurface.h`.

29.485.5.98 `virtual bool Go::SplineSurface::onBoundary ( double u, double v, double eps = 1.0e-4 ) const [virtual]`

Check if a parameter pair lies at the boundary of this surface.

Implements [Go::ParamSurface](#).

29.485.5.99 `int Go::SplineSurface::order_u ( ) const [inline]`

Query the order of the [BsplineBasis](#) for the first parameter

Returns

the order of the [BsplineBasis](#) for the first parameter

Definition at line 688 of file `SplineSurface.h`.

29.485.5.100 `int Go::SplineSurface::order_v ( ) const [inline]`

Query the order of the [BsplineBasis](#) for the second parameter

Returns

the order of the [BsplineBasis](#) for the second parameter

Definition at line 693 of file `SplineSurface.h`.

29.485.5.101 `virtual CurveLoop Go::SplineSurface::outerBoundaryLoop ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [virtual]`

Returns the anticlockwise, outer boundary loop of the surface.

## Parameters

<i>degenerate_epsilon</i>	edges whose length is smaller than this value are ignored.
---------------------------	------------------------------------------------------------

## Returns

a [CurveLoop](#) describing the anticlockwise, outer boundary loop of the surface. A negative *degenerate\_epsilon* indicates that all curves, also the degenerate ones are wanted

Implements [Go::ParamSurface](#).

29.485.5.102 `virtual const RectDomain& Go::SplineSurface::parameterDomain ( ) const` [virtual]

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

## Returns

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

29.485.5.103 `virtual void Go::SplineSurface::point ( Point & pt, double upar, double vpar ) const` [virtual]

Evaluates the surface's position for a given parameter pair.

## Parameters

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

29.485.5.104 `virtual void Go::SplineSurface::point ( std::vector< Point > & pts, double upar, double vpar, int derivs, bool u_from_right = true, bool v_from_right = true, double resolution = 1.0e-12 ) const` [virtual]

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

## Parameters

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives.
------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Parameters

<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implements [Go::ParamSurface](#).

**29.485.5.105** void `Go::SplineSurface::pointsGrid ( int m1, int m2, int derivs, const double * basisvals1, const double * basisvals2, const int * knotint1, const int * knotint2, double * result, double * normals = 0 ) const`

Evaluate points and possibly normals in a regular grid. The B-spline basis functions must be pre evaluated. This is a convenience funtion lifted to the user interface to allow for better performance if several spline surfaces with the same spline spaces are to be evaluated in the same points. Must be used with care.

**29.485.5.106** void `Go::SplineSurface::raiseOrder ( int raise_u, int raise_v )`

Raise the order of the spline surface as indicated by parameters.

## Parameters

<i>raise_u</i>	the order of the <a href="#">BsplineBasis</a> associated with the first parameter will be raised this many times.
<i>raise_v</i>	the order of the <a href="#">BsplineBasis</a> associated with the second parameter will be raised this many times.

**29.485.5.107** bool `Go::SplineSurface::rational ( ) const` `[inline]`

Query whether the surface is rational

## Returns

'true' if the surface is rational, 'false' otherwise

Definition at line 698 of file `SplineSurface.h`.

**29.485.5.108** std::vector<double>::iterator `Go::SplineSurface::rcoefs_begin ( )` `[inline]`

Get an iterator to the start of the internal array of *rational* control points.

## Returns

an (nonconst) iterator ro the start of the internal array of rational control points.

Definition at line 733 of file `SplineSurface.h`.

29.485.5.109 `std::vector<double>::const_iterator Go::SplineSurface::rcoefs_begin ( ) const` `[inline]`

Get a const iterator to the start of the internal array of *rational* control points.

#### Returns

a const iterator to the start of the internal array of rational control points

Definition at line 747 of file SplineSurface.h.

29.485.5.110 `std::vector<double>::iterator Go::SplineSurface::rcoefs_end ( )` `[inline]`

Get an iterator to the one-past-end position of the internal array of *rational* control points.

#### Returns

an (nonconst) iterator to the start of the internal array of rational control points.

Definition at line 740 of file SplineSurface.h.

29.485.5.111 `std::vector<double>::const_iterator Go::SplineSurface::rcoefs_end ( ) const` `[inline]`

Get a const iterator to the one-past-end position of the internal array of *rational* control points.

#### Returns

a const iterator to the one-past-end position of the internal array of rational control points.

Definition at line 754 of file SplineSurface.h.

29.485.5.112 `virtual void Go::SplineSurface::read ( std::istream & is )` `[virtual]`

read object from stream

#### Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.485.5.113 `void Go::SplineSurface::removeKnot_u ( double tpar )`

Remove a knot from the knotvector of the first parameter.

## Parameters

<i>tpar</i>	the parameter value of the knot to be removed
-------------	-----------------------------------------------

29.485.5.114 void Go::SplineSurface::removeKnot\_v ( double *tpar* )

Remove a knot from the knotvector of the second parameter.

## Parameters

<i>tpar</i>	the parameter value of the knot to be removed.
-------------	------------------------------------------------

29.485.5.115 bool Go::SplineSurface::replaceBoundaryCurve ( int *bd\_nmb*, shared\_ptr< SplineCurve > *bd\_crv*, bool *unify = true* )

Replace one boundary curve of this surface Update spline spaces to enable replacement NB! Requires both the surface and the new boundary curve to be either rational or non-rational *bd\_nmb* = 0: *umin* = 1: *umax* = 2: *vmin* = 3: *vmax* Return value: true if a replacement is performed

29.485.5.116 void Go::SplineSurface::replaceCoefficient ( int *ix*, Point *coef* )

Replace one specified coefficient (local enumeration)

29.485.5.117 void Go::SplineSurface::representAsRational ( )

Ensure that the current surface is represented as a rational surface.

29.485.5.118 virtual void Go::SplineSurface::reverseParameterDirection ( bool *direction\_is\_u* ) [virtual]

Reverses the direction of the basis in input direction.

## Parameters

<i>direction_is_u</i>	if 'true', the first parameter direction will be reversed, otherwise, the second parameter direction will be reversed
-----------------------	-----------------------------------------------------------------------------------------------------------------------

Implements [Go::ParamSurface](#).

29.485.5.119 double Go::SplineSurface::setAvBdWeight ( double *wgt*, int *pardir*, bool *at\_start* )

Set the average weight at one boundary to a given value (if rational) *pardir* = 0 : 1. parameter direction *pardir* = 1 : 2. parameter direction output : Variance between existing weights

29.485.5.120 `void Go::SplineSurface::setElementarySurface ( shared_ptr< ElementarySurface > elsurf )`

Set shared pointer to the [ElementarySurface](#) that is represented by `this`.

NOTE: The current [SplineSurface](#) (i.e. `this`), must be created from the argument [ElementarySurface](#) by [ElementarySurface::createSplineSurface\(\)](#), otherwise undefined behaviour may occur. One may check to see if this is the case by using [checkElementarySurface\(\)](#).

29.485.5.121 `virtual void Go::SplineSurface::setParameterDomain ( double u1, double u2, double v1, double v2 )`  
[virtual]

set the parameter domain to a given rectangle

#### Parameters

<i>u1</i>	new min. value of first parameter span
<i>u2</i>	new max. value of first parameter span
<i>v1</i>	new min. value of second parameter span
<i>v2</i>	new max. value of second parameter span

Reimplemented from [Go::ParamSurface](#).

29.485.5.122 `double Go::SplineSurface::startparam ( int idx ) const` [inline]

Get the start parameter value for the parameter direction `idx`.

Definition at line 371 of file `SplineSurface.h`.

29.485.5.123 `virtual double Go::SplineSurface::startparam_u ( ) const` [virtual]

Get the start value for the u-parameter

#### Returns

the start value for the u-parameter

29.485.5.124 `virtual double Go::SplineSurface::startparam_v ( ) const` [virtual]

Get the start value for the v-parameter

#### Returns

the start value for the v-parameter

29.485.5.125 `SplineSurface* Go::SplineSurface::subSurface ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const`

Get a [SplineSurface](#) which represent a part of 'this' [SplineSurface](#)

## Parameters

<i>from_upar</i>	start value for u-parameter in the sub-surface to be generated
<i>from_vpar</i>	start value for v-parameter in the sub-surface to be generated
<i>to_upar</i>	end value for u-parameter in the sub-surface to be generated
<i>to_vpar</i>	end value for v-parameter in the sub-surface to be generated
<i>fuzzy</i>	tolerance used to determine whether given parameter values are located directly <i>knot</i> values.

29.485.5.126 `virtual std::vector<shared_ptr<ParamSurface> > Go::SplineSurface::subSurfaces ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [virtual]`

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

## Parameters

<i>from_upar</i>	lower value for the first parameter in the subdomain
<i>from_vpar</i>	lower value for the second parameter in the subdomain
<i>to_upar</i>	upper value for the first parameter in the subdomain
<i>to_vpar</i>	upper value for the second parameter in the subdomain
<i>fuzzy</i>	tolerance used when determining intersection with interior boundaries

## Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

29.485.5.127 `void Go::SplineSurface::swap ( SplineSurface & other )`

quick swap of two [SplineSurface](#) objects with each other

29.485.5.128 `virtual void Go::SplineSurface::swapParameterDirection ( ) [virtual]`

Swaps the two parameter directions.

Implements [Go::ParamSurface](#).

29.485.5.129 `virtual DirectionCone Go::SplineSurface::tangentCone ( bool pardir_is_u ) const [virtual]`

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

## Parameters

<code>pardir_is↔ _u</code>	if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used.
--------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

```
29.485.5.130 virtual void Go::SplineSurface::turnOrientation () [virtual]
```

Turns the direction of the normal of the surface.

Implements [Go::ParamSurface](#).

```
29.485.5.131 virtual void Go::SplineSurface::write (std::ostream & os) const [virtual]
```

write object to stream

## Parameters

<code>os</code>	stream to which object is written
-----------------	-----------------------------------

Implements [Go::Streamable](#).

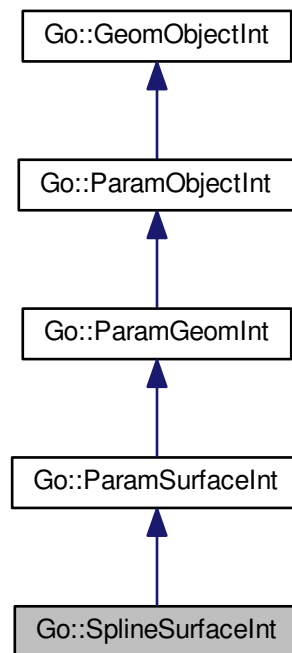

The documentation for this class was generated from the following file:

- [gtools-core/include/GoTools/geometry/SplineSurface.h](#)

### 29.486.1 Detailed Description

This class represents the "intersection object" of a spline surface.

Definition at line 57 of file `SplineSurfaceInt.h`.

### 29.486.2 Constructor & Destructor Documentation

**29.486.2.1** `Go::SplineSurfaceInt::SplineSurfaceInt ( shared_ptr< ParamSurface > surf ) [explicit]`

Constructor.

## Parameters

<i>surf</i>	the parametric curve defining the intersection object.
-------------	--------------------------------------------------------

29.486.2.2 `Go::SplineSurfaceInt::SplineSurfaceInt ( shared_ptr< ParamSurface > surf, ParamGeomInt * parent ) [explicit]`

Constructor.

## Parameters

<i>surf</i>	the parametric curve defining the intersection object.
<i>parent</i>	the parent object to this object.

29.486.2.3 `virtual Go::SplineSurfaceInt::~~SplineSurfaceInt ( ) [inline],[virtual]`

Destructor.

Definition at line 73 of file SplineSurfaceInt.h.

### 29.486.3 Member Function Documentation

29.486.3.1 `virtual bool Go::SplineSurfaceInt::canImplicitize ( ) [virtual]`

Check whether the objects fulfills the requirements to implicitize.

## Returns

Return true if we may implicitize the object.

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.2 `virtual int Go::SplineSurfaceInt::checkPeriodicity ( int paddir ) const [virtual]`

Check if the object is periodic in the specified direction. Analyze periodicity of surface based on number of repeating knots and control points. The return value is -1 if the surface ends are disjoint, otherwise k if cv is  $C^k$  continuous. These are sufficient but not necessary conditions for periodicity, so it is possible that a higher degree of periodicity exists. Should not be called on this layer, should be overruled by inherited class.

## Parameters

<i>paddir</i>	the parameter direction in question.
---------------	--------------------------------------

**Returns**

-1 if the curve ends are disjoint, or k if the surface is proven to be  $C^k$  continuous.

Reimplemented from [Go::ParamSurfaceInt](#).

### 29.486.3.3 `SplineCurve*` `Go::SplineSurfaceInt::constParamCurve ( double parameter, bool padir_is_u ) const`

Generate and return the specified isocurve.

**Parameters**

<i>parameter</i>	value of the fixed parameter.
<i>padir_is_u</i>	'true' if the first parameter is the running parameter, 'false' otherwise.

**Returns**

Pointer to the created isocurve.

### 29.486.3.4 `virtual DirectionCone` `Go::SplineSurfaceInt::directionCone ( ) const` `[virtual]`

A cone which contains all normals of the object.

**Returns**

A cone which contains all normals of the object.

Reimplemented from [Go::ParamSurfaceInt](#).

### 29.486.3.5 `virtual void` `Go::SplineSurfaceInt::getBoundaryObjects ( std::vector< shared_ptr< BoundaryGeomInt > > & bd_objs )` `[virtual]`

Return the boundary objects of this object.

**Parameters**

<i>bd_objs</i>	the boundary objects of this object.
----------------	--------------------------------------

Reimplemented from [Go::ParamSurfaceInt](#).

### 29.486.3.6 `virtual std::vector<double>` `Go::SplineSurfaceInt::getCriticalValsAndKnots ( int padir ) const` `[virtual]`

Return the critical parameter values and inner knots for the object.

## Parameters

<i>parDir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Reimplemented from [Go::ParamSurfaceInt](#).

**29.486.3.7** `virtual bool Go::SplineSurfaceInt::getImplicit ( double tol, double & tol2, AlgObj3DInt & alg_obj_3d_int )`  
[virtual]

Get the implicit representation of the object. Garbage is returned if we are not able to implicitize.

## Parameters

<i>tol</i>	geometric tolerance for the implicitization procedure.
<i>tol2</i>	geometric estimate for the accuracy of the implicitized object. Not yet in use!!!
<i>alg_obj_3d_int</i>	the algebraic object containing the implicitized surface.

## Returns

True if the implicitization was a success.

Reimplemented from [Go::ParamSurfaceInt](#).

**29.486.3.8** `virtual std::vector<double> Go::SplineSurfaceInt::getInnerKnotVals ( int parDir, bool sort = false ) const`  
[virtual]

Return the inner knot values in the specified direction.

## Parameters

<i>parDir</i>	the parameter direction in question. Indexing starts at 0.
<i>sort</i>	the returned values may be sorted by the function.

Reimplemented from [Go::ParamSurfaceInt](#).

**29.486.3.9** `virtual std::vector<double>::iterator Go::SplineSurfaceInt::getMesh ( )` [virtual]

Return the geometric sample mesh for the parametric function.

Reimplemented from [Go::ParamSurfaceInt](#).

**29.486.3.10** `virtual int Go::SplineSurfaceInt::getMeshSize ( int dir )` [virtual]

Return the size of the geometric sample mesh in the specified direction.

## Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
------------	------------------------------------------------------------

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.11 `virtual shared_ptr<ParamSurfaceInt> Go::SplineSurfaceInt::getNormalSurface ( ) const [virtual]`

Returns the normal surface corresponding to this surface.

## Returns

Pointer to the [SplineSurface](#) defining the normal surface.

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.12 `virtual double Go::SplineSurfaceInt::getOptimizedConeAngle ( Point & axis1, Point & axis2 ) [virtual]`

We try to treat problems which will never result in a simple case by shrinking the domain slightly, resulting in smaller cones. This is useful for scenarios where the normals are parallel in a boundary point.

## Parameters

<i>axis1</i>	first vector defining a projection plane
<i>axis2</i>	second vector defining a projection plane

## Returns

The optimized cone angle

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.13 `virtual RotatedBox Go::SplineSurfaceInt::getRotatedBox ( std::vector< Point > & axis ) const [virtual]`

Create a box containing the geometric sample mesh in the input coordinate system.

## Parameters

<i>axis</i>	the axis defining the coordinate system. The size of vector axis is 2, the last point is given as the cross product axis[0]axis[1].
-------------	-------------------------------------------------------------------------------------------------------------------------------------

## Returns

The rotated box

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.14 `shared_ptr<SplineSurface> Go::SplineSurfaceInt::getSplineSurface ( ) [inline]`

Return pointer to the spline surface defining this object.

#### Returns

The spline surface defining this object.

Definition at line 257 of file SplineSurfaceInt.h.

29.486.3.15 `virtual bool Go::SplineSurfaceInt::hasCriticalValsOrKnots ( int pardir ) const [virtual]`

Return true if the object has any critical parameter values or inner knots in the specified parameter direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.16 `virtual bool Go::SplineSurfaceInt::hasInnerKnots ( int pardir ) const [virtual]`

Return true if the object has any inner knots in the specified parameter direction.

#### Parameters

<i>pardir</i>	the parameter direction in question. Indexing starts at 0.
---------------	------------------------------------------------------------

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.17 `virtual bool Go::SplineSurfaceInt::implicitize ( double tol ) [virtual]`

Implicitize the object.

#### Parameters

<i>tol</i>	the geoemtric tolerance for the implicitization.
------------	--------------------------------------------------

#### Returns

True if the implicitization was a success.

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.18 `virtual bool Go::SplineSurfaceInt::isIsoParametric ( ParamCurveInt * curve, int dir, double par, double ptol, double tol ) [virtual]`

Check if a curve is an iso parametric curve in the current surface. NB! Only valid for splines

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.19 `virtual bool Go::SplineSurfaceInt::isSimple ( ) [virtual]`

Estimates if the current surface is simple enough for a singularity iteration. Checks the span of the normal cone and the size of the surface

#### Returns

True if the surface is characterized as simple.

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.20 `virtual bool Go::SplineSurfaceInt::isSpline ( ) [virtual]`

Verify whether the object is a spline.

#### Returns

True if the object is a spline.

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.21 `virtual void Go::SplineSurfaceInt::knotIntervalFuzzy ( double & u, double & v, double utol, double vtol ) const [virtual]`

Find the knot intervals for which u and v lie inside, moving the value u or v if they lie close to a knot.

#### Parameters

<i>u</i>	the <i>u</i> parameter value
<i>v</i>	the <i>v</i> parameter value
<i>utol</i>	the parametric tolerance deciding if the input parameter u should be moved.
<i>vtol</i>	the parametric tolerance deciding if the input parameter v should be moved.

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.22 `virtual shared_ptr<ParamCurveInt> Go::SplineSurfaceInt::makeIntCurve ( shared_ptr< ParamCurve > crv, ParamGeomInt * parent ) [virtual]`

Return an intersection object for the input curve, using parameter parent as parent.

## Parameters

<i>crv</i>	the parametric curve defining the intersection object.
<i>parent</i>	the parent to the created intersection object.

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.23 `virtual shared_ptr<ParamSurfaceInt> Go::SplineSurfaceInt::makeIntObject ( shared_ptr< ParamSurface > surf ) [virtual]`

Return an intersection object for the input surface, using this object as parent.

## Parameters

<i>surf</i>	the parametric surface defining the intersection object.
-------------	----------------------------------------------------------

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.24 `virtual double Go::SplineSurfaceInt::nextSegmentVal ( int dir, double par, bool forward, double tol ) const [virtual]`

Return the value of the knot next to the input parameter par.

## Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>par</i>	the parameter value
<i>forward</i>	if true we return the closest knot to the right, otherwise the closest knot to the left.
<i>tol</i>	the tolerance to determine if <i>par</i> is already located on the start of the next segment.

## Returns

The knot closest to the input parameter.

Reimplemented from [Go::ParamSurfaceInt](#).

29.486.3.25 `virtual double Go::SplineSurfaceInt::paramFromMesh ( int dir, int idx ) [virtual]`

Return the corresponding mesh parameter.

## Parameters

<i>dir</i>	the parameter direction in question. Indexing starts at 0.
<i>idx</i>	the mesh idx in the specified direction. Indexing starts at 0.

Reimplemented from [Go::ParamSurfaceInt](#).

```
29.486.3.26 virtual DirectionCone Go::SplineSurfaceInt::reducedDirectionCone (bool reduce_at_bd[4], double epsge)
const [virtual]
```

Make exact direction cone. Only applicable for Bezier case.

Reimplemented from [Go::ParamGeomInt](#).

```
29.486.3.27 void Go::SplineSurfaceInt::setImplicitDeg ()
```

Choose a degree for the implicit representation.

```
29.486.3.28 virtual shared_ptr<const SplineSurface> Go::SplineSurfaceInt::splineSurface () const [inline],
[virtual]
```

Return pointer to the spline surface defining this object.

#### Returns

The spline surface defining this object.

Definition at line 262 of file SplineSurfaceInt.h.

```
29.486.3.29 virtual void Go::SplineSurfaceInt::splitAtG0 (double angtol, std::vector< shared_ptr< ParamSurfaceInt > >
& subG1) [virtual]
```

Requests from selfintersection computation. Split at G1 discontinuities.

#### Parameters

<i>angtol</i>	angular tolerance defining G1 discontinuity
<i>subG1</i>	vector of subdivided patches that are G1

Reimplemented from [Go::ParamSurfaceInt](#).

## 29.486.4 Member Data Documentation

```
29.486.4.1 shared_ptr<SplineSurface> Go::SplineSurfaceInt::normalsf_ [mutable],[protected]
```

Definition at line 272 of file SplineSurfaceInt.h.

### 29.487.1 Detailed Description

[SplineVolume](#) provides methods for storing, reading and manipulating rational and non-rational B-spline volumes.

Non-rational B-spline volumes represented on the form

$$\sum_{i=1}^{n_1} \sum_{j=1}^{n_2} \sum_{k=1}^{n_3} P_{i,j,k} B_{i,o_1}(u) B_{j,o_2}(v) B_{k,o_3}(w),$$

where the B-spline coefficients are stored in a vector called coefs. The coefs are stored as

$$P_{0,0,0}, P_{1,0,0}, \dots, P_{n_1,n_2,n_3},$$

where  $P_{i,j,k}$  is represented as dim doubles.

NURBS volumes are represented on the form

$$\frac{\sum_{i=1}^{n_1} \sum_{j=1}^{n_2} \sum_{k=1}^{n_3} h_{i,j,k} P_{i,j,k} B_{i,o_1}(u) B_{j,o_2}(v) B_{k,o_3}(w)}{\sum_{i=1}^{n_1} \sum_{j=1}^{n_2} \sum_{k=1}^{n_3} h_{i,j,k} B_{i,o_1}(u) B_{j,o_2}(v) B_{k,o_3}(w)}$$

where  $B_{i,o}$  is the i'th non-rational B-spline of order o. The Projected coefficients are stored in the coefs vector, i.e.

$$h_{0,0,0} \cdot P_{0,0,0}, h_{1,0,0} \cdot P_{1,0,0}, \dots, h_{n_1,n_2,n_3} \cdot P_{n_1,n_2,n_3}.$$

In addition the coefficients for the volume in projective space are kept, i.e

$$P_{0,0,0}, h_{0,0,0}, P_{1,0,0}, h_{1,0,0}, \dots, P_{n_1,n_2,n_3}, h_{n_1,n_2,n_3}.$$

With this representation volume is in the convex hull of the coefficients stored in coefs both for rational and non rational volumes.

Definition at line 201 of file SplineVolume.h.

### 29.487.2 Member Typedef Documentation

#### 29.487.2.1 typedef std::vector<Dvector> Go::SplineVolume::Dmatrix

Definition at line 833 of file SplineVolume.h.

#### 29.487.2.2 typedef std::vector<double> Go::SplineVolume::Dvector

Evaluate positions of all basis values in a specified grid. For non-rationals this is an interface to [BsplineBasis::computeBasisValues](#) where the basis values in each parameter direction are multiplied to compute  $B_i(u) * B_j(v) * B_k(w)$ , for rationals the routine evaluates the rational basis functions, i.e. the basis functions are divided by the denominator of the volume in the given parameter direction

## Parameters

<i>param_u</i>	this vector holds all the numerical values for the first parameter where evaluation will take place
<i>param_v</i>	this vector holds all the numerical values for the second parameter where evaluation will take place
<i>param_w</i>	this vector holds all the numerical values for the third parameter where evaluation will take place
<i>basisValues</i>	the value of all basis functions. The first matrix dimension will correspond to all evaluation parameters, i.e. the size is <code>param_u.size()*param_v*size()*param_w.size()</code> . The second dimension correspond to all coefficients, i.e. <code>nmb_coef_u*nmb_coef_v*nmb_coef_w</code> . Most entries in the matrix will be zero

Definition at line 832 of file `SplineVolume.h`.

### 29.487.3 Constructor & Destructor Documentation

#### 29.487.3.1 `Go::SplineVolume::SplineVolume ( )` `[inline]`

Creates an uninitialized [SplineVolume](#), which can only be assigned to or read(...) into.

Definition at line 206 of file `SplineVolume.h`.

#### 29.487.3.2 `template<typename RandomIterator1 , typename RandomIterator2 , typename RandomIterator3 , typename RandomIterator4 > Go::SplineVolume::SplineVolume ( int number1, int number2, int number3, int order1, int order2, int order3, RandomIterator1 knot1start, RandomIterator2 knot2start, RandomIterator3 knot3start, RandomIterator4 coefsstart, int dim, bool rational = false )` `[inline]`

Create a [SplineVolume](#) by explicitly providing all spline-related information.

## Parameters

<i>number1</i>	number of control points along the u-parameter
<i>number2</i>	number of control points along the v-parameter
<i>number3</i>	number of control points along the w-parameter
<i>order1</i>	<a href="#">BsplineBasis</a> order along the u-parameter
<i>order2</i>	<a href="#">BsplineBasis</a> order along the v-parameter
<i>order3</i>	<a href="#">BsplineBasis</a> order along the w-parameter
<i>knot1start</i>	pointer to the array describing the knotvector for the u-parameter
<i>knot2start</i>	pointer to the array describing the knotvector for the v-parameter
<i>knot3start</i>	pointer to the array describing the knotvector for the w-parameter
<i>coefsstart</i>	pointer to the array where the control points are consecutively stored. The storage order is such that control points along the u-parameter have the shortest stride (stored right after each other), then comes the v-parameter and finally the w-parameter. If the volume is rational, pay attention to the comments below.
<i>dim</i>	dimension of the space in which the volume lies (usually 3).
<i>rational</i>	Specify whether the volume is rational or not. If the volume is rational, coefficients must be in the following format: <code>wP1 wP2 .... wPdim w</code> . I.e. a $(dim+1)$ -dimensional form. (This is the same form that is used within SISL).

Definition at line 245 of file `SplineVolume.h`.

```
29.487.3.3 template<typename RandomIterator > Go::SplineVolume::SplineVolume (const BsplineBasis & basis_u,
const BsplineBasis & basis_v, const BsplineBasis & basis_w, RandomIterator coefsstart, int dim, bool
rational = false) [inline]
```

Create a [SplineVolume](#) by explicitly providing all spline-related information.

#### Parameters

<i>basis_u</i>	the <a href="#">BsplineBasis</a> to be used along the u-direction
<i>basis_v</i>	the <a href="#">BsplineBasis</a> to be used along the v-direction
<i>basis_w</i>	the <a href="#">BsplineBasis</a> to be used along the v-direction
<i>coefsstart</i>	pointer to the array where the control points are consecutively stored. The storage order is such that control points along the u-parameter have the shortest stride (stored right after each other), then comes the v-parameter and finally the w-parameter. If the volume is rational, pay attention to the comments below.
<i>dim</i>	dimension of the space in which the volume lies (usually 3).
<i>rational</i>	Specify whether the volume is rational or not. If the volume is rational, coefficients must be in the following format: wP1 wP2 .... wPdim w. I.e. a (dim+1)-dimensional form. (This is the same form that is used within SISL).

Definition at line 297 of file SplineVolume.h.

```
29.487.3.4 virtual Go::SplineVolume::~~SplineVolume () [virtual]
```

Virtual destructor, enables safe inheritance.

## 29.487.4 Member Function Documentation

```
29.487.4.1 void Go::SplineVolume::add (const SplineVolume * other, double tol = 1.0e-10)
```

Add coefficients from another volume. Weights are not summed for rational cases Nothing is done and exception is raised if

- Spline spaces are different in any paramter direction (order or knot vectors are not identical)
- The geometry spaces of the volumes have different dimension
- One volume is rational while the other is not
- The weights are not equal within a given tolerance (only if volumes are rational)

#### Parameters

<i>other</i>	The other spline volume with coefficients to be added into this volume
<i>tol</i>	tolerance used to test if weights are considered equal in rational case

29.487.4.2 void Go::SplineVolume::appendVolume ( SplineVolume \* vol, int join\_dir, int cont, bool repara = true )

Appends a volume to the end of 'this' volume along a specified parameter direction.

#### Parameters

<i>vol</i>	the volume to append to 'this' volume
<i>join_dir</i>	the parameter direction along which to extend 'this' volume by appending the 'vol' volume. If it is equal to 0, we will extend the volume along the u-parameter; if it equals 1, we will extend the volume along the v-parameter; if it equals 2, we will extend the volume along the w-parameter.
<i>cont</i>	continuity at joint, legal values are 0 and 1 (i.e. $C^0$ or $C^1$ -continuity).
<i>repara</i>	The parametrization of the concerned parameter in the other volume will <i>always</i> be shifted so that it starts where the parametrization of 'this' volume ends. However, if 'repara' is set to 'true', it will also be <i>scaled</i> as a function of position of control points close to the transition.

29.487.4.3 virtual SplineVolume\* Go::SplineVolume::asSplineVolume ( ) [inline],[virtual]

Return the spline surface represented by this surface.

Reimplemented from [Go::ParamVolume](#).

Definition at line 957 of file SplineVolume.h.

29.487.4.4 const BsplineBasis& Go::SplineVolume::basis ( int pdir ) const [inline]

get one of the BsplineBasises of the volume

#### Parameters

<i>pdir</i>	specify whether to return the <a href="#">BsplineBasis</a> for the first parameter (0), for the second parameter (1) or the third (2) parameter.
-------------	--------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

const reference to the requested [BsplineBasis](#).

Definition at line 471 of file SplineVolume.h.

29.487.4.5 virtual BoundingBox Go::SplineVolume::boundingBox ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.487.4.6 void Go::SplineVolume::checkDegeneracy ( double tol, int is\_degenerate[] ) const

Check degeneracy

## Parameters

<i>tol</i>	Tolerance used in test
<i>is_degenerate</i>	0 - Not degenerate, 1 - surface degenerate in specified boundary, 2 - surface degenerate to line, 3 - surface degenerate to point

29.487.4.7 `static ClassType Go::SplineVolume::classType ( ) [inline],[static]`

Definition at line 349 of file SplineVolume.h.

29.487.4.8 `virtual SplineVolume* Go::SplineVolume::clone ( ) const [inline],[virtual]`

make a clone of this volume and return a pointer to it (user is responsible for clearing up memory afterwards).

## Returns

pointer to cloned object

Implements [Go::ParamVolume](#).

Definition at line 352 of file SplineVolume.h.

29.487.4.9 `int Go::SplineVolume::closestCorner ( const Point & pt, double & upar, double & vpar, double & wpar, Point & corner, double & dist ) const`

Returns the corner closest to a given point together with the associated enumeration of the corner coefficient. In degenerate cases, the enumeration will reflect an arbitrary corner

29.487.4.10 `virtual void Go::SplineVolume::closestPoint ( const Point & pt, double & clo_u, double & clo_v, double & clo_w, Point & clo_pt, double & clo_dist, double epsilon, double * seed = 0 ) const [virtual]`

Iterates to the closest point to pt on the volume.

## Parameters

<i>pt</i>	the point to find the closest point to
<i>clo_u</i>	u parameter of the closest point
<i>clo_v</i>	v parameter of the closest point
<i>clo_w</i>	w parameter of the closest point
<i>clo_pt</i>	the geometric position of the closest point
<i>clo_dist</i>	the distance between pt and clo_pt
<i>epsilon</i>	parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)
<i>seed</i>	pointer to parameter values where iteration starts.

Implements [Go::ParamVolume](#).

29.487.4.11 `std::vector<double>::iterator Go::SplineVolume::coefs_begin ( ) [inline]`

Get an iterator to the start of the internal array of non-rational control points.

#### Returns

an (nonconst) iterator to the start of the internal array of non-rational control points

Definition at line 521 of file SplineVolume.h.

29.487.4.12 `std::vector<double>::const_iterator Go::SplineVolume::coefs_begin ( ) const [inline]`

Get a const iterator to the start of the internal array of non-rational control points.

#### Returns

a const iterator to the start of the internal array of non-rational control points.

Definition at line 535 of file SplineVolume.h.

29.487.4.13 `std::vector<double>::iterator Go::SplineVolume::coefs_end ( ) [inline]`

Get an iterator to the one-past-end position of the internal array of non-rational control points

#### Returns

an (nonconst) iterator to the one-past-end position of the internal array of non-rational control points

Definition at line 528 of file SplineVolume.h.

29.487.4.14 `std::vector<double>::const_iterator Go::SplineVolume::coefs_end ( ) const [inline]`

Get a const iterator to the one-past-end position of the internal array of non-rational control points.

#### Returns

a const iterator to the one-past-end position of the internal array of non-rational control points.

Definition at line 542 of file SplineVolume.h.

29.487.4.15 `void Go::SplineVolume::computeBasis ( double param[], std::vector< double > & basisValues, std::vector< double > & basisDerivs_u, std::vector< double > & basisDerivs_v, std::vector< double > & basisDerivs_w, bool evaluate_from_right = true ) const`

Evaluate positions and first derivatives of all basis values in a given parameter tripple For non-rationals this is an interface to [BsplineBasis::computeBasisValues](#) where the basis values in each parameter direction are multiplied to compute  $B_i(u)*B_j(v)*B_k(w)$ , for rationals the routine evaluates the rational basis functions, i.e. the basis functions are divided by the denominator of the volume in the given parameter direction

## Parameters

<i>param</i>	the parameter tripple in which to compute
<i>basisValues</i>	the value of all basis functions, size equal to (degree_u+1)*(degree_v+1)*(degree_w+1)
<i>basisDerivs_u</i>	the derivative of all basis functions, same size as previous
<i>basisDerivs_v</i>	the derivative of all basis functions, same size as previous
<i>basisDerivs_w</i>	the derivative of all basis functions, same size as previous
<i>evaluate_from_right</i>	specifies directional derivatives, true=right, false=left

- 29.487.4.16 void Go::SplineVolume::computeBasis ( const std::vector< double >::const\_iterator & *bas\_vals\_u*, const std::vector< double >::const\_iterator & *bas\_vals\_v*, const std::vector< double >::const\_iterator & *bas\_vals\_w*, int *left\_u*, int *left\_v*, int *left\_w*, std::vector< double > & *basisValues*, std::vector< double > & *basisDerivs\_u*, std::vector< double > & *basisDerivs\_v*, std::vector< double > & *basisDerivs\_w* ) const
- 29.487.4.17 void Go::SplineVolume::computeBasis ( double *param\_u*, double *param\_v*, double *param\_w*, BasisPts & *result* ) const
- 29.487.4.18 void Go::SplineVolume::computeBasis ( double *param\_u*, double *param\_v*, double *param\_w*, BasisDerivs & *result*, bool *evaluate\_from\_right* = true ) const
- 29.487.4.19 void Go::SplineVolume::computeBasis ( double *param\_u*, double *param\_v*, double *param\_w*, BasisDerivs2 & *result*, bool *evaluate\_from\_right* = true ) const
- 29.487.4.20 void Go::SplineVolume::computeBasisGrid ( const Dvector & *param\_u*, const Dvector & *param\_v*, const Dvector & *param\_w*, Dmatrix & *basisValues* ) const
- 29.487.4.21 void Go::SplineVolume::computeBasisGrid ( const Dvector & *param\_u*, const Dvector & *param\_v*, const Dvector & *param\_w*, std::vector< BasisPts > & *result* ) const
- 29.487.4.22 void Go::SplineVolume::computeBasisGrid ( const Dvector & *param\_u*, const Dvector & *param\_v*, const Dvector & *param\_w*, Dmatrix & *basisValues*, Dmatrix & *basisDerivs\_u*, Dmatrix & *basisDerivs\_v*, Dmatrix & *basisDerivs\_w*, bool *evaluate\_from\_right* = true ) const

Evaluate positions and first derivatives of all basis values in a specified grid. For non-rationals this is an interface to [BsplineBasis::computeBasisValues](#) where the basis values in each parameter direction are multiplied to compute  $B_i(u)*B_j(v)*B_k(w)$ , for rationals the routine evaluates the rational basis functions, i.e. the basis functions are divided by the denominator of the volume in the given parameter direction

## Parameters

<i>param_u</i>	this vector holds all the numerical values for the first parameter where evaluation will take place
<i>param_v</i>	this vector holds all the numerical values for the second parameter where evaluation will take place
<i>param_w</i>	this vector holds all the numerical values for the third parameter where evaluation will take place
<i>basisValues</i>	the value of all basis functions. The first matrix dimension will correspond to all evaluation parameters, i.e. the size is <i>param_u.size()*param_v.size()*param_w.size()</i> . The second dimension correspond to all coefficients, i.e. <i>nmb_coef_u*nmb_coef_v*nmb_coef_w</i> . Most entries in the matrix will be zero
<i>basisDerivs_u</i>	the derivative of all basis functions, size as above
<i>basisDerivs_v</i>	the derivative of all basis functions
<i>basisDerivs_w</i>	the derivative of all basis functions
<i>evaluate_from_right</i>	specifies directional derivatives, true=right, false=left

29.487.4.23 `void Go::SplineVolume::computeBasisGrid ( const Dvector & param_u, const Dvector & param_v, const Dvector & param_w, std::vector< BasisDerivs > & result, bool evaluate_from_right = true ) const`

29.487.4.24 `void Go::SplineVolume::computeBasisGrid ( const Dvector & param_u, const Dvector & param_v, const Dvector & param_w, std::vector< BasisDerivs2 > & result, bool evaluate_from_right = true ) const`

29.487.4.25 `virtual SplineSurface* Go::SplineVolume::constParamSurface ( double parameter, int pdir ) const`  
[virtual]

Generate and return a [SplineSurface](#) that represents a constant parameter surface on the volume

#### Parameters

<i>parameter</i>	value of the fixed parameter
<i>pdir</i>	0 if the surface is constant in the u-parameter, 1 if the surface is constant in the v-parameter, 2 if the surface is constant in the w-parameter.

#### Returns

pointer to a newly constructed [SplineSurface](#) representing the specified constant parameter surface. It is the user's responsibility to delete it when it is no longer needed.

Reimplemented from [Go::ParamVolume](#).

29.487.4.26 `std::vector<double>::iterator Go::SplineVolume::ctrl_begin ( )` [inline]

Get an iterator to the start of the internal array of active control points.

#### Returns

an (nonconst) iterator to the start of the internal array of rational or non-rational control points

Definition at line 577 of file SplineVolume.h.

29.487.4.27 `std::vector<double>::const_iterator Go::SplineVolume::ctrl_begin ( ) const` [inline]

Get a const iterator to the start of the internal array of active control points.

#### Returns

a const iterator to the start of the internal array of rational or non-rational control points.

Definition at line 591 of file SplineVolume.h.

29.487.4.28 `std::vector<double>::iterator Go::SplineVolume::ctrl_end ( ) [inline]`

Get an iterator to the one-past-end position of the internal array of active control points

#### Returns

an (nonconst) iterator to the one-past-end position of the internal array of rational or non-rational control points

Definition at line 584 of file SplineVolume.h.

29.487.4.29 `std::vector<double>::const_iterator Go::SplineVolume::ctrl_end ( ) const [inline]`

Get a const iterator to the one-past-end position of the internal array of active control points.

#### Returns

a const iterator to the one-past-end position of the internal array of rational or non-rational control points.

Definition at line 598 of file SplineVolume.h.

29.487.4.30 `void Go::SplineVolume::deform ( const std::vector< double > & vec, int vdim = 0 )`

Adds the given deformation vector to the coefficients. Similar as translate, but with separate vector for each point

29.487.4.31 `SplineVolume* Go::SplineVolume::derivVolume ( int ider1, int ider2, int ider3 ) const`

Get the derivative volume. Expresses the i,j,k-th derivative of a spline volume as a spline volume.

#### Parameters

<i>ider1</i>	what derivative to use along the u parameter
<i>ider2</i>	what derivative to use along the v parameter
<i>ider3</i>	what derivative to use along the w parameter

#### Returns

pointer to a newly constructed [SplineVolume](#) which is the derivative volume. User assumes ownership of this object, and is responsible for destroying it.

29.487.4.32 `virtual int Go::SplineVolume::dimension ( ) const [virtual]`

Return the dimension of the space in which the object lies (3 is expected).

Implements [Go::GeomObject](#).

29.487.4.33 `virtual double Go::SplineVolume::endparam ( int i ) const` [virtual]

Get the end value for the specified parameter direction.

## Parameters

<i>i</i>	the parameter direction
----------	-------------------------

## Returns

the end value for the parameter direction given by the parameter *pardir*

29.487.4.34 `virtual std::vector<shared_ptr<ParamSurface>> Go::SplineVolume::getAllBoundarySurfaces ( ) const`  
[virtual]

Fetch all boundary surfaces corresponding to the volume.

Implements [Go::ParamVolume](#).

29.487.4.35 `shared_ptr<SplineSurface> Go::SplineVolume::getBoundarySurface ( int idx, bool do_clear = false ) const`  
[inline]

Fetch one boundary surface.

Definition at line 682 of file `SplineVolume.h`.

29.487.4.36 `std::vector<shared_ptr<SplineSurface>> Go::SplineVolume::getBoundarySurfaces ( bool do_clear = false ) const`

Fetch all 6 boundary surfaces corresponding to the volume. Sequence: *u\_min*, *u\_max*, *v\_min*, *v\_max*, *w\_min*, *w\_max*

29.487.4.37 `void Go::SplineVolume::getElementBdPar ( int elem_ix, double elem_par[] ) const`

Fetch parameter boundaries of a specified element *elem\_ix* - parameter values of element boundaries, sequence *u\_min*, *u\_max*, *v\_min*, *v\_max*, *w\_min*, *w\_max*

29.487.4.38 `std::vector<shared_ptr<SplineSurface>> Go::SplineVolume::getElementBdSfs ( int elem_ix, double elem_par[] ) const`

Fetch all boundary surfaces of a specified element *elem\_ix* - parameter values of element boundaries, sequence *u\_min*, *u\_max*, *v\_min*, *v\_max*, *w\_min*, *w\_max*

29.487.4.39 `void Go::SplineVolume::getWeights ( std::vector< double > & weights ) const`

has all weights equal to one

Return all weights corresponding to this volume, a non-rational volume

29.487.4.40 `void Go::SplineVolume::gridEvaluator ( int num_u, int num_v, int num_w, std::vector< double > & points, std::vector< double > & der_u, std::vector< double > & der_v, std::vector< double > & der_w, std::vector< double > & param_u, std::vector< double > & param_v, std::vector< double > & param_w, bool evaluate_from_right = true ) const`

Evaluate points and derivatives on an entire grid, taking computational advantage over calculating all these values simultaneously rather than one-by-one.

## Parameters

<i>num_u</i>	number of values to evaluate along first parameter direction
<i>num_v</i>	number of values to evaluate along second parameter direction
<i>num_w</i>	number of values to evaluate along third parameter direction
<i>points</i>	upon function return, this vector holds all the evaluated points
<i>der_u</i>	upon function return, this vector holds all first derivatives in the first parameter direction
<i>der_v</i>	upon function return, this vector holds all first derivatives in the second parameter direction
<i>der_w</i>	upon function return, this vector holds all first derivatives in the third parameter direction
<i>param_u</i>	upon function return, this vector holds all the numerical values for the first parameter where evaluation has taken place
<i>param_v</i>	upon function return, this vector holds all the numerical values for the second parameter where evaluation has taken place.
<i>param_w</i>	upon function return, this vector holds all the numerical values for the third parameter where evaluation has taken place.
<i>evaluate_from_right</i>	specifies directional derivatives, true=right, false=left same behaviour for all parameter directions

```
29.487.4.41 void Go::SplineVolume::gridEvaluator (const std::vector< double > & param_u, const std::vector< double > & param_v, const std::vector< double > & param_w, std::vector< double > & points, std::vector< double > & der_u, std::vector< double > & der_v, std::vector< double > & der_w, bool evaluate_from_right = true) const
```

Evaluate points and derivatives on an entire grid, taking computational advantage over calculating all these values simultaneously rather than one-by-one.

## Parameters

<i>param_u</i>	this vector holds all the numerical values for the first parameter where evaluation will take place
<i>param_v</i>	this vector holds all the numerical values for the second parameter where evaluation will take place
<i>param_w</i>	this vector holds all the numerical values for the third parameter where evaluation will take place
<i>points</i>	upon function return, this vector holds all the evaluated points
<i>der_u</i>	upon function return, this vector holds all first derivatives in the first parameter direction
<i>der_v</i>	upon function return, this vector holds all first derivatives in the second parameter direction
<i>der_w</i>	upon function return, this vector holds all first derivatives in the third parameter direction
<i>evaluate_from_right</i>	specifies directional derivatives, true=right, false=left same behaviour for all parameter directions

```
29.487.4.42 void Go::SplineVolume::gridEvaluator (int num_u, int num_v, int num_w, std::vector< double > & points, std::vector< double > & param_u, std::vector< double > & param_v, std::vector< double > & param_w) const
```

Evaluate points on an entire grid, taking computational advantage over calculating all these values simultaneously rather than one-by-one.

## Parameters

<i>num_u</i>	number of values to evaluate along first parameter direction
<i>num_v</i>	number of values to evaluate along second parameter direction
<i>num_w</i>	number of values to evaluate along third parameter direction
<i>points</i>	upon function return, this vector holds all the evaluated points
<i>param_u</i>	upon function return, this vector holds all the numerical values for the first parameter where evaluation has taken place
<i>param_v</i>	upon function return, this vector holds all the numerical values for the second parameter where evaluation has taken place.
<i>param_w</i>	upon function return, this vector holds all the numerical values for the third parameter where evaluation has taken place.

29.487.4.43 `void Go::SplineVolume::gridEvaluator ( const std::vector< double > & param_u, const std::vector< double > & param_v, const std::vector< double > & param_w, std::vector< double > & points ) const`

Evaluate points on an entire grid, taking computational advantage over calculating all these values simultaneously rather than one-by-one.

## Parameters

<i>param_u</i>	this vector holds all the numerical values for the first parameter where evaluation will take place
<i>param_v</i>	this vector holds all the numerical values for the second parameter where evaluation will take place
<i>param_w</i>	this vector holds all the numerical values for the third parameter where evaluation will take place
<i>points</i>	upon function return, this vector holds all the evaluated points

29.487.4.44 `void Go::SplineVolume::insertKnot ( int pdir, double apar )`

Insert a new knot in the knotvector of the given parameter direction

## Parameters

<i>pdir</i>	parameter direction in which to insert the knots (u=0, v=1, w=2)
<i>apar</i>	the parameter value at which a new knot will be inserted

29.487.4.45 `void Go::SplineVolume::insertKnot ( int pdir, const std::vector< double > & new_knots )`

Insert new knots in the knotvector of the given parameter direction

## Parameters

<i>pdir</i>	parameter direction in which to insert the knots (u=0, v=1, w=2)
<i>new_knots</i>	a vector containing the parameter values of the new knots to insert.

29.487.4.46 **virtual ClassType** Go::SplineVolume::instanceType ( ) const [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.487.4.47 **bool** Go::SplineVolume::isDegenerate ( int *which\_sf*, int & *type*, bool & *b*, bool & *r*, bool & *t*, bool & *l*, double *tol* ) const

Specify degeneracy

#### Parameters

<i>which_sf</i>	0=u_min, 1=u_max, 2=v_min, 3=v_max, 4=w_min, 5=w_max
<i>type</i>	0 - Not degenerate, 1 - surface degenerate in specified boundary, 2 - surface degenerate to line, 3 - surface degenerate to point
<i>b</i>	true if surface is degenerate along bottom curve (v=min for surface in parameterized)
<i>r</i>	true if surface is degenerate along right curve
<i>t</i>	true if surface is degenerate along top curve
<i>l</i>	true if surface is degenerate along left curve
<i>tol</i>	Tolerance used in test

29.487.4.48 **bool** Go::SplineVolume::isLeftHanded ( )

Test if the volume is lefthanded. Returns false if volume does not lie in 3-dimensional space. The test is done by taking the XXX of the derivatives at the centre point. Assumes volume is not self intersecting, and has linearly independent derivatives at the centre.

29.487.4.49 **virtual bool** Go::SplineVolume::isSpline ( ) const [inline],[virtual]

Check if the volume is of type spline.

Reimplemented from [Go::ParamVolume](#).

Definition at line 951 of file SplineVolume.h.

29.487.4.50 **double** Go::SplineVolume::knotSpan ( int *pardir*, int *iknot* ) const

Returns the size of the knot interval (knot[*iknot*],knot[*iknot*+1]) in the specified direction. An index outside the legal range will result in a zero knot span

29.487.4.51 **void** Go::SplineVolume::makeBernsteinKnots ( int *pardir* )

Inserts knots in the specified knot vector, such that all knots have multiplicity order

## Parameters

<i>pardir</i>	the parameter direction (0, 1, or 2)
---------------	--------------------------------------

29.487.4.52 `virtual double Go::SplineVolume::nextSegmentVal ( int dir, double par, bool forward, double tol ) const`  
`[virtual]`

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

## Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0, 1 or 2)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value

## Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamVolume](#).

29.487.4.53 `int Go::SplineVolume::numberOfPatches ( int pardir ) const`

Returns the number of knot intervals in the specified knot vector.

## Parameters

<i>pardir</i>	parameter direction
---------------	---------------------

## Returns

the number of knot intervals in the knotvector for the specified parameter direction

29.487.4.54 `int Go::SplineVolume::numCoefs ( int pardir ) const` `[inline]`

Query the number of control points along the specified parameter direction

## Returns

the number of control points along the specified parameter direction

Definition at line 480 of file SplineVolume.h.

29.487.4.55 `int Go::SplineVolume::numElem ( ) const [inline]`

Query the number of elements in the [SplineVolume](#).

Definition at line 497 of file `SplineVolume.h`.

29.487.4.56 `int Go::SplineVolume::numElem ( int pardir ) const [inline]`

Query the number of elements in one parameter direction of.

`pardir = 0`: u-direction, `pardir = 1`: vdirection, `pardir = 2`: wdirection

Definition at line 505 of file `SplineVolume.h`.

29.487.4.57 `int Go::SplineVolume::order ( int pardir ) const [inline]`

Query the order of the [BsplineBasis](#) for the specified parameter

#### Returns

the order of the [BsplineBasis](#) for the specified parameter

Definition at line 489 of file `SplineVolume.h`.

29.487.4.58 `virtual const Array<double,6> Go::SplineVolume::parameterSpan ( ) const [virtual]`

Return the parameter domain of the volume. This is an array containing the start and end parameter values. The spline's parameter  $i$  has its start value at the array position  $(2i)$  and its end parameter value at the array position  $(2i+1)$

#### Returns

An array describing the parametric domain of the volume

Implements [Go::ParamVolume](#).

29.487.4.59 `virtual void Go::SplineVolume::point ( Point & pt, double upar, double vpar, double wpar ) const [virtual]`

Evaluates the volume's position for a given parameter triple.

#### Parameters

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>wpar</i>	the third parameter

Implements [Go::ParamVolume](#).

```
29.487.4.60 virtual void Go::SplineVolume::point (std::vector< Point > & pts, double upar, double vpar, double wpar,
int derivs, bool u_from_right = true, bool v_from_right = true, bool w_from_right = true, double resolution =
1.0e-12) const [virtual]
```

Evaluates the volume's position and a certain number of derivatives for a given parameter triple.

#### Parameters

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function. Upon completion of the function, its first entry is the volume's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the volume tangents along the first, second and third parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dudw, dv2, dvdw, dw2), and similar for even higher derivatives.
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>wpar</i>	the third parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>w_from_right</i>	specify whether derivatives along the third parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implements [Go::ParamVolume](#).

```
29.487.4.61 void Go::SplineVolume::pointsGrid (int numu, int numv, int numw, std::vector< double >::iterator basisvals_u,
std::vector< double >::iterator basisvals_v, std::vector< double >::iterator basisvals_w, std::vector< int
>::iterator knotinter_u, std::vector< int >::iterator knotinter_v, std::vector< int >::iterator knotinter_w, int
derivs, std::vector< double > & points) const
```

```
29.487.4.62 void Go::SplineVolume::raiseOrder (int raise_u, int raise_v, int raise_w)
```

Raise the order of the spline volume as indicated by parameters.

#### Parameters

<i>raise<sub>u</sub></i>	the order of the <a href="#">BsplineBasis</a> associated with the first parameter will be raised this many times.
<i>raise<sub>v</sub></i>	the order of the <a href="#">BsplineBasis</a> associated with the second parameter will be raised this many times.
<i>raise<sub>w</sub></i>	the order of the <a href="#">BsplineBasis</a> associated with the third parameter will be raised this many times.

**29.487.4.63** `bool Go::SplineVolume::rational ( ) const [inline]`

Query whether the volume is rational

**Returns**

'true' if the volume is rational, 'false' otherwise

Definition at line 514 of file SplineVolume.h.

**29.487.4.64** `std::vector<double>::iterator Go::SplineVolume::rcoefs_begin ( ) [inline]`

Get an iterator to the start of the internal array of *rational* control points.

**Returns**

an (nonconst) iterator to the start of the internal array of rational control points.

Definition at line 549 of file SplineVolume.h.

**29.487.4.65** `std::vector<double>::const_iterator Go::SplineVolume::rcoefs_begin ( ) const [inline]`

Get a const iterator to the start of the internal array of *rational* control points.

**Returns**

a const iterator to the start of the internal array of rational control points

Definition at line 563 of file SplineVolume.h.

**29.487.4.66** `std::vector<double>::iterator Go::SplineVolume::rcoefs_end ( ) [inline]`

Get an iterator to the one-past-end position of the internal array of *rational* control points.

**Returns**

an (nonconst) iterator to the start of the internal array of rational control points.

Definition at line 556 of file SplineVolume.h.

**29.487.4.67** `std::vector<double>::const_iterator Go::SplineVolume::rcoefs_end ( ) const [inline]`

Get a const iterator to the one-past-end position of the internal array of *rational* control points.

**Returns**

a const iterator to the one-past-end position of the internal array of rational control points.

Definition at line 570 of file SplineVolume.h.

**29.487.4.68** `virtual void Go::SplineVolume::read ( std::istream & is ) [virtual]`

read object from stream

## Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.487.4.69 void `Go::SplineVolume::removeKnot ( int pardir, double tpar )`

Remove a knot from the knotvector of the given parameter direction.

## Parameters

<i>pardir</i>	the parameter direction (0, 1 or 2)
<i>tpar</i>	the parameter value of the knot to be removed

29.487.4.70 void `Go::SplineVolume::replaceCoefficient ( int ix, Point coef )`

Replace one specified coefficient (local enumeration)

29.487.4.71 virtual void `Go::SplineVolume::reverseParameterDirection ( int pardir )` [virtual]

Reverses the direction of the basis in input direction.

## Parameters

<i>pardir</i>	which parameter direction to reverse
---------------	--------------------------------------

Implements [Go::ParamVolume](#).

29.487.4.72 void `Go::SplineVolume::scale ( double fac )`

Scale the coefficients of the volume with a given factor.

29.487.4.73 void `Go::SplineVolume::setParameterDomain ( double u1, double u2, double v1, double v2, double w1, double w2 )`

Set the parameter domain to a given box

## Parameters

<i>u1</i>	new min. value of first parameter span
<i>u2</i>	new max. value of first parameter span
<i>v1</i>	new min. value of second parameter span
<i>v2</i>	new max. value of second parameter span
<i>w1</i>	new min. value of third parameter span
<i>w2</i>	new max. value of third parameter span

29.487.4.74 `std::vector<shared_ptr<SplineVolume> > Go::SplineVolume::split ( std::vector< double > & param, int pdir, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const`

29.487.4.75 `virtual double Go::SplineVolume::startparam ( int i ) const` [virtual]

Get the start value for the specified parameter direction.

#### Parameters

<i>i</i>	the parameter direction
----------	-------------------------

#### Returns

the start value for the parameter direction given by the parameter pdir

29.487.4.76 `SplineVolume* Go::SplineVolume::subVolume ( double from_upar, double from_vpar, double from_wpar, double to_upar, double to_vpar, double to_wpar, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const`

Get a [SplineVolume](#) which represents a part of 'this' [SplineVolume](#)

#### Parameters

<i>from_upar</i>	start value for u-parameter in the sub-volume to be generated
<i>from_vpar</i>	start value for v-parameter in the sub-volume to be generated
<i>from_wpar</i>	start value for w-parameter in the sub-volume to be generated
<i>to_upar</i>	end value for u-parameter in the sub-volume to be generated
<i>to_vpar</i>	end value for v-parameter in the sub-volume to be generated
<i>to_wpar</i>	end value for w-parameter in the sub-volume to be generated
<i>fuzzy</i>	tolerance used to determine whether given parameter values are located directly <i>knot</i> values.

29.487.4.77 `void Go::SplineVolume::swap ( SplineVolume & other )`

quick swap of two [SplineVolume](#) objects with each other

29.487.4.78 `virtual void Go::SplineVolume::swapParameterDirection ( int pdir1, int pdir2 )` [virtual]

Swaps two parameter directions

#### Parameters

<i>pdir1</i>	One of the parameter directions (0, 1 or 2) to be swapped
<i>pdir2</i>	The other parameter direction (0, 1 or 2) to be swapped

Implements [Go::ParamVolume](#).

29.487.4.79 `virtual DirectionCone Go::SplineVolume::tangentCone ( int pardir ) const` `[virtual]`

Creates a [DirectionCone](#) covering all tangents to this volume along a given parameter direction.

#### Parameters

<i>pardir</i>	if 1, the <a href="#">DirectionCone</a> will be defined on basis of the volume's tangents along the first parameter direction. If 2, the second parameter direction will be used. If 3, the third parameter direction will be used.
---------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this volume along the specified parameter direction.

Implements [Go::ParamVolume](#).

29.487.4.80 `virtual void Go::SplineVolume::translate ( const Point & vec )` `[virtual]`

Translate.

Implements [Go::ParamVolume](#).

29.487.4.81 `int Go::SplineVolume::volumePeriodicity ( int pardir, double epsilon ) const`

Check if a volume is open, closed or parametric in a given parameter direction

#### Parameters

<i>pardir</i>	The parameter direction in which to check periodicity
<i>epsilon</i>	Tolerance used in computation \ return 0 - Open, i.e. multiple knots in end parameters and not closed 1 - Closed, multiple knots in end parameters > 1 - Periodic knot vector with position and (result-1) derivative equal across the seam

29.487.4.82 `virtual void Go::SplineVolume::write ( std::ostream & os ) const` `[virtual]`

write object to stream

#### Parameters

<i>os</i>	stream to which object is written
-----------	-----------------------------------

Implements [Go::Streamable](#).

The documentation for this class was generated from the following file:

### 29.490.1 Detailed Description

Base class for streamable objects, i.e., objects which can be read from and written to a stream.

Definition at line 56 of file Streamable.h.

## 29.490.2 Constructor & Destructor Documentation

29.490.2.1 virtual Go::Streamable::~Streamable ( ) [virtual]

## 29.490.3 Member Function Documentation

29.490.3.1 virtual void Go::Streamable::read ( std::istream & *is* ) [pure virtual]

read object from stream

## Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implemented in [Go::SplineVolume](#), [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::PointCloud< Dim >](#), [Go::PointCloud< 3 >](#), [Go::SplineCurve](#), [Go::BoundedSurface](#), [Go::CurveOnSurface](#), [Go::BsplineBasis](#), [Go::LRBSpline2D](#), [Go::SurfaceOnVolume](#), [Go::Disc](#), [Go::CurveOnVolume](#), [Go::ObjectHeader](#), [Go::Torus](#), [Go::RectGrid](#), [Go::SurfaceOfRevolution](#), [Go::Mesh2D](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), [Go::LineCloud](#), [Go::BoundedCurve](#), [Go::Sphere](#), [Go::TorusVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), [Go::SphereVolume](#), [Go::Line](#), [Go::Parallelepiped](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), [Go::Ellipse](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::CompositeSurface](#).

**29.490.3.2** `virtual void Go::Streamable::write ( std::ostream & os ) const` [pure virtual]

write object to stream

## Parameters

<i>os</i>	stream to which object is written
-----------	-----------------------------------

Implemented in [Go::SplineVolume](#), [Go::SplineSurface](#), [Go::PointCloud< Dim >](#), [Go::PointCloud< 3 >](#), [Go::LRSplineSurface](#), [Go::SplineCurve](#), [Go::BoundedSurface](#), [Go::CurveOnSurface](#), [Go::BsplineBasis](#), [Go::SurfaceOnVolume](#), [Go::LRBSpline2D](#), [Go::Disc](#), [Go::CurveOnVolume](#), [Go::ObjectHeader](#), [Go::Torus](#), [Go::RectGrid](#), [Go::SurfaceOfRevolution](#), [Go::Mesh2D](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), [Go::LineCloud](#), [Go::BoundedCurve](#), [Go::Sphere](#), [Go::TorusVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), [Go::SphereVolume](#), [Go::Line](#), [Go::Parallelepiped](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), [Go::CompositeSurface](#), [Go::Ellipse](#), and [Go::SurfaceOfLinearExtrusion](#).

### 29.492.1 Detailed Description

Class for the preprocessed data on a specific segment on the tensor mesh sub structure on the parameter space of a surface in the surface model

Definition at line 165 of file ClosestPointUtils.h.

### 29.492.2 Constructor & Destructor Documentation

**29.492.2.1** `Go::boxStructuring::SubSurfaceBoundingBox::SubSurfaceBoundingBox ( shared_ptr< SurfaceData > surface_data, int pos_u, int pos_v, BoundingBox box, shared_ptr< RectDomain > par_domain )`  
`[inline]`

Constructor

- `surface_data` is the surface data of the surface for this segment
- `pos_u` and `pos_v` are the positions of this segment in the segment tensor mesh of the surface
- `box` is the bounding box in the geometry space of the surface
- `par_domain` holds the parameter domain of the segment (the bounding box in the parameter space)

Definition at line 174 of file ClosestPointUtils.h.

### 29.492.3 Member Function Documentation

**29.492.3.1** `void Go::boxStructuring::SubSurfaceBoundingBox::add_polygon_corners ( double par_u, double par_v )`  
`[inline]`

Add a point from the generated polygon inside the parameter domain of the surface. The point is either inside or on the boundary of the segment.

Definition at line 296 of file ClosestPointUtils.h.

**29.492.3.2** `BoundingBox Go::boxStructuring::SubSurfaceBoundingBox::box ( ) const` `[inline]`

Get the geometry space bounding box of the image of the segment.

Definition at line 277 of file ClosestPointUtils.h.

**29.492.3.3** `bool Go::boxStructuring::SubSurfaceBoundingBox::has_polygon ( ) const` `[inline]`

Tell if any of the generated polygon inside the parameter domain hits this segment.

Definition at line 303 of file ClosestPointUtils.h.

29.492.3.4 `bool Go::boxStructuring::SubSurfaceBoundingBox::inside ( ) const` `[inline]`

Tell if the entire segment is known to be inside the parameter domain.

Definition at line 186 of file `ClosestPointUtils.h`.

29.492.3.5 `bool Go::boxStructuring::SubSurfaceBoundingBox::inside ( double par_u, double par_v ) const` `[inline]`

Tell if a specific point is guaranteed to be inside the parameter domain, by testing against an inside polygon of the entire parameter domain. Should always return false if the point is outside Should in most cases return true if the point is inside

Definition at line 195 of file `ClosestPointUtils.h`.

29.492.3.6 `shared_ptr<RectDomain> Go::boxStructuring::SubSurfaceBoundingBox::par_domain ( ) const` `[inline]`

Get the domain of the segment in the surface parameter domain.

Definition at line 289 of file `ClosestPointUtils.h`.

29.492.3.7 `int Go::boxStructuring::SubSurfaceBoundingBox::pos_u ( ) const` `[inline]`

Get the segment position in the first direction in segment mesh of the surface.

Definition at line 265 of file `ClosestPointUtils.h`.

29.492.3.8 `int Go::boxStructuring::SubSurfaceBoundingBox::pos_v ( ) const` `[inline]`

Get the segment position in the second direction in segment mesh of the surface.

Definition at line 271 of file `ClosestPointUtils.h`.

29.492.3.9 `void Go::boxStructuring::SubSurfaceBoundingBox::remove_polygon ( )` `[inline]`

Remove the polygon information.

Definition at line 315 of file `ClosestPointUtils.h`.

29.492.3.10 `void Go::boxStructuring::SubSurfaceBoundingBox::setInside ( bool inside )` `[inline]`

Set whether we know for sure this segment is entirely inside the parameter domain.

Definition at line 180 of file `ClosestPointUtils.h`.

```
29.492.3.11 int Go::boxStructuring::SubSurfaceBoundingBox::size_polygon () const [inline]
```

Get the number of polygon points.

Definition at line 309 of file ClosestPointUtils.h.

```
29.492.3.12 shared_ptr<SurfaceData> Go::boxStructuring::SubSurfaceBoundingBox::surface_data () const [inline]
```

Get the structure data of the surface.

Definition at line 283 of file ClosestPointUtils.h.

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/Utils/ClosestPointUtils.h](#)

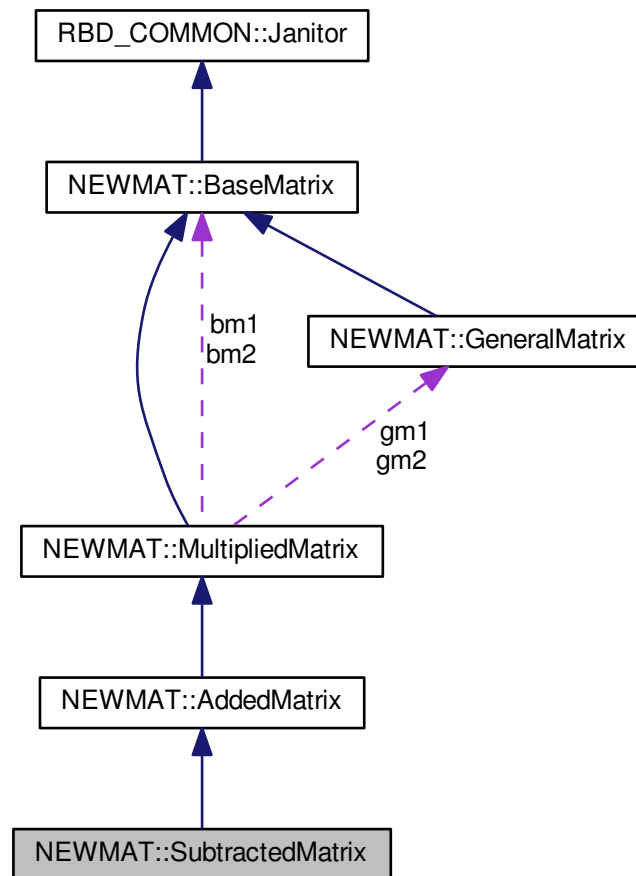

## 29.493 NEWMAT::SubtractedMatrix Class Reference

```
#include <newmat.h>
```

Inheritance diagram for NEWMAT::SubtractedMatrix:

Collaboration diagram for NEWMAT::SubtractedMatrix:

### Public Member Functions

- `~SubtractedMatrix ()`
- `GeneralMatrix * Evaluate (MatrixType mt=MatrixTypeUnSp)`

### Friends

- class `BaseMatrix`
- class `GeneralMatrix`
- class `GenericMatrix`

### Additional Inherited Members

#### 29.493.1 Detailed Description

Definition at line 1298 of file newmat.h.

## 29.493.2 Constructor & Destructor Documentation

29.493.2.1 `NEWMAT::SubtractedMatrix::~~SubtractedMatrix ( )` `[inline]`

Definition at line 1306 of file `newmat.h`.

## 29.493.3 Member Function Documentation

29.493.3.1 `GeneralMatrix * SubtractedMatrix::Evaluate ( MatrixType mt = MatrixTypeUnSp )` `[virtual]`

Reimplemented from [NEWMAT::AddedMatrix](#).

Definition at line 594 of file `newmat7.cpp`.

## 29.493.4 Friends And Related Function Documentation

29.493.4.1 `friend class BaseMatrix` `[friend]`

Definition at line 1302 of file `newmat.h`.

29.493.4.2 `friend class GeneralMatrix` `[friend]`

Definition at line 1303 of file `newmat.h`.

29.493.4.3 `friend class GenericMatrix` `[friend]`

Definition at line 1304 of file `newmat.h`.

The documentation for this class was generated from the following files:

- `newmat/include/newmat.h`
- `newmat/src/newmat7.cpp`

## 29.494 Go::LRSplineUtils::support\_compare Struct Reference

```
#include <LRSplineUtils.h>
```

### Public Member Functions

- `bool operator() (const LRBSpline2D *b1, const LRBSpline2D *b2) const`

### 29.494.1 Detailed Description

Definition at line 158 of file LRSplineUtils.h.

### 29.494.2 Member Function Documentation

29.494.2.1 `bool Go::LRSplineUtils::support_compare::operator() ( const LRBSpline2D * b1, const LRBSpline2D * b2 ) const [inline]`

Definition at line 161 of file LRSplineUtils.h.

The documentation for this struct was generated from the following file:

- [Irsplines2D/include/GoTools/Irsplines2D/LRSplineUtils.h](#)

## 29.495 Go::SurfaceAssembly Class Reference

```
#include <SurfaceAssembly.h>
```

### Public Member Functions

- [SurfaceAssembly](#) (shared\_ptr< [ParamSurfaceInt](#) > surf, std::vector< std::pair< [double](#), int > > u\_div, std::vector< std::pair< [double](#), int > > v\_div, std::vector< [RectDomain](#) > sing\_domain, [double](#) rel\_par\_res)  
*Constructor.*
- [~SurfaceAssembly](#) ()  
*Destructor.*
- void [resetSubIndex](#) (int idx=0)
- void [resetAssemblyIndex](#) ()
- int [getNmbSubSurface](#) ()
- bool [getNextSubSurface](#) (shared\_ptr< [ParamSurfaceInt](#) > &sub\_sf, int &idx, int &sing\_idx)
- bool [getNextAssembly](#) (shared\_ptr< [ParamSurfaceInt](#) > &assembly, int &idx, bool &potential\_sing)

- std::vector< std::pair< [double](#), int > > [getVdiv](#) ()

### 29.495.1 Detailed Description

Collection of sub surfaces used in computation of surface self intersections

Definition at line 50 of file SurfaceAssembly.h.

## 29.495.2 Constructor & Destructor Documentation

29.495.2.1 `Go::SurfaceAssembly::SurfaceAssembly ( shared_ptr< ParamSurfaceInt > surf, std::vector< std::pair< double, int > > u_div, std::vector< std::pair< double, int > > v_div, std::vector< RectDomain > sing_domain, double rel_par_res )`

Constructor.

29.495.2.2 `Go::SurfaceAssembly::~~SurfaceAssembly ( )`

Destructor.

## 29.495.3 Member Function Documentation

29.495.3.1 `bool Go::SurfaceAssembly::doTouch ( int idx1, int idx2 )`

29.495.3.2 `bool Go::SurfaceAssembly::getNextAssembly ( shared_ptr< ParamSurfaceInt > & assembly, int & idx, bool & potential_sing )`

29.495.3.3 `bool Go::SurfaceAssembly::getNextSubSurface ( shared_ptr< ParamSurfaceInt > & sub_sf, int & idx, int & sing_idx )`

29.495.3.4 `int Go::SurfaceAssembly::getNmbSubSurface ( )`

29.495.3.5 `int Go::SurfaceAssembly::getSubSurfaceIndex ( shared_ptr< ParamSurfaceInt > sub_srf, bool & at_end )`

29.495.3.6 `std::vector<std::pair<double,int> > Go::SurfaceAssembly::getUdiv ( ) [inline]`

Definition at line 95 of file SurfaceAssembly.h.

29.495.3.7 `std::vector<std::pair<double,int> > Go::SurfaceAssembly::getVdiv ( ) [inline]`

Definition at line 100 of file SurfaceAssembly.h.

29.495.3.8 `bool Go::SurfaceAssembly::isInFirstAssembly ( shared_ptr< ParamSurfaceInt > sub_srf )`

29.495.3.9 `bool Go::SurfaceAssembly::isInPrevAssembly ( int idx1, int idx2 )`

29.495.3.10 `void Go::SurfaceAssembly::resetAssemblyIndex ( ) [inline]`

Definition at line 67 of file SurfaceAssembly.h.

29.495.3.11 `void Go::SurfaceAssembly::resetSubIndex ( int idx = 0 ) [inline]`

Definition at line 64 of file SurfaceAssembly.h.

### 29.495.3.12 bool Go::SurfaceAssembly::subSfNeighbour ( int *idx1*, int *idx2* )

This function makes a check on whether two sub surfaces are neighbours, but if the surfaces meet at a singularity they are NOT classified as neighbours

### 29.495.3.13 bool Go::SurfaceAssembly::touchAtSingularity ( int *idx1*, int *idx2* )

The documentation for this class was generated from the following file:

- intersections/include/GoTools/intersections/[SurfaceAssembly.h](#)

*Get the internal surface points.*

### 29.496.1 Detailed Description

Class for preprocessed data on a specific surface in the model The surface parameter domain is split into a tensor mesh of sub segments. The splitting is neither required to be regular nor follow knot vector lines (when the underlying surface is a spline surface), but the current code creating the mesh structure chooses regular splittings for elementary surfaces and internal knot vector values for spline surfaces. For trimmed surfaces ([BoundedSurface](#) instances), the structure is created on the underlying surface, thus a segment might be either entirely inside the parameter domain, interely outside the parameter domain, or split by the boundary

Definition at line 70 of file [ClosestPointUtils.h](#).

## 29.496.2 Constructor & Destructor Documentation

29.496.2.1 `Go::boxStructuring::SurfaceData::SurfaceData ( shared_ptr< ParamSurface > surface )` `[inline]`

Constructor.

Definition at line 76 of file `ClosestPointUtils.h`.

## 29.496.3 Member Function Documentation

29.496.3.1 `void Go::boxStructuring::SurfaceData::add_inside_point ( Point pt )` `[inline]`

Add internal surface point.

Definition at line 130 of file `ClosestPointUtils.h`.

29.496.3.2 `int Go::boxStructuring::SurfaceData::index ( ) const` `[inline]`

Get the index of this surface in the [BoundingBoxStructure](#) instance.

Definition at line 107 of file `ClosestPointUtils.h`.

29.496.3.3 `std::vector<Point> Go::boxStructuring::SurfaceData::inside_points ( ) const` `[inline]`

Get the internal surface points.

Definition at line 136 of file `ClosestPointUtils.h`.

29.496.3.4 `int Go::boxStructuring::SurfaceData::segs_u ( ) const` `[inline]`

Get the number of segments in first parameter direction.

Definition at line 89 of file `ClosestPointUtils.h`.

29.496.3.5 `int Go::boxStructuring::SurfaceData::segs_v ( ) const` `[inline]`

Get the number of segments in second parameter direction.

Definition at line 95 of file `ClosestPointUtils.h`.

29.496.3.6 `void Go::boxStructuring::SurfaceData::setIndex ( int index )` `[inline]`

Set the index of this surface in the [BoundingBoxStructure](#) instance.

Definition at line 101 of file `ClosestPointUtils.h`.

29.496.3.7 `void Go::boxStructuring::SurfaceData::setSegments ( int segs_u, int segs_v ) [inline]`

Set the number of segments in the mesh structure in both parameter directions.

Definition at line 82 of file `ClosestPointUtils.h`.

29.496.3.8 `void Go::boxStructuring::SurfaceData::setSurfaceCopies ( int nmb_copies ) [inline]`

Set number of surface copies.

Definition at line 113 of file `ClosestPointUtils.h`.

29.496.3.9 `shared_ptr<ParamSurface> Go::boxStructuring::SurfaceData::surface ( int idx ) const [inline]`

Get a specific copy of the surface.

Definition at line 124 of file `ClosestPointUtils.h`.

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/Utils/ClosestPointUtils.h](#)

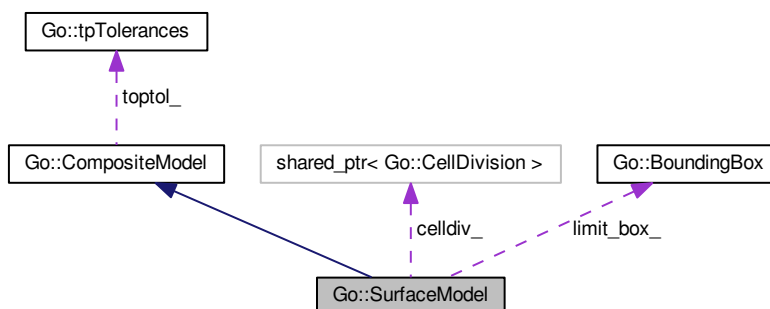

## 29.497 Go::SurfaceModel Class Reference

```
#include <SurfaceModel.h>
```

### 29.497.1 Detailed Description

A surface set or shell including topological information

Definition at line 81 of file SurfaceModel.h.

### 29.497.2 Constructor & Destructor Documentation

**29.497.2.1** `Go::SurfaceModel::SurfaceModel ( double approxtol, double gap, double neighbour, double kink, double bend, std::vector< shared_ptr< ftSurface > > & faces, bool adjacency_set = false )`

Constructor taking a vector of faces

#### Parameters

<i>approxtol</i>	Approximation error tolerance.
<i>gap</i>	If the distance between two points are less than 'gap' they are viewed as identical.
<i>neighbour</i>	Maximum distance between surfaces viewed as adjacent.
<i>kink</i>	If two adjacent surfaces meet with an angle less than 'kink', they are seen as G1 continous. (angles in radians)
<i>bend</i>	If two surfaces meet along a common boundary and corresponding surface normals form an angle which is larger than 'bend', there is an intentional sharp edge between the surfaces.(angles in radians)
<i>faces</i>	A vector of faces.
<i>adjacency_set</i>	True if the application knows that twin information between edges is set.

**29.497.2.2** `Go::SurfaceModel::SurfaceModel ( std::vector< shared_ptr< ftSurface > > & faces, double space_epsilon, double kink = 0.01, bool adjacency_set = false )`

Constructor taking a vector of faces.

#### Parameters

<i>faces</i>	A vector of faces.
<i>space_epsilon</i>	
<i>kink</i>	
<i>adjacency_set</i>	

29.497.2.3 `Go::SurfaceModel::SurfaceModel ( double approxol, double gap, double neighbour, double kink, double bend, std::vector< shared_ptr< ParamSurface > > & surfaces )`

Constructor taking a vector of parametric surfaces

#### Parameters

<i>approxol</i>	Approximation error tolerance. Not used.
<i>gap</i>	If the distance between two points is less than 'gap' they are viewed as identical.
<i>neighbour</i>	Maximum distance between surfaces or curves viewed as adjacent.
<i>kink</i>	If two adjacent surfaces meet with an angle less than 'kink', they are seen as G1 continuous. (angles in radians)
<i>bend</i>	If two surfaces meet along a common boundary and corresponding surface normals form an angle which is larger than 'bend', there is an intentional sharp edge between the surfaces.(angles in radians)
<i>surfaces</i>	A vector of surfaces.

29.497.2.4 `Go::SurfaceModel::SurfaceModel ( double approxol, double gap, double neighbour, double kink, double bend )` `[protected]`

29.497.2.5 `Go::SurfaceModel::SurfaceModel ( const SurfaceModel & sm )`

Constructor Create shallow copy of another [SurfaceModel](#)

#### Parameters

<i>sm</i>	The <a href="#">SurfaceModel</a> to be copied
-----------	-----------------------------------------------

29.497.2.6 `virtual Go::SurfaceModel::~~SurfaceModel ( )` `[virtual]`

Destructor.

### 29.497.3 Member Function Documentation

29.497.3.1 `void Go::SurfaceModel::addSegment ( ftCurve & cv, ftEdgeBase * edge, ftCurveType ty )` `[protected]`

29.497.3.2 `std::vector< shared_ptr< ftSurface > > Go::SurfaceModel::allFaces ( ) const`

Return all faces

#### Returns

Vector of pointer to all faces

29.497.3.3 `bool Go::SurfaceModel::allSplines ( ) const`

Check if all entities are NURBS

Returns

Whether all entities are NURBS

29.497.3.4 `void Go::SurfaceModel::append ( shared_ptr< ftSurface > face, bool set_twin = true, bool adjacency_set = false, bool remove_twins = false, int idx = -1 )`

Append a new face to the surface model. The face is included in the topological structure

Parameters

<i>face</i>	The new face
<i>set_twin</i>	If true, set twin face info.

29.497.3.5 `void Go::SurfaceModel::append ( std::vector< shared_ptr< ftSurface > > faces, bool adjacency_set = false, bool set_twin = true )`

Append a vector of faces to the surface model. The faces are included in the topological structure

Parameters

<i>faces</i>	Vector of pointers to the new faces
--------------	-------------------------------------

29.497.3.6 `void Go::SurfaceModel::append ( shared_ptr< SurfaceModel > anotherModel )`

Append all faces from another surface model. The faces are included in the topological structure

Parameters

<i>anotherModel</i>	Pointer to the other surface model
---------------------	------------------------------------

29.497.3.7 `shared_ptr< SplineSurface > Go::SurfaceModel::approxFaceSet ( double & error, int degree = 3 )`

Approximate surface sets with 4 boundaries with a spline surface. If the set has more than 4 corners, no surface will be produced.

29.497.3.8 `virtual SurfaceModel* Go::SurfaceModel::asSurfaceModel ( ) [inline], [virtual]`

Return surface model pointer

**Returns**

Pointer to this [SurfaceModel](#)

Reimplemented from [Go::CompositeModel](#).

Definition at line 176 of file SurfaceModel.h.

**29.497.3.9 void Go::SurfaceModel::booleanIntersect ( const ftPlane & plane )**

Intersect the model with a plane and trim this model with respect to the plane, the part of the model at the positive side of the plane is removed.

**Parameters**

<i>plane</i>	The plane.
--------------	------------

**29.497.3.10 virtual BoundingBox Go::SurfaceModel::boundingBox ( ) [virtual]**

Bounding box of the entire surface model

**Returns**

Bounding box

Implements [Go::CompositeModel](#).

**29.497.3.11 virtual BoundingBox Go::SurfaceModel::boundingBox ( int idx ) const [virtual]**

Bounding box corresponding to one surface

**Parameters**

<i>idx</i>	Index of surface
------------	------------------

**Returns**

Bounding box of surface with index *idx*.

Implements [Go::CompositeModel](#).

**29.497.3.12 ftMessage Go::SurfaceModel::buildTopology ( int first\_idx = 0, bool set\_twin\_face\_info = true )**

Construct the topology information regarding the input geometry.

**Returns**

Messages

29.497.3.13 **bool** Go::SurfaceModel::checkShellTopology ( )

Debug. Check topology.

29.497.3.14 **virtual SurfaceModel\*** Go::SurfaceModel::clone ( ) **const** [inline],[virtual]

Make a copy of the current model

Returns

Pointer to a copy of this [SurfaceModel](#)

Reimplemented from [Go::CompositeModel](#).

Definition at line 183 of file SurfaceModel.h.

29.497.3.15 **virtual void** Go::SurfaceModel::closestPoint ( **Point & pnt**, **Point & clo\_pnt**, **int & idx**, **double clo\_par[]**, **double & dist** ) [virtual]

Closest point between a given point and this surface model Returns one point

Parameters

<i>pnt</i>	Input point
<i>clo_pnt</i>	Found closest point
<i>idx</i>	Index of surface where the closest point is found
<i>clo_par[]</i>	Parameter value corresponding to the closest point
<i>dist</i>	Distance between input point and found closest point

Implements [Go::CompositeModel](#).

29.497.3.16 **ftPoint** Go::SurfaceModel::closestPoint ( **const Point & point** )

Closest point between a given point and this surface model

Parameters

<i>point</i>	Input point
--------------	-------------

Returns

Closest point

29.497.3.17 **ftPoint** Go::SurfaceModel::closestPoint ( **const ftPoint & point** ) [inline]

Closest point between a given point and this surface model

## Parameters

<i>point</i>	Input point
--------------	-------------

## Returns

Closest point

Definition at line 304 of file SurfaceModel.h.

**29.497.3.18** `virtual double Go::SurfaceModel::curvature ( int idx, double * par ) const` `[inline], [virtual]`

[Curvature](#) of an entity (Curve or Surface), Only Curve is implemented yet.

## Parameters

<i>idx</i>	Index of entity
<i>par</i>	Parameter value at which to compute curvature

## Returns

The curvature.

Implements [Go::CompositeModel](#).

Definition at line 454 of file SurfaceModel.h.

**29.497.3.19** `bool Go::SurfaceModel::doIntersect ( shared_ptr< SplineSurface > sf )`

Check if a spline surface intersects the current surface model.

**29.497.3.20** `void Go::SurfaceModel::enforceCoLinearCoefs ( )`

Modify adjacent spline surfaces from having almost co-linear coefficients to exact co-linearity

**29.497.3.21** `virtual void Go::SurfaceModel::evaluate ( int idx, double par[], Point & pnt ) const` `[virtual]`

Evaluate position

## Parameters

<i>idx</i>	Index of surface
<i>par</i> []	Parameter value
<i>pnt</i>	Result

Implements [Go::CompositeModel](#).

29.497.3.22 `virtual void Go::SurfaceModel::evaluate ( int idx, double par[], int nder, std::vector< Point > & der ) const`  
`[virtual]`

Evaluate position and a number of derivatives The sequence is position, first derivative in first parameter direction, first derivative in second parameter direction, second derivative in first parameter direction, mixed second derivative etc.

#### Parameters

<i>idx</i>	Index
<i>par</i>	Parameter value
<i>nder</i>	Number of derivatives to compute, 0=only position
<i>der</i>	Result

Implements [Go::CompositeModel](#).

29.497.3.23 `virtual void Go::SurfaceModel::extremalPoint ( Point & dir, Point & ext_pnt, int & idx, double ext_par[] )`  
`[virtual]`

Extremal point(s) in a given direction Note that the found extremal point may be less accurate for trimmed surfaces

#### Parameters

<i>dir</i>	Direction
<i>ext_pnt</i>	Found extremal point
<i>idx</i>	Index of surface where the extremal point is found
<i>ext_par</i> []	Parameter value of extremal point

Implements [Go::CompositeModel](#).

29.497.3.24 `std::vector<shared_ptr<ftSurface>> Go::SurfaceModel::facesInPlane ( Point & pnt, Point & axis )`

Fetch all planar faces lying in a specified plane.

29.497.3.25 `shared_ptr<ftSurface> Go::SurfaceModel::fetchAsSharedPtr ( ftFaceBase * face ) const`

Return a specified face as a shared pointer

#### Parameters

<i>face</i>	Pointer to face
-------------	-----------------

**Returns**

Shared pointer to face

**29.497.3.26** void Go::SurfaceModel::fetchSamplePoints ( double *density*, std::vector< SamplePointData > & *sample\_points* ) const

Fetch sample points from all faces including surface normal and curvature information. The distribution is computed from the input parameter density

**29.497.3.27** void Go::SurfaceModel::getAllVertices ( std::vector< shared\_ptr< Vertex > > & *vertices* ) const

Return all vertices associated with this surface model

**Return values**

<i>vertices</i>	Vector of pointers to all vertices.
-----------------	-------------------------------------

**29.497.3.28** double Go::SurfaceModel::getApproximationTol ( ) const [inline]

Return approximation tolerance.

**Returns**

Approximation tolerance.

Definition at line 744 of file SurfaceModel.h.

**29.497.3.29** Body\* Go::SurfaceModel::getBody ( )

Return body (if any)

**29.497.3.30** ftCurve Go::SurfaceModel::getBoundary ( int *whichbound* )

Return a given boundary (may be a hole).

**Parameters**

<i>whichbound</i>	refers to element number in boundary_curves_.
-------------------	-----------------------------------------------

**Returns**

boundary curve

29.497.3.31 `std::vector<shared_ptr<ftEdge> > Go::SurfaceModel::getBoundaryEdges ( ) const`

Fetch all edges at all the boundaries of this model

Return values

<i>edges</i>	Vector of pointers to edges at the boundaries.
--------------	------------------------------------------------

29.497.3.32 `std::vector<shared_ptr<ftEdge> > Go::SurfaceModel::getBoundaryEdges ( int boundary_idx ) const`

Fetch all edges at one of the boundaries of this model

Parameters

<i>boundary_idx</i>	Index of one boundary
---------------------	-----------------------

Return values

<i>edges</i>	Vector of pointers to the edges at one boundary.
--------------	--------------------------------------------------

29.497.3.33 `void Go::SurfaceModel::getBoundaryVertices ( std::vector< shared_ptr< Vertex > > & vertices ) const`

Fetch vertices at the boundaries

Return values

<i>vertices</i>	Vector of pointers to vertices at the boundaries.
-----------------	---------------------------------------------------

29.497.3.34 `const ftCell& Go::SurfaceModel::getCell ( int i ) const`

Return a cell in the cell division

Parameters

<i>i</i>	Index of cell
----------	---------------

Returns

The cell

29.497.3.35 `std::vector<shared_ptr<SurfaceModel> > Go::SurfaceModel::getConnectedModels ( ) const`

Return all compact face sets

29.497.3.36 `void Go::SurfaceModel::getCorners ( std::vector< ftEdge * > & corners )`

Information about kinks on an alternative format

29.497.3.37 `shared_ptr<ftSurface> Go::SurfaceModel::getFace ( int idx ) const`

Return one face

Parameters

<i>idx</i>	Index of face
------------	---------------

Returns

Pointer to face with index *idx*

29.497.3.38 `ftCurve Go::SurfaceModel::getG1Disconts ( )`

Return information about all G1 discontinuities.

29.497.3.39 `ftCurve Go::SurfaceModel::getGaps ( )`

Return information about all gaps.

29.497.3.40 `void Go::SurfaceModel::getGaps ( std::vector< ftEdge * > & gaps )`

Information about gaps on an alternative format

29.497.3.41 `void Go::SurfaceModel::getInconsistentFacePairs ( std::vector< std::pair< ftFaceBase *, ftFaceBase * > > & faces ) [inline]`

Return pointers to pairs of faces that have a problem with the consistency of the face orientation

Definition at line 692 of file SurfaceModel.h.

29.497.3.42 `int Go::SurfaceModel::getIndex ( shared_ptr< ftSurface > face ) const`

Given a face in the surface model, return the index of this face

Parameters

<i>face</i>	Shared pointer to face
-------------	------------------------

**Returns**

Index to face

29.497.3.43 `int Go::SurfaceModel::getIndex ( ftSurface * face ) const`

Given a face in the surface model, return the index of this face

**Parameters**

<i>face</i>	Pointer to face
-------------	-----------------

**Returns**

Index to face

29.497.3.44 `int Go::SurfaceModel::getIndex ( ParamSurface * surf ) const`

Given a surface in the surface model, return the index of this face

**Parameters**

<i>surf</i>	Pointer to surface
-------------	--------------------

**Returns**

Index to face

29.497.3.45 `ftCurve Go::SurfaceModel::getKinks ( )`

Return information about all kinks.

29.497.3.46 `void Go::SurfaceModel::getKinks ( std::vector< ftEdge * > & kinks )`

Information about kinks on an alternative format

29.497.3.47 `void Go::SurfaceModel::getOverlappingEdges ( double tol, std::vector< std::pair< shared_ptr< ftEdgeBase >, shared_ptr< ftEdgeBase > > & edges )`

Return pointers to pairs of overlapping edges.

**Parameters**

<i>tol</i>	Overlap tolerance
------------	-------------------

## Return values

<i>edges</i>	Vector of pairs of overlapping edges
--------------	--------------------------------------

29.497.3.48 `void Go::SurfaceModel::getOverlappingFaces ( double tol, std::vector< std::pair< ftSurface *, ftSurface * > > & faces )`

Return pointers to pairs of overlapping faces.

## Parameters

<i>tol</i>	Overlap tolerance
------------	-------------------

## Return values

<i>faces</i>	Vector of pairs of overlapping faces
--------------	--------------------------------------

29.497.3.49 `shared_ptr<SplineSurface> Go::SurfaceModel::getSplineSurface ( int idx ) const`

Return one surface as [SplineSurface](#) if possible

## Parameters

<i>idx</i>	Index of surface
------------	------------------

## Returns

Pointer to [SplineSurface](#)

29.497.3.50 `shared_ptr<ParamSurface> Go::SurfaceModel::getSurface ( int idx ) const`

Return one surface

## Parameters

<i>idx</i>	Index of surface
------------	------------------

## Returns

Pointer to [ParamSurface](#)

29.497.3.51 `ftSurface* Go::SurfaceModel::getSurface2 ( int index ) const`

Return single surface

29.497.3.52 `std::vector<shared_ptr<ftEdge> > Go::SurfaceModel::getUniqueInnerEdges ( ) const`

Fetch all interval unique inner edges in this model, i.e. a [ftEdge](#) for each boundary edge with a twin, only one of the edges in the pair is returned.

Return values

<i>Vector</i>	of pointers unique inner edges
---------------	--------------------------------

29.497.3.53 `bool Go::SurfaceModel::hit ( const Point & point, const Point & dir, ftPoint & result )`

Test if a line with direction 'dir' through the point 'point' hits this surface model. If it hits, return 'true' and the intersection point closest to 'point'.

Parameters

<i>point</i>	<a href="#">Point</a> on the line.
<i>dir</i>	<a href="#">Line</a> direction.

Return values

<i>result</i>	Closest intersection point.
---------------	-----------------------------

Returns

Whether the line hits or not.

29.497.3.54 `void Go::SurfaceModel::initializeCelldiv ( )`

Creates the [CellDivision](#) object.

29.497.3.55 `virtual shared_ptr<IntResultsModel> Go::SurfaceModel::intersect ( const ftLine & line ) [virtual]`

Intersection with a line. Expected output is points, probably one point. Curves can occur in special configurations

Parameters

<i>line</i>	The line.
-------------	-----------

Returns

Pointer to an [IntResultsModel](#).

Implements [Go::CompositeModel](#).

29.497.3.56 `void Go::SurfaceModel::intersect ( const ftLine & line, ftCurve & int_curves, std::vector< ftPoint > & int_points )`

Intersection with a line. Expected output is points, probably one point. Curves can occur in special configurations

#### Parameters

<i>line</i>	Consist of one point and one direction represented by <a href="#">Point</a> .
-------------	-------------------------------------------------------------------------------

#### Return values

<i>int_curves</i>	Intersection curves, one curve may cross several of the surfaces in the model, but each curve is connected and simple.
<i>int_points</i>	Found intersection points.

29.497.3.57 `ftCurve Go::SurfaceModel::intersect ( const ftPlane & plane )`

Intersect the surface model with a plane.

#### Parameters

<i>plane</i>	The plane.
--------------	------------

#### Returns

Intersection curve.

29.497.3.58 `std::vector<ftPoint> Go::SurfaceModel::intersect ( const ftLine & line, std::vector< bool > & represent_segment )`

Intersect the model with a line.

#### Parameters

<i>line</i>	The intersecting line
-------------	-----------------------

#### Return values

<i>represent_segment</i>	???
--------------------------	-----

#### Returns

Vector of intersection points

```
29.497.3.59 std::vector<std::pair<ftPoint, double> > Go::SurfaceModel::intersect (shared_ptr< SplineCurve > crv,
std::vector< bool > & represent_segment)
```

Intersect the model with a [SplineCurve](#).

#### Parameters

<i>crv</i>	The intersecting <a href="#">SplineCurve</a> .
------------	------------------------------------------------

#### Return values

<i>represent_segment</i>	???
--------------------------	-----

#### Returns

Vector of pairs of intersection points and their curve parameter value

```
29.497.3.60 virtual shared_ptr<IntResultsModel> Go::SurfaceModel::intersect_plane (const ftPlane & plane)
[virtual]
```

Intersection with a plane.

#### Parameters

<i>plane</i>	The plane.
--------------	------------

#### Returns

Pointer to an [IntResultsModel](#).

Implements [Go::CompositeModel](#).

```
29.497.3.61 bool Go::SurfaceModel::isAxisRotational (Point & centre, Point & axis, Point & vec, double & angle,
double & min_ang)
```

Check if a surface model represents a rotational object and extract the eventual rotational axis and angle

```
29.497.3.62 bool Go::SurfaceModel::isClosed () const
```

Check if the [SurfaceModel](#) is a closed shell

#### Returns

*true* if closed, *false* if open

29.497.3.63 **bool** Go::SurfaceModel::isCornerToCorner ( ) const

Check if the model has got a corner-to-corner configuration

#### Returns

Whether the model has got a corner-to-corner configuration

29.497.3.64 **virtual bool** Go::SurfaceModel::isDegenerate ( int *idx* ) const [virtual]

Whether one particular surface is degenerated such that one boundary degenerates to a point

#### Parameters

<i>idx</i>	Index of surface
------------	------------------

#### Returns

Whether the surface is degenerated

Implements [Go::CompositeModel](#).

29.497.3.65 **bool** Go::SurfaceModel::isDegenerate ( int *idx*, **bool** & *b*, **bool** & *t*, **bool** & *l*, **bool** & *r* ) const

Whether one particular surface is degenerated More specific information, relevant only for surfaces

#### Parameters

<i>idx</i>	Index of surface
------------	------------------

#### Return values

<i>b</i>	The bottom curve degenerates to a point
<i>t</i>	The top curve degenerates to a point
<i>l</i>	The left curve degenerates to a point
<i>r</i>	The right curve degenerates to a point

#### Returns

Whether the surface is degenerated

29.497.3.66 **bool** Go::SurfaceModel::isLinearSwept ( **Point** & *pnt*, **Point** & *axis*, **double** & *len* )

Check if a surface model represents a simple linearly swept object that can be generated by sweeping a set of planar surfaces along a vector parallel to the plane normal. Return plane information and distance of sweep

29.497.3.67 `void Go::SurfaceModel::limitVolume ( double xmin, double xmax, double ymin, double ymax, double zmin, double zmax )`

Set limiting volume to mark area of interest.

29.497.3.68 `void Go::SurfaceModel::makeCommonSplineSpaces ( )`

Ensure that the blocks in the model has got common spline spaces.

29.497.3.69 `void Go::SurfaceModel::makeCornerToCorner ( )`

Ensure that the blocks in the model meet in a corner-to-corner configuration. NB! This function must not be applied to closed surface sets.

29.497.3.70 `shared_ptr<ftSurface> Go::SurfaceModel::mergeFaces ( ftSurface * face1, int paddir1, double parval1, bool atstart1, ftSurface * face2, int paddir2, double parval2, bool atstart2, std::pair< Point, Point > co_par1, std::pair< Point, Point > co_par2, std::vector< Point > & seam_joints )`

Merge two faces

Returns

Pointer to resulting face

29.497.3.71 `shared_ptr<ftSurface> Go::SurfaceModel::mergeSeamCrvFaces ( ftSurface * face1, ftSurface * face2, std::vector< Point > & seam_joints )`

Merge two faces

Returns

Pointer to resulting face

29.497.3.72 `shared_ptr<ftSurface> Go::SurfaceModel::mergeSeamFaces ( ftSurface * face1, ftSurface * face2, int paddir, std::vector< Point > & seam_joints )`

Merge two faces

Returns

Pointer to resulting face

29.497.3.73 `int Go::SurfaceModel::nmbBoundaries ( ) const`

Return the number of boundaries of a surface set (including holes).

29.497.3.74 `virtual int Go::SurfaceModel::nmbEntities ( ) const [virtual]`

Number of simple entities

#### Returns

Number of simple entities

Implements [Go::CompositeModel](#).

29.497.3.75 `bool Go::SurfaceModel::pointWithinLimits ( const ftPoint & point )`

Check if a point is within the volume of interest.

#### Parameters

<i>point</i>	The point to check.
--------------	---------------------

#### Returns

Whether the point is within the limits.

29.497.3.76 `bool Go::SurfaceModel::pointWithinLimits ( const Point & point )`

Check if a point is within the volume of interest.

#### Parameters

<i>point</i>	The point to check.
--------------	---------------------

#### Returns

Whether the point is within the limits.

29.497.3.77 `void Go::SurfaceModel::regularizeTwin ( ftSurface * face, std::vector< shared_ptr< ftSurface > > & twinset )`

Regularize face to mimic the division of a twin surface

#### Parameters

<i>face</i>	
-------------	--

#### Return values

<i>twinset</i>	
----------------	--

29.497.3.78 **bool** Go::SurfaceModel::removeFace ( shared\_ptr< ftSurface > *face* )

Remove one face from the face set

Parameters

<i>face</i>	Pointer to the face to be removed
-------------	-----------------------------------

Returns

Whether the face was removed

29.497.3.79 **shared\_ptr<ftSurface>** Go::SurfaceModel::replaceRegularSurface ( ftSurface \* *face*, **bool** *only\_corner* = **false** )

29.497.3.80 **void** Go::SurfaceModel::replaceRegularSurfaces ( )

Approximate regular trimmed surfaces with spline surfaces and replace

29.497.3.81 **void** Go::SurfaceModel::setBoundaryCurves ( )

Set the elements in *boundary\_curves\_* (based on *top\_table\_*).

29.497.3.82 **void** Go::SurfaceModel::setTolerances ( **double** *aproxtol*, **double** *gap*, **double** *kink* )

Set or reset topology tolerances

Parameters

<i>aproxtol</i>	Approximation error tolerance.
<i>gap</i>	If the distance between two points is less than 'gap' they are viewed as identical.
<i>kink</i>	If two adjacent surfaces meet with an angle less than 'kink', they are seen as G1 continuous. (angles in radians)

29.497.3.83 **void** Go::SurfaceModel::setTolerances ( **double** *aproxtol*, **double** *gap*, **double** *neighbour*, **double** *kink*, **double** *bend* )

Set or reset topology tolerances

Parameters

<i>aproxtol</i>	Approximation error tolerance. Not used.
<i>gap</i>	If the distance between two points is less than 'gap' they are viewed as identical.
<i>neighbour</i>	Maximum distance between surfaces or curves viewed as adjacent.
<i>kink</i>	If two adjacent surfaces meet with an angle less than 'kink', they are seen as G1 continuous. (angles in radians)

## Parameters

<i>bend</i>	If two surfaces meet along a common boundary and corresponding surface normals form an angle which is larger than 'bend', there is an intentional sharp edge between the surfaces.(angles in radians)
-------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

29.497.3.84 **ftMessage** Go::SurfaceModel::setTopology ( )

Fetch the topology information from twin information in the input geometry.

## Returns

Messages

29.497.3.85 **void** Go::SurfaceModel::setTwinFaceInfo ( )

Add information about twin faces.

29.497.3.86 **void** Go::SurfaceModel::setVertexIdentity ( )

Add information about faces at the boundary meeting only in vertices.

29.497.3.87 **void** Go::SurfaceModel::simplifyShell ( )

Simplify current shell by merging surfaces with a smooth connection both with regard to the surfaces themselves and the associated boundary curves. The common boundary must be isoparametric in both surfaces

29.497.3.88 **bool** Go::SurfaceModel::simplifyTrimLoops ( **double** & *max\_dist* )

Simplify fragmented trimming loops

## Return values

<i>max_dist</i>	Maximum local distortion around the transitions. ???
-----------------	------------------------------------------------------

## Returns

Whether any faces were modified.

29.497.3.89 **void** Go::SurfaceModel::splitSurfaceModel ( **std::vector**< **shared\_ptr**< **ftSurface** > > & *faces*, **Body** \* *model2*, **std::vector**< **std::vector**< **shared\_ptr**< **ParamSurface** > > > & *result* )

Split a surface models according to a set of faces belonging to a specified surface model

29.497.3.90 `std::vector<shared_ptr<SurfaceModel> > Go::SurfaceModel::splitSurfaceModels ( shared_ptr<SurfaceModel> & model2 )`

Split two surface models according to intersections between them.

#### Parameters

<code>model2</code>	The other model.
---------------------	------------------

#### Returns

Vector of new surface models.

29.497.3.91 `void Go::SurfaceModel::swapFaces ( int idx1, int idx2 )`

Switches the ordering of the faces internal in this construction. To be used if the order in which the faces are handled has a significance

29.497.3.92 `virtual void Go::SurfaceModel::tessellate ( std::vector< shared_ptr< GeneralMesh > > & meshes ) const [virtual]`

Tessellate surface model Tessellate all surfaces with respect to a default resolution

#### Return values

<code>meshes</code>	Tesselated model
---------------------	------------------

Implements [Go::CompositeModel](#).

29.497.3.93 `void Go::SurfaceModel::tessellate ( int uv_res, std::vector< shared_ptr< GeneralMesh > > & meshes ) const`

Tessellate all surfaces with respect to a given total resolution. The resolution in each parameter direction is set from the method

#### Parameters

<code>uv_res</code>	Tesselation resolution
---------------------	------------------------

#### Return values

<code>meshes</code>	Tesselated model
---------------------	------------------

29.497.3.94 `virtual void Go::SurfaceModel::tessellate ( int resolution[], std::vector< shared_ptr< GeneralMesh > > & meshes ) const [virtual]`

Tessellate all surfaces with respect to given resolutions in each parameter direction.

## Parameters

<i>resolution</i> []	Tessellation resolution
----------------------	-------------------------

## Return values

<i>meshes</i>	Tesselated model
---------------	------------------

Implements [Go::CompositeModel](#).

29.497.3.95 `virtual void Go::SurfaceModel::tessellate ( double density, std::vector< shared_ptr< GeneralMesh > > & meshes ) const` [virtual]

Tessellate all surfaces with respect to a given tessellation density

## Parameters

<i>density</i>	Tessellation density
----------------	----------------------

## Return values

<i>meshes</i>	Tesselated model
---------------	------------------

Implements [Go::CompositeModel](#).

29.497.3.96 `void Go::SurfaceModel::tessellate ( const std::vector< shared_ptr< ftFaceBase > > & faces, int uv_res, std::vector< shared_ptr< GeneralMesh > > & meshes ) const`

Tessellate specified surfaces with respect to a given total resolution. The resolution in each parameter direction is set from the method

## Parameters

<i>faces</i>	Specified surfaces
<i>uv_res</i>	Tessellation resolution

## Return values

<i>meshes</i>	Tesselated surfaces
---------------	---------------------

29.497.3.97 `void Go::SurfaceModel::tessellate ( const std::vector< shared_ptr< ftFaceBase > > & faces, int resolution[], std::vector< shared_ptr< GeneralMesh > > & meshes ) const`

Tessellate specified surfaces with respect to given resolutions in each parameter direction.

## Parameters

<i>faces</i>	Specified surfaces
<i>resolution[]</i>	Tessellation resolutions

## Return values

<i>meshes</i>	Tesselated model
---------------	------------------

29.497.3.98 void Go::SurfaceModel::tessellate ( const std::vector< shared\_ptr< ftFaceBase > > & *faces*, double *density*, std::vector< shared\_ptr< GeneralMesh > > & *meshes* ) const

Tessellate specified surfaces with respect to a given tessellation density

## Parameters

<i>faces</i>	Specified surfaces
<i>density</i>	Tessellation density

## Return values

<i>meshes</i>	Tesselated model
---------------	------------------

29.497.3.99 virtual void Go::SurfaceModel::tesselatedCtrPolygon ( std::vector< shared\_ptr< LineCloud > > & *ctr\_pol* ) const [virtual]

Return a tessellation of the control polygon of all surfaces

## Return values

<i>ctr_pol</i>	Tessellation of the control polygon of all surfaces.
----------------	------------------------------------------------------

Implements [Go::CompositeModel](#).

29.497.3.100 void Go::SurfaceModel::tesselatedCtrPolygon ( const std::vector< shared\_ptr< ftFaceBase > > & *faces*, std::vector< shared\_ptr< LineCloud > > & *ctr\_pol* ) const

Return a tessellation of the control polygon of specified surfaces

## Parameters

<i>faces</i>	Specified surfaces
--------------	--------------------

## Return values

<i>ctr_pol</i>	Tessellation of the control polygon of the specified surfaces.
----------------	----------------------------------------------------------------

29.497.3.101 `shared_ptr<ftPointSet> Go::SurfaceModel::triangulate ( double density ) const`

Triangulate the complete surface set with a prescribed point density. NB! The density may be adjusted if the number of points become too high and it is used as an indicator, not an absolute measure.

29.497.3.102 `shared_ptr<SurfaceModel> Go::SurfaceModel::trimWithPlane ( const ftPlane & plane )`

Intersect the model with a plane and return the surface model trimmed with respect to this plane, the part of the model at the positive side of the plane is removed.

## Parameters

<i>plane</i>	The plane.
--------------	------------

## Returns

Pointer to trimmed surface model

29.497.3.103 `virtual void Go::SurfaceModel::turn ( int idx ) [virtual]`

Turn parameter directions of one surface Will turn the orientation of the surface normal An update in the topology structures is required.

## Parameters

<i>idx</i>	Index of surface
------------	------------------

Implements [Go::CompositeModel](#).

29.497.3.104 `virtual void Go::SurfaceModel::turn ( ) [virtual]`

Turn parameter directions of all surfaces An update in the topology structures is required.

Implements [Go::CompositeModel](#).

29.497.3.105 `void Go::SurfaceModel::updateFaceTopology ( shared_ptr< ftSurface > face )`

Update neighbourhood information related to face

## Parameters

<i>face</i>	Pointer to the face
-------------	---------------------

### 29.498.1 Detailed Description

Definition at line 55 of file [SurfaceOfLinearExtrusion.h](#).

## 29.498.2 Constructor & Destructor Documentation

### 29.498.2.1 `Go::SurfaceOfLinearExtrusion::SurfaceOfLinearExtrusion ( ) [inline]`

Default constructor. Constructs an uninitialized [SurfaceOfLinearExtrusion](#) which can only be assigned to or read into.

Definition at line 61 of file `SurfaceOfLinearExtrusion.h`.

### 29.498.2.2 `Go::SurfaceOfLinearExtrusion::SurfaceOfLinearExtrusion ( shared_ptr< SplineCurve > curve, Point axis_dir, bool isSwapped = false )`

Constructor. Input is the location and normalized direction of the axis, and the [SplineCurve](#) that is swept out by the revolution.

### 29.498.2.3 `virtual Go::SurfaceOfLinearExtrusion::~~SurfaceOfLinearExtrusion ( ) [virtual]`

Virtual destructor - ensures safe inheritance.

## 29.498.3 Member Function Documentation

### 29.498.3.1 `std::vector<CurveLoop> Go::SurfaceOfLinearExtrusion::allBoundaryLoops ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [virtual]`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

#### Parameters

<i>degenerate_epsilon</i>	edges whose length is smaller than this value are ignored.
---------------------------	------------------------------------------------------------

#### Returns

a vector containing `CurveLoops`. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

### 29.498.3.2 `virtual double Go::SurfaceOfLinearExtrusion::area ( double tol ) const [virtual]`

Compute the total area of this surface up to some tolerance

#### Parameters

<i>tol</i>	the relative tolerance when approximating the area, i.e. stop iteration when error becomes smaller than $tol/(\text{surface area})$
------------	-------------------------------------------------------------------------------------------------------------------------------------

**Returns**

the area calculated

Implements [Go::ParamSurface](#).

**29.498.3.3** virtual **BoundingBox** Go::SurfaceOfLinearExtrusion::boundingBox ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

**29.498.3.4** static **ClassType** Go::SurfaceOfLinearExtrusion::classType ( ) [static]

**29.498.3.5** virtual **SurfaceOfLinearExtrusion\*** Go::SurfaceOfLinearExtrusion::clone ( ) const [virtual]

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

**Returns**

pointer to cloned object

Implements [Go::ParamSurface](#).

**29.498.3.6** void Go::SurfaceOfLinearExtrusion::closestBoundaryPoint ( const **Point** & *pt*, double & *clo\_u*, double & *clo\_v*, **Point** & *clo\_pt*, double & *clo\_dist*, double *epsilon*, const **RectDomain** \* *rd* = NULL, double \* *seed* = 0 ) const [virtual]

Iterates to the closest point to *pt* on the boundary of the surface.

**See also**

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

**29.498.3.7** virtual **Point** Go::SurfaceOfLinearExtrusion::closestInDomain ( double *u*, double *v* ) const [virtual]

Return the parameter value in the domain of this surface closest to the parameter pair (u,v).

Implements [Go::ParamSurface](#).

**29.498.3.8** void Go::SurfaceOfLinearExtrusion::closestPoint ( const **Point** & *pt*, double & *clo\_u*, double & *clo\_v*, **Point** & *clo\_pt*, double & *clo\_dist*, double *epsilon*, const **RectDomain** \* *domain\_of\_interest* = NULL, double \* *seed* = 0 ) const [virtual]

Iterates to the closest point to *pt* on the surface.

## Parameters

<i>pt</i>	the point to find the closest point to
<i>clo_u</i>	u parameter of the closest point
<i>clo_v</i>	v parameter of the closest point
<i>clo_pt</i>	the geometric position of the closest point
<i>clo_dist</i>	the distance between pt and clo_pt
<i>epsilon</i>	parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)
<i>domain_of_interest</i>	pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched.
<i>seed</i>	pointer to parameter values where iteration starts.

Reimplemented from [Go::ParamSurface](#).

```
29.498.3.9 std::vector<shared_ptr<ParamCurve>> Go::SurfaceOfLinearExtrusion::constParamCurves (double
parameter, bool pdir_is_u) const [virtual]
```

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

## Parameters

<i>parameter</i>	parameter value for the constant parameter (either u or v)
<i>pdir_is_u</i>	specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one.

## Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

```
29.498.3.10 virtual RectDomain Go::SurfaceOfLinearExtrusion::containingDomain () const [virtual]
```

Get a rectangular parameter domain that is guaranteed to contain the surface's [parameterDomain\(\)](#). It may be the same. There is no guarantee that this is the smallest domain containing the actual domain.

## Returns

a [RectDomain](#) that is guaranteed to include the surface's total parameter domain.

Implements [Go::ParamSurface](#).

```
29.498.3.11 SplineSurface* Go::SurfaceOfLinearExtrusion::createSplineSurface () const
```

Create a [SplineSurface](#) representation of the surface of revolution.

29.498.3.12 `virtual int Go::SurfaceOfLinearExtrusion::dimension ( ) const` `[virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.498.3.13 `SplineSurface* Go::SurfaceOfLinearExtrusion::geometrySurface ( ) const`

Return spline representation of the surface of revolution.

29.498.3.14 `Point Go::SurfaceOfLinearExtrusion::getAxisDir ( ) const` `[inline]`

Direction of axis of extrusion.

Definition at line 195 of file `SurfaceOfLinearExtrusion.h`.

29.498.3.15 `void Go::SurfaceOfLinearExtrusion::getBoundaryInfo ( Point & pt1, Point & pt2, double epsilon, SplineCurve *& cv, SplineCurve *& crosscv, double knot_tol=1e-05 ) const` `[virtual]`

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

#### Parameters

<i>pt1</i>	the first point on the boundary, given by the user
<i>pt2</i>	the second point on the boundary, given by the user
<i>epsilon</i>	the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.
<i>cv</i>	upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.
<i>crosscv</i>	upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary.
<i>knot_tol</i>	tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.

Implements [Go::ParamSurface](#).

29.498.3.16 `virtual void Go::SurfaceOfLinearExtrusion::getCornerPoints ( std::vector< std::pair< Point, Point > > & corners ) const` `[virtual]`

Return surface corners, geometric and parametric points in that sequence.

Implements [Go::ParamSurface](#).

29.498.3.17 `shared_ptr<SplineCurve> Go::SurfaceOfLinearExtrusion::getCurve ( ) const [inline]`

Generating curve, i.e. the curve that are rotated around the axis.

Definition at line 199 of file `SurfaceOfLinearExtrusion.h`.

29.498.3.18 `virtual void Go::SurfaceOfLinearExtrusion::getDegenerateCorners ( std::vector< Point > & deg_corners, double tol ) const [virtual]`

Check for parallel and anti parallel partial derivatives in surface corners

Implements [Go::ParamSurface](#).

29.498.3.19 `virtual bool Go::SurfaceOfLinearExtrusion::inDomain ( double u, double v, double eps = 1.0e-4 ) const [virtual]`

Check if a parameter pair lies inside the domain of this surface.

Implements [Go::ParamSurface](#).

29.498.3.20 `virtual int Go::SurfaceOfLinearExtrusion::inDomain2 ( double u, double v, double eps = 1.0e-4 ) const [virtual]`

Check if a parameter pair lies inside the domain of this surface return value = 0: outside = 1: internal = 2: at the boundary

Implements [Go::ParamSurface](#).

29.498.3.21 `virtual ClassType Go::SurfaceOfLinearExtrusion::instanceType ( ) const [virtual]`

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.498.3.22 `bool Go::SurfaceOfLinearExtrusion::isBounded ( ) const`

29.498.3.23 `virtual bool Go::SurfaceOfLinearExtrusion::isSwapped ( ) const [virtual]`

29.498.3.24 `double Go::SurfaceOfLinearExtrusion::nextSegmentVal ( int dir, double par, bool forward, double tol ) const [virtual]`

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

## Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0 or 1)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value

## Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

29.498.3.25 `void Go::SurfaceOfLinearExtrusion::normal ( Point & n, double upar, double vpar ) const` [virtual]

Evaluates the surface normal for a given parameter pair

## Parameters

<i>n</i>	the computed normal will be written to this variable
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

29.498.3.26 `DirectionCone Go::SurfaceOfLinearExtrusion::normalCone ( ) const` [virtual]

Creates a [DirectionCone](#) covering all normals to this surface.

## Returns

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

29.498.3.27 `virtual bool Go::SurfaceOfLinearExtrusion::onBoundary ( double u, double v, double eps = 1.0e-4 ) const` [virtual]

Check if a parameter pair lies at the boundary of this surface.

Implements [Go::ParamSurface](#).

29.498.3.28 `CurveLoop Go::SurfaceOfLinearExtrusion::outerBoundaryLoop ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const` [virtual]

Returns the anticlockwise, outer boundary loop of the surface.

## Parameters

<i>degenerate_epsilon</i>	edges whose length is smaller than this value are ignored.
---------------------------	------------------------------------------------------------

## Returns

a [CurveLoop](#) describing the anticlockwise, outer boundary loop of the surface. A negative *degenerate\_epsilon* indicates that all curves, also the degenerate ones are wanted

Implements [Go::ParamSurface](#).

29.498.3.29 **const RectDomain& Go::SurfaceOfLinearExtrusion::parameterDomain ( ) const** [virtual]

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

## Returns

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

29.498.3.30 **void Go::SurfaceOfLinearExtrusion::point ( Point & pt, double upar, double vpar ) const** [virtual]

Evaluates the surface's position for a given parameter pair.

## Parameters

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

29.498.3.31 **void Go::SurfaceOfLinearExtrusion::point ( std::vector< Point > & pts, double upar, double vpar, int derivs, bool u\_from\_right = true, bool v\_from\_right = true, double resolution = 1.0e-12 ) const** [virtual]

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

## Parameters

<i>pts</i>	the vector containing the evaluated <i>pts</i> values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if <i>'derivs' &gt; 0</i> , the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order $(du_2, dudv, dv_2)$ , and similar for even higher derivatives.
------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Parameters

<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implements [Go::ParamSurface](#).

29.498.3.32 `virtual void Go::SurfaceOfLinearExtrusion::read ( std::istream & is ) [virtual]`

read object from stream

## Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.498.3.33 `void Go::SurfaceOfLinearExtrusion::reverseParameterDirection ( bool direction_is_u ) [virtual]`

Reverses the direction of the basis in input direction.

## Parameters

<i>direction_is_u</i>	if 'true', the first parameter direction will be reversed, otherwise, the second parameter direction will be reversed
-----------------------	-----------------------------------------------------------------------------------------------------------------------

Implements [Go::ParamSurface](#).

29.498.3.34 `void Go::SurfaceOfLinearExtrusion::setParameterBounds ( double from_upar, double from_vpar, double to_upar, double to_vpar )`

Limit the surface by limiting the parameter domain.

29.498.3.35 `SurfaceOfLinearExtrusion* Go::SurfaceOfLinearExtrusion::subSurface ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const`

Pick part of surface.

```
29.498.3.36 std::vector<shared_ptr<ParamSurface> > Go::SurfaceOfLinearExtrusion::subSurfaces (double from_upar,
double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON
) const [virtual]
```

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

#### Parameters

<i>from_upar</i>	lower value for the first parameter in the subdomain
<i>from_vpar</i>	lower value for the second parameter in the subdomain
<i>to_upar</i>	upper value for the first parameter in the subdomain
<i>to_vpar</i>	upper value for the second parameter in the subdomain
<i>fuzzy</i>	tolerance used when determining intersection with interior boundaries

#### Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

```
29.498.3.37 void Go::SurfaceOfLinearExtrusion::swapParameterDirection () [virtual]
```

Swaps the two parameter directions.

Implements [Go::ParamSurface](#).

```
29.498.3.38 DirectionCone Go::SurfaceOfLinearExtrusion::tangentCone (bool paddir_is_u) const [virtual]
```

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

#### Parameters

<i>paddir_is_u</i>	if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used.
--------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

```
29.498.3.39 void Go::SurfaceOfLinearExtrusion::turnOrientation () [virtual]
```

Turns the direction of the normal of the surface.

Implements [Go::ParamSurface](#).

29.498.3.40 `virtual void Go::SurfaceOfLinearExtrusion::write ( std::ostream & os ) const` [virtual]

write object to stream

#### Parameters

<code>os</code>	stream to which object is written
-----------------	-----------------------------------

Implements [Go::Streamable](#).

The documentation for this class was generated from the following file:

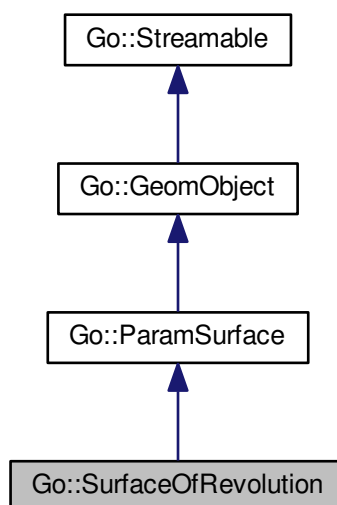

- `gotools-core/include/GoTools/geometry/SurfaceOfLinearExtrusion.h`

## 29.499 Go::SurfaceOfRevolution Class Reference

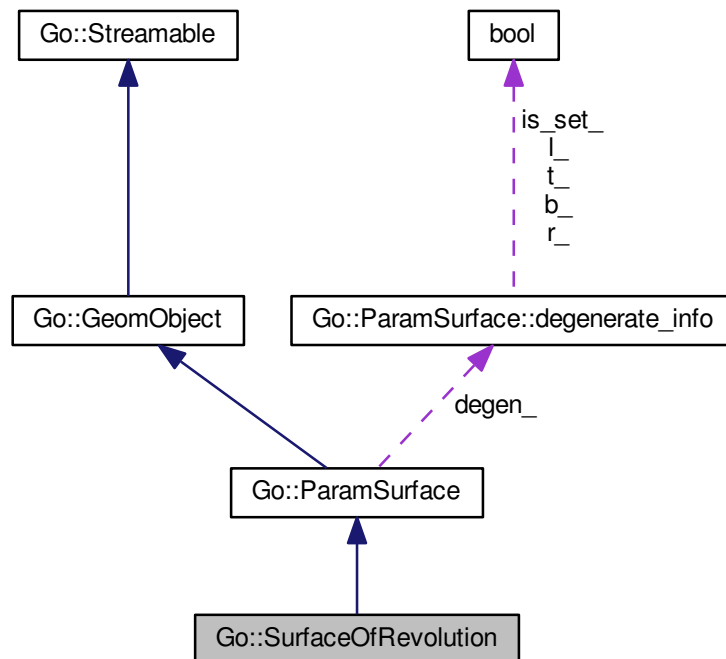

Class that represents a surface of revolution. A [SurfaceOfRevolution](#) is swept out by a [SplineCurve](#) that is rotated around an axis with a complete revolution, and is thereby a parametric surface.

```
#include <SurfaceOfRevolution.h>
```

### 29.499.1 Detailed Description

Class that represents a surface of revolution. A [SurfaceOfRevolution](#) is swept out by a [SplineCurve](#) that is rotated around an axis with a complete revolution, and is thereby a parametric surface.

The parametrization of the surface is given in terms of a location  $\mathbf{C}$ , an axis line  $\mathbf{V}$ , and the spline curve  $\lambda(v)$  with parameter  $v$ :

$$\sigma(u, v) = C + (\lambda(v) - C) \cos u + ((\lambda(v) - C) \cdot V)V(1 - \cos u) + V \times (\lambda(v) - C) \sin u$$

The parameter  $u$  is bounded by:  $0 \leq u \leq 2\pi$ . The axis  $\mathbf{V}$  is normalized.

The curve  $\lambda$  must be such that it doesn't lead to a self-intersecting surface.

Definition at line 77 of file `SurfaceOfRevolution.h`.

### 29.499.2 Constructor & Destructor Documentation

#### 29.499.2.1 `Go::SurfaceOfRevolution::SurfaceOfRevolution ( ) [inline]`

Default constructor. Constructs an uninitialized [SurfaceOfRevolution](#) which can only be assigned to or read into.

Definition at line 83 of file `SurfaceOfRevolution.h`.

#### 29.499.2.2 `Go::SurfaceOfRevolution::SurfaceOfRevolution ( Point location, Point axis_dir, shared_ptr< SplineCurve > curve, bool isSwapped = false )`

Constructor. Input is the location and normalized direction of the axis, and the [SplineCurve](#) that is swept out by the revolution.

#### 29.499.2.3 `virtual Go::SurfaceOfRevolution::~~SurfaceOfRevolution ( ) [virtual]`

Virtual destructor - ensures safe inheritance.

### 29.499.3 Member Function Documentation

#### 29.499.3.1 `std::vector<CurveLoop> Go::SurfaceOfRevolution::allBoundaryLoops ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [virtual]`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

Parameters

<code>degenerate_epsilon</code>	edges whose length is smaller than this value are ignored.
---------------------------------	------------------------------------------------------------

**Returns**

a vector containing CurveLoops. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

**29.499.3.2** `virtual double Go::SurfaceOfRevolution::area ( double tol ) const [virtual]`

Compute the total area of this surface up to some tolerance

**Parameters**

<i>tol</i>	the relative tolerance when approximating the area, i.e. stop iteration when error becomes smaller than $tol/(surface\ area)$
------------	-------------------------------------------------------------------------------------------------------------------------------

**Returns**

the area calculated

Implements [Go::ParamSurface](#).

**29.499.3.3** `virtual BoundingBox Go::SurfaceOfRevolution::boundingBox ( ) const [virtual]`

Return the object's bounding box.

Implements [Go::GeomObject](#).

**29.499.3.4** `static ClassType Go::SurfaceOfRevolution::classType ( ) [static]`

**29.499.3.5** `virtual SurfaceOfRevolution* Go::SurfaceOfRevolution::clone ( ) const [virtual]`

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

**Returns**

pointer to cloned object

Implements [Go::ParamSurface](#).

**29.499.3.6** `void Go::SurfaceOfRevolution::closestBoundaryPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * rd = NULL, double * seed = 0 ) const [virtual]`

Iterates to the closest point to *pt* on the boundary of the surface.

**See also**

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

29.499.3.7 `virtual Point Go::SurfaceOfRevolution::closestInDomain ( double u, double v ) const` [virtual]

Return the parameter value in the domain of this surface closest to the parameter pair (u,v).

Implements [Go::ParamSurface](#).

29.499.3.8 `void Go::SurfaceOfRevolution::closestPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * domain_of_interest = NULL, double * seed = 0 ) const` [virtual]

Iterates to the closest point to pt on the surface.

#### Parameters

<i>pt</i>	the point to find the closest point to
<i>clo_u</i>	u parameter of the closest point
<i>clo_v</i>	v parameter of the closest point
<i>clo_pt</i>	the geometric position of the closest point
<i>clo_dist</i>	the distance between pt and clo_pt
<i>epsilon</i>	parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)
<i>domain_of_interest</i>	pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched.
<i>seed</i>	pointer to parameter values where iteration starts.

Reimplemented from [Go::ParamSurface](#).

29.499.3.9 `std::vector<shared_ptr<ParamCurve>> Go::SurfaceOfRevolution::constParamCurves ( double parameter, bool pdir_is_u ) const` [virtual]

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

#### Parameters

<i>parameter</i>	parameter value for the constant parameter (either u or v)
<i>pdir_is_u</i>	specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one.

#### Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

29.499.3.10 `virtual RectDomain Go::SurfaceOfRevolution::containingDomain ( ) const` [virtual]

Get a rectangular parameter domain that is guaranteed to contain the surface's [parameterDomain\(\)](#). It may be the same. There is no guarantee that this is the smallest domain containing the actual domain.

## Returns

a [RectDomain](#) that is guaranteed to include the surface's total parameter domain.

Implements [Go::ParamSurface](#).

29.499.3.11 [SplineSurface\\*](#) [Go::SurfaceOfRevolution::createSplineSurface \( \) const](#)

Create a [SplineSurface](#) representation of the surface of revolution.

29.499.3.12 `virtual int` [Go::SurfaceOfRevolution::dimension \( \) const](#) `[virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.499.3.13 [SplineSurface\\*](#) [Go::SurfaceOfRevolution::geometrySurface \( \) const](#)

Return spline representation of the surface of revolution.

29.499.3.14 `Point` [Go::SurfaceOfRevolution::getAxisDir \( \) const](#) `[inline]`

Direction of axis of revolution.

Definition at line 219 of file `SurfaceOfRevolution.h`.

29.499.3.15 `void` [Go::SurfaceOfRevolution::getBoundaryInfo \( `Point & pt1`, `Point & pt2`, `double epsilon`, `SplineCurve \*& cv`, `SplineCurve \*& crosscv`, `double knot\_tol = 1e-05` \) const](#) `[virtual]`

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

## Parameters

<i>pt1</i>	the first point on the boundary, given by the user
<i>pt2</i>	the second point on the boundary, given by the user
<i>epsilon</i>	the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.
<i>cv</i>	upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.
<i>crosscv</i>	upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary.
<i>knot_tol</i>	tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.

Implements [Go::ParamSurface](#).

29.499.3.16 `shared_ptr<Circle> Go::SurfaceOfRevolution::getCircle ( double vpar ) const`

Get the circle for a given v parameter.

#### Parameters

<i>vpar</i>	v parameter
-------------	-------------

#### Returns

A circle for the corresponding v parameter. If the v parameter is bounded, only a segment of a full circle is returned.

29.499.3.17 `virtual void Go::SurfaceOfRevolution::getCornerPoints ( std::vector< std::pair< Point, Point > > & corners ) const [virtual]`

Return surface corners, geometric and parametric points in that sequence.

Implements [Go::ParamSurface](#).

29.499.3.18 `shared_ptr<SplineCurve> Go::SurfaceOfRevolution::getCurve ( ) const [inline]`

Generating curve, i.e. the curve that are rotated around the axis.

Definition at line 223 of file SurfaceOfRevolution.h.

29.499.3.19 `virtual void Go::SurfaceOfRevolution::getDegenerateCorners ( std::vector< Point > & deg_corners, double tol ) const [virtual]`

Check for parallel and anti parallel partial derivatives in surface corners

Implements [Go::ParamSurface](#).

29.499.3.20 `Point Go::SurfaceOfRevolution::getLocation ( ) const [inline]`

[Point](#) on axis of revolution.

Definition at line 215 of file SurfaceOfRevolution.h.

29.499.3.21 `virtual bool Go::SurfaceOfRevolution::inDomain ( double u, double v, double eps = 1.0e-4 ) const [virtual]`

Check if a parameter pair lies inside the domain of this surface.

Implements [Go::ParamSurface](#).

29.499.3.22 `virtual int Go::SurfaceOfRevolution::inDomain2 ( double u, double v, double eps = 1.0e-4 ) const` [virtual]

Check if a parameter pair lies inside the domain of this surface return value = 0: outside = 1: internal = 2: at the boundary

Implements [Go::ParamSurface](#).

29.499.3.23 `virtual ClassType Go::SurfaceOfRevolution::instanceType ( ) const` [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.499.3.24 `virtual bool Go::SurfaceOfRevolution::isSwapped ( ) const` [virtual]

29.499.3.25 `double Go::SurfaceOfRevolution::nextSegmentVal ( int dir, double par, bool forward, double tol ) const` [virtual]

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0 or 1)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value

#### Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

29.499.3.26 `void Go::SurfaceOfRevolution::normal ( Point & n, double upar, double vpar ) const` [virtual]

Evaluates the surface normal for a given parameter pair

#### Parameters

<i>n</i>	the computed normal will be written to this variable
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

29.499.3.27 **DirectionCone** `Go::SurfaceOfRevolution::normalCone ( ) const` [virtual]

Creates a [DirectionCone](#) covering all normals to this surface.

Returns

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

29.499.3.28 **virtual bool** `Go::SurfaceOfRevolution::onBoundary ( double u, double v, double eps = 1.0e-4 ) const` [virtual]

Check if a parameter pair lies at the boundary of this surface.

Implements [Go::ParamSurface](#).

29.499.3.29 **CurveLoop** `Go::SurfaceOfRevolution::outerBoundaryLoop ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const` [virtual]

Returns the anticlockwise, outer boundary loop of the surface.

Parameters

<i>degenerate_epsilon</i>	edges whose length is smaller than this value are ignored.
---------------------------	------------------------------------------------------------

Returns

a [CurveLoop](#) describing the anticlockwise, outer boundary loop of the surface. A negative `degenerate_epsilon` indicates that all curves, also the degenerate ones are wanted

Implements [Go::ParamSurface](#).

29.499.3.30 **const RectDomain&** `Go::SurfaceOfRevolution::parameterDomain ( ) const` [virtual]

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

Returns

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

29.499.3.31 **void** `Go::SurfaceOfRevolution::point ( Point & pt, double upar, double vpar ) const` [virtual]

Evaluates the surface's position for a given parameter pair.

## Parameters

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

```
29.499.332 void Go::SurfaceOfRevolution::point (std::vector< Point > & pts, double upar, double vpar, int derivs, bool
u_from_right = true, bool v_from_right = true, double resolution = 1.0e-12) const [virtual]
```

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

## Parameters

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives.
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implements [Go::ParamSurface](#).

```
29.499.333 virtual void Go::SurfaceOfRevolution::read (std::istream & is) [virtual]
```

read object from stream

## Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

```
29.499.334 void Go::SurfaceOfRevolution::reverseParameterDirection (bool direction_is_u) [virtual]
```

Reverses the direction of the basis in input direction.

## Parameters

<i>direction_is_u</i>	if 'true', the first parameter direction will be reversed, otherwise, the second parameter direction will be reversed
-----------------------	-----------------------------------------------------------------------------------------------------------------------

Implements [Go::ParamSurface](#).

```
29.499.3.35 void Go::SurfaceOfRevolution::setParameterBounds (double from_upar, double from_vpar, double to_upar,
double to_vpar)
```

Limit the surface by limiting the parameter domain.

```
29.499.3.36 SurfaceOfRevolution* Go::SurfaceOfRevolution::subSurface (double from_upar, double from_vpar,
double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON) const
```

Pick part of surface.

```
29.499.3.37 std::vector<shared_ptr<ParamSurface>> Go::SurfaceOfRevolution::subSurfaces (double from_upar,
double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON
) const [virtual]
```

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

## Parameters

<i>from_upar</i>	lower value for the first parameter in the subdomain
<i>from_vpar</i>	lower value for the second parameter in the subdomain
<i>to_upar</i>	upper value for the first parameter in the subdomain
<i>to_vpar</i>	upper value for the second parameter in the subdomain
<i>fuzzy</i>	tolerance used when determining intersection with interior boundaries

## Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

```
29.499.3.38 void Go::SurfaceOfRevolution::swapParameterDirection () [virtual]
```

Swaps the two parameter directions.

Implements [Go::ParamSurface](#).

```
29.499.3.39 DirectionCone Go::SurfaceOfRevolution::tangentCone (bool pdir_is_u) const [virtual]
```

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

## Parameters

<code>pardir_is↔ _u</code>	if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used.
--------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

29.499.3.40 `void Go::SurfaceOfRevolution::turnOrientation ( ) [virtual]`

Turns the direction of the normal of the surface.

Implements [Go::ParamSurface](#).

29.499.3.41 `virtual void Go::SurfaceOfRevolution::write ( std::ostream & os ) const [virtual]`

write object to stream

## Parameters

<code>os</code>	stream to which object is written
-----------------	-----------------------------------

Implements [Go::Streamable](#).

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/geometry/SurfaceOfRevolution.h](#)

## 29.500 Go::SurfaceOnVolume Class Reference

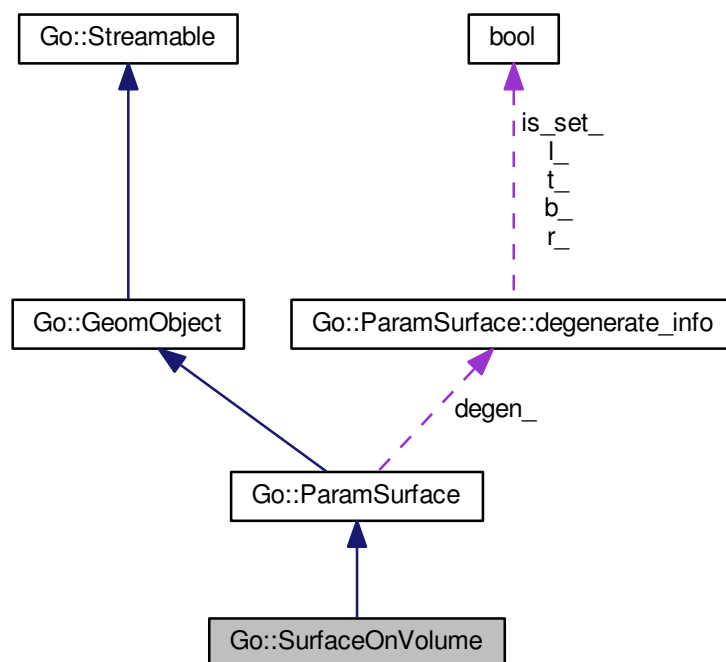

A surface living on a parametric volume. It either has got information about the surface in geometry space and in the parameter domain of the volume or both. The surface may have information on whether it is a constant parameter or boundary surface on the volume.

```
#include <SurfaceOnVolume.h>
```

### 29.500.1 Detailed Description

A surface living on a parametric volume. It either has got information about the surface in geometry space and in the parameter domain of the volume or both. The surface may have information on whether it is a constant parameter or boundary surface on the volume.

Definition at line 54 of file SurfaceOnVolume.h.

### 29.500.2 Constructor & Destructor Documentation

#### 29.500.2.1 Go::SurfaceOnVolume::SurfaceOnVolume ( )

Empty constructor.

#### 29.500.2.2 Go::SurfaceOnVolume::SurfaceOnVolume ( shared\_ptr< ParamVolume > vol, shared\_ptr< ParamSurface > parsurf, shared\_ptr< ParamSurface > spacesurf, bool preferparameter )

Constructor given associated volume, the surface in the parameter plane of this volume and the corresponding surface in geometry space. One surface representation may be a dummy. In that case the parameter indicating which surface representation is the master, must be set accordingly

##### Parameters

<i>vol</i>	associated volume
<i>parsurf</i>	surface in parameter domain of the volume
<i>spacesurf</i>	surface in geometry space
<i>preferparameter</i>	true if the parameter surface is the master

#### 29.500.2.3 Go::SurfaceOnVolume::SurfaceOnVolume ( shared\_ptr< ParamVolume > vol, shared\_ptr< ParamSurface > spacesurf, int constdir, double constpar, int boundary, bool swapped, int orientation = 0 )

Constructor given the volume, the surface in geometry space and constant parameter information related to the surface

##### Parameters

<i>vol</i>	associated volume
<i>spacesurf</i>	surface in geometry space
<i>constdir</i>	0 = not set, 1 = u-parameter constant, 2 = v-parameter constant, 3 = w-parameter constant
<i>constpar</i>	value of constant parameter
<i>boundary</i>	index: -1=no, 0=umin, 1=umax, 2=vmin, 3=vmax, 4=wmin, 5=wmax
<i>swapped</i>	orientation of surface related to underlying volume

29.500.2.4 `Go::SurfaceOnVolume::SurfaceOnVolume ( shared_ptr< ParamVolume > vol, int constdir, double constpar, int boundary )`

Constructor given volume and constant parameter information. Must only be used if the constant parameter information is set

29.500.2.5 `Go::SurfaceOnVolume::SurfaceOnVolume ( shared_ptr< ParamVolume > vol, shared_ptr< ParamSurface > spacesurf, shared_ptr< ParamSurface > parsurf, bool prefer_parameter, int constdir, double constpar, int boundary, bool swapped )`

Constructor to be used if all information is known

#### Parameters

<i>vol</i>	associated volume
<i>parsurf</i>	surface in parameter domain of the volume
<i>spacesurf</i>	surface in geometry space
<i>constdir</i>	0 = not set, 1 = u-parameter constant, 2 = v-parameter constant, 3 = w-parameter constant
<i>constpar</i>	value of constant parameter
<i>boundary</i>	index: -1=no, 0=umin, 1=umax, 2=vmin, 3=vmax, 4=wmin, 5=wmax
<i>swapped</i>	orientation of surface related to underlying volume

29.500.2.6 `Go::SurfaceOnVolume::SurfaceOnVolume ( const SurfaceOnVolume & other )`

Assignment constructor.

29.500.2.7 `virtual Go::SurfaceOnVolume::~~SurfaceOnVolume ( ) [virtual]`

Destructor.

### 29.500.3 Member Function Documentation

29.500.3.1 `virtual std::vector<CurveLoop> Go::SurfaceOnVolume::allBoundaryLoops ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [virtual]`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

#### Parameters

<i>degenerate_epsilon</i>	edges whose length is smaller than this value are ignored.
---------------------------	------------------------------------------------------------

#### Returns

a vector containing CurveLoops. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

**29.500.3.2** `virtual double Go::SurfaceOnVolume::area ( double tol ) const [virtual]`

Compute the total area of this surface up to some tolerance

#### Parameters

<i>tol</i>	the relative tolerance when approximating the area, i.e. stop iteration when error becomes smaller than $tol/(surface\ area)$
------------	-------------------------------------------------------------------------------------------------------------------------------

#### Returns

the area calculated

Implements [Go::ParamSurface](#).

**29.500.3.3** `virtual SplineSurface* Go::SurfaceOnVolume::asSplineSurface ( ) [inline],[virtual]`

Return the spline surface represented by this surface, if any.

Reimplemented from [Go::ParamSurface](#).

Definition at line 150 of file SurfaceOnVolume.h.

**29.500.3.4** `virtual BoundingBox Go::SurfaceOnVolume::boundingBox ( ) const [virtual]`

Axis align box surrounding this object.

Implements [Go::GeomObject](#).

**29.500.3.5** `static ClassType Go::SurfaceOnVolume::classType ( ) [inline],[static]`

Return the class type identifier of type SurfaceOnVolumeBoundedSurface.

Definition at line 138 of file SurfaceOnVolume.h.

**29.500.3.6** `virtual SurfaceOnVolume* Go::SurfaceOnVolume::clone ( ) const [inline],[virtual]`

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

#### Returns

pointer to cloned object

Implements [Go::ParamSurface](#).

Definition at line 144 of file SurfaceOnVolume.h.

```
29.500.3.7 virtual void Go::SurfaceOnVolume::closestBoundaryPoint (const Point & pt, double & clo_u, double & clo_v,
 Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * rd = NULL, double * seed = 0)
 const [virtual]
```

Iterates to the closest point to pt on the boundary of the surface.

See also

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

```
29.500.3.8 virtual Point Go::SurfaceOnVolume::closestInDomain (double u, double v) const [virtual]
```

Return the closest parameter pair in the domain of this surface, given an initial parameter pair

Implements [Go::ParamSurface](#).

```
29.500.3.9 virtual void Go::SurfaceOnVolume::closestPoint (const Point & pt, double & clo_u, double & clo_v, Point &
 clo_pt, double & clo_dist, double epsilon, const RectDomain * domain_of_interest = NULL, double *
 seed = 0) const [virtual]
```

Iterates to the closest point to pt on the surface.

Parameters

<i>pt</i>	the point to find the closest point to
<i>clo_u</i>	u parameter of the closest point
<i>clo_v</i>	v parameter of the closest point
<i>clo_pt</i>	the geometric position of the closest point
<i>clo_dist</i>	the distance between pt and clo_pt
<i>epsilon</i>	parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)
<i>domain_of_interest</i>	pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched.
<i>seed</i>	pointer to parameter values where iteration starts.

Reimplemented from [Go::ParamSurface](#).

```
29.500.3.10 virtual CompositeBox Go::SurfaceOnVolume::compositeBox () const [virtual]
```

Creates a composite box enclosing the surface. The composite box consists of an inner and an edge box. The inner box is supposed to be made from the interior of the surface, while the edge box is made from the boundary curves. The default implementation simply makes both boxes identical to the regular bounding box.

Returns

the [CompositeBox](#) of the surface, as specified above

Reimplemented from [Go::ParamSurface](#).

29.500.3.11 `virtual std::vector<shared_ptr<ParamCurve> > Go::SurfaceOnVolume::constParamCurves ( double parameter, bool pdir_is_u ) const [virtual]`

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

#### Parameters

<i>parameter</i>	parameter value for the constant parameter (either u or v)
<i>pdir_is_u</i>	specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one.

#### Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

29.500.3.12 `virtual RectDomain Go::SurfaceOnVolume::containingDomain ( ) const [virtual]`

Get a rectangular parameter domain that is guaranteed to contain the surface's [parameterDomain\(\)](#). It may be the same. There is no guarantee that this is the smallest domain containing the actual domain.

#### Returns

a [RectDomain](#) that is guaranteed to include the surface's total parameter domain.

Implements [Go::ParamSurface](#).

29.500.3.13 `virtual int Go::SurfaceOnVolume::dimension ( ) const [virtual]`

Dimension of geometry space.

Implements [Go::GeomObject](#).

29.500.3.14 `virtual int Go::SurfaceOnVolume::ElementBoundaryStatus ( int elem_ix, double eps ) [inline], [virtual]`

Check if a polynomial element (for spline surfaces) intersects the (trimming) boundaries of this [ftSurface](#), is inside or outside

#### Parameters

<i>elem_ix</i>	Element index counted according to distinct knot values. Sequence of coordinates: x runs fastest, then y
<i>eps</i>	Intersection tolerance

**Returns**

-1: Not a spline surface or element index out of range 0: Outside trimmed volume 1: On boundary (intersection with boundary found) 2: Internal to trimmed surfaces Note that a touch with the boundaries of the underlying surface is not considered a boundary intersection while touching a trimming curve is seen as an intersection

Reimplemented from [Go::ParamSurface](#).

Definition at line 547 of file SurfaceOnVolume.h.

```
29.500.3.15 virtual int Go::SurfaceOnVolume::ElementOnBoundary (int elem_ix, double eps) [inline],
 [virtual]
```

Check if a polynomial element (for spline surfaces) intersects the (trimming) boundaries of this surface

**Parameters**

<i>elem_ix</i>	Element index counted according to distinct knot values. Sequence of coordinates: x runs fastest, then y
<i>eps</i>	Intersection tolerance

**Returns**

-1: Not a spline surface or element index out of range 0: Not on boundary or touching a boundary curve 1: On boundary (intersection with boundary found) Note that a touch with the boundaries of the underlying surfaces is not considered a boundary intersection while touching a trimming curve is seen as an intersection

Reimplemented from [Go::ParamSurface](#).

Definition at line 527 of file SurfaceOnVolume.h.

```
29.500.3.16 virtual void Go::SurfaceOnVolume::getBoundaryInfo (Point & pt1, Point & pt2, double epsilon, SplineCurve
 *& cv, SplineCurve *& crosscv, double knot_tol = 1e-05) const [virtual]
```

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

**Parameters**

<i>pt1</i>	the first point on the boundary, given by the user
<i>pt2</i>	the second point on the boundary, given by the user
<i>epsilon</i>	the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.
<i>cv</i>	upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.
<i>crosscv</i>	upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary.
<i>knot_tol</i>	tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.

Implements [Go::ParamSurface](#).

29.500.3.17 `int Go::SurfaceOnVolume::getConstDir ( ) const [inline]`

Fetch the constant parameter direction of the volume, if any, associated.

Parameters

<i>return</i>	value: 0 = not set, 1 = u-parameter constant, 2 = v-parameter constant, 3 = w-parameter constant
---------------	--------------------------------------------------------------------------------------------------

Definition at line 505 of file SurfaceOnVolume.h.

29.500.3.18 `double Go::SurfaceOnVolume::getConstVal ( ) const [inline]`

Fetch the constant parameter value of the volume associated with this surface.

Definition at line 495 of file SurfaceOnVolume.h.

29.500.3.19 `virtual void Go::SurfaceOnVolume::getCornerPoints ( std::vector< std::pair< Point, Point > > & corners ) const [virtual]`

Return surface corners, i.e joints between trimming curves, geometric and parametric points in that sequence

Implements [Go::ParamSurface](#).

29.500.3.20 `virtual void Go::SurfaceOnVolume::getDegenerateCorners ( std::vector< Point > & deg_corners, double tol ) const [virtual]`

Check for paralell and anti paralell partial derivatives in surface corners.

Implements [Go::ParamSurface](#).

29.500.3.21 `shared_ptr<const ParamVolume> Go::SurfaceOnVolume::getVolume ( ) const [inline]`

Get volume.

Definition at line 441 of file SurfaceOnVolume.h.

29.500.3.22 `shared_ptr<ParamVolume> Go::SurfaceOnVolume::getVolume ( ) [inline]`

Get volume.

Definition at line 447 of file SurfaceOnVolume.h.

29.500.3.23 `virtual bool Go::SurfaceOnVolume::inDomain ( double u, double v, double eps = 1.0e-4 ) const`  
`[virtual]`

Check if a parameter pair lies inside the domain of this surface.

Implements [Go::ParamSurface](#).

29.500.3.24 `virtual int Go::SurfaceOnVolume::inDomain2 ( double u, double v, double eps = 1.0e-4 ) const`  
`[virtual]`

Check if a parameter pair lies inside the domain of this surface return value = 0: outside = 1: internal = 2: at the boundary

Implements [Go::ParamSurface](#).

29.500.3.25 `virtual ClassType Go::SurfaceOnVolume::instanceType ( ) const` `[virtual]`

Return the class type identifier of type [SurfaceOnVolume](#).

Implements [Go::GeomObject](#).

29.500.3.26 `virtual bool Go::SurfaceOnVolume::isDegenerate ( bool & b, bool & r, bool & t, bool & l, double tolerance )`  
`const [virtual]`

The order of the edge indicators (bottom, right, top, left) matches the `edge_number` of `edgeCurve()`. Query whether any of the four boundary curves are degenerate (zero length) within a certain tolerance. In the below, we refer to 'u' as the first parameter and 'v' as the second.

#### Parameters

<i>b</i>	'true' upon return of function if the boundary ( $v = v_{\min}$ ) is degenerate
<i>r</i>	'true' upon return of function if the boundary ( $v = v_{\max}$ ) is degenerate
<i>t</i>	'true' upon return of function if the boundary ( $u = u_{\min}$ ) is degenerate
<i>l</i>	'true' upon return of function if the boundary ( $u = u_{\max}$ ) is degenerate
<i>tolerance</i>	boundaries are considered degenerate if their length is shorter than this value, given by the user

#### Returns

'true' if at least one boundary curve was found to be degenerate, 'false' otherwise.

Reimplemented from [Go::ParamSurface](#).

29.500.3.27 `virtual bool Go::SurfaceOnVolume::isIsoTrimmed ( double tol ) const` `[virtual]`

Check if the current surface is trimmed along constant parameter curves.

Reimplemented from [Go::ParamSurface](#).

29.500.3.28 `virtual bool Go::SurfaceOnVolume::isLinear ( Point & dir1, Point & dir2, double tol ) [virtual]`

Check if the surface is linear in one or both parameter directions.

Reimplemented from [Go::ParamSurface](#).

29.500.3.29 `virtual double Go::SurfaceOnVolume::nextSegmentVal ( int dir, double par, bool forward, double tol ) const [virtual]`

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0 or 1)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value

#### Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

29.500.3.30 `virtual void Go::SurfaceOnVolume::normal ( Point & n, double upar, double vpar ) const [virtual]`

Evaluates the surface normal for a given parameter pair

#### Parameters

<i>n</i>	the computed normal will be written to this variable
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

29.500.3.31 `virtual DirectionCone Go::SurfaceOnVolume::normalCone ( ) const [virtual]`

Creates a [DirectionCone](#) covering all normals to this surface.

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

29.500.3.32 `virtual bool Go::SurfaceOnVolume::onBoundary ( double u, double v, double eps = 1.0e-4 ) const` [virtual]

Check if a parameter pair lies at the boundary of this surface.

Implements [Go::ParamSurface](#).

29.500.3.33 `virtual CurveLoop Go::SurfaceOnVolume::outerBoundaryLoop ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const` [virtual]

Returns the anticlockwise, outer boundary loop of the surface.

Parameters

<i>degenerate_epsilon</i>	edges whose length is smaller than this value are ignored.
---------------------------	------------------------------------------------------------

Returns

a [CurveLoop](#) describing the anticlockwise, outer boundary loop of the surface.

Implements [Go::ParamSurface](#).

29.500.3.34 `virtual const Domain& Go::SurfaceOnVolume::parameterDomain ( ) const` [virtual]

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

Returns

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

29.500.3.35 `shared_ptr<const ParamSurface> Go::SurfaceOnVolume::parameterSurface ( ) const` [inline]

Get parameter surface.

Definition at line 459 of file `SurfaceOnVolume.h`.

29.500.3.36 `shared_ptr<ParamSurface> Go::SurfaceOnVolume::parameterSurface ( )` [inline]

Get parameter surface.

Definition at line 465 of file `SurfaceOnVolume.h`.

29.500.3.37 `bool Go::SurfaceOnVolume::parPref ( ) const` [inline]

Query whether the parameter surface or the space surface is preferred for computation in this object.

Definition at line 491 of file `SurfaceOnVolume.h`.

29.500.3.38 `virtual void Go::SurfaceOnVolume::point ( Point & pt, double upar, double vpar ) const` [virtual]

Evaluates the surface's position for a given parameter pair.

## Parameters

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

**29.500.3.39** `virtual void Go::SurfaceOnVolume::point ( std::vector< Point > & pts, double upar, double vpar, int derivs, bool u_from_right = true, bool v_from_right = true, double resolution = 1.0e-12 ) const [virtual]`

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

## Parameters

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives.
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implements [Go::ParamSurface](#).

**29.500.3.40** `virtual void Go::SurfaceOnVolume::read ( std::istream & is ) [virtual]`

Read surface on volume information from file Not implemented

Implements [Go::Streamable](#).

**29.500.3.41** `virtual void Go::SurfaceOnVolume::reverseParameterDirection ( bool direction_is_u ) [virtual]`

Reverses the direction of the basis in input direction.

## Parameters

<i>direction_is_u</i>	if 'true', the first parameter direction will be reversed, otherwise, the second parameter direction will be reversed
-----------------------	-----------------------------------------------------------------------------------------------------------------------

Implements [Go::ParamSurface](#).

29.500.3.42 `void Go::SurfaceOnVolume::setSpaceSurface ( shared_ptr< ParamSurface > spacesurf ) [inline]`

For internal use. Careful!

Definition at line 484 of file SurfaceOnVolume.h.

29.500.3.43 `void Go::SurfaceOnVolume::setVolume ( shared_ptr< ParamVolume > volume ) [inline]`

Set/replace volume. NB! Use care.

Definition at line 453 of file SurfaceOnVolume.h.

29.500.3.44 `shared_ptr<const ParamSurface> Go::SurfaceOnVolume::spaceSurface ( ) const [inline]`

Get space surface.

Definition at line 471 of file SurfaceOnVolume.h.

29.500.3.45 `shared_ptr<ParamSurface> Go::SurfaceOnVolume::spaceSurface ( ) [inline]`

Get space surface.

Definition at line 477 of file SurfaceOnVolume.h.

29.500.3.46 `virtual std::vector<shared_ptr<ParamSurface> > Go::SurfaceOnVolume::subSurfaces ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [virtual]`

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

#### Parameters

<i>from_upar</i>	lower value for the first parameter in the subdomain
<i>from_vpar</i>	lower value for the second parameter in the subdomain
<i>to_upar</i>	upper value for the first parameter in the subdomain
<i>to_vpar</i>	upper value for the second parameter in the subdomain
<i>fuzzy</i>	tolerance used when determining intersection with interior boundaries

#### Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

29.500.3.47 `virtual void Go::SurfaceOnVolume::swapParameterDirection ( ) [virtual]`

Swaps the two parameter directions.

Implements [Go::ParamSurface](#).

29.500.3.48 `virtual DirectionCone Go::SurfaceOnVolume::tangentCone ( bool pardir_is_u ) const [virtual]`

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

Parameters

<code><i>pardir_is_u</i></code>	if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used.
---------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

29.500.3.49 `virtual void Go::SurfaceOnVolume::turnOrientation ( ) [virtual]`

Turns the direction of the normal of the surface.

Implements [Go::ParamSurface](#).

29.500.3.50 `void Go::SurfaceOnVolume::unsetParamSurf ( )`

Unset parameter surface information.

29.500.3.51 `Point Go::SurfaceOnVolume::volumeParameter ( double u_par, double v_par ) const`

Volume parameter corresponding to surface parameter.

29.500.3.52 `int Go::SurfaceOnVolume::whichBoundary ( double tol, int & orientation, bool & swap ) const`

Info on relation to corresponding volume Return value: -1=none, 0=umin, 1=umax, 2=vmin, 3=vmax, 4=wmin, 5=wmax orientation = -1 and return value >= 0: the orientation of the surface compared to the volume boundary is not known or the two surfaces are coincident but not identical

```
29.500.3.53 virtual void Go::SurfaceOnVolume::write (std::ostream & os) const [virtual]
```

Write surface on volume information to file for visualization purposes If the geometry space surface exists, only that surface is written

Implements [Go::Streamable](#).

## 29.502 Go::SweepSurfaceCreator Class Reference

Functionality to create a spline surface by linear or rotational sweep.

```
#include <SweepSurfaceCreator.h>
```

## Public Member Functions

- virtual `~SweepSurfaceCreator ()`

## Static Public Member Functions

- static `SplineSurface * linearSweptSurface (const SplineCurve &curv1, const SplineCurve &curv2, const Point &pt)`
- static `SplineSurface * rotationalSweptSurface (const SplineCurve &curve, double angle, const Point &pt, const Point &axis)`

### 29.502.1 Detailed Description

Functionality to create a spline surface by linear or rotational sweep.

Definition at line 51 of file SweepSurfaceCreator.h.

### 29.502.2 Constructor & Destructor Documentation

29.502.2.1 `virtual Go::SweepSurfaceCreator::~~SweepSurfaceCreator ( ) [inline],[virtual]`

Definition at line 57 of file SweepSurfaceCreator.h.

### 29.502.3 Member Function Documentation

29.502.3.1 `static SplineSurface* Go::SweepSurfaceCreator::linearSweptSurface ( const SplineCurve & curv1, const SplineCurve & curv2, const Point & pt ) [static]`

Create a linearly swept surface as a tensor product of two curves. If  $P$  is the point to be swept, and the curves have B-spline coefficients  $C_i$  and  $D_j$ , then the surface has B-spline coefficients  $C_i + D_j - P$ . If the point lies on the first curve, the first curve will be swept along the second curve. If the point lies on the second curve, the second curve will be swept along the first curve.

#### Parameters

<i>curv1</i>	the first curve
<i>curv2</i>	the second curve
<i>pt</i>	the point to be swept

#### Returns

a pointer to the swept surface

29.502.3.2 `static SplineSurface* Go::SweepSurfaceCreator::rotationalSweptSurface ( const SplineCurve & curve, double angle, const Point & pt, const Point & axis ) [static]`

Create a surface as the rotation of a curve around an axis

## Parameters

<i>curve</i>	the curve
<i>angle</i>	the rotation angle (in radians). If less than $2\pi$ , it is truncated down to $2\pi$ . If more than $-2\pi$ , it is truncated up to $-2\pi$ .
<i>pt</i>	a point on the rotation axis
<i>axis</i>	a vector describing the direction of the rotation axis

## Returns

a pointer to the rotated surface

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/geometry/SweepSurfaceCreator.h](#)

## 29.503 Go::SweepVolumeCreator Class Reference

Class with static methods for volume creation by sweep methods.

```
#include <SweepVolumeCreator.h>
```

### Public Member Functions

- virtual [~SweepVolumeCreator](#) ()

### Static Public Member Functions

- static [SplineVolume](#) \* [rotationalSweptVolume](#) (const [SplineSurface](#) &surface, double angle, const [Point](#) &pt, const [Point](#) &axis)

#### 29.503.1 Detailed Description

Class with static methods for volume creation by sweep methods.

Definition at line 53 of file [SweepVolumeCreator.h](#).

#### 29.503.2 Constructor & Destructor Documentation

29.503.2.1 virtual [Go::SweepVolumeCreator::~~SweepVolumeCreator](#) ( ) [[inline](#)], [[virtual](#)]

Definition at line 59 of file [SweepVolumeCreator.h](#).

#### 29.503.3 Member Function Documentation

29.503.3.1 static [SplineVolume](#)\* [Go::SweepVolumeCreator::linearSweptVolume](#) ( const [SplineSurface](#) & surface, const [SplineCurve](#) & curve, const [Point](#) & pt ) [[static](#)]

Create a linearly swept volume as a tensor product of a surface and a curve. If  $P$  is the point to be swept, the surface has B-spline coefficients  $S_{i,j}$  and the curve has B-spline coefficients  $C_k$  then the volume has B-spline coefficients  $S_{i,j} + C_k - P$ . If the point lies on the curve, the curve will be swept along the surface. If the point lies on the surface, the surface will be swept along the curve.

## Parameters

<i>surface</i>	the surface
<i>curve</i>	the curve
<i>pt</i>	the point to be swept

## Returns

a pointer to the swept volume

29.503.3.2 `static SplineVolume* Go::SweepVolumeCreator::rotationalSweptVolume ( const SplineSurface & surface, double angle, const Point & pt, const Point & axis ) [static]`

Create a volume as the rotation of a surface around an axis

## Parameters

<i>surface</i>	the surface
<i>angle</i>	the rotation angle (in radians). If more than $2\pi$ , it is truncated down to $2\pi$ . If less than $-2\pi$ , it is truncated up to $-2\pi$ .
<i>pt</i>	a point on the rotation axis
<i>axis</i>	a vector describing the direction of the rotation axis

## Returns

a pointer to the rotated volume

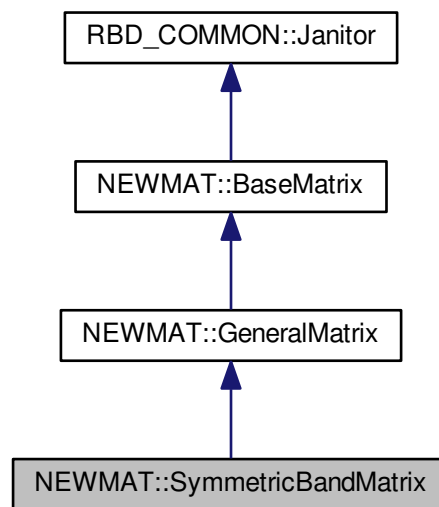

The documentation for this class was generated from the following file:

- `trivariate/include/GoTools/trivariate/SweepVolumeCreator.h`

### 29.511.1 Detailed Description

Class that represents a torus. It is a subclass of [ElementarySurface](#), and thus has a parametrization. A torus may be degenerate. Then the minor radius is greater than the major radius, and it is in principle selfintersecting.

A nondegenerate [Torus](#) has a natural parametrization in terms of the two angles  $u$  and  $v$ :  $\mathbf{p}(u, v) = \mathbf{C} + (R + r \cos v)((\cos u) \mathbf{x} + (\sin u) \mathbf{y}) + (r \sin v) \mathbf{z}$ , where  $\mathbf{C}$  is a position vector,  $R$  is the major radius,  $r$  is the minor radius, and  $\mathbf{x}$ ,  $\mathbf{y}$  and  $\mathbf{z}$  are the (local) axes. The parametrization is bounded by:  $0 \leq u, v \leq 2\pi$ . The dimension is 3.

If the [Torus](#) is degenerate, there is an additional boolean parameter, `select_outer`, which selects the inner or outer (non-selfintersecting) part of the surface. This restricts the parametrization by:  $-\phi \leq v \leq \phi$ , if `select_outer` is true, and  $\phi \leq v \leq 2\pi - \phi$ , if `select_outer` is false. `select_outer` affects the direction of the normal, which always points outwards.

Definition at line 78 of file `Torus.h`.

### 29.511.2 Constructor & Destructor Documentation

#### 29.511.2.1 `Go::Torus::Torus( )` `[inline]`

Default constructor. Constructs an uninitialized [Torus](#) which can only be assigned to or read into.

Definition at line 83 of file `Torus.h`.

#### 29.511.2.2 `Go::Torus::Torus( double major_radius, double minor_radius, Point location, Point z_axis, Point x_axis, bool select_outer = true, bool isSwapped = false )`

Constructor. Input is the major and minor radii, the location, the direction of the z-axis and the (possibly approximate) x-axis. The local coordinate axes are normalized even if `z_axis` and/or `x_axis` are not unit vectors. If degenerate, one may also provide the `select_outer` flag.

#### 29.511.2.3 `virtual Go::Torus::~~Torus( )` `[virtual]`

Virtual destructor - ensures safe inheritance.

### 29.511.3 Member Function Documentation

#### 29.511.3.1 `std::vector<CurveLoop> Go::Torus::allBoundaryLoops( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const` `[virtual]`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

## Parameters

<i>degenerate_epsilon</i>	edges whose length is smaller than this value are ignored.
---------------------------	------------------------------------------------------------

## Returns

a vector containing CurveLoops. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

29.511.3.2 **virtual BoundingBox** `Go::Torus::boundingBox ( ) const` [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.511.3.3 **static ClassType** `Go::Torus::classType ( )` [inline],[static]

Definition at line 112 of file Torus.h.

29.511.3.4 **virtual Torus\*** `Go::Torus::clone ( ) const` [virtual]

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

## Returns

pointer to cloned object

Implements [Go::ElementarySurface](#).

29.511.3.5 **void** `Go::Torus::closestBoundaryPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * rd = NULL, double * seed = 0 ) const` [virtual]

Iterates to the closest point to pt on the boundary of the surface.

## See also

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

29.511.3.6 **void** `Go::Torus::closestPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * domain_of_interest = NULL, double * seed = 0 ) const` [virtual]

Iterates to the closest point to pt on the surface.

## Parameters

<i>pt</i>	the point to find the closest point to
<i>clo_u</i>	u parameter of the closest point
<i>clo_v</i>	v parameter of the closest point
<i>clo_pt</i>	the geometric position of the closest point
<i>clo_dist</i>	the distance between pt and clo_pt
<i>epsilon</i>	parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)
<i>domain_of_interest</i>	pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched.
<i>seed</i>	pointer to parameter values where iteration starts.

Reimplemented from [Go::ParamSurface](#).

```
29.511.3.7 std::vector<shared_ptr<ParamCurve>> > Go::Torus::constParamCurves (double parameter, bool
pardir_is_u) const [virtual]
```

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

## Parameters

<i>parameter</i>	parameter value for the constant parameter (either u or v)
<i>pardir_is_u</i>	specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one.

## Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

```
29.511.3.8 virtual SplineSurface* Go::Torus::createSplineSurface () const [virtual]
```

Create a [SplineSurface](#) representation of the [Torus](#).

Implements [Go::ElementarySurface](#).

```
29.511.3.9 virtual int Go::Torus::dimension () const [virtual]
```

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.511.3.10 `virtual SplineSurface* Go::Torus::geometrySurface ( ) const [virtual]`

Create a [SplineSurface](#) representation of the [Torus](#).

Implements [Go::ElementarySurface](#).

29.511.3.11 `void Go::Torus::getBoundaryInfo ( Point & pt1, Point & pt2, double epsilon, SplineCurve *& cv, SplineCurve *& crosscv, double knot_tol = 1e-05 ) const [virtual]`

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

#### Parameters

<i>pt1</i>	the first point on the boundary, given by the user
<i>pt2</i>	the second point on the boundary, given by the user
<i>epsilon</i>	the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.
<i>cv</i>	upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.
<i>crosscv</i>	upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary.
<i>knot_tol</i>	tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.

Implements [Go::ParamSurface](#).

29.511.3.12 `void Go::Torus::getCoordinateAxes ( Point & x_axis, Point & y_axis, Point & z_axis ) const [inline]`

Local coordinate axes.

Definition at line 209 of file [Torus.h](#).

29.511.3.13 `virtual void Go::Torus::getDegenerateCorners ( std::vector< Point > & deg_corners, double tol ) const [virtual]`

Check for parallel and anti parallel partial derivatives in surface corners.

Implements [Go::ParamSurface](#).

29.511.3.14 `Point Go::Torus::getLocation ( ) const [inline]`

Fetch centre.

Definition at line 205 of file [Torus.h](#).

29.511.3.15 `shared_ptr<Circle> Go::Torus::getMajorCircle ( double vpar ) const`

Get the major circle for a given v parameter.

## Parameters

<i>vpar</i>	v parameter
-------------	-------------

## Returns

A circle for the corresponding v parameter. If the v parameter is bounded, only a segment of a full circle is returned.

**29.511.3.16** `double Go::Torus::getMajorRadius ( ) const` `[inline]`

Fetch major radius.

Definition at line 197 of file Torus.h.

**29.511.3.17** `shared_ptr<Circle> Go::Torus::getMinorCircle ( double upar ) const`

Get the minor circle for a given u parameter.

## Parameters

<i>upar</i>	u parameter
-------------	-------------

## Returns

A circle for the corresponding u parameter. If the u parameter is bounded, only a segment of a full circle is returned.

**29.511.3.18** `double Go::Torus::getMinorRadius ( ) const` `[inline]`

Fetch major radius.

Definition at line 201 of file Torus.h.

**29.511.3.19** `double Go::Torus::getPhi ( ) const` `[inline]`

$\arccos(-\text{major\_radius}/\text{minor\_radius})$ . Used in degeneracy checks and to set the parameter domain of the surface

Definition at line 231 of file Torus.h.

**29.511.3.20** `bool Go::Torus::getSelectOuter ( ) const` `[inline]`

Fetch the `select_outer` flag. If the torus is not degenerate, this function has no effect. If the torus is degenerate, and the value of the flag is changed, this will change the parameter domain of the surface to the appropriate default.

Definition at line 220 of file Torus.h.

29.511.3.21 `virtual ClassType Go::Torus::instanceType ( ) const [virtual]`

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.511.3.22 `bool Go::Torus::isBounded ( ) const [virtual]`

Query if parametrization is bounded. All four parameter bounds must be finite for this to be true.

Returns

*true* if bounded, *false* otherwise

Reimplemented from [Go::ElementarySurface](#).

29.511.3.23 `bool Go::Torus::isClosed ( bool & closed_dir_u, bool & closed_dir_v ) const [virtual]`

Check if the surface is closed.

Reimplemented from [Go::ElementarySurface](#).

29.511.3.24 `bool Go::Torus::isDegenerate ( bool & b, bool & r, bool & t, bool & l, double tolerance ) const [virtual]`

The order of the edge indicators (bottom, right, top, left) matches the `edge_number` of `edgeCurve()`. Query whether any of the four boundary curves are degenerate (zero length) within a certain tolerance. In the below, we refer to 'u' as the first parameter and 'v' as the second.

Parameters

<i>b</i>	'true' upon return of function if the boundary ( $v = v_{\min}$ ) is degenerate
<i>r</i>	'true' upon return of function if the boundary ( $v = v_{\max}$ ) is degenerate
<i>t</i>	'true' upon return of function if the boundary ( $u = u_{\min}$ ) is degenerate
<i>l</i>	'true' upon return of function if the boundary ( $u = u_{\max}$ ) is degenerate
<i>tolerance</i>	boundaries are considered degenerate if their length is shorter than this value, given by the user

Returns

'true' if at least one boundary curve was found to be degenerate, 'false' otherwise.

Reimplemented from [Go::ParamSurface](#).

29.511.3.25 `bool Go::Torus::isDegenerateTorus ( ) const [inline]`

Query if the [Torus](#) is degenerate. Note that a [Torus](#) may be degenerate, although the parameter domain might not represent a degenerate patch. Thus, `isDegenerateTorus()` might return `true` and `isDegerate()` might return `false` at the same time.

Definition at line 238 of file `Torus.h`.

29.511.3.26 `double Go::Torus::nextSegmentVal ( int dir, double par, bool forward, double tol ) const` [virtual]

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0 or 1)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value

#### Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

29.511.3.27 `void Go::Torus::normal ( Point & n, double upar, double vpar ) const` [virtual]

The normal to the torus. The normal always points *outwards* from the surface, as seen from the circle of radius `major_radius_`. Thus, if the torus is degenerate and `select_outer_` is `false`, then the direction of the normal is opposite to  $\partial p / \partial u \times \partial p / \partial v$ .

Implements [Go::ParamSurface](#).

29.511.3.28 `DirectionCone Go::Torus::normalCone ( ) const` [virtual]

Creates a [DirectionCone](#) covering all normals to this surface.

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

29.511.3.29 `const RectDomain& Go::Torus::parameterDomain ( ) const` [virtual]

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

#### Returns

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

29.511.3.30 `void Go::Torus::point ( Point & pt, double upar, double vpar ) const` [virtual]

Evaluates the surface's position for a given parameter pair.

## Parameters

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

```
29.511.3.31 void Go::Torus::point (std::vector< Point > & pts, double upar, double vpar, int derivs, bool u_from_right = true, bool v_from_right = true, double resolution = 1.0e-12) const [virtual]
```

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

## Parameters

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives.
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implements [Go::ParamSurface](#).

```
29.511.3.32 virtual void Go::Torus::read (std::istream & is) [virtual]
```

read object from stream

## Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

```
29.511.3.33 void Go::Torus::setCoordinateAxes () [protected]
```

```
29.511.3.34 void Go::Torus::setDefaultDomain () [protected]
```

29.511.3.35 void Go::Torus::setDegenerateInfo ( ) [protected]

29.511.3.36 virtual void Go::Torus::setParameterBounds ( double *from\_upar*, double *from\_vpar*, double *to\_upar*, double *to\_vpar* ) [virtual]

Limit the surface by limiting the parameter domain.

Implements [Go::ElementarySurface](#).

29.511.3.37 void Go::Torus::setSelectOuter ( bool *select\_outer* )

Set the *select\_outer* flag. If the torus is not degenerate, this function has no effect. If the torus is degenerate, and the value of the flag is changed, this will change the parameter domain of the surface to the appropriate default.

29.511.3.38 **Torus\*** Go::Torus::subSurface ( double *from\_upar*, double *from\_vpar*, double *to\_upar*, double *to\_vpar*, double *fuzzy* = DEFAULT\_PARAMETER\_EPSILON ) const

Return the part of the torus surface limited by the parameter bounds.

29.511.3.39 std::vector<shared\_ptr<ParamSurface>> Go::Torus::subSurfaces ( double *from\_upar*, double *from\_vpar*, double *to\_upar*, double *to\_vpar*, double *fuzzy* = DEFAULT\_PARAMETER\_EPSILON ) const [virtual]

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

#### Parameters

<i>from_upar</i>	lower value for the first parameter in the subdomain
<i>from_vpar</i>	lower value for the second parameter in the subdomain
<i>to_upar</i>	upper value for the first parameter in the subdomain
<i>to_vpar</i>	upper value for the second parameter in the subdomain
<i>fuzzy</i>	tolerance used when determining intersection with interior boundaries

#### Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

29.511.3.40 **DirectionCone** Go::Torus::tangentCone ( bool *pardir\_is\_u* ) const [virtual]

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

## Parameters

<code>pardir_is_↔ _u</code>	if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used.
---------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

**29.511.3.41** `virtual void Go::Torus::write ( std::ostream & os ) const` [virtual]

write object to stream

## Parameters

<code>os</code>	stream to which object is written
-----------------	-----------------------------------

Implements [Go::Streamable](#).

## 29.512 Go::TorusVolume Class Reference

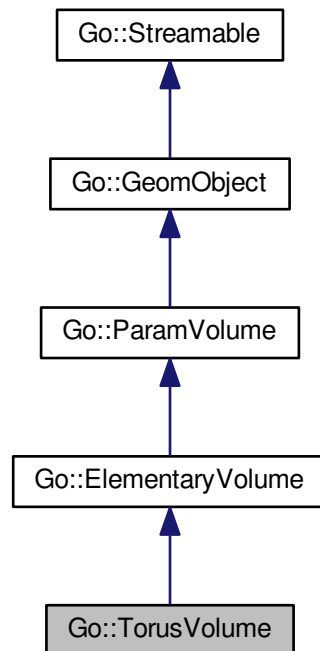

Class that represents a solid torus, maybe with empty interior like a circular pipe, and/or a section (not full revolution along the main axis). It is a subclass of [ElementaryVolume](#), and has a natural parametrization in terms of a radius  $u$  and two angles  $v$  and  $w$ :  $\mathbf{p}(u, v, w) = \mathbf{C} + (R + u \cos w)((\cos v) \mathbf{x} + (\sin v) \mathbf{y}) + (u \sin w) \mathbf{z}$ , where  $\mathbf{C}$  is a position vector,  $R$  is the major radius, and  $\mathbf{x}$ ,  $\mathbf{y}$  and  $\mathbf{z}$  are the (local) axes. The parametrization for a full solid torus is bounded by:  $0 \leq u \leq r$ ,  $0 \leq v, w \leq 2\pi$ , where  $r$  is the minor axis. A bended pipe will have a positive minimal limit for  $u$ , while a torus segment will have other limits for  $v$ . The dimension is 3.

```
#include <TorusVolume.h>
```

#### 29.512.2 Constructor & Destructor Documentation

##### 29.512.2.1 [Go::TorusVolume::TorusVolume](#) ( ) [inline]

Default constructor. Constructs an uninitialized [TorusVolume](#) which can only be assigned to or read into.

Definition at line 73 of file [TorusVolume.h](#).

##### 29.512.2.2 [Go::TorusVolume::TorusVolume](#) ( double *major\_radius*, double *minor\_radius*, [Point](#) *location*, [Point](#) *z\_axis*, [Point](#) *x\_axis* )

Constructor. Input is the major and minor radii, the location, the direction of the z-axis and the (possibly approximate) x-axis.

##### 29.512.2.3 virtual [Go::TorusVolume::~~TorusVolume](#) ( ) [virtual]

Virtual destructor - ensures safe inheritance.

### 29.512.3 Member Function Documentation

29.512.3.1 virtual **BoundingBox** Go::TorusVolume::boundingBox ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.512.3.2 static **ClassType** Go::TorusVolume::classType ( ) [inline],[static]

Definition at line 99 of file TorusVolume.h.

29.512.3.3 virtual **TorusVolume\*** Go::TorusVolume::clone ( ) const [virtual]

make a clone of this volume and return a pointer to it (user is responsible for clearing up memory afterwards).

#### Returns

pointer to cloned object

Implements [Go::ElementaryVolume](#).

29.512.3.4 void Go::TorusVolume::closestPoint ( const **Point** & *pt*, double & *clo\_u*, double & *clo\_v*, double & *clo\_w*, **Point** & *clo\_pt*, double & *clo\_dist*, double *epsilon*, double \* *seed* = 0 ) const [virtual]

Iterates to the closest point to *pt* on the volume.

#### Parameters

<i>pt</i>	the point to find the closest point to
<i>clo_u</i>	u parameter of the closest point
<i>clo_v</i>	v parameter of the closest point
<i>clo_w</i>	w parameter of the closest point
<i>clo_pt</i>	the geometric position of the closest point
<i>clo_dist</i>	the distance between <i>pt</i> and <i>clo_pt</i>
<i>epsilon</i>	parameter tolerance (will in any case not be higher than $\sqrt{\text{machine\_precision}}$ x magnitude of solution)
<i>seed</i>	pointer to parameter values where iteration starts.

Implements [Go::ParamVolume](#).

29.512.3.5 virtual int Go::TorusVolume::dimension ( ) const [virtual]

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.512.3.6 **SplineVolume\*** `Go::TorusVolume::geometryVolume ( ) const` [virtual]

Make a NURBS representation of the object.

Implements [Go::ElementaryVolume](#).

29.512.3.7 `virtual std::vector<shared_ptr<ParamSurface> > Go::TorusVolume::getAllBoundarySurfaces ( ) const`  
[virtual]

Fetch all boundary surfaces corresponding to the volume.

Implements [Go::ParamVolume](#).

29.512.3.8 `virtual ClassType Go::TorusVolume::instanceType ( ) const` [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.512.3.9 `double Go::TorusVolume::nextSegmentVal ( int dir, double par, bool forward, double tol ) const`  
[virtual]

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0, 1 or 2)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value

#### Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamVolume](#).

29.512.3.10 `const Array<double,6> Go::TorusVolume::parameterSpan ( ) const` [virtual]

Return the parameter domain of the volume. This is an array containing the start and end parameter values. The spline's parameter *i* has its start value at the array position (2*i*) and its end parameter value at the array position (2*i*+1)

#### Returns

An array describing the parametric domain of the volume

Implements [Go::ParamVolume](#).

29.512.3.11 `void Go::TorusVolume::point ( Point & pt, double upar, double vpar, double wpar ) const` `[virtual]`

Evaluates the volume's position for a given parameter triple.

#### Parameters

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>wpar</i>	the third parameter

Implements [Go::ParamVolume](#).

29.512.3.12 `void Go::TorusVolume::point ( std::vector< Point > & pts, double upar, double vpar, double wpar, int derivs, bool u_from_right = true, bool v_from_right = true, bool w_from_right = true, double resolution = 1.0e-12 ) const` `[virtual]`

Evaluates the volume's position and a certain number of derivatives for a given parameter triple.

#### Parameters

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function. Upon completion of the function, its first entry is the volume's position at the given parameter pair. Then, if ' <i>derivs</i> ' > 0, the two next entries will be the volume tangents along the first, second and third parameter direction. The next three entries are the second- and cross derivatives, in the order ( <i>du</i> <sup>2</sup> , <i>dudv</i> , <i>dudw</i> , <i>dv</i> <sup>2</sup> , <i>dvdw</i> , <i>dw</i> <sup>2</sup> ), and similar for even higher derivatives.
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>wpar</i>	the third parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>w_from_right</i>	specify whether derivatives along the third parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implements [Go::ParamVolume](#).

29.512.3.13 `virtual void Go::TorusVolume::read ( std::istream & is )` `[virtual]`

read object from stream

#### Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.512.3.14 void `Go::TorusVolume::reverseParameterDirection ( int pardir )` [virtual]

Reverses the direction of the basis in input direction.

#### Parameters

<i>pardir</i>	which parameter direction to reverse
---------------	--------------------------------------

Implements [Go::ParamVolume](#).

29.512.3.15 void `Go::TorusVolume::setParameters ( double from_par, double to_par, int pardir )`

Restrict the size of the torus in one parameter direction.

29.512.3.16 void `Go::TorusVolume::swapParameterDirection ( int pardir1, int pardir2 )` [virtual]

Swaps two parameter directions

#### Parameters

<i>pardir1</i>	One of the parameter directions (0, 1 or 2) to be swapped
<i>pardir2</i>	The other parameter direction (0, 1 or 2) to be swapped

Implements [Go::ParamVolume](#).

29.512.3.17 **DirectionCone** `Go::TorusVolume::tangentCone ( int pardir ) const` [virtual]

Creates a [DirectionCone](#) covering all tangents to this volume along a given parameter direction.

#### Parameters

<i>pardir</i>	if 1, the <a href="#">DirectionCone</a> will be defined on basis of the volume's tangents along the first parameter direction. If 2, the second parameter direction will be used. If 3, the third parameter direction will be used.
---------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this volume along the specified parameter direction.

Implements [Go::ParamVolume](#).

29.512.3.18 `virtual void Go::TorusVolume::translate ( const Point & vec ) [virtual]`

Translate.

Implements [Go::ParamVolume](#).

29.512.3.19 `void Go::TorusVolume::useCentreDegen ( ) [inline]`

A NURBS representation will be a disc with degeneracy in the centre rotated around the centre

Definition at line 156 of file `TorusVolume.h`.

29.512.3.20 `void Go::TorusVolume::useCornerDegen ( ) [inline]`

A NURBS representation will be a disc with degenerate corners rotated around the centre

Definition at line 161 of file `TorusVolume.h`.

29.512.3.21 `virtual void Go::TorusVolume::write ( std::ostream & os ) const [virtual]`

write object to stream

Parameters

<code>os</code>	stream to which object is written
-----------------	-----------------------------------

Implements [Go::Streamable](#).

The documentation for this class was generated from the following file:

- `trivariate/include/GoTools/trivariate/TorusVolume.h`

### 29.513.1 Detailed Description

`tpEdge` is an abstract interface for a half-edge topology structure. Suggested (and minimal) structure of template `edgeType` when using `FaceAdjacency`.

#### Author

Atgeirr F Rasmussen [atgeirr@sintef.no](mailto:atgeirr@sintef.no)

#### See also

`faceType`

Definition at line 63 of file `tpEdge.h`.

### 29.513.2 Constructor & Destructor Documentation

#### 29.513.2.1 virtual `Go::tpEdge::~tpEdge` ( ) [virtual]

Empty destructor.

29.513.2.2 `Go::tpEdge::tpEdge ( )`

Default constructor.

## 29.513.3 Member Function Documentation

29.513.3.1 `void Go::tpEdge::adjacentEdges ( bool at_start_of_edge, std::vector< tpEdge * > & adjacent, std::vector< bool > & at_start )`

Consider the 'node' or 'corner' implied by the startpoint (if *at\_start\_of\_edge* is true) or endpoint (if it is false). The vector *adjacent* is filled with all edges with that 'node' as a startpoint (indicated by a true at the corresponding place in the *at\_start* vector) or endpoint (false in *at\_start*). The edge originally asked for is not included.

29.513.3.2 `virtual BoundingBox Go::tpEdge::boundingBox ( ) [pure virtual]`

Coordinate box surrounding this edge.

29.513.3.3 `tpJointType Go::tpEdge::checkContinuity ( tpEdge * nextedge, double neighbour, double gap, double bend, double kink ) const`

Compute the continuity between this edge and *nextedge* given the necessary continuity parameters. 0 = g1 continuity, 1 = not quite g1, 2 = g0 continuity, 3 = gap, 4 = discontinuous, 5 = last segment

29.513.3.4 `virtual void Go::tpEdge::closeLoop ( tpEdge * last ) [virtual]`

Close edge loop by setting the appropriate pointers between this edge and last edge

29.513.3.5 `virtual void Go::tpEdge::closestpoint ( const Point & pt, double & clo_t, Point & clo_pt, double & clo_dist, double const * seed = 0 ) const [pure virtual]`

Closest point on this edge to a given point.

29.513.3.6 `virtual void Go::tpEdge::connectAfter ( tpEdge * edge ) [virtual]`

Add the edge *edge* to the edge loop after this edge.

29.513.3.7 `virtual void Go::tpEdge::connectTwin ( tpEdge * twin, int & status ) [virtual]`

Set adjacency between the face connected to this edge and the face connected to *twin* by setting twin pointers

29.513.3.8 `virtual void Go::tpEdge::disconnectThis ( ) [virtual]`

Remove this edge from the edge loop it belongs to.

29.513.3.9 `virtual void Go::tpEdge::disconnectTwin ( ) [virtual]`

Disconnect this edge from its twin, i.e. remove adjacency information between the face connected to this edge and the face connected to the twin edge

29.513.3.10 `virtual int Go::tpEdge::entryId ( ) [pure virtual]`

Get id of edge.

29.513.3.11 `virtual tpFace* Go::tpEdge::face ( ) [pure virtual]`

The face corresponding to this edge.

29.513.3.12 `shared_ptr<FaceConnectivity<tpEdge>> Go::tpEdge::getConnectivityInfo ( ) [inline]`

Fetch the continuity information regarding the joint between the face corresponding to this edge and the adjacent face along this edge

Definition at line 160 of file tpEdge.h.

29.513.3.13 `bool Go::tpEdge::hasConnectivityInfo ( ) [inline]`

Check if this edge has access to continuity information regarding the joint between the face corresponding to this edge and the adjacent face along this edge

Definition at line 153 of file tpEdge.h.

29.513.3.14 `tpEdge* Go::tpEdge::next ( )`

Next edge in the edge loop.

29.513.3.15 `virtual Point Go::tpEdge::normal ( double t ) const [pure virtual]`

Evaluate normal of associated face.

29.513.3.16 `bool Go::tpEdge::onBoundary ( ) [inline]`

Check if this edge lies on the boundary of the associated face set, i.e. it has no neighbour

Definition at line 129 of file tpEdge.h.

29.513.3.17 `virtual Point Go::tpEdge::point ( double t ) const [pure virtual]`

Evaluate position.

29.513.3.18 `tpEdge* Go::tpEdge::prev ( )`

Previous edge in the edge loop.

29.513.3.19 `void Go::tpEdge::resetConnectivityInfo ( ) [inline]`

Mark the connectivity information associated to this edge as outdated.

Definition at line 173 of file `tpEdge.h`.

29.513.3.20 `void Go::tpEdge::setConnectivityInfo ( shared_ptr< FaceConnectivity< tpEdge > > info ) [inline]`

corresponding to this edge and the adjacent face along this edge

Store the continuity information regarding the joint between the face

Definition at line 167 of file `tpEdge.h`.

29.513.3.21 `virtual void Go::tpEdge::setEntryId ( int id ) [pure virtual]`

Id of edge. Default set to -1.

29.513.3.22 `virtual tpEdge* Go::tpEdge::split ( double t ) [pure virtual]`

Split should be implemented so that the new edge (returned by the function), is fully connected. It should also be created by operator `new`, so callers should keep in mind that they are responsible for managing the lifetime of the new edge.

29.513.3.23 `virtual Point Go::tpEdge::tangent ( double t ) const [pure virtual]`

Evaluate tangent.

29.513.3.24 `virtual double Go::tpEdge::tMax ( ) const [pure virtual]`

End parameter value of edge.

29.513.3.25 `virtual double Go::tpEdge::tMin ( ) const [pure virtual]`

Start parameter value of edge.

29.513.3.26 `tpEdge* Go::tpEdge::twin ( )`

The corresponding edge on the neighbouring face. If no such neighbour exists, the function returns null.

Definition at line 63 of file tpTolerances.h.

### 29.517.3 Member Data Documentation

29.517.3.1 `double Go::tpTolerances::bend`

Tolerance for when two adjacent faces are assumed to have an intentially smooth connection

Definition at line 59 of file tpTolerances.h.

29.517.3.2 `double Go::tpTolerances::gap`

Tolerance for when two faces are assumed to be C0 continous.

Definition at line 52 of file tpTolerances.h.

29.517.3.3 `double Go::tpTolerances::kink`

Tolerance for when two adjacent faces are assumed to be C1 continous.

Definition at line 56 of file tpTolerances.h.

#### 29.517.3.4 double Go::tpTolerances::neighbour

Tolerance for when two faces are assumed to be neighbours.

Definition at line 54 of file tpTolerances.h.

The documentation for this struct was generated from the following file:

- [topology/include/GoTools/topology/tpTolerances.h](#)

## 29.518 Go::tpTopologicalInfo Struct Reference

```
#include <tpTopologyTable.h>
```

### Public Member Functions

- int [BestStatus](#) () const  
*The highest continuity between the two faces.*
- int [WorstStatus](#) () const  
*The lowest continuity between the two faces.*

### Public Attributes

- std::vector< int > [status\\_](#)
- std::vector< std::pair< double, double > > [parameters\\_](#)  
*Parameter intervals limiting the areas of the found state of continuity.*

### 29.518.1 Detailed Description

A structure storing the connectivity information between two adjacent faces. Used with [tpTopologyTable](#)

Definition at line 64 of file tpTopologyTable.h.

### 29.518.2 Member Function Documentation

#### 29.518.2.1 int Go::tpTopologicalInfo::BestStatus ( ) const [inline]

The highest continuity between the two faces.

Definition at line 81 of file tpTopologyTable.h.

#### 29.518.2.2 int Go::tpTopologicalInfo::WorstStatus ( ) const [inline]

The lowest continuity between the two faces.

Definition at line 90 of file tpTopologyTable.h.

### 29.518.3 Member Data Documentation

#### 29.518.3.1 `std::vector< std::pair<double, double> >` `Go::tpTopologicalInfo::parameters_`

Parameter intervals limiting the areas of the found state of continuity.

Definition at line 78 of file `tpTopologyTable.h`.

#### 29.518.3.2 `std::vector<int>` `Go::tpTopologicalInfo::status_`

The status is: 0 : edges join smoothly.  $G^1$ . 1 : edges join, but normals are slightly discontinuous. A kink. 2 : edges join, but the normals are discontinuous.  $G^0$ . 3 : edges almost join. A gap. 4 : edges are totally discontinuous. The minimal `tpTopologicalInfo` has a one-element status vector and a two-element parameters vector

Definition at line 76 of file `tpTopologyTable.h`.

The documentation for this struct was generated from the following file:

- `topology/include/GoTools/topology/tpTopologyTable.h`

## 29.519 `Go::tpTopologyTable< edgeType, faceType >` Class Template Reference

### 29.519.1 Detailed Description

```
template<class edgeType, class faceType>
class Go::tpTopologyTable< edgeType, faceType >
```

[tpTopologyTable](#) - Encapsulates a topology structure. Should be used only for static faces sets.

This class encapsulates a topology structure. It points to external (to this class) surface objects, which are gotten as input to the [PrepareTable\(\)](#) and [ConstructTable\(\)](#) members. It is implemented in terms of [edgeType](#) objects in a half-edge data structure, and many members operate on and/or return pointers to the [edgeType](#) objects owned by the [tpTopologyTable](#) object.

## 29.519.2 Constructor & Destructor Documentation

29.519.2.1 `template<class edgeType , class faceType > Go::tpTopologyTable< edgeType, faceType >::tpTopologyTable ( double tol_gap, double tol_neighbour, double tol_kink, double tol_bend ) [inline]`

Constructor. Detailed description.

Definition at line 179 of file tpTopologyTable.h.

29.519.2.2 `template<class edgeType , class faceType > Go::tpTopologyTable< edgeType, faceType >::~~tpTopologyTable ( ) [inline]`

Destructor. Detailed description.

Definition at line 188 of file tpTopologyTable.h.

## 29.519.3 Member Function Documentation

29.519.3.1 `template<class edgeType , class faceType > void Go::tpTopologyTable< edgeType, faceType >::addEntry ( edgeType * e1, edgeType * e2, double min1, double max1, double min2, double max2, const tpTopologicalInfo & info, int status ) [inline]`

In the AddEntry() function, the min? and max? arguments are the parameter values associated with the endpoints of the curve segments. min1 <= max1 and min2 <= max2. BUT the edges may very well run in different directions, and the point on the first edge corresponding to min1 may be adjacent to either the min2- or the max2- corresponding point on the second edge.

Definition at line 334 of file tpTopologyTable.h.

29.519.3.2 `template<class edgeType , class faceType > void Go::tpTopologyTable< edgeType, faceType >::addFaceToTable ( shared_ptr< faceType > face ) [inline]`

Definition at line 766 of file tpTopologyTable.h.

29.519.3.3 `template<class edgeType , class faceType > void Go::tpTopologyTable< edgeType, faceType >::BoundaryLoops ( std::vector< std::vector< edgeType * > > & loopvec ) [inline]`

Returns all boundary loops. Keep in mind that calling next() on elements on the boundary will not iterate around the boundary, but around the face the edge comes from.

Definition at line 431 of file tpTopologyTable.h.

29.519.3.4 `template<class edgeType , class faceType > void Go::tpTopologyTable< edgeType, faceType >::BoundaryLoops ( std::vector< std::vector< shared_ptr< edgeType > > > & loopvec ) [inline]`

Definition at line 470 of file tpTopologyTable.h.

```
29.519.3.5 template<class edgeType , class faceType > const std::vector<tpTableEntry<edgeType> >&
Go::tpTopologyTable< edgeType, faceType >::connectedEdges () const [inline]
```

Returns a const reference to a vector representing twin edges.

Definition at line 638 of file tpTopologyTable.h.

```
29.519.3.6 template<class edgeType , class faceType > std::vector<edgeType*> Go::tpTopologyTable< edgeType,
faceType >::connectTwins (edgeType * e1, edgeType * e2, double min1, double max1, double min2,
double max2, int & status) [inline]
```

Returns pointer to (vector of) twin edges. Updates topological structure and, if necessary, splits edges.

Definition at line 373 of file tpTopologyTable.h.

```
29.519.3.7 template<class edgeType , class faceType > void Go::tpTopologyTable< edgeType, faceType
>::constructTable (const std::vector< shared_ptr< faceType > > & faces, bool test_orientation = false)
[inline]
```

Definition at line 218 of file tpTopologyTable.h.

```
29.519.3.8 template<class edgeType , class faceType > void Go::tpTopologyTable< edgeType, faceType
>::cornersAndKinks (std::vector< edgeType * > & vec) [inline]
```

Only gives the first of every pair of edges representing a cornering edge or kink edge.

Definition at line 589 of file tpTopologyTable.h.

```
29.519.3.9 template<class edgeType , class faceType > void Go::tpTopologyTable< edgeType, faceType
>::disjointObjects (std::vector< std::vector< faceType * > > & grouped_faces) [inline]
```

Definition at line 523 of file tpTopologyTable.h.

```
29.519.3.10 template<class edgeType , class faceType > std::vector<edgeType*> Go::tpTopologyTable< edgeType,
faceType >::edgesBoundingFace (faceType * face) const [inline]
```

Returns all edges bounding a specific face.

Definition at line 613 of file tpTopologyTable.h.

```
29.519.3.11 template<class edgeType , class faceType > const void Go::tpTopologyTable< edgeType, faceType
>::getInconsistentFaces (std::vector< std::pair< faceType *, faceType * > > & faces) [inline]
```

Returns information about face pair with an orientation inconsistency.

Definition at line 646 of file tpTopologyTable.h.

29.519.3.12 `template<class edgeType , class faceType > tpTolerances Go::tpTopologyTable< edgeType, faceType >::getTolerances ( ) [inline]`

Definition at line 202 of file tpTopologyTable.h.

29.519.3.13 `template<class edgeType , class faceType > const tpTopologicalInfo& Go::tpTopologyTable< edgeType, faceType >::info ( int n ) [inline]`

Returns the raw topological info element.

Definition at line 603 of file tpTopologyTable.h.

29.519.3.14 `template<class edgeType , class faceType > void Go::tpTopologyTable< edgeType, faceType >::prepareTable ( const std::vector< shared_ptr< faceType > > & faces ) [inline]`

Definition at line 209 of file tpTopologyTable.h.

29.519.3.15 `template<class edgeType , class faceType > void Go::tpTopologyTable< edgeType, faceType >::removeFaceFromTable ( shared_ptr< faceType > face ) [inline]`

Definition at line 714 of file tpTopologyTable.h.

29.519.3.16 `template<class edgeType , class faceType > void Go::tpTopologyTable< edgeType, faceType >::setTable ( const std::vector< shared_ptr< faceType > > & faces ) [inline]`

Definition at line 677 of file tpTopologyTable.h.

29.519.3.17 `template<class edgeType , class faceType > void Go::tpTopologyTable< edgeType, faceType >::setTolerances ( const tpTolerances & tol ) [inline]`

Changes the tolerances used in constructing the table.

Definition at line 195 of file tpTopologyTable.h.

29.519.3.18 `template<class edgeType , class faceType > void Go::tpTopologyTable< edgeType, faceType >::updateTableEntry ( edgeType * e1, edgeType * e2 ) [inline]`

### 29.524.1 Detailed Description

**Triangulation** class for the half-edge data structure with adaption to TTL.

Definition at line 220 of file HeTriang.h.

### 29.524.2 Constructor & Destructor Documentation

#### 29.524.2.1 `hed::Triangulation::Triangulation ( )` `[inline]`

Default constructor.

Definition at line 230 of file HeTriang.h.

#### 29.524.2.2 `hed::Triangulation::Triangulation ( const Triangulation & tr )` `[inline]`

Copy constructor.

Definition at line 233 of file HeTriang.h.

#### 29.524.2.3 `hed::Triangulation::~~Triangulation ( )` `[inline]`

Destructor.

Definition at line 239 of file HeTriang.h.

### 29.524.3 Member Function Documentation

#### 29.524.3.1 `void hed::Triangulation::addLeadingEdge ( Edge * edge )` `[inline]`, `[protected]`

Definition at line 224 of file HeTriang.h.

#### 29.524.3.2 `bool Triangulation::checkDelaunay ( )` `const`

Checks if the triangulation is Delaunay.

Definition at line 608 of file HeTriang.cpp.

#### 29.524.3.3 `void Triangulation::cleanAll ( )` `[protected]`

Definition at line 363 of file HeTriang.cpp.

#### 29.524.3.4 Dart Triangulation::createDart ( )

Creates an arbitrary CCW dart.

Definition at line 326 of file HeTriang.cpp.

#### 29.524.3.5 void hed::Triangulation::createDelaunay ( std::vector< Node \* >::iterator *first*, std::vector< Node \* >::iterator *last* )

Creates a Delaunay triangulation from a set of points.

#### 29.524.3.6 void hed::Triangulation::flagNodes ( bool *flag* ) const

Sets flag in all the nodes.

#### 29.524.3.7 Edge \* Triangulation::getBoundaryEdge ( ) const

Returns an arbitrary boundary edge.

Definition at line 719 of file HeTriang.cpp.

#### 29.524.3.8 list< Edge \* > \* Triangulation::getEdges ( bool *skip\_boundary\_edges* = false ) const

Returns a list of half-edges (one half-edge for each arc)

Definition at line 423 of file HeTriang.cpp.

#### 29.524.3.9 Edge \* Triangulation::getInteriorNode ( ) const

Returns an arbitrary interior node (as the source node of the returned edge)

Definition at line 681 of file HeTriang.cpp.

#### 29.524.3.10 const list<Edge\*>& hed::Triangulation::getLeadingEdges ( ) const [inline]

Returns a list of "triangles" (one leading half-edge for each triangle)

Definition at line 274 of file HeTriang.h.

#### 29.524.3.11 list<Node\*>\* hed::Triangulation::getNodes ( ) const

Returns a list of nodes. This function requires TTL\_USE\_NODE\_FLAG to be defined.

See also

[Node](#).

**29.524.3.12** `Edge* hed::Triangulation::initTwoEnclosingTriangles ( std::vector< Node * >::iterator first, std::vector< Node * >::iterator last )`

Creates an initial Delaunay triangulation from two enclosing triangles.

**29.524.3.13** `int hed::Triangulation::noTriangles ( ) const` `[inline]`

Returns the number of triangles.

Definition at line 277 of file HeTriang.h.

**29.524.3.14** `void Triangulation::optimizeDelaunay ( )`

Swaps edges until the triangulation is Delaunay (constrained edges are not swapped)

Definition at line 648 of file HeTriang.cpp.

**29.524.3.15** `void hed::Triangulation::printEdges ( std::ofstream & os ) const`

Print edges for plotting with, e.g., gnuplot.

**29.524.3.16** `bool Triangulation::removeLeadingEdgeFromList ( Edge * leadingEdge )` `[protected]`

Definition at line 334 of file HeTriang.cpp.

**29.524.3.17** `void Triangulation::removeTriangle ( Edge & edge )`

Removes the boundary triangle associated with edge.

Definition at line 197 of file HeTriang.cpp.

**29.524.3.18** `void Triangulation::reverse_splitTriangle ( Edge & edge )`

The reverse operation of removeTriangle.

Definition at line 252 of file HeTriang.cpp.

**29.524.3.19** `Edge * Triangulation::splitTriangle ( Edge & edge, Node & point )`

Splits the triangle associated with edge into three new triangles joining at point.

Definition at line 448 of file HeTriang.cpp.

29.524.3.20 void Triangulation::swapEdge ( Edge & *diagonal* )

Swaps the edge associated with diagonal.

Definition at line 542 of file HeTriang.cpp.

#### 29.524.4 Member Data Documentation

29.524.4.1 list<Edge\*> hed::Triangulation::leadingEdges\_ [protected]

Definition at line 223 of file HeTriang.h.

The documentation for this class was generated from the following files:

- virtual int [nmbCvs](#) ()

### 29.525.1 Detailed Description

This class represents the curve obtained by projecting a given 3D curve onto a given part of a given 3D surface. Used to improve the accuracy of an already existing trimming curve.

Definition at line 59 of file TrimCurve.h.

### 29.525.2 Constructor & Destructor Documentation

#### 29.525.2.1 Go::TrimCurve::TrimCurve ( [CurveOnSurface](#) \* bd\_crv )

Constructor given the [CurveOnSurface](#) curve representing the trim curve.

#### 29.525.2.2 Go::TrimCurve::TrimCurve ( [CurveOnSurface](#) \* bd\_crv, [double](#) start, [double](#) end )

Constructor given the [CurveOnSurface](#) curve representing the trim curve limited in the parameter domain

#### 29.525.2.3 Go::TrimCurve::TrimCurve ( [Point](#) startpt, [Point](#) endpt, [CurveOnSurface](#) \* bd\_crv )

Constructor given the [CurveOnSurface](#) curve representing the trim curve limited in the geometry space

#### 29.525.2.4 virtual Go::TrimCurve::~~TrimCurve ( ) [virtual]

virtual destructor ensures safe inheritance

### 29.525.3 Member Function Documentation

#### 29.525.3.1 virtual bool Go::TrimCurve::approximationOK ( [double](#) par, [const](#) [std::vector](#)< [Point](#) > & approxpos, [double](#) tol1, [double](#) tol2 ) [virtual]

Inherited from [EvalCurveSet::approximationOK\(\)](#). For this class, the specified tolerances are not used; the internally stored 'epsgeo' value is used as tolerance (this value was specified in the constructor).

## Parameters

<i>par</i>	the parameter at which to check the curve
<i>approxpos</i>	the position we want to check whether or not the curve approximates for parameter 'par'.
<i>tol1</i>	unused
<i>tol2</i>	unused

## Returns

'true' if the curve approximates the point at the parameter, 'false' otherwise.

Implements [Go::EvalCurveSet](#).

**29.525.3.2** `virtual int Go::TrimCurve::dim ( ) [virtual]`

Inherited from [EvalCurveSet::dim\(\)](#).

Implements [Go::EvalCurveSet](#).

**29.525.3.3** `virtual double Go::TrimCurve::end ( ) [virtual]`

End parameter of domain.

## Returns

end parameter of the spline space.

Implements [Go::EvalCurveSet](#).

**29.525.3.4** `std::vector<Point> Go::TrimCurve::eval ( double t ) [virtual]`

Evaluate the curves.

## Parameters

<i>t</i>	parameter in which to evaluate.
----------	---------------------------------

## Returns

the evaluated points for the curve set.

Implements [Go::EvalCurveSet](#).

**29.525.3.5** `virtual void Go::TrimCurve::eval ( double t, int n, std::vector< std::vector< Point > > & der ) [virtual]`

Evaluate the curve derivatives.

## Parameters

<i>t</i>	parameter in which to evaluate.
<i>n</i>	number of derivatives to compute.
<i>der</i>	the evaluated points up to the n'th derivative for the curve set.

Implements [Go::EvalCurveSet](#).

**29.525.3.6** `virtual int Go::TrimCurve::nmbCvs ( ) [virtual]`

The number of curves in the curve set.

## Returns

the number of curves in the curve set.

Implements [Go::EvalCurveSet](#).

**29.525.3.7** `virtual double Go::TrimCurve::start ( ) [virtual]`

Start parameter of domain.

## Returns

start parameter of the spline space.

Implements [Go::EvalCurveSet](#).

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/creators/TrimCurve.h](#)

## 29.526 Go::ttlPoint Class Reference

```
#include <ttlPoint.h>
```

### Public Member Functions

## Static Public Attributes

- static [Triangulation](#) \* `triang_` = NULL

### 29.527.1 Detailed Description

**Traits** class (static struct) for the half-edge data structure.

The member functions are those required by different function templates in the TTL. Documentation is given here to explain what actions should be carried out on the actual data structure as required by the functions in the `ttr` namespace.

The source code of `HeTraits.h` shows how the traits class is implemented for the half-edge data structure.

See also

[Application Programming Interface to TTL \(API\)](#)

Definition at line 70 of file `HeTraits.h`.

### 29.527.2 Member Typedef Documentation

#### 29.527.2.1 typedef double hed::TTLtraits::real\_type

The floating point type used in calculations involving scalar products and cross products.

Definition at line 78 of file `HeTraits.h`.

### 29.527.3 Member Function Documentation

#### 29.527.3.1 static real\_type hed::TTLtraits::crossProduct2d ( const Dart & v1, const Dart & v2 ) [inline], [static]

Cross product between two vectors in the plane represented as darts. The z-component of the cross product is returned.

[ttr\\_util::crossProduct2d](#) can be used.

Definition at line 121 of file `HeTraits.h`.

#### 29.527.3.2 static real\_type hed::TTLtraits::crossProduct2d ( const Dart & v, const Node & p ) [inline], [static]

Cross product between two vectors in the plane. The first vector is represented by a dart `v`, and the second vector has direction from the source node of `v` to the point `p`. The z-component of the cross product is returned.

[ttr\\_util::crossProduct2d](#) can be used.

Definition at line 137 of file `HeTraits.h`.

29.527.3.3 `static real_type hed::TTLtraits::orient2d ( const Dart & n1, const Dart & n2, const Node & p )`  
`[inline],[static]`

Let  $n1$  and  $n2$  be the nodes associated with two darts, and let  $p$  be a point in the plane. Return a positive value if  $n1$ ,  $n2$ , and  $p$  occur in counterclockwise order; a negative value if they occur in clockwise order; and zero if they are collinear.

Definition at line 150 of file HeTraits.h.

29.527.3.4 `static real_type hed::TTLtraits::orient2d ( const Dart & n1, const Dart & n2, const Dart & p )`  
`[inline],[static]`

This is the same predicate as represented with the function above, but with a slightly different interface: The last parameter is given as a dart where the source node of the dart represents a point in the plane. This function is required for constrained triangulation.

Definition at line 166 of file HeTraits.h.

29.527.3.5 `static void hed::TTLtraits::removeBoundaryTriangle ( Dart & d )` `[inline],[static]`

Removes a triangle with an edge at the boundary of the triangulation in the actual data structure

Definition at line 290 of file HeTraits.h.

29.527.3.6 `static void hed::TTLtraits::reverse_splitTriangle ( Dart & dart )` `[inline],[static]`

The reverse operation of [TTLtraits::splitTriangle](#). This function is only required for functions that involve removal of interior nodes; see for example [ttl::removeInteriorNode](#).

Definition at line 281 of file HeTraits.h.

29.527.3.7 `static real_type hed::TTLtraits::scalarProduct2d ( const Dart & v1, const Dart & v2 )` `[inline],`  
`[static]`

Scalar product between two 2D vectors represented as darts.

[ttl\\_util::scalarProduct2d](#) can be used.

Definition at line 93 of file HeTraits.h.

29.527.3.8 `static real_type hed::TTLtraits::scalarProduct2d ( const Dart & v, const Node & p )` `[inline],`  
`[static]`

Scalar product between two 2D vectors. The first vector is represented by a dart  $v$ , and the second vector has direction from the source node of  $v$  to the point  $p$ .

[ttl\\_util::scalarProduct2d](#) can be used.

Definition at line 108 of file HeTraits.h.

29.527.3.9 `static void hed::TTLtraits::splitTriangle ( Dart & dart, Node & point )` `[inline],[static]`

Splits the triangle associated with  $dart$  in the actual data structure into three new triangles joining at  $point$ .

## Parameters

<i>dart</i>	Output: A CCW dart incident with the new node; see the figure.
-------------	----------------------------------------------------------------

Definition at line 257 of file HeTraits.h.

29.527.3.10 `static void hed::TTLtraits::swapEdge ( Dart & dart ) [inline],[static]`

Swaps the edge associated with *dart* in the actual data structure.

## Parameters

<i>dart</i>	Some of the functions require a dart as output. If this is required by the actual function, the dart should be delivered back in a position as seen if it was glued to the edge when swapping (rotating) the edge CCW; see the figure.
-------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Note

- If the edge is *constrained*, or if it should not be swapped for some other reason, this function need not do the actual swap of the edge.
- Some functions in TTL require that `swapEdge` is implemented such that darts outside the quadrilateral are not affected by the swap.

Definition at line 241 of file HeTraits.h.

## 29.527.4 Member Data Documentation

29.527.4.1 `Triangulation * TTLtraits::triang_ = NULL [static]`

Definition at line 73 of file HeTraits.h.

### 29.528.2 Member Typedef Documentation

#### 29.528.2.1 typedef double hetriang::TTLtraits::real\_type

The floating point type used in calculations involving scalar products and cross products.

Definition at line 75 of file ttlTraits.h.

### 29.528.3 Member Function Documentation

#### 29.528.3.1 static real\_type hetriang::TTLtraits::crossProduct2d ( const Dart & v1, const Dart & v2 ) [inline], [static]

Cross product between two vectors in the plane represented as darts.

The z-component of the cross product is returned.

[ttl\\_util::crossProduct2d](#) can be used.

Definition at line 102 of file ttlTraits.h.

#### 29.528.3.2 static real\_type hetriang::TTLtraits::crossProduct2d ( const Dart & v, const Go::ttlPoint & p ) [inline], [static]

Cross product between two vectors in the plane.

The first vector is represented by a dart  $v$ , and the second vector has direction from the source node of  $v$  to the point  $p$ .

The z-component of the cross product is returned.

[ttl\\_util::crossProduct2d](#) can be used.

Definition at line 114 of file ttlTraits.h.

**29.528.3.3** `static real_type hetriang::TTLtraits::orient2d ( const Dart & n1, const Dart & n2, const Go::ttlPoint & p )`  
`[inline],[static]`

Let  $n1$  and  $n2$  be the nodes associated with two darts, and let  $p$  be a point in the plane. Return a positive value if  $n1$ ,  $n2$ , and  $p$  occur in counterclockwise order; a negative value if they occur in clockwise order; and zero if they are collinear.

Definition at line 126 of file `ttlTraits.h`.

**29.528.3.4** `static real_type hetriang::TTLtraits::orient2d ( const Dart & n1, const Dart & n2, const Dart & p )`  
`[inline],[static]`

Definition at line 134 of file `ttlTraits.h`.

**29.528.3.5** `static void hetriang::TTLtraits::removeBoundaryTriangle ( Dart & d )` `[inline],[static]`

Removes a triangle with an edge at the boundary of the triangulation in the actual data structure

Definition at line 219 of file `ttlTraits.h`.

**29.528.3.6** `static void hetriang::TTLtraits::reverse_splitTriangle ( Dart & dart )` `[inline],[static]`

The reverse operation of [TTLtraits::splitTriangle](#).

This function is only required for functions that involve removal of interior nodes; see for example [ttl::removeInteriorNode](#).

Definition at line 213 of file `ttlTraits.h`.

**29.528.3.7** `static real_type hetriang::TTLtraits::scalarProduct2d ( const Dart & v1, const Dart & v2 )` `[inline],[static]`

Scalar product between two 2D vectors represented as darts.

[ttl\\_util::scalarProduct2d](#) can be used.

Definition at line 82 of file `ttlTraits.h`.

**29.528.3.8** `static real_type hetriang::TTLtraits::scalarProduct2d ( const Dart & v, const Go::ttlPoint & p )`  
`[inline],[static]`

Scalar product between two 2D vectors.

The first vector is represented by a dart  $v$ , and the second vector has direction from the source node of  $v$  to the point  $p$ .

[ttl\\_util::scalarProduct2d](#) can be used.

Definition at line 93 of file `ttlTraits.h`.

**29.528.3.9** `static void hetriang::TTLtraits::splitTriangle ( Dart & dart, Go::ttlPoint & point )` `[inline],[static]`

Splits the triangle associated with  $dart$  in the actual data structure into three new triangles joining at  $point$ .

## Return values

<i>dart</i>	A CCW dart incident with the new node
-------------	---------------------------------------

Definition at line 197 of file `tTlTraits.h`.

**29.528.3.10** `static void hetriang::TTLtraits::swapEdge ( Dart & dart ) [inline],[static]`

Swaps the edge associated with *dart* in the actual data structure.

## Return values

<i>dart</i>	Some of the functions require a dart as output. If this is required by the actual function, the dart should be delivered back in a position as seen if it was glued to the edge when swapping (rotating) the edge CCW; see the figure.
-------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Note

Some functions in TTL require that `swapEdge` is implemented such that darts outside the quadrilateral are not affected by the swap.

Definition at line 185 of file `tTlTraits.h`.

**29.528.4 Member Data Documentation**

**29.528.4.1** `Triangulation*` `hetriang::TTLtraits::triang_ [static]`

Definition at line 70 of file `tTlTraits.h`.

The documentation for this struct was generated from the following file:

- `compositemodel/include/GoTools/compositemodel/tTlTraits.h`

*Check the consistency of the edge information in this vertex.*

### 29.535.1 Detailed Description

The vertex class represents the vertex entity in a boundary represented solid or face set.

Definition at line 57 of file Vertex.h.

## 29.535.2 Constructor & Destructor Documentation

### 29.535.2.1 Go::Vertex::Vertex ( Point *vertex\_point* )

Constructor. Give the geometric position of the vertex.

### 29.535.2.2 Go::Vertex::Vertex ( Point *vertex\_point*, std::vector< ftEdge \* > *edges* )

Constructor. Give the geometric position of the vertex and associated edges

### 29.535.2.3 Go::Vertex::Vertex ( Point *vertex\_point*, ftEdge \* *edges* )

Constructor. Give the geometric position of the vertex and one associated edge

### 29.535.2.4 Go::Vertex::Vertex ( ftEdge \* *edge*, bool *at\_start* )

Constructor. Give one associated edge and an indication on which of the two vertices belonging to this edge should be constructed

### 29.535.2.5 Go::Vertex::~~Vertex ( )

Destructor.

## 29.535.3 Member Function Documentation

### 29.535.3.1 void Go::Vertex::addEdge ( ftEdge \* *edge* )

Add a new edge to this vertex. Used in topology build.

### 29.535.3.2 std::vector<ftEdge\*> Go::Vertex::allEdges ( ) const

Returns all edges meeting in this vertex including twins.

### 29.535.3.3 void Go::Vertex::averageVertexPos ( )

Average corners of spline surfaces corresponding to this vertex.

### 29.535.3.4 bool Go::Vertex::checkVertexTopology ( )

Check the consistency of the edge information in this vertex.

29.535.3.5 **bool** Go::Vertex::connectedToSameVertex ( **Vertex** \* *other* ) **const**

Check if this vertex and the other vertex are connected to the same vertex

29.535.3.6 **void** Go::Vertex::disconnectTwin ( **ftEdge** \* *edge* )

Given an edge connected to this vertex, remove twin information about the edge in the vertex. Used in connection with topology changes in the associated model

29.535.3.7 **std::vector<ftSurface\*>** Go::Vertex::faces ( ) **const**

Get all faces meeting in this vertex.

29.535.3.8 **std::vector<ftSurface\*>** Go::Vertex::faces ( **Body** \* *bd* ) **const**

Get all faces belonging to a given body meeting in this vertex.

29.535.3.9 **std::vector<ftEdge\*>** Go::Vertex::freeEdges ( )

Get edges which are not associated a face.

29.535.3.10 **std::vector<Body\*>** Go::Vertex::getBodies ( )

Get all bodies meeting in this vertex.

29.535.3.11 **ftEdge\*** Go::Vertex::getCommonEdge ( **Vertex** \* *other* ) **const**

Get the edge associated with two vertices, if any.

29.535.3.12 **ftEdge\*** Go::Vertex::getCommonEdgeInFace ( **Vertex** \* *other*, **ftSurface** \* *face* ) **const**

Fetch the edge, if any, joining this vertex with the vertex other belonging to the specified face

29.535.3.13 **std::vector<ftSurface\*>** Go::Vertex::getCommonFaces ( **Vertex** \* *other* ) **const**

Get the faces associated with two vertices, if any.

29.535.3.14 **Vertex\*** Go::Vertex::getCommonVertex ( **Vertex** \* *other* ) **const**

Fetch the vertex connected (through an edge) to both this and the other vertex, if any

29.535.3.15 `double Go::Vertex::getDist ( shared_ptr< Vertex > other_point ) [inline]`

The distance between this vertex an another vertex.

Definition at line 161 of file Vertex.h.

29.535.3.16 `ftEdge* Go::Vertex::getEdge ( int idx ) [inline]`

Get the specified edge, twin edges are counted once and it is arbitrary which twin edge is returned

Definition at line 120 of file Vertex.h.

29.535.3.17 `void Go::Vertex::getEdgeDiscontinuities ( std::vector< std::pair< ftEdge *, ftEdge * > > & gaps, double tol, std::vector< std::pair< ftEdge *, ftEdge * > > & kinks, double angtol, double angmax ) const`

Collect attached edges where the distance between the endpoints are larger than the specified tolerance or where the curves meet with an angle that are more than the kink tolerance, but less than the corner tolerance

29.535.3.18 `std::vector<ftEdge*> Go::Vertex::getFaceEdges ( ftSurface * face ) const`

Get the edges meeting in this vertex associated with a given face.

29.535.3.19 `Point Go::Vertex::getFacePar ( ftSurface * face )`

Get parameter of associated face corresponding to vertex.

29.535.3.20 `std::vector<std::pair<ftSurface*, Point> > Go::Vertex::getFaces ( )`

Get all faces meeting in this vertex and the parameter value in the face corresponding to the vertex

29.535.3.21 `std::vector<std::pair<ftSurface*, Point> > Go::Vertex::getFaces ( Body * bd )`

Get all faces belonging to a given body meeting in this vertex and the parameter value in the face corresponding to the vertex

29.535.3.22 `std::vector<shared_ptr<Vertex> > Go::Vertex::getNextVertex ( ftSurface * face ) const`

Fetch the next vertices in the given face.

29.535.3.23 `Point Go::Vertex::getVertexPoint ( ) [inline]`

Get the geometrical position associated to this vertex.

Definition at line 126 of file Vertex.h.

**29.535.3.24** `bool Go::Vertex::hasEdge ( ftEdge * edge ) const`

Check if the vertex is connected to the given edge.

**29.535.3.25** `bool Go::Vertex::hasEdgeSingle ( ftEdge * edge ) const`

Check if the vertex is connected to the given edge, and this edge is represented in the vertex with no twin

**29.535.3.26** `bool Go::Vertex::hasFace ( ftSurface * face ) const`

Check if the vertex is adjacent to the given face.

**29.535.3.27** `bool Go::Vertex::isBoundaryVertex ( ) const`

Check if this vertex lies at a model boundary, i.e. is connected to edges with no twin

**29.535.3.28** `bool Go::Vertex::isCornerInFace ( ftSurface * face, double tol )`

Check if the vertex is a corner in the given face.

**29.535.3.29** `void Go::Vertex::joinVertex ( shared_ptr< Vertex > other )`

Vertices belonging to two adjacent edges are represented as one entity. Used in topology build

**29.535.3.30** `bool Go::Vertex::meetInVertex ( ftEdge * e1, ftEdge * e2 ) const`

Check if two given edges meet in this vertex.

**29.535.3.31** `int Go::Vertex::nmbUniqueEdges ( ) [inline]`

Number of unique edges meeting in this vertex, twin edges are counted only once

Definition at line 108 of file Vertex.h.

**29.535.3.32** `int Go::Vertex::nmbUniqueEdges ( Body * bd )`

**29.535.3.33** `void Go::Vertex::removeEdge ( ftEdge * edge )`

Remove an edge from this vertex. Used in connection with topology changes in the associated model

29.535.3.34 `void Go::Vertex::reOrganize ( )`

Reorganize edges according to twin information.

29.535.3.35 `bool Go::Vertex::sameEdge ( Vertex * other ) const`

Check if this vertex and the other vertex belongs to the same edge.

29.535.3.36 `bool Go::Vertex::sameFace ( Vertex * other ) const`

Check if this vertex and the other vertex belongs to the same face.

29.535.3.37 `bool Go::Vertex::sameUnderlyingSurface ( Vertex * other ) const`

Check if this vertex and the other vertex belongs to the same underlying surface (one surface can give rise to several faces)

29.535.3.38 `void Go::Vertex::setVertexPoint ( Point vertex_point ) [inline]`

Set the geometrical position associated to this vertex.

Definition at line 132 of file Vertex.h.

29.535.3.39 `std::vector<ftEdge*> Go::Vertex::uniqueEdges ( )`

Returns all geometrically unique edges meeting in this vertex. One edge is return for a pair of twins.

29.535.3.40 `std::vector<ftEdge*> Go::Vertex::uniqueEdges ( Body * bd )`

Returns all edges belonging to a given body. Twin edges are represented only as one edge

The documentation for this class was generated from the following file:

- `compositemodel/include/GoTools/compositemodel/Vertex.h`

## 29.539 Go::VolumeAdjacency Class Reference

Adjacency analysis of volume models.

```
#include <VolumeAdjacency.h>
```

## Public Member Functions

- [VolumeAdjacency](#) (double gap, double neighbour)  
*Constructor giving tolerances for adjacency analysis.*
- [~VolumeAdjacency](#) ()  
*Destructor.*
- void [setAdjacency](#) (std::vector< shared\_ptr< [Body](#) > > &solids)  
*Perform topology analysis on a set of bodies.*
- void [setAdjacency](#) (std::vector< shared\_ptr< [Body](#) > > &solids, int new\_solid\_pos)

### 29.539.1 Detailed Description

Adjacency analysis of volume models.

Definition at line 52 of file [VolumeAdjacency.h](#).

### 29.539.2 Constructor & Destructor Documentation

#### 29.539.2.1 Go::VolumeAdjacency::VolumeAdjacency ( double gap, double neighbour )

Constructor giving tolerances for adjacency analysis.

#### 29.539.2.2 Go::VolumeAdjacency::~~VolumeAdjacency ( )

Destructor.

### 29.539.3 Member Function Documentation

#### 29.539.3.1 void Go::VolumeAdjacency::setAdjacency ( std::vector< shared\_ptr< [Body](#) > > & solids )

Perform topology analysis on a set of bodies.

#### 29.539.3.2 void Go::VolumeAdjacency::setAdjacency ( std::vector< shared\_ptr< [Body](#) > > & solids, int new\_solid\_pos )

Perform topology analysis on a set of bodies where it is assumed the the topological relationship between the first new\_solid\_pos bodies are known already

The documentation for this class was generated from the following file:

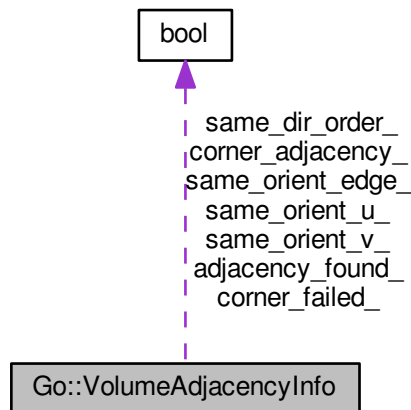

- [trivariatemodel/include/GoTools/trivariatemodel/VolumeAdjacency.h](#)

## 29.540 Go::VolumeAdjacencyInfo Struct Reference

Struct to store information about adjacency relations between two bodies.

```
#include <ftVolume.h>
```

### 29.540.1 Detailed Description

Struct to store information about adjacency relations between two bodies.

Definition at line 54 of file ftVolume.h.

### 29.540.2 Constructor & Destructor Documentation

#### 29.540.2.1 `Go::VolumeAdjacencyInfo::VolumeAdjacencyInfo ( ) [inline]`

Constructor.

Definition at line 83 of file ftVolume.h.

### 29.540.3 Member Data Documentation

#### 29.540.3.1 `bool Go::VolumeAdjacencyInfo::adjacency_found_`

True if adjacency was found, false if not.

Definition at line 58 of file ftVolume.h.

#### 29.540.3.2 `int Go::VolumeAdjacencyInfo::bd_idx_1_`

Boundary index of first volume. Value 0-5 in order umin, umax, vmin, vmax, wmin, wmax.

Definition at line 62 of file ftVolume.h.

#### 29.540.3.3 `int Go::VolumeAdjacencyInfo::bd_idx_2_`

Boundary index of second volume. Same interpretation as `bd_idx_1_`.

Definition at line 64 of file ftVolume.h.

#### 29.540.3.4 `bool Go::VolumeAdjacencyInfo::corner_adjacency_`

True if two volumes meet in along an edge.

Definition at line 60 of file ftVolume.h.

#### 29.540.3.5 `bool Go::VolumeAdjacencyInfo::corner_failed_`

True if adjacency is found, user wanted to test if the surfaces meet in corner-to-corner configuration, and the test failed. Otherwise false.

Definition at line 80 of file ftVolume.h.

**29.540.3.6** int Go::VolumeAdjacencyInfo::edg\_idx\_1\_

Set if corner\_adjacency\_ is true. 0-3 in the order umin, umax, vmin, vmax.

Definition at line 66 of file ftVolume.h.

**29.540.3.7** int Go::VolumeAdjacencyInfo::edg\_idx\_2\_

Set if corner\_adjacency\_ is true. 0-3 in the order umin, umax, vmin, vmax.

Definition at line 68 of file ftVolume.h.

**29.540.3.8** bool Go::VolumeAdjacencyInfo::same\_dir\_order\_

True if u-directions coincide for both boundary surfaces (regardless of orientation)

Definition at line 77 of file ftVolume.h.

**29.540.3.9** bool Go::VolumeAdjacencyInfo::same\_orient\_edge\_

True if corner\_adjacency\_ is found and the boundary curves are equally oriented.

Definition at line 75 of file ftVolume.h.

**29.540.3.10** bool Go::VolumeAdjacencyInfo::same\_orient\_u\_

True if common boundaries are equally oriented in first parameter direction of first surface.

Definition at line 70 of file ftVolume.h.

**29.540.3.11** bool Go::VolumeAdjacencyInfo::same\_orient\_v\_

True if common boundaries are equally oriented in second parameter direction of first surface.

Definition at line 72 of file ftVolume.h.

## Additional Inherited Members

### 29.541.1 Detailed Description

A set of volumes including topology information.

Definition at line 54 of file `VolumeModel.h`.

### 29.541.2 Constructor & Destructor Documentation

29.541.2.1 `Go::VolumeModel::VolumeModel ( std::vector< shared_ptr< ftVolume > > &volumes, double gap, double neighbour, double kink, double bend, bool adjacency_set = false )`

Constructor given a set of volumes and topologic tolerances.

29.541.2.2 `Go::VolumeModel::VolumeModel ( std::vector< shared_ptr< ftVolume > > & volumes, double gap, double kink )`

Constructor given a set of volumes and topologic tolerances.

29.541.2.3 `Go::VolumeModel::VolumeModel ( double gap, double neighbour, double kink, double bend )`

Constructor topologic tolerances.

29.541.2.4 `Go::VolumeModel::VolumeModel ( const VolumeModel & vm )`

Copy constructor.

29.541.2.5 `virtual Go::VolumeModel::~~VolumeModel ( ) [virtual]`

Destructor.

### 29.541.3 Member Function Documentation

29.541.3.1 `bool Go::VolumeModel::allSplines ( ) const`

Check if all entities are NURBS.

29.541.3.2 `void Go::VolumeModel::append ( shared_ptr< ftVolume > volume )`

Append a new body to the volume model. The body is included in the topological structure

29.541.3.3 `void Go::VolumeModel::append ( std::vector< shared_ptr< ftVolume > > volumes )`

Append a vector of bodies to the volume model. The bodies are included in the topological structure

29.541.3.4 `void Go::VolumeModel::append ( shared_ptr< VolumeModel > anotherModel )`

Append all bodies from another volume model. The bodies are included in the topological structure

29.541.3.5 `void Go::VolumeModel::averageCorrespondingCoefs ( )`

Ensure exact match between corresponding coefficients.

29.541.3.6 virtual **BoundingBox** Go::VolumeModel::boundingBox ( ) [virtual]

Bounding box of the entire model.

Implements [Go::CompositeModel](#).

29.541.3.7 virtual **BoundingBox** Go::VolumeModel::boundingBox ( int *idx* ) const [virtual]

Bounding box corresponding to one entity.

Implements [Go::CompositeModel](#).

29.541.3.8 void Go::VolumeModel::buildTopology ( )

Construct the topology information regarding the input geometry Construct the topology information regarding the input geometry for all pairs of volumes

29.541.3.9 void Go::VolumeModel::buildTopology ( shared\_ptr< ftVolume > *body* )

Construct the topology information regarding the input geometry involving a given volume

29.541.3.10 bool Go::VolumeModel::checkModelTopology ( )

Debug.

29.541.3.11 virtual **VolumeModel\*** Go::VolumeModel::clone ( ) const [inline],[virtual]

Make a copy of the current model.

Reimplemented from [Go::CompositeModel](#).

Definition at line 77 of file VolumeModel.h.

29.541.3.12 virtual void Go::VolumeModel::closestPoint ( Point & *pnt*, Point & *clo\_pnt*, int & *idx*, double *clo\_par*[], double & *dist* ) [virtual]

Compute one closest point, interface heritage, not implemented.

Implements [Go::CompositeModel](#).

29.541.3.13 virtual double Go::VolumeModel::curvature ( int *idx*, double \* *par* ) const [virtual]

[Curvature](#), interface heritage, not implemente.

Implements [Go::CompositeModel](#).

29.541.3.14 `virtual void Go::VolumeModel::evaluate ( int idx, double par[], Point & pnt ) const` `[virtual]`

Evaluate position.

Implements [Go::CompositeModel](#).

29.541.3.15 `virtual void Go::VolumeModel::evaluate ( int idx, double par[], int nder, std::vector< Point > & der ) const` `[virtual]`

Evaluate position and a number of derivatives.

Implements [Go::CompositeModel](#).

29.541.3.16 `virtual void Go::VolumeModel::extremalPoint ( Point & dir, Point & ext_pnt, int & idx, double ext_par[] )` `[virtual]`

Extremal point(s) in a given direction

Parameters

<i>dir</i>	Direction
<i>ext_pnt</i>	Found extremal point
<i>idx</i>	Index of curve or surface where the extremal point is found
<i>ext_par</i> []	Parameter value of extremal point

Implements [Go::CompositeModel](#).

29.541.3.17 `shared_ptr<ftVolume> Go::VolumeModel::fetchAsSharedPtr ( Body * body ) const`

Return a specified body as a shared pointer.

29.541.3.18 `void Go::VolumeModel::getAllVertices ( std::vector< shared_ptr< Vertex > > & vertices ) const`

Fetch all vertices in the model.

29.541.3.19 `double Go::VolumeModel::getApproximationTol ( ) const` `[inline]`

Return approximation tolerance.

Returns

Approximation tolerance.

Definition at line 220 of file VolumeModel.h.

29.541.3.20 `shared_ptr<ftVolume> Go::VolumeModel::getBody ( int idx ) const`

Return one body.

29.541.3.21 `std::vector<shared_ptr<ftSurface> > Go::VolumeModel::getBoundaryFaces ( ) const`

Fetch all faces at the outer boundary of this model

29.541.3.22 `std::vector<shared_ptr<ftSurface> > Go::VolumeModel::getBoundaryFaces ( int boundary_idx ) const`

Fetch all faces at one of the boundaries of this model

Parameters

<i>boundary_idx</i>	Index of one boundary
---------------------	-----------------------

Return values

<i>faces</i>	Vector of pointers to the faces at one boundary.
--------------	--------------------------------------------------

29.541.3.23 `std::vector<shared_ptr<VolumeModel> > Go::VolumeModel::getConnectedModels ( )`

Divide this model into connected volume model.

29.541.3.24 `int Go::VolumeModel::getIndex ( shared_ptr< ftVolume > body ) const`

Given a body in the volume model, return the index of this face.

29.541.3.25 `int Go::VolumeModel::getIndex ( ftVolume * body ) const`

Given a body in the volume model, return the index of this face.

29.541.3.26 `shared_ptr<SurfaceModel> Go::VolumeModel::getOuterBoundary ( int idx ) const`

Fetch specified boundary of this model.

29.541.3.27 `void Go::VolumeModel::getRadialEdges ( std::vector< shared_ptr< EdgeVertex > > & rad_edges ) const`

Fetch all radial edges in the model.

29.541.3.28 `shared_ptr<SplineVolume> Go::VolumeModel::getSplineVolume ( int idx ) const`

Return one volume as [SplineVolume](#) if possible.

29.541.3.29 `std::vector<shared_ptr<ftSurface>> Go::VolumeModel::getUniqueInnerFaces ( ) const`

Fetch all interval unique inner faces in this model, i.e. a [ftSurface](#) for each boundary face with a twin, only one of the surfaces in the pair is returned

29.541.3.30 `shared_ptr<ParamVolume> Go::VolumeModel::getVolume ( int idx ) const`

Return one volume.

29.541.3.31 `virtual shared_ptr<IntResultsModel> Go::VolumeModel::intersect ( const ftLine & line ) [virtual]`

Intersection with a line, interface heritage, not implemented. Expected output is points, probably one point. Curves can occur in special configurations.

Implements [Go::CompositeModel](#).

29.541.3.32 `virtual shared_ptr<IntResultsModel> Go::VolumeModel::intersect_plane ( const ftPlane & plane ) [virtual]`

Intersection with a plane, interface heritage, not implemented.

Implements [Go::CompositeModel](#).

29.541.3.33 `bool Go::VolumeModel::isCornerToCorner ( double tol = DEFAULT_SPACE_EPSILON ) const`

Check if the model has got a corner-to-corner configuration.

29.541.3.34 `virtual bool Go::VolumeModel::isDegenerate ( int idx ) const [virtual]`

Whether one particular entity is degenerate, interface heritage, not implemented

Implements [Go::CompositeModel](#).

29.541.3.35 `void Go::VolumeModel::makeCommonSplineSpaces ( )`

Ensure that the blocks in the model has got common spline spaces.

29.541.3.36 `void Go::VolumeModel::makeCornerToCorner ( double tol = DEFAULT_SPACE_EPSILON )`

Ensure that the blocks in the model meet in a corner-to-corner configuration

29.541.3.37 `int Go::VolumeModel::nmbBoundaries ( ) const`

Return the number of boundaries of a volume set (including holes).

29.541.3.38 `virtual int Go::VolumeModel::nmbEntities ( ) const` [virtual]

Number of simple entities.

Implements [Go::CompositeModel](#).

29.541.3.39 `void Go::VolumeModel::regularizeBdShells ( )`

Update the model by regularizing all boundary shells, i.e. all faces in all boundary shells of all connected volumes should be 4-sided, and no T-joints are allowed

29.541.3.40 `void Go::VolumeModel::removeSolid ( shared_ptr< ftVolume > vol )`

Remove one volume from the model.

29.541.3.41 `void Go::VolumeModel::replaceNonRegVolumes ( int degree = 3, int split_mode = 1 )`

Replaces volumes that are not regular with sets of regular volumes.

29.541.3.42 `void Go::VolumeModel::setBoundarySfs ( )`

Compute boundary shells

29.541.3.43 `void Go::VolumeModel::setVertexIdentity ( )`

Add topology information regarding degenerate volumes meeting along an edge

29.541.3.44 `virtual void Go::VolumeModel::tessellate ( std::vector< shared_ptr< GeneralMesh > > & meshes ) const`  
[virtual]

Tessellate model, interface heritage, not implemented.

Implements [Go::CompositeModel](#).

29.541.3.45 `virtual void Go::VolumeModel::tessellate ( int resolution[], std::vector< shared_ptr< GeneralMesh > > & meshes ) const` [virtual]

Tessellate model, interface heritage, not implemented.

Implements [Go::CompositeModel](#).

```
29.541.3.46 virtual void Go::VolumeModel::tessellate (double density, std::vector< shared_ptr< GeneralMesh > > &
 meshes) const [virtual]
```

Tessellate model, interface heritage, not implemented.

Implements [Go::CompositeModel](#).

```
29.541.3.47 virtual void Go::VolumeModel::tesselatedCtrPolygon (std::vector< shared_ptr< LineCloud > > & ctr_pol)
 const [virtual]
```

Tessellate model, interface heritage, not implemented.

Implements [Go::CompositeModel](#).

```
29.541.3.48 virtual void Go::VolumeModel::turn (int idx) [virtual]
```

Interface heritage, not implemented.

Implements [Go::CompositeModel](#).

```
29.541.3.49 virtual void Go::VolumeModel::turn () [virtual]
```

Interface heritage, not implemented.

Implements [Go::CompositeModel](#).

```
29.541.3.50 void Go::VolumeModel::uniqueNonRadialEdges (std::vector< shared_ptr< ftEdge > > & edges) const
```

Fetch edges where no radial edge exist, i.e. there is no adjacent volume along any boundary surface meeting in this edge. Only one occurrence in an edge, twin-edge pair is returned

### 29.543.1 Detailed Description

An evaluator based curve representing the parameter domain curve in a given volume which represents the same curve as a given space curve. Project a geometry curve into the parameter domain of a volume.

Definition at line 58 of file `VolumeParameterCurve.h`.

### 29.543.2 Constructor & Destructor Documentation

29.543.2.1 `Go::VolumeParameterCurve::VolumeParameterCurve ( shared_ptr< ParamVolume > vol, shared_ptr< ParamCurve > crv )`

Constructor

Parameters

<code>vol</code>	volume in which the curve lies
<code>crv</code>	space curve representing the same curve

29.543.2.2 `Go::VolumeParameterCurve::VolumeParameterCurve ( shared_ptr< ParamVolume > vol, shared_ptr< ParamCurve > crv, shared_ptr< Point > par1, shared_ptr< Point > par2 )`

Constructor

Parameters

<i>vol</i>	volume in which the curve lies
<i>crv</i>	space curve representing the same curve
<i>par1</i>	startparameter of the final curve <code>par1 &gt;= crv-&gt;startparam()</code>
<i>par2</i>	endparameter of the final curve <code>par1 &lt;= crv-&gt;endparam()</code>

29.543.2.3 `virtual Go::VolumeParameterCurve::~~VolumeParameterCurve ( ) [virtual]`

virtual destructor ensures save inheritance

### 29.543.3 Member Function Documentation

29.543.3.1 `virtual bool Go::VolumeParameterCurve::approximationOK ( double par, Point approxpos, double tol1, double tol2 ) const [virtual]`

Check if the curve, evaluated at a given parameter, approximates a given position within a given tolerance.

Parameters

<i>par</i>	the parameter at which to check the curve
<i>approxpos</i>	the position we want to check whether or not the curve approximates for parameter 'par'.
<i>tol1</i>	approximation tolerance.
<i>tol2</i>	another approximation tolerance (its use is defined by some of the derived classes.

Returns

'true' if the curve approximates the point at the parameter, 'false' otherwise.

Implements [Go::EvalCurve](#).

29.543.3.2 `virtual int Go::VolumeParameterCurve::dim ( ) const [virtual]`

Get the dimension of the space in which the curve lies.

Returns

the space dimension of the curve.

Implements [Go::EvalCurve](#).

29.543.3.3 virtual double Go::VolumeParameterCurve::end ( ) const [virtual]

Get the end parameter of the curve.

#### Returns

the end parameter of the curve.

Implements [Go::EvalCurve](#).

29.543.3.4 virtual Point Go::VolumeParameterCurve::eval ( double t ) const [virtual]

Evaluate a point on the curve for a given parameter

#### Parameters

<i>t</i>	the parameter for which to evaluate the curve.
----------	------------------------------------------------

#### Returns

the evaluated point

Implements [Go::EvalCurve](#).

29.543.3.5 virtual void Go::VolumeParameterCurve::eval ( double t, int n, Point der[] ) const [virtual]

Evaluate a point and a certain number of derivatives on the curve for a given parameter.

#### Parameters

<i>t</i>	the parameter for which to evaluate the curve.
<i>n</i>	the number of derivatives (0 or more)

#### Return values

<i>der</i>	pointer to an array of Points where the result will be written. The position will be stored first, then the first derivative (tangent), then the second, etc.. <b>NB:</b> For most (all) derived classes of ' <a href="#">EvalCurve</a> ', the implementation actually only supports the computation of one derivative, i.e. if $n > 1$ , only one derivative will be computed anyway.
------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Implements [Go::EvalCurve](#).

29.543.3.6 virtual double Go::VolumeParameterCurve::start ( ) const [virtual]

Get the start parameter of the curve.

**Returns**

the start parameter of the curve.

Implements [Go::EvalCurve](#).

The documentation for this class was generated from the following file:

- [trivariate/include/GoTools/trivariate/VolumeParameterCurve.h](#)

## 29.544 Go::VolumeSpaceCurve Class Reference

An evaluator based curve representing the space curve corresponding to parameter domain curve in a given volume. Compute the space curve corresponding to a curve in the parameter domain of a volume.

```
#include <VolumeSpaceCurve.h>
```

Inheritance diagram for Go::VolumeSpaceCurve:

Collaboration diagram for Go::VolumeSpaceCurve:

### 29.544.1 Detailed Description

An evaluator based curve representing the space curve corresponding to parameter domain curve in a given volume. Compute the space curve corresponding to a curve in the parameter domain of a volume.

Definition at line 59 of file [VolumeSpaceCurve.h](#).

### 29.544.2 Constructor & Destructor Documentation

29.544.2.1 `Go::VolumeSpaceCurve::VolumeSpaceCurve ( shared_ptr< ParamVolume > vol, shared_ptr< ParamCurve > crv )`

Constructor

Parameters

<i>vol</i>	volume in which the curve lies
<i>crv</i>	curve in the parameter domain of the given volume

29.544.2.2 `virtual Go::VolumeSpaceCurve::~~VolumeSpaceCurve ( ) [virtual]`

virtual destructor ensures save inheritance

### 29.544.3 Member Function Documentation

29.544.3.1 `virtual bool Go::VolumeSpaceCurve::approximationOK ( double par, Point approxpos, double tol1, double tol2 ) const [virtual]`

Check if the curve, evaluated at a given parameter, approximates a given position within a given tolerance.

Parameters

<i>par</i>	the parameter at which to check the curve
<i>approxpos</i>	the position we want to check whether or not the curve approximates for parameter 'par'.
<i>tol1</i>	approximation tolerance.
<i>tol2</i>	another approximation tolerance (its use is defined by some of the derived classes.

**Returns**

'true' if the curve approximates the point at the parameter, 'false' otherwise.

Implements [Go::EvalCurve](#).

**29.544.3.2** `virtual int Go::VolumeSpaceCurve::dim ( ) const [virtual]`

Get the dimension of the space in which the curve lies.

**Returns**

the space dimension of the curve.

Implements [Go::EvalCurve](#).

**29.544.3.3** `virtual double Go::VolumeSpaceCurve::end ( ) const [virtual]`

Get the end parameter of the curve.

**Returns**

the end parameter of the curve.

Implements [Go::EvalCurve](#).

**29.544.3.4** `virtual Point Go::VolumeSpaceCurve::eval ( double t ) const [virtual]`

Evaluate a point on the curve for a given parameter

**Parameters**

<i>t</i>	the parameter for which to evaluate the curve.
----------	------------------------------------------------

**Returns**

the evaluated point

Implements [Go::EvalCurve](#).

**29.544.3.5** `virtual void Go::VolumeSpaceCurve::eval ( double t, int n, Point der[] ) const [virtual]`

Evaluate a point and a certain number of derivatives on the curve for a given parameter.

**Parameters**

<i>t</i>	the parameter for which to evaluate the curve.
<i>n</i>	the number of derivatives (0 or more)

## Return values

<i>der</i>	pointer to an array of Points where the result will be written. The position will be stored first, then the first derivative (tangent), then the second, etc.. <b>NB:</b> For most (all) derived classes of 'EvalCurve', the implementation actually only supports the computation of one derivative, i.e. if $n > 1$ , only one derivative will be computed anyway.
------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Implements [Go::EvalCurve](#).

**29.544.3.6** `virtual double Go::VolumeSpaceCurve::start ( ) const [virtual]`

Get the start parameter of the curve.

## Returns

the start parameter of the curve.

Implements [Go::EvalCurve](#).

This graph shows which files directly or indirectly include this file:

## Classes

- struct [Go::SamplePointData](#)

Sample data related to one face. The struct contains one point in a point set with information about position, associated surface normal and curvature. Points lying on the face boundary know about its associated edge. If the surface normal and curvature information regarding boundary points is not unique, the associated data is set to be equal to `MAX_DOUBLE`.

```
#include "GoTools/compositemodel/ftSurface.h"
```

```
#include "GoTools/geometry/BoundedSurface.h"
```

Include dependency graph for RegularizeFace.h:

## Classes

- class [Go::RegularizeFace](#)

*Split one face into a number of 4-sided domains without inner trimming. This class is intended for use in block structuring. One face with possible inner and outer trimming is split according to certain rules to result in a face set with 4 sided faces although faces with less than 4 sides can occur. A side is defined as a piece of the face boundary between two corners or between vertices where there are more than one adjacent face. The trimmed surfaces being output from this class can later be approximated by spline surfaces. The splitting procedure is recursive.*
