**Note:** Must be implemented such that *dart* is delivered back in a position as seen if it was glued to the edge when swapping (rotating) the edge CCW

## Assumes:

- The node associated with *dart* is at the boundary of the triangulation.

## See also

[ttl::swapEdgesAwayFromInteriorNode](#)

Definition at line 1753 of file ttl.h.

```
28.59.2.34 template<class TraitsType , class DartType , class ListType > void ttl::swapEdgesAwayFromInteriorNode (DartType
 & dart, ListType & swapped_edges)
```

Swaps edges away from the (interior) node associated with *dart* such that that exactly three edges remain incident with the node. This function is used as a first step in [ttl::removeInteriorNode](#)

## Return values

|             |                                   |
|-------------|-----------------------------------|
| <i>dart</i> | A CCW dart incident with the node |
|-------------|-----------------------------------|

## Assumes:

- The node associated with *dart* is interior to the triangulation.
- [TraitsType::swapEdge](#) (DartType& *dart*)
 

**Note:** Must be implemented such that *dart* is delivered back in a position as seen if it was glued to the edge when swapping (rotating) the edge CCW

## Note

- A degenerate triangle may be left at the node.
- The function is not unique as it depends on which dart at the node that is given as input.

## See also

[ttl::swapEdgesAwayFromBoundaryNode](#)

Definition at line 1695 of file ttl.h.

```
28.59.2.35 template<class TraitsType , class DartType > bool ttl::swappableEdge (const DartType & dart, bool
 allowDegeneracy)
```

Checks if the edge associated with *dart* is swappable, i.e., if the edge is a diagonal in a *strictly* convex (or convex) quadrilateral.

## Parameters

|                        |                                                                                                                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>allowDegeneracy</i> | If set to true, the function will also return true if the numerical calculations indicate that the quadrilateral is convex only, and not necessarily strictly convex. |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- [TraitsType::crossProduct2d](#) (Dart&, Dart&)

Definition at line 1290 of file ttl.h.

```
28.59.2.36 template<class TraitsType , class DartType > bool ttl::swapTestDelaunay (const DartType & dart, bool
 cycling_check)
```

Checks if the edge associated with *dart* should be swapped according to the *Delaunay* criterion, i.e., the *circumcircle* criterion (or equivalently the *MaxMin* angle criterion).

## Parameters

|                      |                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>cycling_check</i> | Must be set to true when used in connection with optimization algorithms, e.g., optimizeDelaunay. This will avoid cycling and infinite loops in nearly neutral cases. |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- [TraitsType::scalarProduct2d](#) (DartType&, DartType&)
- [TraitsType::crossProduct2d](#) (DartType&, DartType&)

void [transformToConstraint](#) (DartType &dstart, DartType &dend, std::list< DartType > &elist)

### 28.60.1 Detailed Description

Constrained Delaunay triangulation.

Basic generic algorithms in TTL for inserting a constrained edge between two existing nodes. See documentation for the namespace `tfl` for general requirements and assumptions.

Author

Oyvind Hjelle, [oyvindhj@ifi.uio.no](mailto:oyvindhj@ifi.uio.no)

### 28.60.2 Function Documentation

## 28.61 `tfl_util` Namespace Reference

Utilities.

## Functions

### Computational geometry

- `template<class real_type >`  
`real_type scalarProduct2d` (`real_type dx1`, `real_type dy1`, `real_type dx2`, `real_type dy2`)
- `template<class real_type >`  
`real_type crossProduct2d` (`real_type dx1`, `real_type dy1`, `real_type dx2`, `real_type dy2`)
- `template<class real_type >`  
`real_type orient2dfast` (`real_type pa[2]`, `real_type pb[2]`, `real_type pc[2]`)

### Utilities involving points

- `template<class PointType >`  
`std::vector< PointType * > * createRandomData` (`int noPoints`, `int seed=1`)

## 28.61.1 Detailed Description

Utilities.

This name space contains utility functions for TTL.

Point and vector algebra such as scalar product and cross product between vectors are implemented here. These functions are required by functions in the `tll` namespace, where they are assumed to be present in the `TTLtraits` class. Thus, the user can call these functions from the traits class. For efficiency reasons, the user may consider implementing these functions in the the API directly on the actual data structure; see [Application Programming Interface to TTL \(API\)](#).

#### Note

- Cross product between vectors in the xy-plane delivers a scalar, which is the z-component of the actual cross product (the x and y components are both zero).

#### See also

[tll](#) and [Application Programming Interface to TTL \(API\)](#)

#### Author

Oyvind Hjelle, [oyvindhj@ifi.uio.no](mailto:oyvindhj@ifi.uio.no)

## 28.61.2 Function Documentation

**28.61.2.1** `template<class PointType > std::vector<PointType*>* tll_util::createRandomData ( int noPoints, int seed = 1 )`

Creates random data on the unit square.

#### Parameters

|                 |                                                 |
|-----------------|-------------------------------------------------|
| <i>noPoints</i> | Number of random points to be generated         |
| <i>seed</i>     | Initial value for pseudorandom number generator |

- Constructor `PointType::PointType(double x, double y)`.  
For example, one can use `pair<double, double>`.

**Note**

- To deduce template argument for `PointType` the function must be called with the syntax: `create↵ RandomData<MyPoint>(…)` where `MyPoint` is the actual point type.

Definition at line 279 of file `ttl_util.h`.

**28.61.2.2** `template<class real_type > real_type ttl_util::crossProduct2d ( real_type dx1, real_type dy1, real_type dx2, real_type dy2 )`

Cross product between two 2D vectors. (The z-component of the actual cross product.)

**Returns:**

`dx1*dy2 - dy1*dx2`

Definition at line 117 of file `ttl_util.h`.

**28.61.2.3** `template<class real_type > real_type ttl_util::orient2dfast ( real_type pa[2], real_type pb[2], real_type pc[2] )`

Returns a positive value if the 2D nodes/points *pa*, *pb*, and *pc* occur in counterclockwise order; a negative value if they occur in clockwise order; and zero if they are collinear.

**Note**

- This is a finite arithmetic fast version. It can be made more robust using exact arithmetic schemes by Jonathan Richard Shewchuk. See <http://www-2.cs.cmu.edu/~quake/robust.html>

Definition at line 133 of file `ttl_util.h`.

**28.61.2.4** `template<class real_type > real_type ttl_util::scalarProduct2d ( real_type dx1, real_type dy1, real_type dx2, real_type dy2 )`

Scalar product between two 2D vectors.

**Returns:**

`dx1*dx2 + dy1*dy2`

Definition at line 103 of file `ttl_util.h`.

#### 29.1.1 Detailed Description

This class can generate a B-spline curve that approximates an evaluator based curve within a given accuracy  
Definition at line 68 of file AdaptCurve.h.

#### 29.1.2 Constructor & Destructor Documentation

##### 29.1.2.1 Go::AdaptCurve::AdaptCurve ( [const EvalCurve](#) \* evalcrv, [double](#) aepsge )

Constructor where the evaluator based curve and the approximation tolerance are specified. The generated curve will have a spline basis of order 4 (cubic).

## Parameters

|                |                     |
|----------------|---------------------|
| <i>evalcrv</i> | curve to adapt to   |
| <i>aepsge</i>  | geometric tolerance |

29.1.2.2 `Go::AdaptCurve::AdaptCurve ( const EvalCurve * evalcrv, double aepsge, int in, int ik )`

Constructor where the evaluator based curve and the approximation tolerance are specified as well as the size of the initial spline space

## Parameters

|                |                                                          |
|----------------|----------------------------------------------------------|
| <i>evalcrv</i> | curve to adapt to                                        |
| <i>aepsge</i>  | geometric tolerance                                      |
| <i>in</i>      | the number of control points of the initial spline curve |
| <i>ik</i>      | the order of the initial spline curve (pol. degree + 1)  |

29.1.2.3 `Go::AdaptCurve::AdaptCurve ( const EvalCurve * evalcrv, double aepsge, int in, int ik, std::vector< double > & knots )`

Constructor where the evaluator based curve and the approximation tolerance are specified as well as the initial spline space

## Parameters

|                |                                                          |
|----------------|----------------------------------------------------------|
| <i>evalcrv</i> | curve to adapt to                                        |
| <i>aepsge</i>  | geometric tolerance                                      |
| <i>in</i>      | the number of control points of the initial spline curve |
| <i>ik</i>      | the order of the initial spline curve (pol. degree + 1)  |
| <i>knots</i>   | specifies the knotvector of the resulting spline curve.  |

29.1.2.4 `Go::AdaptCurve::AdaptCurve ( const EvalCurve * evalcrv, double aepsge, shared_ptr< SplineCurve > curve )`

Constructor where the evaluator based curve and the approximation tolerance are specified as well as an initial spline curve

## Parameters

|                |                      |
|----------------|----------------------|
| <i>evalcrv</i> | curve to adapt to    |
| <i>aepsge</i>  | geometric tolerance  |
| <i>crv</i>     | initial spline curve |

## 29.1.2.5 Go::AdaptCurve::~~AdaptCurve ( )

Destructor.

## 29.1.2.6 Go::AdaptCurve::AdaptCurve ( ) [protected]

Default constructor.

## 29.1.3 Member Function Documentation

29.1.3.1 int Go::AdaptCurve::approximate ( int *max\_iter* = 5 )

Perform the approximation

Parameters

|                 |                                                 |
|-----------------|-------------------------------------------------|
| <i>max_iter</i> | specify the maximum number of iterations to use |
|-----------------|-------------------------------------------------|

29.1.3.2 shared\_ptr<SplineCurve> Go::AdaptCurve::getAdaptCurve ( double & *maxdist*, double & *avdist*, int *max\_iter* = 5 )

Fetch the approximating curve

Return values

|                |                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------|
| <i>maxdist</i> | report the maximum distance between the generated curve and the data points generated from the input curve |
| <i>avdist</i>  | report the average distance between the generated curve and the datapoints                                 |

Returns

a shared pointer to the generated [SplineCurve](#), approximating the input evaluatorbased curve

29.1.3.3 void Go::AdaptCurve::setEndPoints ( const std::vector< Point > & *start\_point*, const std::vector< Point > & *end\_point* )

The user may decide upon end tangents of approximation curve. If these are not set, the final end tangents result from smoothing equation. The user may specifically decide the start and end points and tangents of the approximation curve (if these are not set, this information will result from the smoothing equation). This function lets the user specify the start and end points and tangents.

Parameters

|                    |                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------|
| <i>start_point</i> | this vector should contain one or two elements: the start point and optionally the start tangent of the curve. |
| <i>end_point</i>   | this vector should contain one or two elements: the end point and optionally the end tangent of the curve.     |

#### 29.1.3.4 void Go::AdaptCurve::setSmooth ( double $w$ )

Set smoothing weight  $0 < w < 1$

##### Parameters

|     |                      |
|-----|----------------------|
| $w$ | the smoothing weight |
|-----|----------------------|

#### 29.1.3.5 void Go::AdaptCurve::unsetSmooth ( )

Unset smoothing weight (set it to zero)

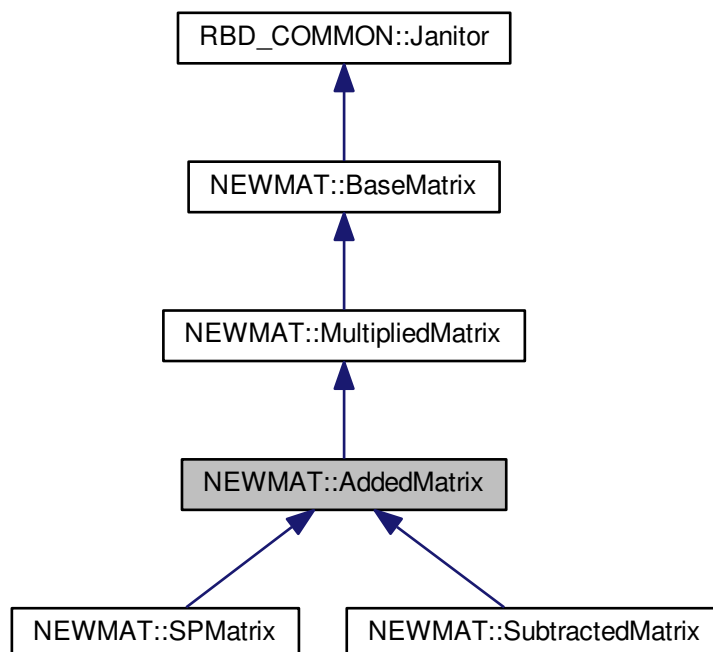

The documentation for this class was generated from the following file:

### 29.6.1 Detailed Description

Class for 2-dimensional algebraic intersection objects.

Definition at line 73 of file AlgObj2DInt.h.

### 29.6.2 Constructor & Destructor Documentation

#### 29.6.2.1 Go::AlgObj2DInt::AlgObj2DInt ( int *degree* )

Constructor.

Parameters

|               |                                                                                              |
|---------------|----------------------------------------------------------------------------------------------|
| <i>degree</i> | the total degree of the algebraic expression, i.e. the maximum sum of exponents of a factor. |
|---------------|----------------------------------------------------------------------------------------------|

#### 29.6.2.2 Go::AlgObj2DInt::AlgObj2DInt ( const std::vector< Alg2DElem > & *terms* )

Constructor.

Parameters

|              |                                                                                    |
|--------------|------------------------------------------------------------------------------------|
| <i>terms</i> | the terms in the algebraic expression, i.e. elements on the form $a_{ij}x^i y^j$ . |
|--------------|------------------------------------------------------------------------------------|

#### 29.6.2.3 virtual Go::AlgObj2DInt::~~AlgObj2DInt ( ) [virtual]

Destructor.

### 29.6.3 Member Function Documentation

#### 29.6.3.1 int Go::AlgObj2DInt::numTerms ( ) [inline]

Get the number of terms in the algebraic object.

Returns

The number of terms in the object.

Definition at line 90 of file AlgObj2DInt.h.

### 29.6.3.2 Alg2DElem Go::AlgObj2DInt::term ( int *index* )

Get a term from the algebraic object.

#### Returns

the term with index *index*

### 29.7.1 Detailed Description

Class for 3-dimensional algebraic intersection objects. Supports two different representations: Polynomials on power basis, or Bernstein polynomials on a tetrahedron.

Definition at line 78 of file [AlgObj3DInt.h](#).

### 29.7.2 Constructor & Destructor Documentation

#### 29.7.2.1 Go::AlgObj3DInt::AlgObj3DInt ( int *degree* )

Constructor.

#### Parameters

|               |                                                                                            |
|---------------|--------------------------------------------------------------------------------------------|
| <i>degree</i> | the total degree of the algebraic expression, i.e. the maximum sum of exponents of a term. |
|---------------|--------------------------------------------------------------------------------------------|

29.7.2.2 `Go::AlgObj3DInt::AlgObj3DInt ( const std::vector< Alg3DElem > & terms )`

Constructor.

Parameters

|              |                                                                                         |
|--------------|-----------------------------------------------------------------------------------------|
| <i>terms</i> | the terms in the algebraic expression, i.e. elements on the form $a_{ijk}x^i y^j z^k$ . |
|--------------|-----------------------------------------------------------------------------------------|

29.7.2.3 `Go::AlgObj3DInt::AlgObj3DInt ( const BernsteinTetrahedralPoly & implicit, const BaryCoordSystem3D & bc )`

Constructor. We define the algebraic expression using another representation than the standard power basis formulation. This will (typically) be the result from an approximative implicitization of a spline surface.

Parameters

|                 |                                                           |
|-----------------|-----------------------------------------------------------|
| <i>implicit</i> | the implicit object.                                      |
| <i>bc</i>       | the barycentric coordinate system for the representation. |

29.7.2.4 `virtual Go::AlgObj3DInt::~~AlgObj3DInt ( ) [virtual]`

Destructor.

### 29.7.3 Member Function Documentation

29.7.3.1 `int Go::AlgObj3DInt::degree ( ) [inline]`

Get the degree of the algebraic object

Returns

the degree

Definition at line 111 of file AlgObj3DInt.h.

29.7.3.2 `void Go::AlgObj3DInt::getImplicit ( BernsteinTetrahedralPoly & impl, BaryCoordSystem3D & bc ) [inline]`

Get the implicit representation of the object.

Parameters

|             |                                      |
|-------------|--------------------------------------|
| <i>impl</i> | the implicit representation.         |
| <i>bc</i>   | the corresponding coordinate system. |

Definition at line 122 of file AlgObj3DInt.h.

#### 29.7.3.3 `int Go::AlgObj3DInt::numTerms ( ) [inline]`

Get the number of terms in the algebraic object.

##### Returns

The number of terms in the object.

Definition at line 106 of file AlgObj3DInt.h.

#### 29.7.3.4 `Alg3DElem Go::AlgObj3DInt::term ( int index )`

Get the corresponding term from the algebraic object.

##### Parameters

|              |                                                          |
|--------------|----------------------------------------------------------|
| <i>index</i> | the index of the term in question. Indexing starts at 0. |
|--------------|----------------------------------------------------------|

#### 29.7.3.5 `bool Go::AlgObj3DInt::usingPowerBasis ( ) [inline]`

Verify whether we are using a standard power basis representation for the object.

##### Returns

True if we are using a standard power basis representation. For typical algebraic objects like spheres this will be the case, but not for approximative implicitizations of spline surfaces.

Definition at line 134 of file AlgObj3DInt.h.

### 29.7.4 Member Data Documentation

#### 29.7.4.1 `BaryCoordSystem3D Go::AlgObj3DInt::bc_ [protected]`

*Default constructor.*

### 29.9.1 Detailed Description

This class can generate B-spline curves that approximates sequences of points for a given accuracy.

Definition at line 67 of file `ApproxCrvToSeqs.h`.

### 29.9.2 Constructor & Destructor Documentation

**29.9.2.1** `Go::ApproxCrvToSeqs::ApproxCrvToSeqs ( const std::vector< std::vector< double > > & points, const std::vector< std::vector< double > > & parvals, int dim, double aepsge )`

Constructor where the user specifies a set of parameterized points and a tolerance to be used. The generated curve will have a spline basis of order 4 (cubic), and a number of control points equal to one-sixth of the number of input points. The knotvector of the curve's basis will be set to uniform.

#### Parameters

|                |                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>points</i>  | vector containing the sequences points to approximate. These are stored consecutively in "xyzxyzxyz-fashion". The dimension of all points is expected to be the same, but the number of points in the sequences may differ |
| <i>parvals</i> | the parameter values associated with the points to approximate. The parameter values must correspond for all sequences                                                                                                     |
| <i>dim</i>     | the spatial dimension of the points (usually 3)                                                                                                                                                                            |
| <i>aepsge</i>  | the geometric tolerance to work with                                                                                                                                                                                       |

**29.9.2.2** `Go::ApproxCrvToSeqs::ApproxCrvToSeqs ( const std::vector< std::vector< double > > & points, const std::vector< std::vector< double > > & parvals, int dim, double aepsge, int in, int ik )`

Constructor where the user specifies a set of parameterized points and a tolerance to be used, as well as the spline order and number of control points. The knotvector of the curve's basis will be set to uniform.

#### Parameters

|                |                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>points</i>  | vector containing the sequences points to approximate. These are stored consecutively in "xyzxyzxyz-fashion". The dimension of all points is expected to be the same, but the number of points in the sequences may differ |
| <i>parvals</i> | the parameter values associated with the points to approximate. The parameter values must correspond for all sequences                                                                                                     |
| <i>dim</i>     | the spatial dimension of the points (usually 3)                                                                                                                                                                            |
| <i>aepsge</i>  | the geometric tolerance to work with                                                                                                                                                                                       |
| <i>in</i>      | the number of control points of the resulting spline curve                                                                                                                                                                 |
| <i>ik</i>      | the order of the resulting spline curve (pol. degree + 1)                                                                                                                                                                  |

29.9.2.3 `Go::ApproxCrvToSeqs::ApproxCrvToSeqs ( const std::vector< std::vector< double > > & points, const std::vector< std::vector< double > > & parvals, int dim, double aepsge, int in, int ik, std::vector< double > & knots )`

Constructor where the user specifies a set of parameterized points, a tolerance and the spline space to use for constructing the curve. Constructor where the user specifies a set of parameterized points and a tolerance to be used, as well as the spline order and number of control points. The knotvector of the curve's basis will be set to uniform.

#### Parameters

|                |                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>points</i>  | vector containing the sequences points to approximate. These are stored consecutively in "xyzxyzxyz-fashion". The dimension of all points is expected to be the same, but the number of points in the sequences may differ |
| <i>parvals</i> | the parameter values associated with the points to approximate. The parameter values must correspond for all sequences                                                                                                     |
| <i>dim</i>     | the spatial dimension of the points (usually 3)                                                                                                                                                                            |
| <i>aepsge</i>  | the geometric tolerance to work with                                                                                                                                                                                       |
| <i>in</i>      | the number of control points of the resulting spline curve                                                                                                                                                                 |
| <i>ik</i>      | the order of the resulting spline curve (pol. degree + 1)                                                                                                                                                                  |
| <i>knots</i>   | specifies the knotvector of the resulting spline curve.                                                                                                                                                                    |

29.9.2.4 `Go::ApproxCrvToSeqs::~~ApproxCrvToSeqs ( )`

Destructor.

29.9.2.5 `Go::ApproxCrvToSeqs::ApproxCrvToSeqs ( )` [protected]

Default constructor.

### 29.9.3 Member Function Documentation

29.9.3.1 `std::vector<shared_ptr<SplineCurve> > Go::ApproxCrvToSeqs::getApproxCurves ( double & maxdist, double & avdist, int max_iter = 5 )`

When everything else is set, this function can be used to fetch the approximating curves

#### Return values

|                |                                                                              |
|----------------|------------------------------------------------------------------------------|
| <i>maxdist</i> | report the maximum distance between the generated curves and the data points |
| <i>avdist</i>  | report the average distance between the generated curves and the datapoints  |

#### Parameters

|                 |                                                 |
|-----------------|-------------------------------------------------|
| <i>max_iter</i> | specify the maximum number of iterations to use |
|-----------------|-------------------------------------------------|

**Returns**

a shared pointer to the generated [SplineCurve](#), approximating the points as specified.

**29.9.3.2 void Go::ApproxCrvToSeqs::setC1Approx ( double fac )**

Approximate C1 continuity with a given impartance  $0 \leq \text{fac}$ .

**29.9.3.3 void Go::ApproxCrvToSeqs::setEndPoints ( const std::vector< std::vector< Point > > & start\_point, const std::vector< std::vector< Point > > & end\_point )**

The user may decide upon end tangents of approximation curve. If these are not set, the final end tangents result from smoothing equation. The user may specifically decide the start and end points and tangents of the approximation curve (if these are not set, this information will result from the smoothing equation). This function lets the user specify the start and end points and tangents.

**Parameters**

|                    |                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <i>start_point</i> | for each curve, this vector should contain up to two elements: the start point and optionally the start tangent of the curve. |
| <i>end_point</i>   | for each curve, this vector should contain up to two elements: the end point and optionally the end tangent of the curve.     |

**29.9.3.4 void Go::ApproxCrvToSeqs::setSmooth ( double w )**

Set smoothing weight  $0 < w < 1$

**Parameters**

|          |                      |
|----------|----------------------|
| <i>w</i> | the smoothing weight |
|----------|----------------------|

**29.9.3.5 void Go::ApproxCrvToSeqs::unsetSmooth ( )**

Unset smoothing weight (set it to zero)

### 29.10.1 Detailed Description

This class can generate a B-spline curve that approximates a set of points for a given accuracy.

Definition at line 67 of file `ApproxCurve.h`.

### 29.10.2 Constructor & Destructor Documentation

- 29.10.2.1 `Go::ApproxCurve::ApproxCurve ( const std::vector< double > & points, const std::vector< double > & parvals, int dim, double aepsge )`

Constructor where the user specifies a set of parameterized points and a tolerance to be used. The generated curve will have a spline basis of order 4 (cubic), and a number of control points equal to one-sixth of the number of input points. The knotvector of the curve's basis will be set to uniform.

#### Parameters

|                |                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------|
| <i>points</i>  | vector containing the points to approximate. These are stored consecutively in "xyzxyzxyz-fashion". |
| <i>parvals</i> | the parameter values associated with the points to approximate                                      |
| <i>dim</i>     | the spatial dimension of the points (usually 3)                                                     |
| <i>aepsge</i>  | the geometric tolerance to work with                                                                |

**29.10.2.2** `Go::ApproxCurve::ApproxCurve ( const std::vector< double > & points, const std::vector< double > & parvals, int dim, double aepsge, int in, int ik )`

Constructor where the user specifies a set of parameterized points and a tolerance to be used, as well as the spline order and number of control points. The knotvector of the curve's basis will be set to uniform.

#### Parameters

|                |                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------|
| <i>points</i>  | vector containing the points to approximate. These are stored consecutively in "xyzxyzxyz-fashion". |
| <i>parvals</i> | the parameter values associated with the points to approximate                                      |
| <i>dim</i>     | the spatial dimension of the points (usually 3)                                                     |
| <i>aepsge</i>  | the geometric tolerance to work with                                                                |
| <i>in</i>      | the number of control points of the resulting spline curve                                          |
| <i>ik</i>      | the order of the resulting spline curve (pol. degree + 1)                                           |

**29.10.2.3** `Go::ApproxCurve::ApproxCurve ( const std::vector< double > & points, const std::vector< double > & parvals, int dim, double aepsge, int in, int ik, const std::vector< double > & knots )`

Constructor where the user specifies a set of parameterized points, a tolerance and the spline space to use for constructing the curve.

#### Parameters

|                |                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------|
| <i>points</i>  | vector containing the points to approximate. These are stored consecutively in "xyzxyzxyz-fashion". |
| <i>parvals</i> | the parameter values associated with the points to approximate                                      |
| <i>dim</i>     | the spatial dimension of the points (usually 3)                                                     |
| <i>aepsge</i>  | the geometric tolerance to work with                                                                |
| <i>in</i>      | the number of control points of the resulting spline curve                                          |
| <i>ik</i>      | the order of the resulting spline curve (pol. degree + 1)                                           |
| <i>knots</i>   | specifies the knotvector of the resulting spline curve.                                             |

**29.10.2.4** `Go::ApproxCurve::~~ApproxCurve ( )`

Destructor.

**29.10.2.5** `Go::ApproxCurve::ApproxCurve ( ) [protected]`

Default constructor.

### 29.10.3 Member Function Documentation

**29.10.3.1** `shared_ptr<SplineCurve> Go::ApproxCurve::getApproxCurve ( double & maxdist, double & avdist, int max_iter = 5 )`

When everything else is set, this function can be used to fetch the approximating curve

## Return values

|                |                                                                             |
|----------------|-----------------------------------------------------------------------------|
| <i>maxdist</i> | report the maximum distance between the generated curve and the data points |
| <i>avdist</i>  | report the average distance between the generated curve and the datapoints  |

## Parameters

|                 |                                                 |
|-----------------|-------------------------------------------------|
| <i>max_iter</i> | specify the maximum number of iterations to use |
|-----------------|-------------------------------------------------|

## Returns

a shared pointer to the generated [SplineCurve](#), approximating the points as specified.

## 29.10.3.2 void Go::ApproxCurve::setC1Approx ( double fac )

Approximate C1 continuity with a given importance  $0 \leq \text{fac} < 1$ .

## 29.10.3.3 void Go::ApproxCurve::setEndPoints ( const std::vector&lt; Point &gt; &amp; start\_point, const std::vector&lt; Point &gt; &amp; end\_point )

The user may decide upon end tangents of approximation curve. If these are not set, the final end tangents result from smoothing equation. The user may specifically decide the start and end points and tangents of the approximation curve (if these are not set, this information will result from the smoothing equation). This function lets the user specify the start and end points and tangents.

## Parameters

|                    |                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------|
| <i>start_point</i> | this vector should contain one or two elements: the start point and optionally the start tangent of the curve. |
| <i>end_point</i>   | this vector should contain one or two elements: the end point and optionally the end tangent of the curve.     |

## 29.10.3.4 void Go::ApproxCurve::setSmooth ( double w )

Set smoothing weight  $0 < w < 1$

## Parameters

|          |                      |
|----------|----------------------|
| <i>w</i> | the smoothing weight |
|----------|----------------------|

## 29.10.3.5 void Go::ApproxCurve::unsetSmooth ( )

Unset smoothing weight (set it to zero)

#### 29.11.1 Detailed Description

This class can generate a B-spline surface that approximates a set of points for a given accuracy.

Definition at line 71 of file ApproxSurf.h.

#### 29.11.2 Constructor & Destructor Documentation

- 29.11.2.1 [Go::ApproxSurf::ApproxSurf](#) ( std::vector< shared\_ptr< [SplineCurve](#) > > &crvs, const std::vector< double > & points, const std::vector< double > & parvals, double domain[], int dim, double aepsge, int constdir = 0, bool repar = true )

Constructor where the user specifies the boundary curves of the surface to generate, a parameter domain for the surface, the points to approximate and their parameter values, as well as the geometric tolerance. The two spline bases of the generated tensor product spline surface will be determined by unifying bases of opposing boundary curves.

## Parameters

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>crvs</i>     | the boundary curves of the surface to be generated. This vector should contain exactly <i>four</i> curves, whose endpoints are connected so that they form a loop.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>points</i>   | vector containing the coordinates of the points that this surface should interpolate. They are stored in "xyzxyz...-fashion".                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <i>parvals</i>  | vector containing the parameter values of the points given in the 'points' vector. They are stored in "uvuv...-fashion".                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>domain</i>   | pointer to an array of four doubles specifying the parametric domain for the surface to be generated. They should be stored as "u_min, u_max, v_min, v_max".                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>dim</i>      | spatial dimension of the points (usually 3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>aepsge</i>   | geometric tolerance to use internally                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>constdir</i> | The points <i>will</i> be reparameterized internally according to their spatial position with respect to the surface that shall be generated. However, they might be reparameterized in both their u and v parameters, only in their u parameters or only in their v parameters. The user can specify this with 'constdir'. If 'constdir' is set to 0, the points will be reparameterized in both u and v. If 'constdir' is set to 1, they will only be reparameterized in the v parameter. If 'constdir' is set to 2, they will only be reparameterized in the u parameter. |

29.11.2.2 `Go::ApproxSurf::ApproxSurf ( shared_ptr< SplineSurface > & srf, const std::vector< double > & points, const std::vector< double > & parvals, int dim, double aepsge, int constdir = 0, bool approx_orig = false, bool close_belt = false, int nmb_stabil = 0, bool repar = true )`

Constructor where the user specifies a spline surface that should be modified, the points to approximate and their parameter values, as well as the geometric tolerance. The surface that is given as argument is not copied internally, only pointed to, so it *will* be modified.

## Parameters

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>srf</i>        | the surface that will be modified to approximate the points. Assumed to contain k-regular knots.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>points</i>     | vector containing the coordinates of the points that this surface should interpolate. They are stored in "xyzxyz...-fashion".                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <i>parvals</i>    | vector containing the parameter values of the points given in the 'points' vector. They are stored in "uvuv...-fashion".                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>dim</i>        | spatial dimension of the points (usually 3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>aepsge</i>     | geometric tolerance to use internally                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>constdir</i>   | The points <i>will</i> be reparameterized internally according to their spatial position with respect to the surface that shall be generated. However, they might be reparameterized in both their u and v parameters, only in their u parameters or only in their v parameters. The user can specify this with 'constdir'. If 'constdir' is set to 0, the points will be reparameterized in both u and v. If 'constdir' is set to 1, they will only be reparameterized in the v parameter. If 'constdir' is set to 2, they will only be reparameterized in the u parameter. |
| <i>close_belt</i> | Indicates if only coefficients close to the sampling points should be modified                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

29.11.2.3 `Go::ApproxSurf::~~ApproxSurf ( )`

Destructor.

29.11.2.4 `Go::ApproxSurf::ApproxSurf ( )` [protected]

Default constructor.

### 29.11.3 Member Function Documentation

#### 29.11.3.1 void Go::ApproxSurf::edgeFix ( int *edge\_fix*[ ] ) [inline]

Decide whether specific edges of the surface's boundary should be kept fixed (i.e. unchanged by approximation process), as well as a certain number of cross- derivatives across these curves.

##### Parameters

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>edge_fix</i> | pointer to an array of four integers specifying to which extent each surface edge should be kept fixed during the approximation process. A value of 0 means that it will not be kept fixed, 1 means that its position will be kept fixed, 2 means that its position and cross-tangent will be kept fixed, etc. The integers are associated with the surface edges starting with the edge 'v=vmin' and moving counterclockwise. |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Definition at line 181 of file ApproxSurf.h.

#### 29.11.3.2 shared\_ptr<SplineSurface> Go::ApproxSurf::getApproxSurf ( double & *maxdist*, double & *avdist*, int & *nmb\_out\_eps*, int *max\_iter* = 4, int *keep\_init* = 0 )

Fetch the approximating surface.

When everything else is set, this function can be used to run the approximation process and fetch the approximated surface.

##### Return values

|                |                                                                                  |
|----------------|----------------------------------------------------------------------------------|
| <i>maxdist</i> | report the maximum distance between the approximated surface and the data points |
| <i>avdist</i>  | report the average distance between the approximated surface and the datapoints  |

##### Parameters

|                    |                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>nmb_out_eps</i> | report the number of data points that were found to lie outside the geometric tolerance (as specified by the 'aepsge' argument to the <a href="#">ApproxSurf</a> constructor. |
| <i>max_iter</i>    | maximum number of iterations                                                                                                                                                  |

##### Returns

a shared pointer to the generated [SplineCurve](#), approximating the points as specified.

#### 29.11.3.3 bool Go::ApproxSurf::getDoRefine ( ) [inline]

Check whether or not the spline space will be refined during the approximation iterations

Definition at line 232 of file ApproxSurf.h.

#### 29.11.3.4 int Go::ApproxSurf::reParam ( )

Reparameterize the data points by a closest point match against the current surface.

29.11.3.5 void Go::ApproxSurf::setC1Approx ( double *fac1*, double *fac2* )

Approximate C1 continuity with a given importance  $0 \leq \text{fac} < 1$ .

29.11.3.6 void Go::ApproxSurf::setDoRefine ( bool *refine* ) [inline]

Set whether or not the spline space is to be refined during the approximation iterations

Definition at line 239 of file ApproxSurf.h.

29.11.3.7 void Go::ApproxSurf::setFixBoundary ( bool *fix\_boundary* ) [inline]

Decide whether or not the total boundary of the surface should be kept fixed (i.e. unchanged by approximation process). Default is true. Cross derivatives will not be kept fixed. (If you want to keep cross derivatives fixed, use the [edgeFix\(\)](#) member function instead).

#### Parameters

|                     |                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------|
| <i>fix_boundary</i> | if 'true' the boundary of the surface will not be modified, if 'false' it will be open to modification. |
|---------------------|---------------------------------------------------------------------------------------------------------|

Definition at line 164 of file ApproxSurf.h.

29.11.3.8 void Go::ApproxSurf::setNormalConditions ( const std::vector< double > & *points*, const std::vector< double > & *parvals*, int *nmb\_stabil* = 0 ) [inline]

Forces the surface to approximate certain normals at certain parameter values.

#### Parameters

|                |                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>points</i>  | this vector contains the normals that should be approximated. They are stored in 'xyzxyz... fashion'.                       |
| <i>parvals</i> | this vector contains the parameter values of the normals that should be approximated. They are stored in 'uvuv... fashion'. |

Definition at line 193 of file ApproxSurf.h.

29.11.3.9 void Go::ApproxSurf::setSmoothingWeight ( double *smooth* ) [inline]

Sets the smoothing weight to something other than the default (1e-9). The value should lie in the unit interval, typically close to 0.

#### Parameters

|               |                           |
|---------------|---------------------------|
| <i>smooth</i> | the new smoothing weight. |
|---------------|---------------------------|

Definition at line 152 of file ApproxSurf.h.

### 29.12.1 Detailed Description

```
template<typename T, int Dim>
class Go::Array< T, Dim >
```

Compile-time sized array. Encapsulates an array with full value semantics, i.e. copying and assignment works as expected. The class also has some vector algebra functionality, such as scalar product, multiplication by scalars etc. In such contexts the objects are talked about as 'vectors' and not 'Arrays'.

Definition at line 61 of file Array.h.

### 29.12.2 Constructor & Destructor Documentation

29.12.2.1 `template<typename T, int Dim> Go::Array< T, Dim >::Array ( ) [inline]`

Default constructor, does not initialize elements.

Definition at line 68 of file Array.h.

29.12.2.2 `template<typename T, int Dim> Go::Array< T, Dim >::Array ( T x ) [inline], [explicit]`

Constructor filling the 'Dim'-tuple with the same value. (J.O. 080211) I don't think this one should interfere with other constructors, particularly since there doesn't seem to be support for an M==1 case already...?!

Definition at line 74 of file Array.h.

29.12.2.3 `template<typename T, int Dim> Go::Array< T, Dim >::Array ( T x, T y ) [inline]`

Constructor taking 2 arguments, only compiles if [Array](#) dimension argument is 2.

Definition at line 82 of file Array.h.

29.12.2.4 `template<typename T, int Dim> Go::Array< T, Dim >::Array ( T x, T y, T z ) [inline]`

Constructor taking 3 arguments, only compiles if [Array](#) dimension argument is 3.

Definition at line 90 of file Array.h.

29.12.2.5 `template<typename T, int Dim> Go::Array< T, Dim >::Array ( T x, T y, T z, T w ) [inline]`

Constructor taking 4 arguments, only compiles if [Array](#) dimension argument is 4.

Definition at line 99 of file Array.h.

29.12.2.6 `template<typename T, int Dim> Go::Array< T, Dim >::Array ( const Array< T, Dim > & v ) [inline]`

Copy constructor.

Definition at line 108 of file Array.h.

29.12.2.7 `template<typename T, int Dim> template<typename RandomAccessIterator > Go::Array< T, Dim >::Array ( RandomAccessIterator start ) [inline], [explicit]`

Constructor taking a pointer or other random access iterator and copying all elements into the [Array](#).

Definition at line 116 of file Array.h.

29.12.2.8 `template<typename T, int Dim> template<typename U > Go::Array< T, Dim >::Array ( const Array< U, Dim > & v ) [inline], [explicit]`

Constructor that takes an [Array](#) of a compatible type.

Definition at line 132 of file Array.h.

### 29.12.3 Member Function Documentation

29.12.3.1 `template<typename T, int Dim> T Go::Array< T, Dim >::angle ( const Array< T, Dim > & v ) const`  
[inline]

The angle between this and another vector.

Definition at line 411 of file Array.h.

29.12.3.2 `template<typename T, int Dim> const T* Go::Array< T, Dim >::begin ( ) const` [inline]

Get a read-only start iterator.

Definition at line 198 of file Array.h.

29.12.3.3 `template<typename T, int Dim> T* Go::Array< T, Dim >::begin ( )` [inline]

Get a start iterator.

Definition at line 200 of file Array.h.

29.12.3.4 `template<typename T, int Dim> T Go::Array< T, Dim >::cosAngle ( const Array< T, Dim > & v ) const`  
[inline]

The cosine of the angle between this and another vector.

Definition at line 399 of file Array.h.

29.12.3.5 `template<typename T, int Dim> Array Go::Array< T, Dim >::cross ( const Array< T, Dim > & v ) const`  
[inline]

The cross product of two vectors. Only compiles if dimension is 3.

Definition at line 392 of file Array.h.

29.12.3.6 `template<typename T, int Dim> T Go::Array< T, Dim >::dist ( const Array< T, Dim > & v ) const`  
[inline]

Get the euclidian length of the difference between this vector and another vector.

Definition at line 254 of file Array.h.

29.12.3.7 `template<typename T, int Dim> T Go::Array< T, Dim >::dist2 ( const Array< T, Dim > & v ) const`  
[inline]

Get the square of the euclidian length of the difference between this vector and another vector.

Definition at line 241 of file Array.h.

**29.12.3.8** `template<typename T, int Dim> T Go::Array< T, Dim >::distInf ( const Array< T, Dim > & v ) const [inline]`

Get the infinity-norm (or max-norm) length of the difference between this vector and another vector.

Definition at line 265 of file Array.h.

**29.12.3.9** `template<typename T, int Dim> const T* Go::Array< T, Dim >::end ( ) const [inline]`

Get a read-only end iterator.

Definition at line 202 of file Array.h.

**29.12.3.10** `template<typename T, int Dim> T* Go::Array< T, Dim >::end ( ) [inline]`

Get a end iterator.

Definition at line 204 of file Array.h.

**29.12.3.11** `template<typename T, int Dim> T Go::Array< T, Dim >::length ( ) const [inline]`

Get the euclidian length of the vector.

Definition at line 220 of file Array.h.

**29.12.3.12** `template<typename T, int Dim> T Go::Array< T, Dim >::length2 ( ) const [inline]`

Get the square of the euclidian length of the vector.

Definition at line 211 of file Array.h.

**29.12.3.13** `template<typename T, int Dim> T Go::Array< T, Dim >::lengthInf ( ) const [inline]`

Get the infinity-norm (or max-norm) length of the vector.

Definition at line 230 of file Array.h.

**29.12.3.14** `template<typename T, int Dim> void Go::Array< T, Dim >::normalize ( ) [inline]`

Normalize this vector, i.e. divide every element by `length()`.

Definition at line 278 of file Array.h.

```
29.12.3.15 template<typename T, int Dim> Array Go::Array< T, Dim >::operator%(const Array< T, Dim > & v) const
[inline]
```

The cross product of two vectors. Only compiles if dimension is 3.

Definition at line 376 of file Array.h.

```
29.12.3.16 template<typename T, int Dim> Array Go::Array< T, Dim >::operator*(T d) const [inline]
```

The product of a vector and a scalar.

Definition at line 325 of file Array.h.

```
29.12.3.17 template<typename T, int Dim> T Go::Array< T, Dim >::operator*(const Array< T, Dim > & v) const
[inline]
```

The scalar product (or inner product, or dot product) of two vectors.

Definition at line 366 of file Array.h.

```
29.12.3.18 template<typename T, int Dim> Array& Go::Array< T, Dim >::operator*=(T d) [inline]
```

Multiply this vector by a scalar.

Definition at line 333 of file Array.h.

```
29.12.3.19 template<typename T, int Dim> Array Go::Array< T, Dim >::operator+ (const Array< T, Dim > & v) const
[inline]
```

The sum of two vectors.

Definition at line 284 of file Array.h.

```
29.12.3.20 template<typename T, int Dim> Array& Go::Array< T, Dim >::operator+=(const Array< T, Dim > & v)
[inline]
```

Add a vector to this vector.

Definition at line 300 of file Array.h.

```
29.12.3.21 template<typename T, int Dim> Array Go::Array< T, Dim >::operator- (const Array< T, Dim > & v) const
[inline]
```

The difference between two vectors.

Definition at line 308 of file Array.h.

29.12.3.22 `template<typename T, int Dim> Array Go::Array< T, Dim >::operator- ( ) const [inline]`

The negation of a vector.

Definition at line 356 of file Array.h.

29.12.3.23 `template<typename T, int Dim> Array& Go::Array< T, Dim >::operator-= ( const Array< T, Dim > & v ) [inline]`

Subtract a vector from this vector.

Definition at line 316 of file Array.h.

29.12.3.24 `template<typename T, int Dim> Array Go::Array< T, Dim >::operator/ ( double d ) const [inline]`

A vector divided by a scalar.

Definition at line 341 of file Array.h.

29.12.3.25 `template<typename T, int Dim> Array& Go::Array< T, Dim >::operator/= ( double d ) [inline]`

Divide this vector with a scalar.

Definition at line 348 of file Array.h.

29.12.3.26 `template<typename T, int Dim> Array& Go::Array< T, Dim >::operator= ( const Array< T, Dim > & v ) [inline]`

Assignment operator.

Definition at line 147 of file Array.h.

29.12.3.27 `template<typename T, int Dim> bool Go::Array< T, Dim >::operator==( const Array< T, Dim > & v ) const [inline]`

Add a vector to this vector.

Definition at line 292 of file Array.h.

29.12.3.28 `template<typename T, int Dim> const T& Go::Array< T, Dim >::operator[]( int i ) const [inline]`

Read-only index access.

Definition at line 193 of file Array.h.

29.12.3.29 `template<typename T, int Dim> T& Go::Array< T, Dim >::operator[]( int i ) [inline]`

Index access.

Definition at line 195 of file Array.h.

29.12.3.30 `template<typename T, int Dim> void Go::Array< T, Dim >::read ( std::istream & is ) [inline]`

Reads an [Array](#) elementwise from a standard istream.

Definition at line 157 of file Array.h.

29.12.3.31 `template<typename T, int Dim> template<typename RandomAccessIterator > void Go::Array< T, Dim >::setValue ( RandomAccessIterator from ) [inline]`

Takes a pointer or other random access iterator and copies all elements into the [Array](#).

Definition at line 124 of file Array.h.

29.12.3.32 `template<typename T, int Dim> template<typename RandomAccessIterator > void Go::Array< T, Dim >::setValueConvert ( RandomAccessIterator from ) [inline]`

Takes a pointer or other random access iterator with compatible value type and copies all elements into the [Array](#).

Definition at line 141 of file Array.h.

29.12.3.33 `template<typename T, int Dim> int Go::Array< T, Dim >::size ( ) const [inline]`

Get the dimension of the [Array](#).

Definition at line 207 of file Array.h.

29.12.3.34 `template<typename T, int Dim> void Go::Array< T, Dim >::write ( std::ostream & os ) const [inline]`

Writes an [Array](#) elementwise to a standard ostream. Precision is set to 16 by this function.

Definition at line 165 of file Array.h.

29.12.3.35 `template<typename T, int Dim> const T& Go::Array< T, Dim >::x ( ) const [inline]`

Access to first element. (Deprecated, kept for backward compatibility)

Definition at line 175 of file Array.h.

29.12.3.36 `template<typename T, int Dim> T& Go::Array< T, Dim >::x ( ) [inline]`

Access to first element. (Deprecated, kept for backward compatibility)

Definition at line 178 of file Array.h.

29.12.3.37 `template<typename T, int Dim> const T& Go::Array< T, Dim >::y ( ) const [inline]`

Access to first element. (Deprecated, kept for backward compatibility)

Definition at line 181 of file Array.h.

29.12.3.38 `template<typename T, int Dim> T& Go::Array< T, Dim >::y ( ) [inline]`

Access to first element. (Deprecated, kept for backward compatibility)

Definition at line 184 of file Array.h.

29.12.3.39 `template<typename T, int Dim> const T& Go::Array< T, Dim >::z ( ) const [inline]`

Access to first element. (Deprecated, kept for backward compatibility)

Definition at line 187 of file Array.h.

29.12.3.40 `template<typename T, int Dim> T& Go::Array< T, Dim >::z ( ) [inline]`

Access to first element. (Deprecated, kept for backward compatibility)

Definition at line 190 of file Array.h.

29.12.3.41 `template<typename T, int Dim> void Go::Array< T, Dim >::zero ( ) [inline]`

Sets the vector to the zero vector.

Definition at line 421 of file Array.h.

## 29.13 NEWMAT::ArrayLengthSpecifier Class Reference

```
#include <newmat.h>
```

## Public Member Functions

- `int Value () const`
- `ArrayLengthSpecifier (int l)`

### 29.13.1 Detailed Description

Definition at line 216 of file `newmat.h`.

### 29.13.2 Constructor & Destructor Documentation

29.13.2.1 `NEWMAT::ArrayLengthSpecifier::ArrayLengthSpecifier ( int l ) [inline]`

Definition at line 221 of file `newmat.h`.

### 29.13.3 Member Function Documentation

29.13.3.1 `int NEWMAT::ArrayLengthSpecifier::Value ( ) const [inline]`

Definition at line 220 of file `newmat.h`.

The documentation for this class was generated from the following file:

- `newmat/include/newmat.h`

## 29.14 RBD\_COMMON::Bad\_alloc Class Reference

```
#include <myexcept.h>
```

Inheritance diagram for `RBD_COMMON::Bad_alloc`:

Collaboration diagram for RBD\_COMMON::Bad\_alloc:

- static unsigned long [Select](#)
- [Bad\\_alloc](#) (const char \*a\_what=0)

## Additional Inherited Members

### 29.14.1 Detailed Description

Definition at line 427 of file myexcept.h.

### 29.14.2 Constructor & Destructor Documentation

#### 29.14.2.1 `Bad_alloc::Bad_alloc ( const char * a_what = 0 )`

Definition at line 468 of file myexcept.cpp.

### 29.14.3 Member Data Documentation

#### 29.14.3.1 `unsigned long Bad_alloc::Select [static]`

Definition at line 430 of file myexcept.h.

The documentation for this class was generated from the following files:

- [newmat/include/myexcept.h](#)

*Read from input stream.*
- void [write \(std::ostream &os\) const](#)  
*Write to output stream.*

### 29.17.1 Detailed Description

```
template<int Dim>
class Go::BaryCoordSystem< Dim >
```

Encapsulates a barycentric coordinate system. It is designed to work in any dimension, but at the time of writing, only dimension 2 and 3 is supported by the functions in the included header "Volumes.h"

You specify the dimension with a template parameter:

```
BaryCoordSystem<2> bc(corner_pointer);
```

... or by using the supplied typedefs:

```
BaryCoordSystem2D bc(corner_pointer);
```

This file also contains the small function called `triangle_area_signed()`.

Definition at line 68 of file `BaryCoordSystem.h`.

### 29.17.2 Constructor & Destructor Documentation

29.17.2.1 `template<int Dim> Go::BaryCoordSystem< Dim >::BaryCoordSystem ( ) [inline]`

Empty default constructor.

Definition at line 71 of file `BaryCoordSystem.h`.

29.17.2.2 `template<int Dim> Go::BaryCoordSystem< Dim >::BaryCoordSystem ( const Array< double, Dim > * corners ) [inline]`

Constructor. Takes an array of points that will become the corners of the coordinate simplex.

Definition at line 75 of file `BaryCoordSystem.h`.

### 29.17.3 Member Function Documentation

29.17.3.1 `template<int Dim> template<class T > Array< T, Dim > Go::BaryCoordSystem< Dim >::baryToCart ( const Array< T, Dim+1 > & bary_pt ) const [inline]`

Input is a barycentric point, output is the corresponding cartesian point.

Definition at line 135 of file `BaryCoordSystem.h`.

29.17.3.2 `template<int Dim> template<class T > Array< T, Dim+1 > Go::BaryCoordSystem< Dim >::cartToBary ( const Array< T, Dim > & cart_pt ) const [inline]`

Input is a cartesian point, output is the corresponding barycentric point.

Definition at line 148 of file `BaryCoordSystem.h`.

29.17.3.3 `template<int Dim> const Array<double,Dim>& Go::BaryCoordSystem< Dim >::corner ( int i ) const`  
`[inline]`

Returns the corner points.

Definition at line 89 of file BaryCoordSystem.h.

29.17.3.4 `template<int Dim> void Go::BaryCoordSystem< Dim >::read ( std::istream & is )` `[inline]`

Read from input stream.

Definition at line 105 of file BaryCoordSystem.h.

29.17.3.5 `template<int Dim> void Go::BaryCoordSystem< Dim >::setCorners ( const Array< double, Dim > * corners )` `[inline]`

Set corners.

Definition at line 82 of file BaryCoordSystem.h.

29.17.3.6 `template<int Dim> void Go::BaryCoordSystem< Dim >::write ( std::ostream & os ) const` `[inline]`

Write to output stream.

Definition at line 117 of file BaryCoordSystem.h.

The documentation for this class was generated from the following file:

- [gtools-core/include/GoTools/utills/BaryCoordSystem.h](#)

## 29.18 Go::BaryCoordSystemTriangle3D Class Reference

```
#include <BaryCoordSystemTriangle3D.h>
```

### Public Member Functions

- [BaryCoordSystemTriangle3D \(\)](#)  
*Empty default constructor.*
- [BaryCoordSystemTriangle3D \(const Array< double, 3 > \\*corners\)](#)
- `template<typename T >`  
[Array< T, 3 > baryToCart \(const Array< T, 3 > &bary\\_pt\) const](#)
- `template<typename T >`  
[Array< T, 3 > cartToBary \(const Array< T, 3 > &cart\\_pt\) const](#)

### 29.18.1 Detailed Description

A barycentric coordinate system for a triangle (2-manifold) embedded in 3D. Note that this differs from what can be expressed using the [BaryCoordSystem](#) template in that for the latter, the dimension of the simplex and the dimension of the space is equal.

Definition at line 58 of file `BaryCoordSystemTriangle3D.h`.

### 29.18.2 Constructor & Destructor Documentation

29.18.2.1 `Go::BaryCoordSystemTriangle3D::BaryCoordSystemTriangle3D ( ) [inline]`

Empty default constructor.

Definition at line 61 of file `BaryCoordSystemTriangle3D.h`.

29.18.2.2 `Go::BaryCoordSystemTriangle3D::BaryCoordSystemTriangle3D ( const Array< double, 3 > * corners ) [inline]`

Constructor. Takes an array of points that will become the corners of the coordinate simplex.

Definition at line 65 of file `BaryCoordSystemTriangle3D.h`.

### 29.18.3 Member Function Documentation

29.18.3.1 `template<typename T > Array<T, 3> Go::BaryCoordSystemTriangle3D::baryToCart ( const Array< T, 3 > & bary_pt ) const [inline]`

Input is a barycentric point, output is the corresponding cartesian point.

Definition at line 76 of file `BaryCoordSystemTriangle3D.h`.

29.18.3.2 `template<typename T > Array<T, 3> Go::BaryCoordSystemTriangle3D::cartToBary ( const Array< T, 3 > & cart_pt ) const [inline]`

Input is a cartesian point, output is the corresponding barycentric point.

Definition at line 90 of file `BaryCoordSystemTriangle3D.h`.

The documentation for this class was generated from the following file:

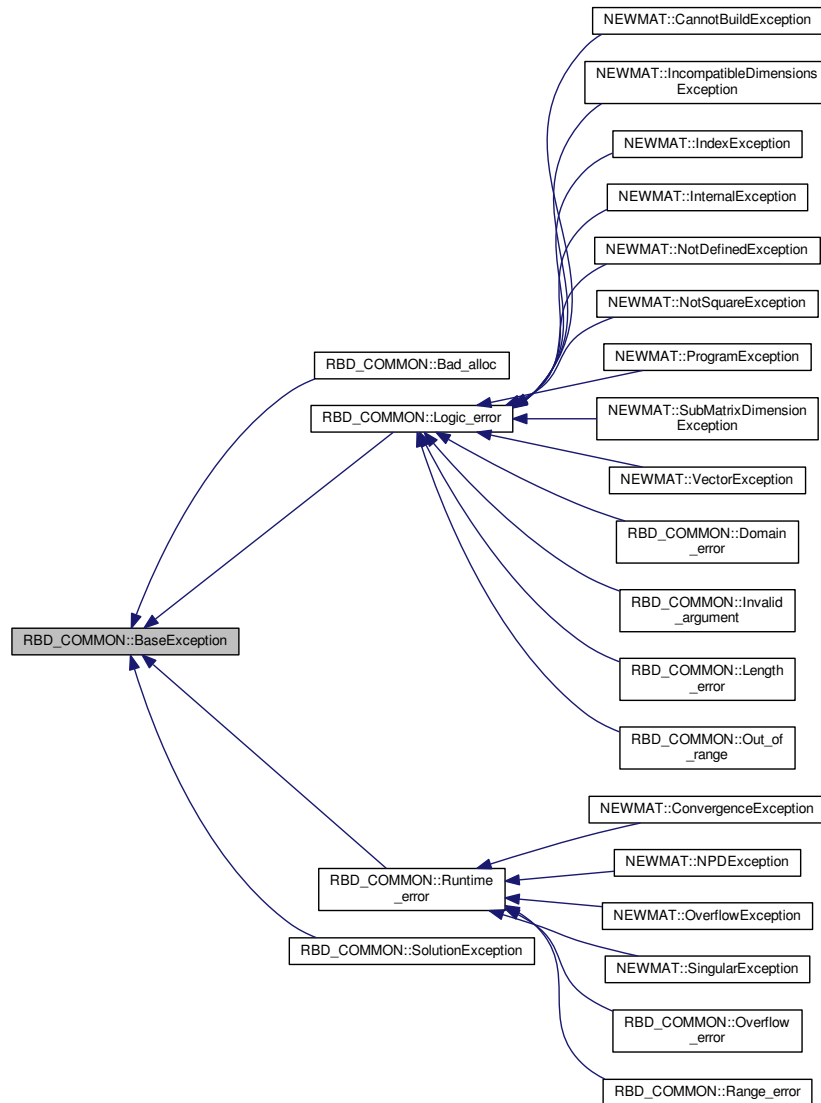

- [gotools-core/include/GoTools/utis/BaryCoordSystemTriangle3D.h](#)

## 29.19 RBD\_COMMON::BaseException Class Reference

### 29.22.1 Detailed Description

Structure for storage of results of grid evaluation of the basis function of s spline volume. Evaluation of position and first derivatives in one parameter value

Definition at line 87 of file SplineVolume.h.

### 29.22.2 Member Function Documentation

29.22.2.1 `void Go::BasisDerivs::prepareDerivs ( double u, double v, double w, int idx_u, int idx_v, int idx_w, int size )`  
[inline]

Constructor.

Definition at line 105 of file SplineVolume.h.

### 29.22.3 Member Data Documentation

29.22.3.1 `std::vector< double > Go::BasisDerivs::basisDerivs_u`

the derivative of all basis functions in u direction, same size as previous

Definition at line 98 of file SplineVolume.h.

29.22.3.2 `std::vector< double > Go::BasisDerivs::basisDerivs_v`

the derivative of all basis functions in v direction, same size as previous

Definition at line 100 of file SplineVolume.h.

29.22.3.3 `std::vector< double > Go::BasisDerivs::basisDerivs_w`

the derivative of all basis functions in w direction, same size as previous

Definition at line 102 of file SplineVolume.h.

29.22.3.4 `std::vector< double > Go::BasisDerivs::basisValues`

The value of all basis functions, size equal to  $(\text{degree\_u}+1)*(\text{degree\_v}+1)*(\text{degree\_w}+1)$

Definition at line 96 of file SplineVolume.h.

29.22.3.5 `int Go::BasisDerivs::left_idx[3]`

Index of the knot interval where the parameter value is situated for all parameter directions. The indices of the non-zero basis functions are `left_idx[i]-order[i]+1, ..., left_idx[i]` for  $i=0,1,2$

Definition at line 94 of file SplineVolume.h.

## 29.22.3.6 double Go::BasisDerivs::param[3]

Parameter tripple in which the basis functions are evaluated.

Definition at line 90 of file SplineVolume.h.

The documentation for this struct was generated from the following file:

- [trivariate/include/GoTools/trivariate/SplineVolume.h](#)

Constructor.

Definition at line 156 of file SplineVolume.h.

### 29.23.3 Member Data Documentation

29.23.3.1 `std::vector< double > Go::BasisDerivs2::basisDerivs_u`

the derivative of all basis functions in u direction, same size as previous

Definition at line 136 of file SplineVolume.h.

29.23.3.2 `std::vector< double > Go::BasisDerivs2::basisDerivs_uu`

the second derivative of all basis functions twice in u direction, same size as previous

Definition at line 143 of file SplineVolume.h.

29.23.3.3 `std::vector< double > Go::BasisDerivs2::basisDerivs_uv`

the second derivative of all basis functions in u and v direction, same size as previous

Definition at line 145 of file SplineVolume.h.

29.23.3.4 `std::vector< double > Go::BasisDerivs2::basisDerivs_uw`

the second derivative of all basis functions in u and w direction, same size as previous

Definition at line 147 of file SplineVolume.h.

29.23.3.5 `std::vector< double > Go::BasisDerivs2::basisDerivs_v`

the derivative of all basis functions in v direction, same size as previous

Definition at line 138 of file SplineVolume.h.

**29.23.3.6** `std::vector< double > Go::BasisDerivs2::basisDerivs_vv`

the second derivative of all basis functions twice in v direction, same size as previous

Definition at line 149 of file SplineVolume.h.

**29.23.3.7** `std::vector< double > Go::BasisDerivs2::basisDerivs_vw`

the second derivative of all basis functions in v and w direction, same size as previous

Definition at line 151 of file SplineVolume.h.

**29.23.3.8** `std::vector< double > Go::BasisDerivs2::basisDerivs_w`

the derivative of all basis functions in w direction, same size as previous

Definition at line 140 of file SplineVolume.h.

**29.23.3.9** `std::vector< double > Go::BasisDerivs2::basisDerivs_ww`

the second derivative of all basis functions twice in w direction, same size as previous

Definition at line 153 of file SplineVolume.h.

**29.23.3.10** `std::vector< double > Go::BasisDerivs2::basisValues`

The value of all basis functions, size equal to  $(\text{degree\_u}+1)*(\text{degree\_v}+1)*(\text{degree\_w}+1)$

Definition at line 133 of file SplineVolume.h.

**29.23.3.11** `int Go::BasisDerivs2::left_idx[3]`

Index of the knot interval where the parameter value is situated for all parameter directions. The indices of the non-zero basis functions are `left_idx[i]-order[i]+1, ..., left_idx[i]` for `i=0,1,2`

Definition at line 131 of file SplineVolume.h.

**29.23.3.12** `double Go::BasisDerivs2::param[3]`

Parameter tripple in which the basis functions are evaluated.

Definition at line 127 of file SplineVolume.h.

### 29.29.1 Detailed Description

Class that implements bivariate tensor product Bernstein polynomials on the domain  $[0,1] \times [0,1]$ .

The formula for a degree (m,n) polynomial is

$$p(u, v) = \sum_{i=0}^m \sum_{j=0}^n B_i(u) B_j(v) c_{ij}$$

where the basis functions in the first parameter direction are defined by

$$B_i(u) = \binom{m}{i} u^i (1-u)^{m-i}$$

The coefficients  $c_{ij}$  are stored in the following order:  $c_{00}, c_{10}, c_{20}, \dots, c_{mn}$ .

Definition at line 71 of file BernsteinMulti.h.

### 29.29.2 Constructor & Destructor Documentation

29.29.2.1 Go::BernsteinMulti::BernsteinMulti ( ) [inline]

Default constructor.

Definition at line 74 of file BernsteinMulti.h.

29.29.2.2 Go::BernsteinMulti::BernsteinMulti ( int m, int n, const std::vector< double > &coefs ) [inline]

Constructor.

Parameters

|         |                                          |
|---------|------------------------------------------|
| $m$     | degree in the first parameter direction  |
| $n$     | degree in the second parameter direction |
| $coefs$ | vector of Bernstein coefficients         |

Definition at line 79 of file BernsteinMulti.h.

29.29.2.3 `template<typename ForwardIterator > Go::BernsteinMulti::BernsteinMulti ( int m, int n, ForwardIterator begin, ForwardIterator end ) [inline]`

Constructor

Parameters

|              |                                                            |
|--------------|------------------------------------------------------------|
| <i>m</i>     | degree in the first parameter direction                    |
| <i>n</i>     | degree in the second parameter direction                   |
| <i>begin</i> | iterator to start of container with Bernstein coefficients |
| <i>end</i>   | iterator to end of container                               |

Definition at line 93 of file BernsteinMulti.h.

29.29.2.4 `Go::BernsteinMulti::BernsteinMulti ( double coef ) [inline],[explicit]`

Constructs a constant polynomial.

Parameters

|             |                                      |
|-------------|--------------------------------------|
| <i>coef</i> | the constant value of the polynomial |
|-------------|--------------------------------------|

Definition at line 98 of file BernsteinMulti.h.

## 29.29.3 Member Function Documentation

29.29.3.1 `BernsteinPoly Go::BernsteinMulti::bindU ( double u ) const`

Function that "binds" the u-parameter.

Returns

a [BernsteinPoly](#) in the v-direction for a constant value of u.

29.29.3.2 `BernsteinPoly Go::BernsteinMulti::bindV ( double v ) const`

Function that "binds" the v-parameter.

Returns

a [BernsteinPoly](#) in the u-direction for a constant value of v.

29.29.3.3 `double Go::BernsteinMulti::blossom ( const std::vector< double > & uvec, const std::vector< double > & vvec ) const`

Evaluates the blossom of the polynomial. The blossom of the polynomial  $p$  of degree  $(m,n)$  is a multi-affine  $(m+n)$ -variate function  $B_p$  that satisfies

$$B_p(\underbrace{u, \dots, u}_m, \underbrace{v, \dots, v}_n) = p(u, v)$$

and is symmetric in the first  $m$  and last  $n$  arguments separately.

## Parameters

|             |                                                                                          |
|-------------|------------------------------------------------------------------------------------------|
| <i>uvec</i> | the vector of values at which the blossom is evaluated in the first parameter direction  |
| <i>vvec</i> | the vector of values at which the blossom is evaluated in the second parameter direction |

## Returns

the value of the blossom at (*uvec*,*vvec*)

**29.29.3.4** `std::vector<double>::iterator Go::BernsteinMulti::coefsBegin ( ) [inline]`

Access function for coefficients.

Definition at line 117 of file BernsteinMulti.h.

**29.29.3.5** `std::vector<double>::const_iterator Go::BernsteinMulti::coefsBegin ( ) const [inline]`

Access function for coefficients.

Definition at line 120 of file BernsteinMulti.h.

**29.29.3.6** `std::vector<double>::iterator Go::BernsteinMulti::coefsEnd ( ) [inline]`

Access function for coefficients.

Definition at line 123 of file BernsteinMulti.h.

**29.29.3.7** `std::vector<double>::const_iterator Go::BernsteinMulti::coefsEnd ( ) const [inline]`

Access function for coefficients.

Definition at line 126 of file BernsteinMulti.h.

**29.29.3.8** `void Go::BernsteinMulti::degreeElevate ( int du, int dv )`

Degree elevation.

## Parameters

|           |                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------|
| <i>du</i> | the polynomial degree in which you want to represent this polynomial in the first parameter direction  |
| <i>dv</i> | the polynomial degree in which you want to represent this polynomial in the second parameter direction |

29.29.3.9 `int Go::BernsteinMulti::degreeU ( ) const [inline]`

Get the degree in the first parameter direction.

#### Returns

the degree in the first parameter direction

Definition at line 103 of file BernsteinMulti.h.

29.29.3.10 `int Go::BernsteinMulti::degreeV ( ) const [inline]`

Get the degree in the second parameter direction.

#### Returns

the degree in the second parameter direction

Definition at line 107 of file BernsteinMulti.h.

29.29.3.11 `BernsteinMulti Go::BernsteinMulti::deriv ( int der1, int der2 ) const`

Finds the derivative of the polynomial in terms of a new [BernsteinMulti](#).

#### Parameters

|             |                                                                      |
|-------------|----------------------------------------------------------------------|
| <i>der1</i> | the order of derivatives requested in the first parameter direction  |
| <i>der2</i> | the order of derivatives requested in the second parameter direction |

#### Returns

a new polynomial q given by

$$q(u, v) = D^{(der1, der2)}p(u, v).$$

29.29.3.12 `BernsteinMulti Go::BernsteinMulti::detHess ( ) const`

Calculates the determinant of the Hessian as a [BernsteinMulti](#) Describes Gaussian curvature of the graph of the polynomial

29.29.3.13 `bool Go::BernsteinMulti::isNonNegative ( const double eps = 0.0 ) const`

Check if polynomial is non-negative

#### Parameters

|            |                                                              |
|------------|--------------------------------------------------------------|
| <i>eps</i> | the threshold value with which every coefficient is compared |
|------------|--------------------------------------------------------------|

**Returns**

true if for every coefficient  $c$ ,  $c \geq -eps$ , false otherwise

**29.29.3.14** `bool Go::BernsteinMulti::isStrictlyNegative ( const double eps = 0.0 ) const`

Check if polynomial is strictly negative

**Parameters**

|                  |                                                              |
|------------------|--------------------------------------------------------------|
| <code>eps</code> | the threshold value with which every coefficient is compared |
|------------------|--------------------------------------------------------------|

**Returns**

true if for every coefficient  $c$ ,  $c < -eps$ , false otherwise

**29.29.3.15** `bool Go::BernsteinMulti::isStrictlyPositive ( const double eps = 0.0 ) const`

Check if polynomial is strictly positive

**Parameters**

|                  |                                                              |
|------------------|--------------------------------------------------------------|
| <code>eps</code> | the threshold value with which every coefficient is compared |
|------------------|--------------------------------------------------------------|

**Returns**

true if for every coefficient  $c$ ,  $c > eps$ , false otherwise

**29.29.3.16** `bool Go::BernsteinMulti::isZero ( const double eps = 0.0 ) const`

Check if the polynomial is the zero function

**Parameters**

|                  |                                                              |
|------------------|--------------------------------------------------------------|
| <code>eps</code> | the threshold value with which every coefficient is compared |
|------------------|--------------------------------------------------------------|

**Returns**

true if for every coefficient  $c$ ,  $|c| \leq eps$ , false otherwise

**29.29.3.17** `double Go::BernsteinMulti::mean ( ) const`

Calculates the mean value of the coefficients.

29.29.3.18 `double Go::BernsteinMulti::norm ( ) const`

Calculates the norm of the polynomial, defined as the sum of absolute values of the coefficients divided by the number of coefficients. This norm is not the same as the L1 norm of the polynomial on the domain  $[0,1] \times [0,1]$ , unless the polynomial does not change sign. In any case this norm is greater than or equal to the L1 norm of the polynomial.

29.29.3.19 `void Go::BernsteinMulti::normalize ( )`

Normalizes the polynomial by dividing all coefficients with `norm()`, which is close to (but not identical to) the L1 norm of the polynomial.

See also

[norm\(\)](#)

29.29.3.20 `double Go::BernsteinMulti::operator() ( double u, double v ) const`

Evaluation operator, based on the de Casteljau algorithm.

Parameters

|          |                  |
|----------|------------------|
| <i>u</i> | first parameter  |
| <i>v</i> | second parameter |

Returns

the value of the polynomial at (*u*,*v*)

29.29.3.21 `double Go::BernsteinMulti::operator() ( const Vector2D & pt ) const` `[inline]`

Evaluation operator - as above, but taking the arguments in a Vector2D.

Parameters

|           |                 |
|-----------|-----------------|
| <i>pt</i> | parameter point |
|-----------|-----------------|

Returns

the value of the polynomial at *pt*

Definition at line 138 of file BernsteinMulti.h.

29.29.3.22 `double Go::BernsteinMulti::operator() ( const std::vector< double > & pt ) const` `[inline]`

Evaluation operator - as above, but taking the arguments in a `std::vector`.

## Parameters

|      |                 |
|------|-----------------|
| $pt$ | parameter point |
|------|-----------------|

## Returns

the value of the polynomial at  $pt$

Definition at line 144 of file BernsteinMulti.h.

**29.29.3.23 BernsteinMulti& Go::BernsteinMulti::operator\*= ( const BernsteinMulti & multi )**

Multiplication with another polynomial.

**29.29.3.24 BernsteinMulti& Go::BernsteinMulti::operator\*= ( double c )**

Multiplication with a scalar.

**29.29.3.25 BernsteinMulti& Go::BernsteinMulti::operator+= ( const BernsteinMulti & multi )**

Addition with another polynomial.

**29.29.3.26 BernsteinMulti& Go::BernsteinMulti::operator+= ( double c )**

Addition with a scalar.

**29.29.3.27 BernsteinMulti& Go::BernsteinMulti::operator-= ( const BernsteinMulti & multi )**

Subtraction with another polynomial.

**29.29.3.28 BernsteinMulti& Go::BernsteinMulti::operator-= ( double c )**

Subtraction with a scalar.

**29.29.3.29 BernsteinMulti& Go::BernsteinMulti::operator/= ( double c )**

Division with a scalar.

**29.29.3.30 const double& Go::BernsteinMulti::operator[] ( int num ) const [inline]**

Access function for coefficients.

Definition at line 111 of file BernsteinMulti.h.

**29.29.3.31** `double& Go::BernsteinMulti::operator[]( int num ) [inline]`

Access function for coefficients.

Definition at line 114 of file BernsteinMulti.h.

**29.29.3.32** `BernsteinMulti Go::BernsteinMulti::pickDomain ( double u0, double u1, double v0, double v1 ) const`

Finds a new [BernsteinMulti](#) representing the original on some rectangular domain. The new polynomial is defined on  $[0,1] \times [0,1]$ . If  $p$  is the old polynomial and  $q$  is the new one,  $q$  is defined by

$$q(u, v) = p((1 - u) \cdot u_0 + u \cdot u_1, (1 - v) \cdot v_0 + v \cdot v_1).$$

The function is implemented by blossoming.

#### Parameters

|      |                                                             |
|------|-------------------------------------------------------------|
| $u0$ | the start of the interval in the first parameter direction  |
| $u1$ | the end of the interval in the first parameter direction    |
| $v0$ | the start of the interval in the second parameter direction |
| $v1$ | the end of the interval in the second parameter direction   |

#### Returns

a polynomial  $q$  as specified above

**29.29.3.33** `BernsteinPoly Go::BernsteinMulti::pickLine ( Array< double, 2 > a, Array< double, 2 > b ) const`

Routine that picks out the line with endpoints  $a$  and  $b$  as a new [BernsteinPoly](#). The new polynomial is defined on  $[0,1]$ . If  $p$  is the old bivariate polynomial and  $q$  is the new one,  $q$  is defined by

$$q(t) = p((1 - t)a_0 + tb_0, (1 - t)a_1 + tv_1).$$

The function is implemented by blossoming.

**29.29.3.34** `void Go::BernsteinMulti::read ( std::istream & is )`

Read from an input stream.

**29.29.3.35** `BernsteinMulti Go::BernsteinMulti::traceHess ( ) const`

Calculates the trace of the Hessian as a BernsteinMulti Describes mean curvature (modulo a factor 2) of the graph of the polynomial

**29.29.3.36** `void Go::BernsteinMulti::write ( std::ostream & os ) const`

Write to an output stream.

### 29.30.1 Detailed Description

Class that implements Bernstein polynomials on the interval [0,1]. The formula for Bernstein polynomials is

$$p(t) = \sum_{i=0}^n \binom{n}{i} t^i (1-t)^{n-i} c_i.$$

The coefficients  $c_i$  are stored in a vector of doubles.

Definition at line 58 of file BernsteinPoly.h.

### 29.30.2 Constructor & Destructor Documentation

#### 29.30.2.1 Go::BernsteinPoly::BernsteinPoly ( ) [inline]

Default constructor.

Definition at line 61 of file BernsteinPoly.h.

#### 29.30.2.2 Go::BernsteinPoly::BernsteinPoly ( const std::vector< double > & *coefs* ) [inline],[explicit]

Constructor

Parameters

|              |                                                           |
|--------------|-----------------------------------------------------------|
| <i>coefs</i> | a vector of doubles containing the Bernstein coefficients |
|--------------|-----------------------------------------------------------|

Definition at line 65 of file BernsteinPoly.h.

#### 29.30.2.3 template<typename ForwardIterator > Go::BernsteinPoly::BernsteinPoly ( ForwardIterator *begin*, ForwardIterator *end* ) [inline]

Constructor

Parameters

|              |                                                                      |
|--------------|----------------------------------------------------------------------|
| <i>begin</i> | iterator to start of container containing the Bernstein coefficients |
| <i>end</i>   | iterator to end of same container                                    |

Definition at line 72 of file BernsteinPoly.h.

#### 29.30.2.4 Go::BernsteinPoly::BernsteinPoly ( double *coef* ) [inline],[explicit]

Constructor for a constant polynomial

## Parameters

|             |                                      |
|-------------|--------------------------------------|
| <i>coef</i> | the constant value of the polynomial |
|-------------|--------------------------------------|

Definition at line 76 of file BernsteinPoly.h.

### 29.30.3 Member Function Documentation

#### 29.30.3.1 `double Go::BernsteinPoly::blossom ( const std::vector< double > & tvec ) const`

Evaluates the blossom of the polynomial. The blossom of the polynomial  $p$  of degree  $n$  is a multi-affine  $n$ -variate symmetric function  $B_p$  that satisfies  $B_p(t, \dots, t) = p(t)$ .

## Parameters

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>tvec</i> | the vector of values at which the blossom is evaluated. |
|-------------|---------------------------------------------------------|

## Returns

the value of the blossom at *tvec*

#### 29.30.3.2 `std::vector<double>::iterator Go::BernsteinPoly::coefsBegin ( ) [inline]`

Access function for coefficients.

Definition at line 91 of file BernsteinPoly.h.

#### 29.30.3.3 `std::vector<double>::const_iterator Go::BernsteinPoly::coefsBegin ( ) const [inline]`

Access function for coefficients.

Definition at line 94 of file BernsteinPoly.h.

#### 29.30.3.4 `std::vector<double>::iterator Go::BernsteinPoly::coefsEnd ( ) [inline]`

Access function for coefficients.

Definition at line 97 of file BernsteinPoly.h.

#### 29.30.3.5 `std::vector<double>::const_iterator Go::BernsteinPoly::coefsEnd ( ) const [inline]`

Access function for coefficients.

Definition at line 100 of file BernsteinPoly.h.

29.30.3.6 `int Go::BernsteinPoly::degree ( ) const [inline]`

Get the degree of the polynomial

Returns

the degree of the polynomial

Definition at line 81 of file BernsteinPoly.h.

29.30.3.7 `void Go::BernsteinPoly::degreeElevate ( int d )`

Degree elevation.

Parameters

|          |                                                                       |
|----------|-----------------------------------------------------------------------|
| <i>d</i> | the polynomial degree in which you want to represent this polynomial. |
|----------|-----------------------------------------------------------------------|

29.30.3.8 `BernsteinPoly Go::BernsteinPoly::deriv ( int der ) const`

Calculates the derivative in terms of a new [BernsteinPoly](#).

Parameters

|            |                                    |
|------------|------------------------------------|
| <i>der</i> | the order of derivatives requested |
|------------|------------------------------------|

Returns

a new polynomial q given by

$$q(t) = p^{(der)}(t).$$

29.30.3.9 `double Go::BernsteinPoly::integral ( double a = 0.0, double b = 1.0 ) const`

Calculates the integral of the polynomial over an interval. The default interval is [0,1].

29.30.3.10 `bool Go::BernsteinPoly::isStrictlyPositive ( const double eps = 0.0 ) const`

Check if the polynomial is strictly positive. NOTE: If the return value is 'true', then the polynomial is guaranteed to be strictly positive. If the return value is 'false', the situation is undetermined and the polynomial may still be strictly positive.

Parameters

|            |                                                              |
|------------|--------------------------------------------------------------|
| <i>eps</i> | the threshold value with which every coefficient is compared |
|------------|--------------------------------------------------------------|

**Returns**

true if for every coefficient  $c$ ,  $c > eps$ , false otherwise

**29.30.3.11** `bool Go::BernsteinPoly::isZero ( const double eps = 0.0 ) const`

Check if the polynomial is the zero function

**Parameters**

|                  |                                                              |
|------------------|--------------------------------------------------------------|
| <code>eps</code> | the threshold value with which every coefficient is compared |
|------------------|--------------------------------------------------------------|

**Returns**

true if for every coefficient  $c$ ,  $|c| \leq eps$ , false otherwise

**29.30.3.12** `double Go::BernsteinPoly::norm ( ) const`

Calculates a norm, defined as the sum of the absolute values of the coefficients divided by the number of coefficients. This norm is not the same as the L1 norm of the polynomial (on the interval  $[0,1]$ ), unless the polynomial does not change sign. In any case this norm is greater than or equal to the L1 norm of the polynomial.

**29.30.3.13** `void Go::BernsteinPoly::normalize ( )`

Normalizes the polynomial by dividing all coefficients with `norm()`, which is close to (but not identical to) the L1 norm of the polynomial.

**See also**

[norm\(\)](#)

**29.30.3.14** `double Go::BernsteinPoly::operator() ( double t ) const`

Evaluation operator, based on the de Casteljau algorithm.

**Parameters**

|                |                                                          |
|----------------|----------------------------------------------------------|
| <code>t</code> | the parameter value at which the polynomial is evaluated |
|----------------|----------------------------------------------------------|

**Returns**

the value of the polynomial at  $t$

**29.30.3.15** `BernsteinPoly& Go::BernsteinPoly::operator*= ( const BernsteinPoly & poly )`

Multiplication with another polynomial.

29.30.3.16 **BernsteinPoly**& Go::BernsteinPoly::operator\*=( double c )

Multiplication with a scalar.

29.30.3.17 **BernsteinPoly**& Go::BernsteinPoly::operator+=( const BernsteinPoly & poly )

Addition with another polynomial.

29.30.3.18 **BernsteinPoly**& Go::BernsteinPoly::operator+=( double c )

Addition with a scalar.

29.30.3.19 **BernsteinPoly**& Go::BernsteinPoly::operator-=( const BernsteinPoly & poly )

Subtraction with another polynomial.

29.30.3.20 **BernsteinPoly**& Go::BernsteinPoly::operator-=( double c )

Subtraction with a scalar.

29.30.3.21 **BernsteinPoly**& Go::BernsteinPoly::operator/=( double c )

Division with a scalar.

29.30.3.22 **const double&** Go::BernsteinPoly::operator[]( int num ) const `[inline]`

Access function for coefficients.

Definition at line 85 of file BernsteinPoly.h.

29.30.3.23 **double&** Go::BernsteinPoly::operator[]( int num ) `[inline]`

Access function for coefficients.

Definition at line 88 of file BernsteinPoly.h.

29.30.3.24 **BernsteinPoly** Go::BernsteinPoly::pickInterval( double a, double b ) const

Finds a new [BernsteinPoly](#) representing the original on some interval. The new polynomial is defined on [0,1]. If p is the old polynomial and q is the new one, q is defined by

$$q(t) = p(a(1 - t) + tb).$$

## Parameters

|          |                           |
|----------|---------------------------|
| <i>a</i> | the start of the interval |
| <i>b</i> | the end of the interval   |

## Returns

a polynomial  $q$  as specified above

29.30.3.25 void Go::BernsteinPoly::read ( std::istream & *is* )

Read from input stream.

29.30.3.26 void Go::BernsteinPoly::write ( std::ostream & *os* ) const

Write to output stream.

### 29.31.1 Detailed Description

Class that implements Bernstein polynomials on a tetrahedron. The formula for a tetrahedral Bernstein polynomial of degree  $n$  is

$$p(\beta_0, \beta_1, \beta_2, \beta_3) = \sum_{i+j+k+l=n} \frac{n!}{i!j!k!l!} \beta_0^i \beta_1^j \beta_2^k \beta_3^l c_{(i,j,k)}.$$

The coefficients  $c_{ijk}$  are stored in the following order:  $c_{(n,0,0,0)}$ ,  $c_{(n-1,1,0,0)}$ ,  $c_{(n-2,2,0,0)}$ ,  $\dots$ ,  $c_{(0,n,0,0)}$ ,  $c_{(n-1,0,1,0)}$ ,  $c_{(n-2,1,1,0)}$ ,  $\dots$ ,  $c_{(0,0,0,n)}$ . That is, a reverse lexicographical ordering with the most significant index being the last one.

Definition at line 71 of file `BernsteinTetrahedralPoly.h`.

### 29.31.2 Constructor & Destructor Documentation

**29.31.2.1** `Go::BernsteinTetrahedralPoly::BernsteinTetrahedralPoly ( )` [`inline`]

Default constructor.

Definition at line 74 of file `BernsteinTetrahedralPoly.h`.

**29.31.2.2** `Go::BernsteinTetrahedralPoly::BernsteinTetrahedralPoly ( int deg, const std::vector< double > &coefs )` [`inline`]

Constructor.

Parameters

|              |                                  |
|--------------|----------------------------------|
| <i>deg</i>   | degree of the polynomial         |
| <i>coefs</i> | vector of Bernstein coefficients |

Definition at line 78 of file BernsteinTetrahedralPoly.h.

```
29.31.2.3 template<typename ForwardIterator > Go::BernsteinTetrahedralPoly::BernsteinTetrahedralPoly (int deg,
ForwardIterator begin, ForwardIterator end) [inline]
```

Constructor.

#### Parameters

|              |                                                       |
|--------------|-------------------------------------------------------|
| <i>deg</i>   | degree of the polynomial                              |
| <i>begin</i> | iterator to start of vector of Bernstein coefficients |
| <i>end</i>   | iterator to end of vector of Bernstein coefficients   |

Definition at line 86 of file BernsteinTetrahedralPoly.h.

```
29.31.2.4 Go::BernsteinTetrahedralPoly::BernsteinTetrahedralPoly (double coef) [inline],[explicit]
```

Constructor for a constant polynomial.

#### Parameters

|             |                                      |
|-------------|--------------------------------------|
| <i>coef</i> | the constant value of the polynomial |
|-------------|--------------------------------------|

Definition at line 91 of file BernsteinTetrahedralPoly.h.

### 29.31.3 Member Function Documentation

```
29.31.3.1 template<typename T > T Go::BernsteinTetrahedralPoly::blossom (const std::vector< Array< T, 4 > > & uvec
) const [inline]
```

Evaluates the blossom of the polynomial. The blossom of the polynomial  $p$  of degree  $n$  is a multi-affine, symmetric  $n$ -variate function  $B_p$  that satisfies

$$B_p(b, \dots, b) = p(b).$$

#### Parameters

|             |                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------|
| <i>uvec</i> | the vector of values at which the blossom is evaluated, each value is a domain point given in barycentric coordinates. |
|-------------|------------------------------------------------------------------------------------------------------------------------|

Definition at line 172 of file BernsteinTetrahedralPoly.h.

```
29.31.3.2 int Go::BernsteinTetrahedralPoly::degree () const [inline]
```

Get the degree

**Returns**

the degree of the polynomial

Definition at line 96 of file BernsteinTetrahedralPoly.h.

**29.31.3.3** `void Go::BernsteinTetrahedralPoly::deriv ( int der, const Vector4D & d, BernsteinTetrahedralPoly & btp ) const`

Calculates the *der*'th derivative in the *d*-direction in terms of a new [BernsteinTetrahedralPoly](#). The direction is given in barycentric coordinates, so it is a vector whose elements sum to zero.

**Parameters**

|            |                               |
|------------|-------------------------------|
| <i>der</i> | order of derivative requested |
| <i>d</i>   | direction of derivative       |

**Return values**

|            |                           |
|------------|---------------------------|
| <i>btp</i> | the derivative polynomial |
|------------|---------------------------|

**29.31.3.4** `double Go::BernsteinTetrahedralPoly::norm ( ) const`

Calculates the norm of the polynomial, defined as the sum of absolute values of the coefficients divided by the number of coefficients. This norm is not the same as the L1 norm of the polynomial over the tetrahedron, but is an upper bound for it.

**29.31.3.5** `void Go::BernsteinTetrahedralPoly::normalize ( )`

Normalizes the polynomial by dividing all coefficients with [norm\(\)](#), which is related to (but not identical to) the L1 norm of the polynomial.

**See also**

[norm\(\)](#)

**29.31.3.6** `template<typename T > T Go::BernsteinTetrahedralPoly::operator() ( const Array< T, 4 > & u ) const`  
`[inline]`

Evaluation operator, based on the tetrahedral de Casteljau algorithm. Generalized from 'tri\_decas' in Farin: "Curves and Surfaces for CAGD".

**Parameters**

|          |                                                  |
|----------|--------------------------------------------------|
| <i>u</i> | parameter point given in barycentric coordinates |
|----------|--------------------------------------------------|

**Returns**

the value of the polynomial at  $u$

Definition at line 112 of file BernsteinTetrahedralPoly.h.

**29.31.3.7** `BernsteinTetrahedralPoly& Go::BernsteinTetrahedralPoly::operator*=( const BernsteinTetrahedralPoly & poly )`

Multiplication with another polynomial.

**29.31.3.8** `BernsteinTetrahedralPoly& Go::BernsteinTetrahedralPoly::operator*=( double c )`

Multiplication with a scalar.

**29.31.3.9** `BernsteinTetrahedralPoly& Go::BernsteinTetrahedralPoly::operator+=( const BernsteinTetrahedralPoly & poly )`

Addition with another polynomial.

**29.31.3.10** `BernsteinTetrahedralPoly& Go::BernsteinTetrahedralPoly::operator+=( double c )`

Addition with a scalar.

**29.31.3.11** `BernsteinTetrahedralPoly& Go::BernsteinTetrahedralPoly::operator-=( const BernsteinTetrahedralPoly & poly )`

Subtraction with another polynomial.

**29.31.3.12** `BernsteinTetrahedralPoly& Go::BernsteinTetrahedralPoly::operator-=( double c )`

Subtraction with a scalar.

**29.31.3.13** `BernsteinTetrahedralPoly& Go::BernsteinTetrahedralPoly::operator/=( double c )`

Division with a scalar.

**29.31.3.14** `const double& Go::BernsteinTetrahedralPoly::operator[]( int num ) const [inline]`

Access function for coefficients.

Definition at line 100 of file BernsteinTetrahedralPoly.h.

29.31.3.15 `double& Go::BernsteinTetrahedralPoly::operator[] ( int num ) [inline]`

Access function for coefficients.

Definition at line 103 of file BernsteinTetrahedralPoly.h.

29.31.3.16 `BernsteinPoly Go::BernsteinTetrahedralPoly::pickLine ( const Array< double, 4 > & a, const Array< double, 4 > & b ) const`

Routine that picks out the line with endpoints a and b as a new [BernsteinPoly](#). The new polynomial is defined on [0,1]. If p is the old bivariate polynomial and q is the new one, q is defined by

$$q(t) = p((1-t)a_0 + tb_0, (1-t)a_1 + tb_1).$$

The function is implemented by blossoming.

#### Parameters

|          |                                                           |
|----------|-----------------------------------------------------------|
| <i>a</i> | the starting point of the line in barycentric coordinates |
| <i>b</i> | the endpoint of the line in barycentric coordinates       |

29.31.3.17 `void Go::BernsteinTetrahedralPoly::read ( std::istream & is )`

Read from an input stream.

29.31.3.18 `void Go::BernsteinTetrahedralPoly::write ( std::ostream & os ) const`

Write to an output stream.

### 29.32.1 Detailed Description

Class that implements Bernstein polynomials on a triangle. The formula for a triangular Bernstein polynomial of degree  $n$  is

$$p(\beta_0, \beta_1, \beta_2) = \sum_{i+j+k=n} \frac{n!}{i!j!k!} \beta_0^i \beta_1^j \beta_2^k c_{(i,j,k)}.$$

The coefficients  $c_{ijk}$  are stored in the following order:  $c_{(n,0,0)}$ ,  $c_{(n-1,1,0)}$ ,  $c_{(n-2,2,0)}$ ,  $\dots$ ,  $c_{(0,n,0)}$ ,  $c_{(n-1,0,1)}$ ,  $c_{(n-2,1,1)}$ ,  $\dots$ ,  $c_{(0,0,n)}$ .

Definition at line 66 of file `BernsteinTriangularPoly.h`.

### 29.32.2 Constructor & Destructor Documentation

29.32.2.1 `Go::BernsteinTriangularPoly::BernsteinTriangularPoly ( ) [inline]`

Default constructor.

Definition at line 69 of file `BernsteinTriangularPoly.h`.

29.32.2.2 `Go::BernsteinTriangularPoly::BernsteinTriangularPoly ( int deg, const std::vector< double > &coefs ) [inline]`

Constructor.

## Parameters

|              |                                  |
|--------------|----------------------------------|
| <i>deg</i>   | degree of the polynomial         |
| <i>coefs</i> | vector of Bernstein coefficients |

Definition at line 73 of file BernsteinTriangularPoly.h.

```

ForwardIterator begin, ForwardIterator end) [inline]
```

Constructor.

## Parameters

|              |                                                       |
|--------------|-------------------------------------------------------|
| <i>deg</i>   | degree of the polynomial                              |
| <i>begin</i> | iterator to start of vector of Bernstein coefficients |
| <i>end</i>   | iterator to end of vector of Bernstein coefficients   |

Definition at line 81 of file BernsteinTriangularPoly.h.

```
29.32.2.4 Go::BernsteinTriangularPoly::BernsteinTriangularPoly (double coef) [inline],[explicit]
```

Constructor for a constant polynomial.

## Parameters

|             |                                      |
|-------------|--------------------------------------|
| <i>coef</i> | the constant value of the polynomial |
|-------------|--------------------------------------|

Definition at line 86 of file BernsteinTriangularPoly.h.

### 29.32.3 Member Function Documentation

```
29.32.3.1 template<typename T > T Go::BernsteinTriangularPoly::blossom (const std::vector< Array< T, 3 > > & uvec)
const [inline]
```

Evaluates the blossom of the polynomial. The blossom of the polynomial  $p$  of degree  $n$  is a multi-affine, symmetric  $n$ -variate function  $B_p$  that satisfies

$$B_p(b, \dots, b) = p(b).$$

## Parameters

|             |                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------|
| <i>uvec</i> | the vector of values at which the blossom is evaluated, each value is a domain point given in barycentric coordinates. |
|-------------|------------------------------------------------------------------------------------------------------------------------|

Definition at line 164 of file BernsteinTriangularPoly.h.

29.32.3.2 `int Go::BernsteinTriangularPoly::degree ( ) const` `[inline]`

Get the degree

Returns

the degree of the polynomial

Definition at line 91 of file BernsteinTriangularPoly.h.

29.32.3.3 `void Go::BernsteinTriangularPoly::deriv ( int der, const Vector3D & d, BernsteinTriangularPoly & btp ) const`

Calculates the *der*'th derivative in the *d*-direction in terms of a new [BernsteinTriangularPoly](#). The direction is given in barycentric coordinates, so it is a vector whose elements sum to zero.

Parameters

|            |                               |
|------------|-------------------------------|
| <i>der</i> | order of derivative requested |
| <i>d</i>   | direction of derivative       |

Return values

|            |                           |
|------------|---------------------------|
| <i>btp</i> | the derivative polynomial |
|------------|---------------------------|

29.32.3.4 `double Go::BernsteinTriangularPoly::norm ( ) const`

Calculates the norm of the polynomial, defined as the sum of absolute values of the coefficients divided by the number of coefficients. This norm is not the same as the L1 norm of the polynomial over the triangle, but is an upper bound for it.

29.32.3.5 `void Go::BernsteinTriangularPoly::normalize ( )`

Normalizes the polynomial by dividing all coefficients with [norm\(\)](#), which is related to (but not identical to) the L1 norm of the polynomial.

See also

[norm\(\)](#)

29.32.3.6 `template<typename T> T Go::BernsteinTriangularPoly::operator() ( const Array< T, 3 > & u ) const`  
`[inline]`

Evaluation operator, based on the triangular de Casteljau algorithm. Adapted from 'tri\_decas' in Farin: "Curves and Surfaces for CAGD".

## Parameters

|     |                                                  |
|-----|--------------------------------------------------|
| $u$ | parameter point given in barycentric coordinates |
|-----|--------------------------------------------------|

## Returns

the value of the polynomial at  $u$

Definition at line 107 of file BernsteinTriangularPoly.h.

**29.32.3.7 BernsteinTriangularPoly& Go::BernsteinTriangularPoly::operator\*=( const BernsteinTriangularPoly & *poly* )**

Multiplication with another polynomial.

**29.32.3.8 BernsteinTriangularPoly& Go::BernsteinTriangularPoly::operator\*=( double *c* )**

Multiplication with a scalar.

##### 29.34.3.1 Go::Binomial::Binomial( ) [inline]

Default constructor.

Definition at line 60 of file Binomial.h.

##### 29.34.3.2 Go::Binomial::Binomial( int n ) [inline]

Constructor that creates an initial Pascal's triangle to some specified level.

## Parameters

|     |                                                     |
|-----|-----------------------------------------------------|
| $n$ | the level up to which you want to make the triangle |
|-----|-----------------------------------------------------|

Definition at line 71 of file Binomial.h.

### 29.34.4 Member Function Documentation

#### 29.34.4.1 `double Go::Binomial::operator()( int $n$ , int $i$ ) [inline]`

Evaluates a binomial coefficient. If the current table is too small, the table will be expanded accordingly.

## Parameters

|     |            |
|-----|------------|
| $n$ | an integer |
| $i$ | an integer |

## Returns

$$\binom{n}{i}$$

Definition at line 82 of file Binomial.h.

#### 29.34.4.2 `iter Go::Binomial::operator[]( int $n$ ) [inline]`

Gives an iterator to the first element of the vector containing the  $n$ 'th line of Pascal's triangle. Expands the table if necessary.

## Parameters

|     |            |
|-----|------------|
| $n$ | an integer |
|-----|------------|

## Returns

an iterator `iter` such that `iter[i] = operator()(n,i)`.

Definition at line 96 of file Binomial.h.

#### 29.34.4.3 `double Go::Binomial::quadrinomial ( int $n$ , int $i$ , int $j$ , int $k$ ) [inline]`

Evaluates a quadrinomial coefficient. This function should be considered a temporary solution.

## Parameters

|     |            |
|-----|------------|
| $n$ | an integer |
| $i$ | an integer |
| $j$ | an integer |
| $k$ | an integer |

## Returns

$$\frac{n!}{i!j!k!(n-i-j-k)!}$$

Definition at line 127 of file Binomial.h.

**29.34.4.4** `double Go::Binomial::trinomial ( int  $n$ , int  $i$ , int  $j$  ) [inline]`

Evaluates a trinomial coefficient. This function should be considered a temporary solution.

## Parameters

|     |            |
|-----|------------|
| $n$ | an integer |
| $i$ | an integer |
| $j$ | an integer |

## Returns

$$\frac{n!}{i!j!(n-i-j)!}$$

Definition at line 110 of file Binomial.h.

### 29.38.1 Detailed Description

A boundary represented solid.

Definition at line 53 of file Body.h.

### 29.38.2 Constructor & Destructor Documentation

#### 29.38.2.1 Go::Body::Body ( )

Default constructor.

#### 29.38.2.2 Go::Body::Body ( std::vector< shared\_ptr< SurfaceModel > > & shells, int material\_id = -1 )

Constructor with multiple shells.

#### 29.38.2.3 Go::Body::Body ( shared\_ptr< SurfaceModel > shell, int material\_id = -1 )

Constructor with one outer shell.

#### 29.38.2.4 Go::Body::~~Body ( )

Destructor.

### 29.38.3 Member Function Documentation

#### 29.38.3.1 void Go::Body::addBodyPointers ( ) [protected]

#### 29.38.3.2 void Go::Body::addshell ( shared\_ptr< SurfaceModel > shell )

Add another shell to the solid description. Used in connection with building the solid

#### 29.38.3.3 virtual bool Go::Body::areNeighbours ( Body \* other, shared\_ptr< ftSurface > & bd\_face1, shared\_ptr< ftSurface > & bd\_face2, int adj\_idx = 0 ) const [virtual]

Check if two bodies are neighbours.

#### 29.38.3.4 virtual BoundingBox Go::Body::boundingBox ( ) const [virtual]

The bounding box corresponding to this solid.

Reimplemented in [Go::ftVolume](#).

29.38.3.5 void Go::Body::eraseBodyAdjacency ( )

Remove adjacency information to other bodies.

29.38.3.6 void Go::Body::getAdjacentBodies ( std::vector< Body \* > & neighbours )

Fetch all bodies adjacent to this one. This function is relevant in an assembly system or in an isogeometric setting

29.38.3.7 std::vector<shared\_ptr<SurfaceModel> > Go::Body::getAllShells ( ) const [inline]

Fetch all shells belonging to this solid. The first shell corresponds to the outer boundary of the solid, any subsequent shells are void

Definition at line 96 of file Body.h.

29.38.3.8 int Go::Body::getMaterial ( ) const [inline]

Definition at line 129 of file Body.h.

29.38.3.9 shared\_ptr<SurfaceModel> Go::Body::getOuterShell ( ) const [inline]

Fetch the outer shell belonging to this solid.

Definition at line 84 of file Body.h.

29.38.3.10 shared\_ptr<SurfaceModel> Go::Body::getShell ( int idx ) const [inline]

Fetch a specified shell. Index zero corresponds to the outer shell

Definition at line 109 of file Body.h.

29.38.3.11 shared\_ptr<SurfaceModel> Go::Body::getShell ( ftSurface \* face ) const

Find the shell containing a given face (if any)

29.38.3.12 tpTolerances Go::Body::getTolerances ( ) [inline]

Return topology tolerances.

Definition at line 161 of file Body.h.

29.38.3.13 bool Go::Body::hasMaterialInfo ( ) const [inline]

Definition at line 124 of file Body.h.

29.38.3.14 `bool Go::Body::isInside ( const Point & pnt ) const`

Check if a point lies inside this body.

29.38.3.15 `int Go::Body::nmbOfFaces ( ) const`

Total number of faces.

29.38.3.16 `int Go::Body::nmbOfShells ( ) const [inline]`

The number of shells belonging to this solid.

Definition at line 102 of file Body.h.

29.38.3.17 `void Go::Body::setMaterial ( int material_id ) [inline]`

Material information.

Definition at line 119 of file Body.h.

29.38.3.18 `std::vector<shared_ptr<Vertex> > Go::Body::vertices ( ) const`

Fetch all vertices.

## 29.38.4 Member Data Documentation

29.38.4.1 `int Go::Body::material_id_ [protected]`

Possibility to store material information (-1 = not set)

Definition at line 175 of file Body.h.

29.38.4.2 `std::vector<shared_ptr<SurfaceModel> > Go::Body::shells_ [protected]`

Outer and possibly inner void shells.

Definition at line 172 of file Body.h.

29.38.4.3 `tpTolerances Go::Body::toptol_ [protected]`

Tolerances used in topology analysis.

Definition at line 181 of file Body.h.

The documentation for this class was generated from the following file:

- `compositemodel/include/GoTools/compositemodel/Body.h`

## 29.39 bool Class Reference

- *int* *pardir\_*
- *double* *par\_*

#### 29.40.1 Detailed Description

This struct is a helper struct that bundles boundary information for an object of type [ParamFunctionInt](#).

Definition at line 57 of file [BoundaryFunctionInt.h](#).

#### 29.40.2 Constructor & Destructor Documentation

29.40.2.1 [Go::BoundaryFunctionInt::BoundaryFunctionInt](#) ([shared\\_ptr< ParamFunctionInt >](#) *bd\_obj*, *int dir*, *double par*) [*inline*]

Constructor

## Parameters

|               |                                                     |
|---------------|-----------------------------------------------------|
| <i>bd_obj</i> | shared pointer to the object of interest            |
| <i>dir</i>    | parameter direction that specifies the boundary     |
| <i>par</i>    | the value of the relevant parameter at the boundary |

Definition at line 68 of file BoundaryFunctionInt.h.

### 29.40.3 Member Function Documentation

#### 29.40.3.1 `int Go::BoundaryFunctionInt::getDir ( ) [inline]`

Get the parameter direction that specifies the boundary

## Returns

the parameter direction

Definition at line 78 of file BoundaryFunctionInt.h.

#### 29.40.3.2 `shared_ptr<ParamFunctionInt> Go::BoundaryFunctionInt::getObject ( ) [inline]`

Get the object which the boundary belongs to

## Returns

shared pointer to the object

Definition at line 88 of file BoundaryFunctionInt.h.

#### 29.40.3.3 `double Go::BoundaryFunctionInt::getPar ( ) [inline]`

Get the value of the relevant parameter at the boundary

## Returns

the parameter value

Definition at line 83 of file BoundaryFunctionInt.h.

### 29.40.4 Member Data Documentation

#### 29.40.4.1 `shared_ptr<ParamFunctionInt> Go::BoundaryFunctionInt::bd_obj_`

Definition at line 59 of file BoundaryFunctionInt.h.

|---------------|-----------------------------------------------------|
| <i>bd_obj</i> | shared pointer to the object of interest            |
| <i>dir</i>    | parameter direction that specifies the boundary     |
| <i>par</i>    | the value of the relevant parameter at the boundary |

Definition at line 67 of file `BoundaryGeomInt.h`.

**29.41.2.2** `Go::BoundaryGeomInt::~~BoundaryGeomInt ( )` [`inline`]

Destructor.

Definition at line 76 of file `BoundaryGeomInt.h`.

### 29.41.3 Member Function Documentation

**29.41.3.1** `int Go::BoundaryGeomInt::getDir ( )` [`inline`]

Get the parameter direction that specifies the boundary

Returns

the parameter direction

Definition at line 80 of file `BoundaryGeomInt.h`.

**29.41.3.2** `shared_ptr<ParamGeomInt> Go::BoundaryGeomInt::getObject ( )` [`inline`]

Get the object which the boundary belongs to

Returns

shared pointer to the object

Definition at line 90 of file `BoundaryGeomInt.h`.

29.41.3.3 **double** Go::BoundaryGeomInt::getPar ( ) [inline]

Get the value of the relevant parameter at the boundary

#### Returns

the parameter value

Definition at line 85 of file BoundaryGeomInt.h.

### 29.41.4 Member Data Documentation

29.41.4.1 **shared\_ptr<ParamGeomInt>** Go::BoundaryGeomInt::bd\_obj\_

Definition at line 58 of file BoundaryGeomInt.h.

29.41.4.2 **double** Go::BoundaryGeomInt::par\_

Definition at line 61 of file BoundaryGeomInt.h.

29.41.4.3 **int** Go::BoundaryGeomInt::paddir\_

Definition at line 59 of file BoundaryGeomInt.h.

The documentation for this struct was generated from the following file:

*Chain of IntersectionPoints making up the intersection.*

### 29.42.1 Detailed Description

Helper struct to be used with [IntersectionPool::intersectAlongCommonBoundary\(\)](#)

Definition at line 968 of file IntersectionPool.h.

### 29.42.2 Member Data Documentation

#### 29.42.2.1 int Go::BoundaryIntersectionData::dir[2]

Running parameter direction in object 1 and 2.

Definition at line 972 of file IntersectionPool.h.

#### 29.42.2.2 double Go::BoundaryIntersectionData::par[2]

Parameter value for the fixed parameter in object 1 and 2 (-1 if the object does not have a fixed parameter, i.e. when the object is a curve).

Definition at line 977 of file IntersectionPool.h.

#### 29.42.2.3 std::vector<shared\_ptr<IntersectionPoint> > Go::BoundaryIntersectionData::pts

Chain of IntersectionPoints making up the intersection.

Definition at line 980 of file IntersectionPool.h.

The documentation for this struct was generated from the following file:

- intersections/include/GoTools/intersections/[IntersectionPool.h](#)

## 29.43 Go::BoundedCurve Class Reference

A bounded curve. Both parameter values and end points may be given to define the boundaries. Assuming that both points prefer parameter, or both points prefer points. Typically used to bound infinite curves, for instance lines.

```
#include <BoundedCurve.h>
```

Inheritance diagram for Go::BoundedCurve:

### Additional Inherited Members

#### 29.43.1 Detailed Description

A bounded curve. Both parameter values and end points may be given to define the boundaries. Assuming that both points prefer parameter, or both points prefer points. Typically used to bound infinite curves, for instance lines.

Definition at line 56 of file [BoundedCurve.h](#).

## 29.43.2 Constructor & Destructor Documentation

### 29.43.2.1 `Go::BoundedCurve::BoundedCurve ( ) [inline]`

Default constructor. Constructs an uninitialized [Line](#) which can only be assigned to or read into.

Definition at line 62 of file `BoundedCurve.h`.

### 29.43.2.2 `Go::BoundedCurve::BoundedCurve ( shared_ptr< ParamCurve > curve, bool prefer_bd_par, double start_par, double end_par, Point start_pt, Point end_pt )`

Constructor. Input is start point and end point. Assumed to lie on curve (or at least close to it).

### 29.43.2.3 `Go::BoundedCurve::BoundedCurve ( shared_ptr< ParamCurve > curve, Point start_pt, Point end_pt )`

Constructor. Input is start point and end point. Assumed to lie on curve (or at least close to it). Only position given.

### 29.43.2.4 `Go::BoundedCurve::BoundedCurve ( shared_ptr< ParamCurve > curve, double start_par, double end_par )`

Constructor. Input is start point and end point. Assumed to lie on curve (or at least close to it). Only parameter value of curve given.

### 29.43.2.5 `virtual Go::BoundedCurve::~~BoundedCurve ( ) [virtual]`

virtual destructor - ensures safe inheritance

## 29.43.3 Member Function Documentation

### 29.43.3.1 `virtual void Go::BoundedCurve::appendCurve ( ParamCurve * cv, bool reparam = true ) [virtual]`

append a curve to this curve, with eventual reparametrization NB: This virtual member function currently only works for `SplineCurves` and `CurveOnSurfaces`. Moreover, 'this' curve and the 'cv' curve must be of the same type.

#### Parameters

|                |                                                          |
|----------------|----------------------------------------------------------|
| <i>cv</i>      | the curve to append to 'this' curve.                     |
| <i>reparam</i> | specify whether or not there should be reparametrization |

Implements [Go::ParamCurve](#).

### 29.43.3.2 `virtual void Go::BoundedCurve::appendCurve ( ParamCurve * cv, int continuity, double & dist, bool reparam = true ) [virtual]`

append a curve to this curve, with eventual reparametrization

## Parameters

|                   |                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------|
| <i>cv</i>         | the curve to append to 'this' curve.                                                                  |
| <i>continuity</i> | the required continuity at the transition. Can be $G^{(-1)}$ and upwards.                             |
| <i>dist</i>       | a measure of the local distortion around the transition in order to achieve the specified continuity. |
| <i>reparam</i>    | specify whether or not there should be reparametrization                                              |

Implements [Go::ParamCurve](#).

29.43.3.3 `virtual BoundingBox Go::BoundedCurve::boundingBox ( ) const [virtual]`

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.43.3.4 `static ClassType Go::BoundedCurve::classType ( ) [static]`

29.43.3.5 `virtual BoundedCurve* Go::BoundedCurve::clone ( ) const [virtual]`

The clone-function is inherited from [GeomObject](#), but overridden here to get a covariant return type (for those compilers that allow this).

Implements [Go::ParamCurve](#).

29.43.3.6 `virtual void Go::BoundedCurve::closestPoint ( const Point & pt, double tmin, double tmax, double & clo_t, Point & clo_pt, double & clo_dist, double const * seed = 0 ) const [virtual]`

Compute the closest point from an interval of this curve to a specified point.

## Parameters

|                 |                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>       | point we want to find the closest point to                                                                                               |
| <i>tmin</i>     | start parameter of search interval                                                                                                       |
| <i>tmax</i>     | end parameter of search interval                                                                                                         |
| <i>clo_t</i>    | upon function return, 'clo_t' will contain the parameter value of the closest point found.                                               |
| <i>clo_pt</i>   | upon function return, 'clo_pt' will contain the position of the closest point found.                                                     |
| <i>clo_dist</i> | upon function return, 'clo_dist' will contain the distance between 'pt' and the closest point found.                                     |
| <i>seed</i>     | pointer to initial guess value, provided by the user (can be 0, for which the algorithm will determine a (hopefully) reasonable choice). |

Implements [Go::ParamCurve](#).

29.43.3.7 `virtual int Go::BoundedCurve::dimension ( ) const [virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.43.3.8 `virtual DirectionCone Go::BoundedCurve::directionCone ( ) const [virtual]`

Creates a [DirectionCone](#) which covers all tangent directions of this curve.

**Returns**

the smallest [DirectionCone](#) containing all tangent directions of this curve.

Implements [Go::ParamCurve](#).

29.43.3.9 `virtual double Go::BoundedCurve::endparam ( ) const [virtual]`

Query the end parameter of the curve

**Returns**

the curve's end parameter

Implements [Go::ParamCurve](#).

29.43.3.10 `virtual SplineCurve* Go::BoundedCurve::geometryCurve ( ) [virtual]`

If the definition of this [ParamCurve](#) contains a [SplineCurve](#) describing its spatial shape, then this function will return a pointer to this [SplineCurve](#). Otherwise it will return a null pointer. The returned curve is NEWed, so the user is responsible for deleting it. This function may have side-effects.

**Returns**

a pointer to a [SplineCurve](#) representation of the [ParamCurve](#), if it exists. Null pointer otherwise.

Implements [Go::ParamCurve](#).

29.43.3.11 `virtual ClassType Go::BoundedCurve::instanceType ( ) const [virtual]`

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.43.3.12 `virtual bool Go::BoundedCurve::isAxisRotational ( Point & centre, Point & axis, Point & vec, double & angle ) [virtual]`

Check if the curve is axis rotational. Only true if a connection to an axis rotational elementary curve exist The axis and rotational angle is only specified if the curve is actually rotational

Reimplemented from [Go::ParamCurve](#).

29.43.3.13 `virtual bool Go::BoundedCurve::isDegenerate ( double degenerate_epsilon ) [virtual]`

Query whether the curve is degenerate (collapsed into a single point).

## Parameters

|                           |                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>degenerate_epsilon</i> | the tolerance used in determine whether the curve is degenerate. A curve is considered degenerate if its total length is shorter than this value. |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

## Returns

`true` if the curve is degenerate, `false` otherwise.

Implements [Go::ParamCurve](#).

**29.43.3.14** `virtual bool Go::BoundedCurve::isInPlane ( const Point & loc, const Point & axis, double eps, Point & normal ) const` [virtual]

Check if the curve lies in a plane passing through a given axis.

Reimplemented from [Go::ParamCurve](#).

**29.43.3.15** `virtual bool Go::BoundedCurve::isLinear ( Point & dir, double tol )` [virtual]

Check if the curve is linear.

Reimplemented from [Go::ParamCurve](#).

**29.43.3.16** `virtual double Go::BoundedCurve::length ( double tol )` [virtual]

Compute the total length of this curve up to some tolerance

## Parameters

|            |                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>tol</i> | the relative tolerance when approximating the length, i.e. stop iteration when error becomes smaller than $tol/(curve\ length)$ |
|------------|---------------------------------------------------------------------------------------------------------------------------------|

## Returns

the length calculated

Implements [Go::ParamCurve](#).

**29.43.3.17** `virtual void Go::BoundedCurve::point ( Point & pt, double tpar ) const` [virtual]

Evaluate the curve's position at a given parameter

## Parameters

|             |                                                                      |
|-------------|----------------------------------------------------------------------|
| <i>pt</i>   | the evaluated position will be written to this <a href="#">Point</a> |
| <i>tpar</i> | the parameter for which we wish to evaluate the curve                |

Implements [Go::ParamCurve](#).

29.43.3.18 `virtual void Go::BoundedCurve::point ( std::vector< Point > & pts, double tpar, int derivs, bool from_right = true ) const` [virtual]

Evaluate the curve's position and a certain number of derivatives at a given parameter.

#### Parameters

|                   |                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pts</i>        | the evaluated position and derivatives (tangent, curvature vector, etc.) will be written to this vector. The first entry will be the position, the second entry will be the first derivative, etc. The size of this vector must be set to 'derivs'+ 1 prior to calling this function. |
| <i>tpar</i>       | the parameter for which we want to evaluate the curve                                                                                                                                                                                                                                 |
| <i>derivs</i>     | the number of derivatives we want to have calculated                                                                                                                                                                                                                                  |
| <i>from_right</i> | specify whether we should calculate derivatives 'from the right' or 'from the left' (default is from the right). This matters only when the curve presents discontinuities in its derivatives.                                                                                        |

Implements [Go::ParamCurve](#).

29.43.3.19 `virtual void Go::BoundedCurve::read ( std::istream & is )` [virtual]

Read object from stream

#### Parameters

|           |                                  |
|-----------|----------------------------------|
| <i>is</i> | stream from which object is read |
|-----------|----------------------------------|

Implements [Go::Streamable](#).

29.43.3.20 `virtual void Go::BoundedCurve::reverseParameterDirection ( bool switchparam = false )` [virtual]

Set the parameter direction of the curve. The curve's parameter interval will always remain constant, but by flipping the parameter direction, the curve will be traced the opposite way when moving a parameter over the parameter interval.

#### Parameters

|                    |                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>switchparam</i> | if true, and the curve is 2D, the x and y coordinates should be swapped. This is used when turning the orientation of bounded (trimmed) surfaces. |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

Implements [Go::ParamCurve](#).

29.43.3.21 `void Go::BoundedCurve::setParamBounds ( double startpar, double endpar )`

Set bounds for the parametrization of the [Line](#).

## Parameters

|                 |                 |
|-----------------|-----------------|
| <i>startpar</i> | start parameter |
| <i>endpar</i>   | end parameter   |

29.43.3.22 virtual void Go::BoundedCurve::setParameterInterval ( double *t1*, double *t2* ) [virtual]

Set bounds for the parametrization of the curve

## Parameters

|                 |                 |
|-----------------|-----------------|
| <i>startpar</i> | start parameter |
| <i>endpar</i>   | end parameter   |

Implements [Go::ParamCurve](#).

29.43.3.23 virtual double Go::BoundedCurve::startparam ( ) const [virtual]

Query the start parameter of the curve

## Returns

the curve's start parameter

Implements [Go::ParamCurve](#).

29.43.3.24 virtual BoundedCurve\* Go::BoundedCurve::subCurve ( double *from\_par*, double *to\_par*, double *fuzzy* = DEFAULT\_PARAMETER\_EPSILON ) const [virtual]

Returns a curve which is a part of this curve. The result is NEWed, so the user is responsible for deleting it. NB: It is not guaranteed that the [ParamCurve](#) that is returned is of the same type as the curve itself. Thus, the returned curve might be a [SplineCurve](#).

## Parameters

|                 |                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>from_par</i> | start value of parameter interval that will define the subcurve                                                                                                                                   |
| <i>to_par</i>   | end value of parameter interval that will define the subcurve                                                                                                                                     |
| <i>fuzzy</i>    | since subCurve works on those curves who are spline-based, this tolerance defines how close the start and end parameter must be to an existing knot in order to be considered <i>on</i> the knot. |

## Returns

a pointer to a new subcurve which represents the part of the curve between 'from\_par' and 'to\_par'. It will be spline-based and have a k-regular knotvector. The user is responsible for deleting this subcurve when it is no longer needed.

Implements [Go::ParamCurve](#).

29.43.3.25 `shared_ptr<ParamCurve> Go::BoundedCurve::underlyingCurve ( ) const` `[inline]`

Get a pointer to the underlying curve

#### Returns

shared pointer to the underlying curve

Definition at line 156 of file BoundedCurve.h.

29.43.3.26 `virtual void Go::BoundedCurve::write ( std::ostream & os ) const` `[virtual]`

Write object to stream

#### Parameters

|                 |                                   |
|-----------------|-----------------------------------|
| <code>os</code> | stream to which object is written |
|-----------------|-----------------------------------|

Implements [Go::Streamable](#).

## Additional Inherited Members

### 29.44.1 Detailed Description

The class representing trimmed surfaces in [Go](#). Surface should be connected.

Definition at line 59 of file [BoundedSurface.h](#).

### 29.44.2 Constructor & Destructor Documentation

#### 29.44.2.1 [Go::BoundedSurface::BoundedSurface](#) ( )

Create an empty [BoundedSurface](#) that can be assigned or [read\(\)](#) into.

#### 29.44.2.2 [Go::BoundedSurface::BoundedSurface](#) ( shared\_ptr< [ParamSurface](#) > surf, std::vector< shared\_ptr< [CurveOnSurface](#) > > loop, double space\_epsilon, bool fix\_trim\_cvs = true )

Create a [BoundedSurface](#) by specifying the underlying surface and a loop of curves that specifies the trimming of the surface.

#### Parameters

|                      |                                                                                                                                                                                                                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>surf</i>          | the created <a href="#">BoundedSurface</a> will represent a trimmed version of this surface                                                                                                                                                                                                    |
| <i>loop</i>          | a vector of <a href="#">CurveOnSurface</a> s that together describe the boundary that defines the trimming of the surface. The curves in this vector should all lie on the surface in question, and when placed head-to-tail they should form a closed loop with counterclockwise orientation. |
| <i>space_epsilon</i> | geometrical tolerance used when treating the loops.                                                                                                                                                                                                                                            |
| <i>fix_trim_cvs</i>  | the constructor may alter loop curves if they are not consistent.                                                                                                                                                                                                                              |

#### 29.44.2.3 [Go::BoundedSurface::BoundedSurface](#) ( shared\_ptr< [ParamSurface](#) > surf, std::vector< std::vector< shared\_ptr< [CurveOnSurface](#) > > > loops, double space\_epsilon, bool fix\_trim\_cvs = true )

Create a [BoundedSurface](#) by specifying the underlying surface and a number of loops of curves that specify the trimming of the surface.

#### Parameters

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>surf</i>  | the created <a href="#">BoundedSurface</a> will represent a trimmed version of this surface                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>loops</i> | each entry in 'loop is a vector of <a href="#">CurveOnSurface</a> s that describe a closed loop forming a part of the trimmed surface's boundary. (Since the surface may have internal holes, more than one loop might be required to describe its boundary). The curve loops should all lie on the surface in question. The first entry in this vector describes the outermost boundary, which should be oriented counterclockwise. The other entries represent holes, and should be oriented |
|              | clockwise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Parameters

|                      |                                                                   |
|----------------------|-------------------------------------------------------------------|
| <i>space_epsilon</i> | geometrical tolerance used when treating the loops.               |
| <i>fix_trim_cvs</i>  | the constructor may alter loop curves if they are not consistent. |

29.44.2.4 `Go::BoundedSurface::BoundedSurface ( shared_ptr< ParamSurface > surf, std::vector< std::vector< shared_ptr< CurveOnSurface > > > loops, std::vector< double > space_emptons, bool fix_trim_cvs = true )`

Create a [BoundedSurface](#) by specifying the underlying surface and a number of loops of curves that specify the trimming of the surface.

## Parameters

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

(Since the surface may have internal holes, more than one loop might be required to describe its boundary). The curve loops should all lie on the surface in question. The first entry in this vector describes the outermost boundary, which should be oriented counterclockwise. The other entries represent holes, and should be oriented clockwise. |
| <i>space_emptons</i> | geometrical tolerances used when treating the loops.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>fix_trim_cvs</i>  | the constructor may alter loop curves if they are not consistent.                                                                                                                                                                                                                                                                                                                                                                                                                                           |

29.44.2.5 `Go::BoundedSurface::BoundedSurface ( shared_ptr< ParamSurface > surf, double space_epsilon )`

Create a bounded surface from a non-trimmed one.

29.44.2.6 `Go::BoundedSurface::BoundedSurface ( shared_ptr< ParamSurface > surf, std::vector< CurveLoop > & loops )`

Create a bounded surface from a non-trimmed one.

29.44.2.7 `Go::BoundedSurface::BoundedSurface ( shared_ptr< ParamSurface > surf, std::vector< shared_ptr< CurveLoop > > & loops )`

Create a bounded surface from a non-trimmed one.

29.44.2.8 `virtual Go::BoundedSurface::~~BoundedSurface ( ) [virtual]`

Virtual destructor ensures safe inheritance.

### 29.44.3 Member Function Documentation

#### 29.44.3.1 `std::vector<CurveLoop> Go::BoundedSurface::absolutelyAllBoundaryLoops ( ) const`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops. This function works like [allBoundaryLoops\(\)](#), except that it includes degenerate edges.

#### Returns

vector containing CurveLoops. The first of these describe the outer boundary of the surface (counterclockwise) whereas the others describe boundaries of interior holes (clockwise).

#### 29.44.3.2 `virtual std::vector<CurveLoop> Go::BoundedSurface::allBoundaryLoops ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [virtual]`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

#### Parameters

|                           |                                                            |
|---------------------------|------------------------------------------------------------|
| <i>degenerate_epsilon</i> | edges whose length is smaller than this value are ignored. |
|---------------------------|------------------------------------------------------------|

#### Returns

a vector containing CurveLoops. The first of these describe the outer boundary of the surface (counterclockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

#### 29.44.3.3 `bool Go::BoundedSurface::allIsSpline ( ) const`

Test if underlying surface and all loop curves are [CurveOnSurface](#) where the space curves are [SplineCurve](#).

#### 29.44.3.4 `BoundedSurface* Go::BoundedSurface::allSplineCopy ( ) const`

Return copy where underlying surface and all loop curves are [CurveOnSurface](#) where the space curves are [SplineCurve](#).

#### 29.44.3.5 `void Go::BoundedSurface::analyzeLoops ( )`

Checking all boundary\_loops\_ to see if they fulfill requirements. Routine sets valid\_state\_. Must be called after surface is altered.

#### 29.44.3.6 `virtual double Go::BoundedSurface::area ( double tol ) const [virtual]`

Compute the total area of this surface up to some tolerance

## Parameters

|            |                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------|
| <i>tol</i> | the relative tolerance when approximating the area, i.e. stop iteration when error becomes smaller than $tol/(surface\ area)$ |
|------------|-------------------------------------------------------------------------------------------------------------------------------|

## Returns

the area calculated NB! Intermediate solution with lower accuracy

Implements [Go::ParamSurface](#).

**29.44.3.7** `virtual SplineSurface* Go::BoundedSurface::asSplineSurface ( ) [inline],[virtual]`

Return the spline surface represented by this surface, if any.

Reimplemented from [Go::ParamSurface](#).

Definition at line 175 of file BoundedSurface.h.

**29.44.3.8** `virtual BoundingBox Go::BoundedSurface::boundingBox ( ) const [virtual]`

Return the object's bounding box.

Implements [Go::GeomObject](#).

**29.44.3.9** `static ClassType Go::BoundedSurface::classType ( ) [inline],[static]`

Return the class type identifier of type [BoundedSurface](#).

Definition at line 168 of file BoundedSurface.h.

**29.44.3.10** `virtual BoundedSurface* Go::BoundedSurface::clone ( ) const [virtual]`

clone this [BoundedSurface](#) and return a pointer to the clone

Implements [Go::ParamSurface](#).

**29.44.3.11** `virtual void Go::BoundedSurface::closestBoundaryPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * domain_of_interest = NULL, double * seed = 0 ) const [virtual]`

Iterates to the closest point to pt on the boundary of the surface.

## See also

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

29.44.3.12 `virtual Point Go::BoundedSurface::closestInDomain ( double u, double v ) const` [virtual]

Fetch the parameter value in the parameter domain of the surface closest to the parameter pair (u,v)

Implements [Go::ParamSurface](#).

29.44.3.13 `virtual void Go::BoundedSurface::closestPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * domain_of_interest = NULL, double * seed = 0 ) const` [virtual]

Iterates to the closest point to pt on the surface.

## Parameters

|                           |                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>                 | the point to find the closest point to                                                                                       |
| <i>clo_u</i>              | u parameter of the closest point                                                                                             |
| <i>clo_v</i>              | v parameter of the closest point                                                                                             |
| <i>clo_pt</i>             | the geometric position of the closest point                                                                                  |
| <i>clo_dist</i>           | the distance between pt and clo_pt                                                                                           |
| <i>epsilon</i>            | parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)                    |
| <i>domain_of_interest</i> | pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched. |
| <i>seed</i>               | pointer to parameter values where iteration starts.                                                                          |

Reimplemented from [Go::ParamSurface](#).

29.44.3.14 **bool** Go::BoundedSurface::closeToUnderlyingBoundary ( **double** *upar*, **double** *vpar*, **double** *domain\_fraction* = 0.01 ) **const**

29.44.3.15 **SplineCurve\*** Go::BoundedSurface::constParamCurve ( **double** *parameter*, **bool** *direction\_is\_u* ) **const**

Get the space-curve resulting from fixing one of the surface's parameters and moving the other along its allowed range (inside the trimmed domain). If this results in several disjoint curves, an exception is thrown.

## Parameters

|                                      |                                                                                                                                            |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>parameter</i>                     | the parameter value of the fixed parameter                                                                                                 |
| <i>direction_is_u</i> ↔<br><i>_u</i> | if 'true' then the "free" parameter will be the first one, and the second parameter will be fixed. If 'false', it is the other way around. |

## Returns

a newly created [SplineCurve](#) representing the requested space-curve. The ownership is assumed by the user.

29.44.3.16 **virtual std::vector<shared\_ptr<ParamCurve>>** Go::BoundedSurface::constParamCurves ( **double** *parameter*, **bool** *pardir\_is\_u* ) **const** [virtual]

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

## Parameters

|                                   |                                                                                                                                              |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>parameter</i>                  | parameter value for the constant parameter (either u or v)                                                                                   |
| <i>pardir_is_u</i> ↔<br><i>_u</i> | specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one. |

**Returns**

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

29.44.3.17 `virtual RectDomain Go::BoundedSurface::containingDomain ( ) const [virtual]`

Get a rectangular parameter domain that is guaranteed to contain the surface's [parameterDomain\(\)](#). It may be the same. There is no guarantee that this is the smallest domain containing the actual domain.

**Returns**

a [RectDomain](#) that is guaranteed to include the surface's total parameter domain.

Implements [Go::ParamSurface](#).

29.44.3.18 `virtual int Go::BoundedSurface::dimension ( ) const [virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.44.3.19 `virtual int Go::BoundedSurface::ElementBoundaryStatus ( int elem_ix, double eps ) [virtual]`

Check if a polynomial element (for spline surfaces) intersects the (trimming) boundaries of this [ftSurface](#), is inside or outside

**Parameters**

|                |                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------|
| <i>elem_ix</i> | Element index counted according to distinct knot values. Sequence of coordinates: x runs fastest, then y |
| <i>eps</i>     | Intersection tolerance                                                                                   |

**Returns**

-1: Not a spline surface or element index out of range 0: Outside trimmed volume 1: On boundary (intersection with boundary found) 2: Internal to trimmed surfaces Note that a touch with the boundaries of the underlying surface is not considered a boundary intersection while touching a trimming curve is seen as an intersection

Reimplemented from [Go::ParamSurface](#).

29.44.3.20 `virtual int Go::BoundedSurface::ElementOnBoundary ( int elem_ix, double eps ) [virtual]`

Check if a polynomial element (for spline surfaces) intersects the (trimming) boundaries of this surface

## Parameters

|                |                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------|
| <i>elem_ix</i> | Element index counted according to distinct knot values. Sequence of coordinates: x runs fastest, then y |
| <i>eps</i>     | Intersection tolerance                                                                                   |

## Returns

-1: Not a spline surface or element index out of range  
 0: Not on boundary or touching a boundary curve  
 1: On boundary (intersection with boundary found)  
 Note that a touch with the boundaries of the underlying surfaces is not considered a boundary intersection while touching a trimming curve is seen as an intersection

Reimplemented from [Go::ParamSurface](#).

```
29.44.3.21 virtual void Go::BoundedSurface::evalGrid (int num_u, int num_v, double umin, double umax, double vmin,
double vmax, std::vector< double > & points, double nodata_val = -9999) const [virtual]
```

Evaluate points in a grid The nodata value is applicable for bounded surfaces and grid points outside the trimming loop(s) will get this value

Reimplemented from [Go::ParamSurface](#).

```
29.44.3.22 bool Go::BoundedSurface::fixInvalidSurface (double & max_loop_gap, double max_tol_mult = 1.0)
```

We try to fix the invalid loops. Return value: true if the loops are valid. Returned max\_gap is the largest gap between end segments in the loops. Assuming that max\_tol\_mult >= 1.0. The routine is allowed to alter the eps to eps\*max\_tol\_mult.

```
29.44.3.23 virtual void Go::BoundedSurface::getBoundaryInfo (Point & pt1, Point & pt2, double epsilon, SplineCurve
*& cv, SplineCurve *& crosscv, double knot_tol = 1e-05) const [virtual]
```

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created. **NB:** This function has not yet been implemented!

## Parameters

|                 |                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pt1</i>      | the first point on the boundary, given by the user                                                                                                                                                                                                                                                                                |
| <i>pt2</i>      | the second point on the boundary, given by the user                                                                                                                                                                                                                                                                               |
| <i>epsilon</i>  | the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.                                                                                                                                                                          |
| <i>cv</i>       | upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.                                                  |
| <i>crosscv</i>  | upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2' The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary. |
| <i>knot_tol</i> | tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.                                                                                                                                                                               |

Implements [Go::ParamSurface](#).

29.44.3.24 `void Go::BoundedSurface::getBoundaryInfo ( Point & pt1, Point & pt2, std::vector< shared_ptr< CurveOnSurface > > & bd_cvs ) const`

Get the boundary curve segment between two points on the same boundary loop. If the given points are not positioned on the same boundary loop (within a certain tolerance), no curves will be returned.

#### Parameters

|            |                                                     |
|------------|-----------------------------------------------------|
| <i>pt1</i> | the first point on the boundary, given by the user  |
| <i>pt2</i> | the second point on the boundary, given by the user |

#### Return values

|               |                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>bd_cvs</i> | upon return, this will contain shared pointers to curves that, taken consecutively, describe the requested boundary segment in its entirety. |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|

29.44.3.25 `virtual void Go::BoundedSurface::getCornerPoints ( std::vector< std::pair< Point, Point > > & corners ) const [virtual]`

Return surface corners, i.e joints between trimming curves, geometric and parametric points in that sequence

Implements [Go::ParamSurface](#).

29.44.3.26 `virtual void Go::BoundedSurface::getDegenerateCorners ( std::vector< Point > & deg_corners, double tol ) const [virtual]`

Check for parallel and anti parallel partial derivatives in surface corners.

Implements [Go::ParamSurface](#).

29.44.3.27 `double Go::BoundedSurface::getEpsGeo ( ) const`

Run through the boundary loops, returning the smallest epsgeo.

29.44.3.28 `virtual Point Go::BoundedSurface::getInternalPoint ( double & u, double & v ) const [virtual]`

Fetch an arbitrary internal point in the surface Used for localization purposes

Reimplemented from [Go::ParamSurface](#).

29.44.3.29 `shared_ptr<ParamSurface> Go::BoundedSurface::getIsoTrimSurface ( double tol ) const`

Fetch.

29.44.3.30 **Point** Go::BoundedSurface::getSurfaceParameter ( int *loop\_idx*, int *cv\_idx*, double *bd\_par* ) const

Given a parameter value corresponding to on specified curve in a specified boundary loop, return the corresponding surface parameter

29.44.3.31 **bool** Go::BoundedSurface::hasUnderlyingSpline ( shared\_ptr< SplineSurface > & *srf* )

Check if the final underlying surface is a spline surface and in that case return this surface

29.44.3.32 **virtual bool** Go::BoundedSurface::inDomain ( double *u*, double *v*, double *eps* = 1.0e-4 ) const  
[virtual]

Check if a parameter pair lies inside the domain of this surface.

Implements [Go::ParamSurface](#).

29.44.3.33 **virtual int** Go::BoundedSurface::inDomain2 ( double *u*, double *v*, double *eps* = 1.0e-4 ) const  
[virtual]

Check if a parameter pair lies inside the domain of this surface return value = 0: outside = 1: internal = 2: at the boundary

Implements [Go::ParamSurface](#).

29.44.3.34 **virtual ClassType** Go::BoundedSurface::instanceType ( ) const [virtual]

Return the class type identifier of type [BoundedSurface](#).

Implements [Go::GeomObject](#).

29.44.3.35 **virtual bool** Go::BoundedSurface::isAxisRotational ( Point & *centre*, Point & *axis*, Point & *vec*, double & *angle* ) [virtual]

Check if the surface is axis rotational. Only true if a connection to an axis rotational elementary surface exist The axis and rotational angle is only specified if the surface is actually rotational

Reimplemented from [Go::ParamSurface](#).

29.44.3.36 **virtual bool** Go::BoundedSurface::isDegenerate ( bool & *b*, bool & *r*, bool & *t*, bool & *l*, double *tolerance* ) const [virtual]

Query whether any of the four boundaries of the *underlying surface* are degenerate (zero length) within a certain tolerance. In the below, we refer to 'u' as the first parameter and 'v' as the second.

## Parameters

|                  |                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------|
| <i>b</i>         | 'true' upon return of function if the boundary ( $v = v_{\min}$ ) is degenerate                    |
| <i>r</i>         | 'true' upon return of function if the boundary ( $v = v_{\max}$ ) is degenerate                    |
| <i>t</i>         | 'true' upon return of function if the boundary ( $u = u_{\min}$ ) is degenerate                    |
| <i>l</i>         | 'true' upon return of function if the boundary ( $u = u_{\max}$ ) is degenerate                    |
| <i>tolerance</i> | boundaries are considered degenerate if their length is shorter than this value, given by the user |

## Returns

'true' if at least one boundary curve was found to be degenerate, 'false' otherwise.

Reimplemented from [Go::ParamSurface](#).

**29.44.3.37** `virtual bool Go::BoundedSurface::isAlsoTrimmed ( double tol ) const` [virtual]

Check if the current surface is trimmed along constant parameter curves.

Reimplemented from [Go::ParamSurface](#).

**29.44.3.38** `virtual bool Go::BoundedSurface::isLinear ( Point & dir1, Point & dir2, double tol )` [virtual]

Check if the surface is linear in one or both parameter directions.

Reimplemented from [Go::ParamSurface](#).

**29.44.3.39** `virtual bool Go::BoundedSurface::isPlanar ( Point & normal, double tol )` [virtual]

This surface is planar if the underlying surface is.

Reimplemented from [Go::ParamSurface](#).

**29.44.3.40** `bool Go::BoundedSurface::isValid ( int & valid_state ) const`

The boundary loops may be outside the loop tolerance, or the loops do not fulfill the loop requirements (1 outer loop which is ccw, cw loops inside, loops should be simple and disjoint).

**29.44.3.41** `shared_ptr<CurveLoop> Go::BoundedSurface::loop ( int idx )` [inline]

Get a shared pointer to a specific boundary loop.

Definition at line 532 of file BoundedSurface.h.

**29.44.3.42** `void Go::BoundedSurface::makeBoundaryCurvesG1 ( double kink )`

This function processes all the curves that participate in defining the surface's (trimmed) boundary. Those curves that are not G1 within a certain tolerance are split into several curves, so that all G1-discontinuities will end up *between* consecutive curve segments.

## Parameters

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>kink</i> | the tolerance to use for checking G1 continuity |
|-------------|-------------------------------------------------|

29.44.3.43 `bool Go::BoundedSurface::makeUnderlyingSpline ( )`

Test if underlying surface is spline, if not try to convert it to spline /return wether underlying surface is spline afterwards

29.44.3.44 `double Go::BoundedSurface::maxLoopGap ( )`

We measure the largest distance between loop segments.

29.44.3.45 `double Go::BoundedSurface::maxLoopSfDist ( int loop_ind, int nmb_seg_samples = 100 )`

We measure the largest distance from loop to the surface. If the loops are defined by curves in the parameter domain, then it is trivially 0.0. Useful for testing whether the tolerance makes any sense.

29.44.3.46 `virtual double Go::BoundedSurface::nextSegmentVal ( int dir, double par, bool forward, double tol ) const [virtual]`

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

## Parameters

|                |                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------|
| <i>dir</i>     | the parameter direction in which we search for the next segment (0 or 1)                             |
| <i>par</i>     | the parameter value starting from which we search for the start value of the next segment            |
| <i>forward</i> | define whether we shall move forward ('true') or backwards when searching along this parameter       |
| <i>tol</i>     | tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value |

## Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

29.44.3.47 `virtual void Go::BoundedSurface::normal ( Point & n, double upar, double vpar ) const [virtual]`

Evaluates the surface normal for a given parameter pair

## Parameters

|             |                                                      |
|-------------|------------------------------------------------------|
| <i>n</i>    | the computed normal will be written to this variable |
| <i>upar</i> | the first parameter                                  |
| <i>vpar</i> | the second parameter                                 |

Implements [Go::ParamSurface](#).

29.44.3.48 `virtual DirectionCone Go::BoundedSurface::normalCone ( ) const [virtual]`

Creates a [DirectionCone](#) covering all normals to this surface.

## Returns

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

29.44.3.49 `int Go::BoundedSurface::numberOfLoops ( ) const [inline]`

Get the number of boundary loops that describe the trimmed surface.

Definition at line 528 of file BoundedSurface.h.

29.44.3.50 `virtual bool Go::BoundedSurface::onBoundary ( double u, double v, double eps = 1.0e-4 ) const [virtual]`

Check if a parameter pair lies at the boundary of this surface.

Implements [Go::ParamSurface](#).

29.44.3.51 `bool Go::BoundedSurface::orientationIsSet ( ) [inline]`

Check if the loop orientation is tested and corrected.

Definition at line 583 of file BoundedSurface.h.

29.44.3.52 `bool Go::BoundedSurface::orientationOK ( ) [inline]`

Check the status of the loop orientation. If a fix has been performed or the loop is not OK, the return value will be false

Definition at line 590 of file BoundedSurface.h.

29.44.3.53 `virtual CurveLoop Go::BoundedSurface::outerBoundaryLoop ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [virtual]`

Returns the anticlockwise, outer boundary loop of the surface.

## Parameters

|                           |                                                            |
|---------------------------|------------------------------------------------------------|
| <i>degenerate_epsilon</i> | edges whose length is smaller than this value are ignored. |
|---------------------------|------------------------------------------------------------|

## Returns

a [CurveLoop](#) describing the anticlockwise, outer boundary loop of the surface.

Implements [Go::ParamSurface](#).

29.44.3.54 `virtual const CurveBoundedDomain& Go::BoundedSurface::parameterDomain ( ) const` [virtual]

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [CurveBoundedDomain](#), found in the `sisl_dependent` module).

## Returns

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

29.44.3.55 `virtual void Go::BoundedSurface::point ( Point & pt, double upar, double vpar ) const` [virtual]

Evaluates the surface's position for a given parameter pair.

## Parameters

|             |                                              |
|-------------|----------------------------------------------|
| <i>pt</i>   | the result of the evaluation is written here |
| <i>upar</i> | the first parameter                          |
| <i>vpar</i> | the second parameter                         |

Implements [Go::ParamSurface](#).

29.44.3.56 `virtual void Go::BoundedSurface::point ( std::vector< Point > & pts, double upar, double vpar, int derivs, bool u_from_right = true, bool v_from_right = true, double resolution = 1.0e-12 ) const` [virtual]

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

## Parameters

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pts</i>  | the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives. |
| <i>upar</i> | the first parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Parameters

|                     |                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vpar</i>         | the second parameter                                                                                                                                             |
| <i>derivs</i>       | number of requested derivatives                                                                                                                                  |
| <i>u_from_right</i> | specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')                           |
| <i>v_from_right</i> | specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')                          |
| <i>resolution</i>   | tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects). |

Implements [Go::ParamSurface](#).

29.44.3.57 virtual void `Go::BoundedSurface::read ( std::istream & is )` [virtual]

read this [BoundedSurface](#) from a stream

Implements [Go::Streamable](#).

29.44.3.58 void `Go::BoundedSurface::read ( std::istream & is, bool fix_trim_cvs )`

29.44.3.59 void `Go::BoundedSurface::removeMismatchCurves ( double max_tol_mult )`

If both parameter and space curve are given for a segment, and they do not match, one of them is removed, unless we may alter the tolerance slightly (at most to  $\text{epsgeo} * \text{max\_tol\_mult}$ ).

29.44.3.60 void `Go::BoundedSurface::removeSmallBoundaryCurves ( double gap, double neighbour, double kink )`

This function processes all the curves that participate in defining the surface's (trimmed) boundary. Those curves that are smaller than a given tolerance is merged with one of the adjacent curves if possible

## Parameters

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <i>gap</i>       | positional tolerance used to check for possibility of merge |
| <i>neighbour</i> | tolerance used for checking if a curve is small             |
| <i>kink</i>      | angular tolerance used to check for possibility of merge    |

29.44.3.61 virtual void `Go::BoundedSurface::reverseParameterDirection ( bool direction_is_u )` [virtual]

Reverses the direction of the basis in input direction. **NB:** This function has not yet been implemented!

## Parameters

|                       |                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>direction_is_u</i> | if 'true', the first parameter direction will be reversed, otherwise, the second parameter direction will be reversed |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------|

Implements [Go::ParamSurface](#).

29.44.3.62 `virtual void Go::BoundedSurface::setIterator ( IteratorType type ) [inline], [virtual]`

Set type of closest point iterator type == Iterator\_parametric - use conjugate gradient iteration type == Iterator\_↔  
geometric - sisl type geometric closest point iteration

Reimplemented from [Go::ParamSurface](#).

Definition at line 570 of file BoundedSurface.h.

29.44.3.63 `void Go::BoundedSurface::setOrientationOK ( ) [inline]`

Remove history of loop orientation fixes.

Definition at line 601 of file BoundedSurface.h.

29.44.3.64 `virtual void Go::BoundedSurface::setParameterDomain ( double u1, double u2, double v1, double v2 ) [virtual]`

Change the parameter domain of the underlying surface, and modify the boundary loops with respect to this change

#### Parameters

|           |                                     |
|-----------|-------------------------------------|
| <i>u1</i> | new start value of first parameter  |
| <i>u2</i> | new end value of first parameter    |
| <i>v1</i> | new start value of second parameter |
| <i>v2</i> | new end value of second parameter   |

Reimplemented from [Go::ParamSurface](#).

29.44.3.65 `bool Go::BoundedSurface::simplifyBdLoops ( double tol, double ang_tol, double & max_dist )`

Simplify boundary loops by reducing the number of curves if possible.

29.44.3.66 `void Go::BoundedSurface::splitSingleLoops ( )`

Split all boundary loops defined by only *curve* into three parts. (This somewhat exotic member function is included due to its handiness with the [GoTools](#) topology analysator).

29.44.3.67 `virtual std::vector<shared_ptr<ParamSurface>> Go::BoundedSurface::subSurfaces ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [virtual]`

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

## Parameters

|                  |                                                                       |
|------------------|-----------------------------------------------------------------------|
| <i>from_upar</i> | lower value for the first parameter in the subdomain                  |
| <i>from_vpar</i> | lower value for the second parameter in the subdomain                 |
| <i>to_upar</i>   | upper value for the first parameter in the subdomain                  |
| <i>to_vpar</i>   | upper value for the second parameter in the subdomain                 |
| <i>fuzzy</i>     | tolerance used when determining intersection with interior boundaries |

## Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

29.44.3.68 virtual void `Go::BoundedSurface::swapParameterDirection ( )` [virtual]

Swaps the two parameter directions.

Implements [Go::ParamSurface](#).

29.44.3.69 virtual `DirectionCone` `Go::BoundedSurface::tangentCone ( bool paddir_is_u ) const` [virtual]

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

## Parameters

|                    |                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>paddir_is_u</i> | if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used. |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

29.44.3.70 void `Go::BoundedSurface::turnLoopOrientation ( int idx )`

Turn orientation of specified loop, and remember turning it.

29.44.3.71 virtual void `Go::BoundedSurface::turnOrientation ( )` [virtual]

Turns the direction of the normal of the surface.

Implements [Go::ParamSurface](#).

29.44.3.72 `shared_ptr<ParamSurface> Go::BoundedSurface::underlyingSurface ( ) [inline]`

Get a pointer to the underlying surface

#### Returns

shared pointer to the underlying surface

Definition at line 515 of file BoundedSurface.h.

29.44.3.73 `shared_ptr<const ParamSurface> Go::BoundedSurface::underlyingSurface ( ) const [inline]`

Get a pointer to the underlying surface

#### Returns

shared pointer to the underlying surface

Definition at line 520 of file BoundedSurface.h.

29.44.3.74 `virtual void Go::BoundedSurface::write ( std::ostream & os ) const [virtual]`

write this [BoundedSurface](#) to a stream

Implements [Go::Streamable](#).

## 29.44.4 Friends And Related Function Documentation

29.44.4.1 `void GeometryTools::setParameterDomain ( std::vector< shared_ptr< BoundedSurface > > & sfs, double u1, double u2, double v1, double v2 ) [friend]`

The documentation for this class was generated from the following file:

### 29.45.1 Detailed Description

Axis-aligned bounding box. A [BoundingBox](#) object can be an axis-aligned box in any number of dimensions.

Definition at line 56 of file [BoundingBox.h](#).

### 29.45.2 Constructor & Destructor Documentation

#### 29.45.2.1 `Go::BoundingBox::BoundingBox ( ) [inline]`

The default constructor makes an uninitialized object, with dimension zero.

Definition at line 61 of file [BoundingBox.h](#).

29.45.2.2 `Go::BoundingBox::BoundingBox ( int dim ) [inline], [explicit]`

Creates a [BoundingBox](#) of the specified dimension, but apart from that still uninitialized.

Definition at line 64 of file `BoundingBox.h`.

29.45.2.3 `Go::BoundingBox::BoundingBox ( const Point & low, const Point & high ) [inline]`

Creates a [BoundingBox](#) with the [Point](#) *low* specifying the lower bound in all dimensions and *high* specifying the upper bound.

Definition at line 69 of file `BoundingBox.h`.

29.45.2.4 `Go::BoundingBox::~~BoundingBox ( )`

Do not inherit from this class – nonvirtual destructor.

### 29.45.3 Member Function Documentation

29.45.3.1 `void Go::BoundingBox::addUnionWith ( const Point & pt )`

After the call, the bounding box will contain both this box and the given point.

29.45.3.2 `void Go::BoundingBox::addUnionWith ( const BoundingBox & box )`

After the call, the bounding box will contain both initial boxes.

29.45.3.3 `void Go::BoundingBox::check ( ) const`

Check that box validity. Call [valid\(\)](#) to find out if check succeeded.

29.45.3.4 `bool Go::BoundingBox::containsBox ( const BoundingBox & box, double tol = 0.0 ) const`

Returns true if this box contain the box passed as a parameter, if enlarged by *tol* in all directions.

29.45.3.5 `bool Go::BoundingBox::containsPoint ( const Point & pt, double tol = 0.0 ) const`

Returns true if the point *pt* is inside the box, or within *tol* of the boundary.

29.45.3.6 `int Go::BoundingBox::dimension ( ) const [inline]`

The dimension of the bounding box.

Definition at line 149 of file `BoundingBox.h`.

29.45.3.7 **bool** Go::BoundingBox::getOverlap ( **const** BoundingBox & *box*, **double** & *overlap*, **double** *tol* = 0.0 ) **const**

29.45.3.8 **const Point&** Go::BoundingBox::high ( ) **const** [inline]

The upper bound of the bounding box.

Definition at line 154 of file BoundingBox.h.

29.45.3.9 **std::vector<Point>** Go::BoundingBox::lineIntersect ( **const** Point & *p1*, **const** Point & *dir* ) **const**

Compute the intersections with this box and a line.

29.45.3.10 **const Point&** Go::BoundingBox::low ( ) **const** [inline]

The lower bound of the bounding box.

Definition at line 152 of file BoundingBox.h.

29.45.3.11 **bool** Go::BoundingBox::overlaps ( **const** BoundingBox & *box*, **double** *tol* = 0.0 ) **const**

Returns true if the two boxes overlap, or are a distance less than *tol* apart.

29.45.3.12 **void** Go::BoundingBox::read ( **std::istream** & *is* )

Read a bounding box from a standard istream.

29.45.3.13 **template<typename FloatType > void** Go::BoundingBox::setFromArray ( **const** FloatType \* *start*, **const** FloatType \* *end*, **int** *dim* ) [inline]

Given an array of *dim*-dimensional points stored as doubles or floats, makes the smallest bounding box containing all points in the array.

Definition at line 82 of file BoundingBox.h.

29.45.3.14 **template<typename ForwardIterator > void** Go::BoundingBox::setFromArray ( **ForwardIterator** *start*, **ForwardIterator** *end*, **int** *dim* ) [inline]

Given an array of *dim*-dimensional points stored as doubles or floats, makes the smallest bounding box containing all points in the array.

Definition at line 104 of file BoundingBox.h.

29.45.3.15 **void** Go::BoundingBox::setFromPoints ( **const** Point & *low*, **const** Point & *high* )

Makes the bounding box have lower bounds as specified in *low* and upper bounds as specified in *high*.

29.45.3.16 void Go::BoundingBox::setFromPoints ( const std::vector< Point > & points ) [inline]

Given a vector of dim-dimensional points, makes the smallest bounding box containing all points in the array.

Definition at line 125 of file BoundingBox.h.

29.45.3.17 void Go::BoundingBox::unset ( ) [inline]

Unset bounding box.

Definition at line 182 of file BoundingBox.h.

29.45.3.18 bool Go::BoundingBox::valid ( ) const [inline]

Is the bounding box initialized?

Definition at line 179 of file BoundingBox.h.

29.45.3.19 void Go::BoundingBox::write ( std::ostream & os ) const

Write a bounding box to a standard ostream.

### 29.46.1 Detailed Description

Class for the preprocessed information of a surface model The geometry space is split into voxels, axis aligned boxes of the same cubic shape (equal side length in all directions) The union of the voxels is rectangular, and holds all the surfaces

Definition at line 358 of file ClosestPointUtils.h.

### 29.46.2 Member Function Documentation

**29.46.2.1** `void Go::boxStructuring::BoundingBoxStructure::addBox ( shared_ptr< SubSurfaceBoundingBox > box )`  
[inline]

Add information of a specific parameter sub segment of a surface to the structure.

Definition at line 364 of file ClosestPointUtils.h.

**29.46.2.2** `void Go::boxStructuring::BoundingBoxStructure::addSurface ( shared_ptr< SurfaceData > surface )`  
[inline]

Add a surface from the surface model to the structure.

Definition at line 370 of file ClosestPointUtils.h.

**29.46.2.3** `Point Go::boxStructuring::BoundingBoxStructure::big_vox_low ( ) const` [inline]

Get the lower left corner of the entire voxel structure.

Definition at line 419 of file ClosestPointUtils.h.

29.46.2.4 `std::vector<int> Go::boxStructuring::BoundingBoxStructure::boxes_in_voxel ( int i, int j, int k ) const`  
[inline]

Get all the segments that might hit a given voxel (those where the bounding boxes hit the voxel)

Definition at line 432 of file ClosestPointUtils.h.

29.46.2.5 `void Go::boxStructuring::BoundingBoxStructure::BuildVoxelStructure ( BoundingBox bigbox, double volume_reduction )` [inline]

Creates the voxel structure with information about the segment bounding boxes that hit each voxel *bigbox* is the entire bounding box of the surface structure, the voxel structure must include *bigbox* *volume\_reduction* gives the ratio of the volume of the *bigbox* structure. It will be a lower limit on the number of voxels

Definition at line 450 of file ClosestPointUtils.h.

29.46.2.6 `bool Go::boxStructuring::BoundingBoxStructure::closestPoint ( int box_idx, bool any_tested, double best_dist, bool isInside, const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * domain_of_interest, double * seed ) const` [inline]

Test for `closestPoint`. Only used by the old code, `closestVectorsOld()` Will be removed if we know `closestVectors()` is safe

Definition at line 492 of file ClosestPointUtils.h.

29.46.2.7 `shared_ptr<SubSurfaceBoundingBox> Go::boxStructuring::BoundingBoxStructure::getBox ( int i ) const`  
[inline]

Get a specific segment in the structure.

Definition at line 389 of file ClosestPointUtils.h.

29.46.2.8 `shared_ptr<SurfaceData> Go::boxStructuring::BoundingBoxStructure::getSurface ( int i ) const` [inline]

Get a specific surface in the structure.

Definition at line 395 of file ClosestPointUtils.h.

29.46.2.9 `int Go::boxStructuring::BoundingBoxStructure::n_boxes ( ) const` [inline]

Get the number of segments in the structure.

Definition at line 377 of file ClosestPointUtils.h.

29.46.2.10 `int Go::boxStructuring::BoundingBoxStructure::n_surfaces ( ) const` [inline]

Get the number of surfaces in the structure.

Definition at line 383 of file ClosestPointUtils.h.

29.46.2.11 `int Go::boxStructuring::BoundingBoxStructure::n_voxels_x ( ) const [inline]`

Get the number of voxels in first coordinate direction.

Definition at line 401 of file `ClosestPointUtils.h`.

29.46.2.12 `int Go::boxStructuring::BoundingBoxStructure::n_voxels_y ( ) const [inline]`

Get the number of voxels in second coordinate direction.

Definition at line 407 of file `ClosestPointUtils.h`.

29.46.2.13 `int Go::boxStructuring::BoundingBoxStructure::n_voxels_z ( ) const [inline]`

Get the number of voxels in third coordinate direction.

Definition at line 413 of file `ClosestPointUtils.h`.

29.46.2.14 `void Go::boxStructuring::BoundingBoxStructure::setSurfaceCopies ( int nmb_copies ) [inline]`

Set number of surface copies.

Definition at line 438 of file `ClosestPointUtils.h`.

29.46.2.15 `double Go::boxStructuring::BoundingBoxStructure::voxel_length ( ) const [inline]`

Get the common length of all sides in the voxels.

Definition at line 425 of file `ClosestPointUtils.h`.

### 29.48.1 Detailed Description

Class representing a B-spline basis of a spline space. This basis is defined by its order, its dimension (number of basis functions) and its knotvector.

Definition at line 63 of file BsplineBasis.h.

### 29.48.2 Constructor & Destructor Documentation

#### 29.48.2.1 `Go::BsplineBasis::BsplineBasis ( ) [inline]`

Default constructor, making an empty basis.

Definition at line 67 of file BsplineBasis.h.

#### 29.48.2.2 `template<typename RandomIterator > Go::BsplineBasis::BsplineBasis ( int number, int order, RandomIterator knotstart ) [inline]`

Constructor

Parameters

|                  |                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number</i>    | Number of basis functions in space                                                                                                                  |
| <i>order</i>     | order of the basis functions (polynomial degree + 1)                                                                                                |
| <i>knotstart</i> | iterator pointing to start of defining knotvector The length of the knotvector is deduced automatically, and should be equal to 'order' + 'number'. |

Definition at line 79 of file BsplineBasis.h.

**29.48.2.3** `template<typename RandomIterator > Go::BsplineBasis::BsplineBasis ( int order, RandomIterator knotstart, RandomIterator knotend ) [inline]`

Constructor

Parameters

|                  |                                                                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>order</i>     | order of the basis functions (polynomial degree + 1)                                                                                                                                |
| <i>knotstart</i> | iterator pointing to start of defining knotvector                                                                                                                                   |
| <i>knotend</i>   | iterator pointing to one-past-end of defining knotvector. The number of basis functions will be deduced automatically by subtracting the 'order' from the length of the knotvector. |

Definition at line 96 of file BsplineBasis.h.

**29.48.2.4** `virtual Go::BsplineBasis::~BsplineBasis ( ) [virtual]`

Virtual destructor, enables safe inheritance.

### 29.48.3 Member Function Documentation

**29.48.3.1** `std::vector<double>::const_iterator Go::BsplineBasis::begin ( ) const [inline]`

Get a const-iterator to the beginning of the knotvector

Returns

an iterator to the beginning of the knotvector

Definition at line 349 of file BsplineBasis.h.

**29.48.3.2** `std::vector<double>::iterator Go::BsplineBasis::begin ( ) [inline]`

Get an iterator to the beginning of the knotvector

Returns

an iterator to the beginning of the knotvector

Definition at line 359 of file BsplineBasis.h.

**29.48.3.3** `void Go::BsplineBasis::check ( ) const`

Checks the validity of the object. Throws at error.

**29.48.3.4** `void Go::BsplineBasis::cNDiscontinuities ( std::vector< double > & cNDisconts, int depth ) const`

Find the first knot, the last knot, and all knots where not all B-splines have  $C^N$ -continuity, i.e. knots with multiplicity at least the order of the B-splines minus N

## Parameters

|                   |                                                             |
|-------------------|-------------------------------------------------------------|
| <i>cNdisconts</i> | upon function return, this vector holds all the knots found |
| <i>depth</i>      | the value of N, the degree of smoothness                    |

29.48.3.5 `void Go::BsplineBasis::coefsAffectingParam ( double tpar, int & first_coef, int & last_coef ) const`

Get the range of basis functions that are involved when evaluating at a given parameter.

## Parameters

|                   |                                                                |
|-------------------|----------------------------------------------------------------|
| <i>tpar</i>       | the parameter where we want to determine the influential range |
| <i>first_coef</i> | on function completion, will point to start of relevant range  |
| <i>last_coef</i>  | on function completion, will point to end of relevant range    |

29.48.3.6 `std::vector<double> Go::BsplineBasis::computeBasisValues ( double t, int derivs = 0 ) const`

Create a vector containing the basis values in a given parameter.

## Parameters

|               |                                                                                         |
|---------------|-----------------------------------------------------------------------------------------|
| <i>t</i>      | the parameter at which to evaluate the basis functions                                  |
| <i>derivs</i> | the number of function derivatives to calculate for each nonzero basis function at 't'. |

## Returns

a vector containing `order()` \* ('derivs'+1) values, which are the function values and derivatives up to order 'derivs' of the nonzero basis functions at parameter value 't'. The order in which these values are stored is as follows: first all function values for the 'order' nonzero basis functions, then their first derivatives, then their second, etc..

29.48.3.7 `void Go::BsplineBasis::computeBasisValues ( double t, double * basisvals_start, int derivs = 0, double resolution = 1.0e-12 ) const`

Space for the basis values is allocated outside and passed in. Needed space is equal to `order()*('derivs'+1)` doubles.

## Parameters

|                        |                                                                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>t</i>               | the parameter at which to evaluate the basis function                                                                                                                                                        |
| <i>basisvals_start</i> | pointer to the memory area where the result will be written. This must be allocated by the user. The order in which the result values are written is similar to <code>computeBasisValues(double, int)</code> |
| <i>derivs</i>          | number of derivatives that should be evaluated for each nonzero basis function ( <code>derivs</code> = 0 => only function values will be computed).                                                          |
| <i>resolution</i>      | accuracy for determining whether a given parametric value lies exactly 'on' a knot.                                                                                                                          |

29.48.3.8 `void Go::BsplineBasis::computeBasisValues ( const double * parvals_start, const double * parvals_end, double * basisvals_start, int * knotinter_start, int derivs = 0 ) const`

Compute basis values for many points simultaneously.

#### Parameters

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>parvals_start</i>   | pointer to the start of list of parameters where you want to evaluate the basis functions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>parvals_end</i>     | pointer to one-past-end of list of parameters where you want to evaluate the basis functions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>basisvals_start</i> | pointer to range where the result of the evaluations will be written. The necessary memory is equal to 'derivs' multiplied by <code>order()</code> multiplied by length of parameter list, and should be allocated by user before calling the function. The order in which these values are stored is: first all values concerning the first parameter in the input range, then all values concerning the second parameter in the input range, etc. For each such parameter, the concerned values are stored in the order described in <code>computeBasisValues(double, int)</code> |
| <i>knotinter_start</i> | pointer to range where the indexes to the parameter intervals in which the evaluated parameter values are located. ie. the index at <code>knotinter_start[i]</code> refer to the parameter interval where the i'th parameter in the range [ <code>parvals_start</code> , <code>parvals_end</code> ] is located. The total size of this range is therefore equal to ( <code>parvals_end</code> - <code>parvals_start</code> ), and should be allocated by the user.                                                                                                                  |
| <i>derivs</i>          | number of derivatives that should be evaluated for each nonzero basis function ( <code>derivs = 0</code> => only function values will be computed).                                                                                                                                                                                                                                                                                                                                                                                                                                 |

29.48.3.9 `std::vector<double> Go::BsplineBasis::computeBasisValuesLeft ( double tval, int derivs ) const`

This function is similar to `computeBasisValues(double, int)`, except that the values are calculated from the left, as opposed to the default right-evaluation.

#### See also

[computeBasisValues\(\)](#)

29.48.3.10 `void Go::BsplineBasis::computeBasisValuesLeft ( const double * parvals_start, const double * parvals_end, double * basisvals_start, int * knotinter_start, int derivs ) const`

This function is similar to `computeBasisValues(const double*, const double*, double*, int*, int)`, except that the values are calculated from the left, as opposed to the default right-evaluation.

29.48.3.11 `std::vector<double>::const_iterator Go::BsplineBasis::end ( ) const` `[inline]`

Get a const-iterator to the end of the knotvector

#### Returns

an iterator to the end of the knotvector

Definition at line 354 of file `BsplineBasis.h`.

29.48.3.12 `std::vector<double>::iterator Go::BsplineBasis::end ( )` `[inline]`

Get an iterator to the end of the knotvector

#### Returns

an iterator to the end of the knotvector

Definition at line 363 of file BsplineBasis.h.

29.48.3.13 `int Go::BsplineBasis::endMultiplicity ( bool atstart )` `const`

return the multiplicity of the first or the last knot

#### Parameters

|                |                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>atstart</i> | if this is 'true' then the multiplicity of the first knot will be returned. Otherwise, the multiplicity of the last knot will be returned. |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------|

#### Returns

the corresponding knot multiplicity

29.48.3.14 `double Go::BsplineBasis::endparam ( )` `const` `[inline]`

Query the end value of the parameter range

#### Returns

the end value of the parameter range

Definition at line 344 of file BsplineBasis.h.

29.48.3.15 `BsplineBasis Go::BsplineBasis::extendedBasis ( int order )` `const`

Make a basis function with the same inner knots, but with increased degree NB! The continuity of the space is increased If the basis is periodic, the new knots will be inserted at the start and end of the parameter interval, i.e. the continuity at the seam will be reduced Order is equal to polynomial degree + 1 The function throws if the specified order is less than the existing one

29.48.3.16 `std::vector<double> Go::BsplineBasis::getKnots ( )` `[inline]`

Definition at line 366 of file BsplineBasis.h.

29.48.3.17 `int Go::BsplineBasis::getMinContinuity ( )` `const`

The minimum continuity at inner knots.

29.48.3.18 `double Go::BsplineBasis::grevilleParameter ( int index )` `const` `[inline]`

Get the greville parameter starting from a certain knot

## Parameters

|              |                                                                             |
|--------------|-----------------------------------------------------------------------------|
| <i>index</i> | the index of the knot from which the greville parameter should be computed. |
|--------------|-----------------------------------------------------------------------------|

## Returns

the corresponding greville parameter

Definition at line 417 of file BsplineBasis.h.

**29.48.3.19** void Go::BsplineBasis::increaseOrder ( int *order* )

Adapt the knot vector to an increased polynomial order The given order is the expected new polynomial order of the basis

**29.48.3.20** bool Go::BsplineBasis::indistinctKnots ( double *tol*, std::vector< double > & *first\_knotval* ) const

Look for indistinct knots.

**29.48.3.21** void Go::BsplineBasis::insertKnot ( double *apar* )

Insert a knot into the knotvector.

## Parameters

|             |                                  |
|-------------|----------------------------------|
| <i>apar</i> | parameter value of the new knot. |
|-------------|----------------------------------|

**29.48.3.22** void Go::BsplineBasis::insertKnot ( const std::vector< double > & *new\_knots* )

Insert several knots into the knotvector

## Parameters

|                  |                                                                 |
|------------------|-----------------------------------------------------------------|
| <i>new_knots</i> | a STL vector containing the new knots to insert into the vector |
|------------------|-----------------------------------------------------------------|

**29.48.3.23** bool Go::BsplineBasis::isKreg ( ) const `[inline]`

query whether the basis has a k-regular knotvector (start and end knot has multiplicity equal to [order\(\)](#)).

## Returns

whether this basis has a k-regular knotvector or not.

Definition at line 314 of file BsplineBasis.h.

29.48.3.24 `bool Go::BsplineBasis::isOK ( ) const`

Checks the validity of the object. Does not throw.

29.48.3.25 `int Go::BsplineBasis::knotInterval ( double t ) const`

Find the interval in which the parameter value '*t*' lies.

#### Parameters

|          |                              |
|----------|------------------------------|
| <i>t</i> | the parameter value to test. |
|----------|------------------------------|

29.48.3.26 `int Go::BsplineBasis::knotIntervalFuzzy ( double & t, double tol = DEFAULT_PARAMETER_EPSILON ) const`

Find the interval in which a given parameter lies.

#### Parameters

|            |                                                                                                                                                                                                               |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>t</i>   | the parameter we want to locate within an interval                                                                                                                                                            |
| <i>tol</i> | if ' <i>t</i> ' is within DEFAULT_PARAMETER_EPSILON of an existing knot, ' <i>t</i> ' will be changed to that knot. To some callers of this function, that may be the primary wanted effect of this function. |

29.48.3.27 `void Go::BsplineBasis::knotMultiplicities ( std::vector< int > & multiplicities ) const`

Get the vector of knot multiplicities. To get the vector of corresponding knot values, use [knotsSimple\(\)](#).

#### Parameters

|                       |                                             |
|-----------------------|---------------------------------------------|
| <i>multiplicities</i> | the resulting vector of knot multiplicities |
|-----------------------|---------------------------------------------|

29.48.3.28 `int Go::BsplineBasis::knotMultiplicity ( const double parval ) const`

If there is a knot in the knotvector with the value '*parval*', its multiplicity is returned. Otherwise, 0 is returned.

#### Parameters

|               |                                                                     |
|---------------|---------------------------------------------------------------------|
| <i>parval</i> | the parameter value for which we want to know the knot multiplicity |
|---------------|---------------------------------------------------------------------|

#### Returns

the multiplicity in case the knot exists, 0 otherwise.

29.48.3.29 void Go::BsplineBasis::knotsSimple ( std::vector< double > & *result* ) const

Store all knots without multiplicity into one array

#### Parameters

|               |                                                       |
|---------------|-------------------------------------------------------|
| <i>result</i> | upon function return, this vector holds all the knots |
|---------------|-------------------------------------------------------|

29.48.3.30 int Go::BsplineBasis::lastKnotInterval ( ) const [inline]

Return the index of the left knot of the last knot interval accessed for some reason (evaluation, etc.) in this basis.

Definition at line 411 of file BsplineBasis.h.

29.48.3.31 std::vector<double> Go::BsplineBasis::missingKnots ( const BsplineBasis & *other*, double *tol* = DEFAULT\_PARAMETER\_EPSILON ) const

Return knots existing in the other spline space, but not in this one.

29.48.3.32 int Go::BsplineBasis::numCoefs ( ) const [inline]

Query the number of basis functions

#### Returns

the number of basis functions

Definition at line 329 of file BsplineBasis.h.

29.48.3.33 int Go::BsplineBasis::numElem ( ) const

Query the number of elements, number of non-degenerate knot intervals, in the knot vector

29.48.3.34 int Go::BsplineBasis::order ( ) const [inline]

Query the order of the basis functions

#### Returns

the order of the basis functions

Definition at line 334 of file BsplineBasis.h.

29.48.3.35 virtual void Go::BsplineBasis::read ( std::istream & *is* ) [virtual]

Read the [BsplineBasis](#) from a stream (ASCII mode).

## Parameters

|           |                                                                 |
|-----------|-----------------------------------------------------------------|
| <i>is</i> | the stream from which the <a href="#">BsplineBasis</a> is read. |
|-----------|-----------------------------------------------------------------|

Implements [Go::Streamable](#).

29.48.3.36 `virtual void Go::BsplineBasis::read_bin ( std::istream & is ) [virtual]`

Read the [BsplineBasis](#) from a stream (binary mode).

## Parameters

|           |                                                                 |
|-----------|-----------------------------------------------------------------|
| <i>is</i> | the stream from which the <a href="#">BsplineBasis</a> is read. |
|-----------|-----------------------------------------------------------------|

29.48.3.37 `void Go::BsplineBasis::removeKnot ( double old_knot )`

Remove a knot from the knotvector.

## Parameters

|                 |                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>old_knot</i> | Parameter value indicating the knot to be removed. The corresponding knot is the largest one which is less than or equal to 'old_knot'. |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------|

29.48.3.38 `void Go::BsplineBasis::rescale ( double new_start, double new_end )`

Rescales the knotvector so that parameter values lay in the specified interval.

## Parameters

|                  |                              |
|------------------|------------------------------|
| <i>new_start</i> | start of specified interval. |
| <i>new_end</i>   | end of specified interval.   |

29.48.3.39 `void Go::BsplineBasis::reverseParameterDirection ( )`

We want the new knot vector to be a mirror image of the old one, translated so that it starts and ends in the same values as before.

29.48.3.40 `bool Go::BsplineBasis::sameSplineSpace ( const BsplineBasis & other, double tol = DEFAULT_PARAMETER_EPSILON ) const`

Check equality of two spline spaces.

29.48.3.41 `template<typename RandomIterator > void Go::BsplineBasis::setData ( int number, int order, RandomIterator knotstart ) [inline]`

Change the defining data of an already-existing [BsplineBasis](#).

#### Parameters

|                  |                                                    |
|------------------|----------------------------------------------------|
| <i>number</i>    | Number of basis functions in space                 |
| <i>order</i>     | of the basis functions (polynomial degree + 1)     |
| <i>knotstart</i> | iterator pointing to start of defining knotvector. |

Definition at line 115 of file BsplineBasis.h.

29.48.3.42 `double Go::BsplineBasis::startparam ( ) const [inline]`

Query the start value of the parameter range

#### Returns

the start value of the parameter range

Definition at line 339 of file BsplineBasis.h.

29.48.3.43 `BsplineBasis Go::BsplineBasis::subBasis ( double tmin, double tmax, double knot_diff_tol = 1e-05 ) const`

Return the basis for the subspace limited by the interval [tmin,tmax].

29.48.3.44 `void Go::BsplineBasis::swap ( BsplineBasis & other )`

Quick swap of two BsplineBasises.

#### Parameters

|              |                                                |
|--------------|------------------------------------------------|
| <i>other</i> | the <a href="#">BsplineBasis</a> to swap with. |
|--------------|------------------------------------------------|

29.48.3.45 `virtual void Go::BsplineBasis::write ( std::ostream & os ) const [virtual]`

Write the [BsplineBasis](#) to a stream (ASCII mode).

#### Parameters

|           |                                                                 |
|-----------|-----------------------------------------------------------------|
| <i>os</i> | the stream to which the <a href="#">BsplineBasis</a> is written |
|-----------|-----------------------------------------------------------------|

Implements [Go::Streamable](#).

29.48.3.46 `virtual void Go::BsplineBasis::write_bin ( std::ostream & os ) const` [virtual]

Write the [BsplineBasis](#) to a stream (binary mode).

#### Parameters

|                 |                                                                 |
|-----------------|-----------------------------------------------------------------|
| <code>os</code> | the stream to which the <a href="#">BsplineBasis</a> is written |
|-----------------|-----------------------------------------------------------------|

## 29.48.4 Friends And Related Function Documentation

29.48.4.1 `void computeBasisValuesLeft ( double tval, double * basisvals_start, int derivs, double resolution = 1.0e-12 ) const` [related]

This function is similar to `computeBasisValues(double, double*, int)`, except that the values are calculated from the left, as opposed to the default right-evaluation.

#### Parameters

|                         |                                                                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>resolution</code> | tolerance deciding whether a parameter value is situated "directly on" a knot. (In such situations, it might matter whether we evaluate from left or from left). |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 29.51.1 Detailed Description

Used internally in [SurfaceModel](#). [CellDivision](#) divides the space occupied by a surface model into a number of equal boxes. The division is intended to improve the performance in closest point and intersection computations by giving the means to perform an initial interception test before the actual computations are started

## 29.52.1 Detailed Description

Class that represents a circle. It is a subclass of `ElementaryCurve` and thus has a parametrization.

A `Circle` has a natural parametrization in terms of the angle  $t$ :  $\mathbf{p}(t) = \mathbf{C} + r(\cos(t) \mathbf{x} + \sin(t) \mathbf{y})$ , where  $\mathbf{C}$  is the centre,  $r$  is the radius, and  $\mathbf{x}$  and  $\mathbf{y}$  are the (local) axes. The parametrization is (in principle) bounded:  $0 \leq t \leq 2\pi$ . The dimension is either 2 or 3.

Definition at line 59 of file `Circle.h`.

## 29.52.2 Constructor & Destructor Documentation

### 29.52.2.1 `Go::Circle::Circle ( ) [inline]`

Default constructor. Constructs an uninitialized [Circle](#) which can only be assigned to or read into.

Definition at line 64 of file `Circle.h`.

### 29.52.2.2 `Go::Circle::Circle ( double radius, Point centre, Point normal, Point x_axis, bool isReversed = false )`

Constructor. Input is the radius, the centre, the normal to the plane of the circle, and the (approximate) direction of the x-axis. The dimension must be either 2 or 3.

### 29.52.2.3 `virtual Go::Circle::~~Circle ( ) [virtual]`

virtual destructor - ensures safe inheritance

## 29.52.3 Member Function Documentation

### 29.52.3.1 `virtual void Go::Circle::appendCurve ( ParamCurve * cv, bool reparam = true ) [virtual]`

append a curve to this curve, with eventual reparametrization NB: This virtual member function currently only works for `SplineCurves` and `CurveOnSurfaces`. Moreover, 'this' curve and the 'cv' curve must be of the same type.

#### Parameters

|                |                                                          |
|----------------|----------------------------------------------------------|
| <i>cv</i>      | the curve to append to 'this' curve.                     |
| <i>reparam</i> | specify whether or not there should be reparametrization |

Implements [Go::ParamCurve](#).

### 29.52.3.2 `virtual void Go::Circle::appendCurve ( ParamCurve * cv, int continuity, double & dist, bool reparam = true ) [virtual]`

append a curve to this curve, with eventual reparametrization

#### Parameters

|                   |                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------|
| <i>cv</i>         | the curve to append to 'this' curve.                                                                  |
| <i>continuity</i> | the required continuity at the transition. Can be $G^{(-1)}$ and upwards.                             |
| <i>dist</i>       | a measure of the local distortion around the transition in order to achieve the specified continuity. |
| <i>reparam</i>    | specify whether or not there should be reparametrization                                              |

Implements [Go::ParamCurve](#).

29.52.3.3 virtual **BoundingBox** Go::Circle::boundingBox ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.52.3.4 static **ClassType** Go::Circle::classType ( ) [static]

29.52.3.5 virtual **Circle\*** Go::Circle::clone ( ) const [virtual]

The clone-function is herited from [GeomObject](#), but overridden here to get a covariant return type (for those compilers that allow this).

Implements [Go::ElementaryCurve](#).

29.52.3.6 virtual void Go::Circle::closestPoint ( const **Point** & *pt*, double *tmin*, double *tmax*, double & *clo\_t*, **Point** & *clo\_pt*, double & *clo\_dist*, double const \* *seed* = 0 ) const [virtual]

Compute the closest point from an interval of this curve to a specified point.

Parameters

|                 |                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>       | point we want to find the closest point to                                                                                               |
| <i>tmin</i>     | start parameter of search interval                                                                                                       |
| <i>tmax</i>     | end parameter of search interval                                                                                                         |
| <i>clo_t</i>    | upon function return, 'clo_t' will contain the parameter value of the closest point found.                                               |
| <i>clo_pt</i>   | upon function return, 'clo_pt' will contain the position of the closest point found.                                                     |
| <i>clo_dist</i> | upon function return, 'clo_dist' will contain the distance between 'pt' and the closest point found.                                     |
| <i>seed</i>     | pointer to initial guess value, provided by the user (can be 0, for which the algorithm will determine a (hopefully) reasonable choice). |

Implements [Go::ParamCurve](#).

29.52.3.7 virtual **SplineCurve\*** Go::Circle::createSplineCurve ( ) const [virtual]

Creates a [SplineCurve](#) representation of the circle. The spline representation is geometrically exact, but the parametrization is only an approximation. If `setParameterBounds()` have been used to set bounds on the parametrization, then the endpoints of the resulting spline curve *does* have correct parameter values.

Implements [Go::ElementaryCurve](#).

29.52.3.8 virtual int Go::Circle::dimension ( ) const [virtual]

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.52.3.9 virtual **DirectionCone** Go::Circle::directionCone ( ) const [virtual]

Creates a [DirectionCone](#) which covers all tangent directions of this curve.

**Returns**

the smallest [DirectionCone](#) containing all tangent directions of this curve.

Implements [Go::ParamCurve](#).

29.52.3.10 virtual **double** Go::Circle::endparam ( ) const [virtual]

Query the end parameter of the curve

**Returns**

the curve's end parameter

Implements [Go::ParamCurve](#).

29.52.3.11 virtual **SplineCurve\*** Go::Circle::geometryCurve ( ) [virtual]

If the definition of this [ParamCurve](#) contains a [SplineCurve](#) describing its spatial shape, then this function will return a pointer to this [SplineCurve](#). Otherwise it will return a null pointer. The returned curve is NEWed, so the user is responsible for deleting it. This function may have side-effects.

**Returns**

a pointer to a [SplineCurve](#) representation of the [ParamCurve](#), if it exists. Null pointer otherwise.

Implements [Go::ParamCurve](#).

29.52.3.12 **Point** Go::Circle::getCentre ( ) const [inline]

Definition at line 151 of file Circle.h.

29.52.3.13 **Point** Go::Circle::getNormal ( ) const [inline]

Definition at line 156 of file Circle.h.

29.52.3.14 **double** Go::Circle::getRadius ( ) const [inline]

Definition at line 166 of file Circle.h.

29.52.3.15 `Point Go::Circle::getXAxis ( ) const [inline]`

Definition at line 161 of file Circle.h.

29.52.3.16 `virtual ClassType Go::Circle::instanceType ( ) const [virtual]`

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.52.3.17 `virtual bool Go::Circle::isAxisRotational ( Point & centre, Point & axis, Point & vec, double & angle ) [virtual]`

Check if the curve is axis rotational. Only true if a connection to an axis rotational elementary curve exist The axis and rotational angle is only specified if the curve is actually rotational

Reimplemented from [Go::ParamCurve](#).

29.52.3.18 `bool Go::Circle::isClosed ( ) const`

29.52.3.19 `virtual bool Go::Circle::isDegenerate ( double degenerate_epsilon ) [virtual]`

Query whether the curve is degenerate (collapsed into a single point).

#### Parameters

|                           |                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>degenerate_epsilon</i> | the tolerance used in determine whether the curve is degenerate. A curve is considered degenerate if its total length is shorter than this value. |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

#### Returns

`true` if the curve is degenerate, `false` otherwise.

Implements [Go::ParamCurve](#).

29.52.3.20 `virtual bool Go::Circle::isInPlane ( const Point & loc, const Point & axis, double eps, Point & normal ) const [virtual]`

Check if the line lies in a plane passing through a given axis.

Reimplemented from [Go::ParamCurve](#).

29.52.3.21 `virtual bool Go::Circle::isInPlane ( const Point & norm, double eps, Point & pos ) const [virtual]`

Check if the circle lies in a plane with a given normal.

Reimplemented from [Go::ParamCurve](#).

29.52.3.22 virtual double Go::Circle::length ( double *tol* ) [virtual]

Compute the total length of this curve up to some tolerance

## Parameters

|            |                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>tol</i> | the relative tolerance when approximating the length, i.e. stop iteration when error becomes smaller than $tol/(curve\ length)$ |
|------------|---------------------------------------------------------------------------------------------------------------------------------|

## Returns

the length calculated

Implements [Go::ParamCurve](#).

**29.52.3.23** `virtual void Go::Circle::point ( Point & pt, double tpar ) const [virtual]`

Evaluate the curve's position at a given parameter

## Parameters

|             |                                                                      |
|-------------|----------------------------------------------------------------------|
| <i>pt</i>   | the evaluated position will be written to this <a href="#">Point</a> |
| <i>tpar</i> | the parameter for which we wish to evaluate the curve                |

Implements [Go::ParamCurve](#).

**29.52.3.24** `virtual void Go::Circle::point ( std::vector< Point > & pts, double tpar, int derivs, bool from_right = true ) const [virtual]`

Evaluate the curve's position and a certain number of derivatives at a given parameter.

## Parameters

|                   |                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pts</i>        | the evaluated position and derivatives (tangent, curvature vector, etc.) will be written to this vector. The first entry will be the position, the second entry will be the first derivative, etc. The size of this vector must be set to 'derivs'+ 1 prior to calling this function. |
| <i>tpar</i>       | the parameter for which we want to evaluate the curve                                                                                                                                                                                                                                 |
| <i>derivs</i>     | the number of derivatives we want to have calculated                                                                                                                                                                                                                                  |
| <i>from_right</i> | specify whether we should calculate derivatives 'from the right' or 'from the left' (default is from the right). This matters only when the curve presents discontinuities in its derivatives.                                                                                        |

Implements [Go::ParamCurve](#).

**29.52.3.25** `virtual void Go::Circle::read ( std::istream & is ) [virtual]`

Read object from stream

## Parameters

|           |                                  |
|-----------|----------------------------------|
| <i>is</i> | stream from which object is read |
|-----------|----------------------------------|

Implements [Go::Streamable](#).

**29.52.3.26** virtual void `Go::Circle::setParamBounds ( double startpar, double endpar )` [virtual]

Set bounds for the parametrization of the [Circle](#) other than the default  $[0, 2\pi]$ . Requirements for a valid parametrization are: 1) The first parameter must be strictly less than the second, 2) Parameter values must be in  $[-2\pi, 2\pi]$ , and 3) ( $endpar - startpar$ ) must not exceed  $2\pi$ .

Parameters

|                 |                 |
|-----------------|-----------------|
| <i>startpar</i> | start parameter |
| <i>endpar</i>   | end parameter   |

Implements [Go::ElementaryCurve](#).

**29.52.3.27** virtual void `Go::Circle::setParameterInterval ( double t1, double t2 )` [virtual]

[Circle](#) parametrized on  $[0, 2 * M\_PI]$ . Allowing class to be defined on a section of the circle.

Implements [Go::ParamCurve](#).

**29.52.3.28** void `Go::Circle::setSpanningVectors ( )` [protected]

**29.52.3.29** virtual double `Go::Circle::startparam ( )` const [virtual]

Query the start parameter of the curve

Returns

the curve's start parameter

Implements [Go::ParamCurve](#).

**29.52.3.30** virtual `Circle*` `Go::Circle::subCurve ( double from_par, double to_par, double fuzzy = DEFAULT_PARAMETER_EPSILON )` const [virtual]

Returns a curve which is a part of this curve. The result is NEWed, so the user is responsible for deleting it. NB: It is not guaranteed that the [ParamCurve](#) that is returned is of the same type as the curve itself. Thus, the returned curve might be a [SplineCurve](#).

Parameters

|                 |                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>from_par</i> | start value of parameter interval that will define the subcurve                                                                                                                                                |
| <i>to_par</i>   | end value of parameter interval that will define the subcurve                                                                                                                                                  |
| <i>fuzzy</i>    | since <code>subCurve</code> works on those curves who are spline-based, this tolerance defines how close the start and end parameter must be to an existing knot in order to be considered <i>on</i> the knot. |

**Returns**

a pointer to a new subcurve which represents the part of the curve between 'from\_par' and 'to\_par'. It will be spline-based and have a k-regular knotvector. The user is responsible for deleting this subcurve when it is no longer needed.

Implements [Go::ElementaryCurve](#).

**29.52.3.31** virtual void `Go::Circle::swapParameters2D ( )` [virtual]

If the curve is 2 dimensional, x and y coordinates will be swapped. Used when curve is a parameter curve.

Implements [Go::ElementaryCurve](#).

**29.52.3.32** virtual void `Go::Circle::translateCurve ( const Point & dir )` [virtual]

Implements [Go::ElementaryCurve](#).

**29.52.3.33** virtual void `Go::Circle::write ( std::ostream & os ) const` [virtual]

Write object to stream

**Parameters**

|                 |                                   |
|-----------------|-----------------------------------|
| <code>os</code> | stream to which object is written |
|-----------------|-----------------------------------|

Implements [Go::Streamable](#).

## 29.56 Go::CompleteEdgeNet Class Reference

Complete the edge net of a [SurfaceModel](#). Fetches the wire frame model corresponding to a surface model, and extends it such that the extended wire frame will become the wire frame model corresponding to a volume model have the given surface model as its outer boundary. The extension to the wireframe is represented as pairs of vertices where these vertices lie at the endpoints of the missing edges. NB! This solution is currently not expected to handle all configurations.

```
#include <CompleteEdgeNet.h>
```

### Public Member Functions

- shared\_ptr< [SurfaceModel](#) > [getRegularizedModel](#) ()
- std::vector< std::pair< shared\_ptr< [Vertex](#) >, shared\_ptr< [Vertex](#) > > > [getMissingEdges](#) ()

#### 29.56.1 Detailed Description

Complete the edge net of a [SurfaceModel](#). Fetches the wire frame model corresponding to a surface model, and extends it such that the extended wire frame will become the wire frame model corresponding to a volume model have the given surface model as its outer boundary. The extension to the wireframe is represented as pairs of vertices where these vertices lie at the endpoints of the missing edges. NB! This solution is currently not expected to handle all configurations.

Definition at line 55 of file CompleteEdgeNet.h.

#### 29.56.2 Constructor & Destructor Documentation

**29.56.2.1** `Go::CompleteEdgeNet::CompleteEdgeNet ( shared_ptr< SurfaceModel > sfmodel, bool perform_step2, bool smooth_connections )`

Constructor. The method is applied on a [SurfaceModel](#)

##### Parameters

|                |                                           |
|----------------|-------------------------------------------|
| <i>sfmodel</i> | Pointer to a <a href="#">SurfaceModel</a> |
|----------------|-------------------------------------------|

**29.56.2.2** `Go::CompleteEdgeNet::~~CompleteEdgeNet ( )`

Destructor.

#### 29.56.3 Member Function Documentation

29.56.3.1 `std::vector<std::pair<shared_ptr<Vertex>, shared_ptr<Vertex> > >` `Go::CompleteEdgeNet::getMissingEdges ( )` `[inline]`

Fetch new edges represented by their end vertices

#### Returns

Vector of pointers to end vertices of the edges

Definition at line 81 of file `CompleteEdgeNet.h`.

29.56.3.2 `shared_ptr<SurfaceModel>` `Go::CompleteEdgeNet::getRegularizedModel ( )` `[inline]`

Fetch modified model (after regularization)

#### Returns

Pointer to the modified model

Definition at line 73 of file `CompleteEdgeNet.h`.

29.56.3.3 `bool` `Go::CompleteEdgeNet::perform ( std::vector< std::pair< Point, Point > > & corr_vx_pts )`

Apply algorithm for completing the edge net and create a starting ground for a block structured model of solids

#### Returns

Whether the edge net was completed or not.

### 29.57.1 Detailed Description

This class contains statistical information used to check whether an intersection problem is simplified during recursive subdivision

Definition at line 50 of file ComplexityInfo.h.

### 29.57.2 Constructor & Destructor Documentation

#### 29.57.2.1 `Go::ComplexityInfo::ComplexityInfo ( )` `[inline]`

Default constructor.

Definition at line 53 of file ComplexityInfo.h.

#### 29.57.2.2 `Go::ComplexityInfo::~~ComplexityInfo ( )` `[inline]`

Destructor.

Definition at line 61 of file ComplexityInfo.h.

### 29.57.3 Member Function Documentation

#### 29.57.3.1 `double Go::ComplexityInfo::getBoxOverlap ( )` `[inline]`

Get the overlap between two boxes

##### Returns

the box overlap

Definition at line 80 of file ComplexityInfo.h.

#### 29.57.3.2 `double Go::ComplexityInfo::getConeOverlap ( )` `[inline]`

Get the overlapping angle between two cones

##### Returns

the overlapping angle

Definition at line 70 of file ComplexityInfo.h.

29.57.3.3 `int Go::ComplexityInfo::getNmbIntpts ( ) [inline]`

Get the number of intersection points between two objects

**Returns**

the number of intersection points

Definition at line 90 of file ComplexityInfo.h.

29.57.3.4 `int Go::ComplexityInfo::getNmbSingpts ( ) [inline]`

Get the number of singular points

**Returns**

the number of singular points

Definition at line 100 of file ComplexityInfo.h.

29.57.3.5 `bool Go::ComplexityInfo::isComplex ( ) [inline]`

Get flag for complex case

**Returns**

`true` if complex, `false` otherwise

Definition at line 109 of file ComplexityInfo.h.

29.57.3.6 `void Go::ComplexityInfo::setBoxOverlap ( double overlap ) [inline]`

Set the overlap between two boxes

**Parameters**

|                |                 |
|----------------|-----------------|
| <i>overlap</i> | the box overlap |
|----------------|-----------------|

Definition at line 75 of file ComplexityInfo.h.

29.57.3.7 `void Go::ComplexityInfo::setComplex ( ) [inline]`

Set flag for complex case.

Definition at line 104 of file ComplexityInfo.h.

29.57.3.8 void Go::ComplexityInfo::setConeOverlap ( double *overlap* ) [inline]

Set the overlapping angle between two cones

Parameters

|                |                       |
|----------------|-----------------------|
| <i>overlap</i> | the overlapping angle |
|----------------|-----------------------|

Definition at line 65 of file ComplexityInfo.h.

29.57.3.9 void Go::ComplexityInfo::setNmbIntpts ( int *nmbpts* ) [inline]

Set the number of intersection points between two objects

Parameters

|               |                                   |
|---------------|-----------------------------------|
| <i>nmbpts</i> | the number of intersection points |
|---------------|-----------------------------------|

Definition at line 85 of file ComplexityInfo.h.

29.57.3.10 void Go::ComplexityInfo::setNmbSingpts ( int *nmbpts* ) [inline]

Set the number of singular points

Parameters

|               |                               |
|---------------|-------------------------------|
| <i>nmbpts</i> | the number of singular points |
|---------------|-------------------------------|

Definition at line 95 of file ComplexityInfo.h.

- `bool containsBox (const CompositeBox &box, double toli=0.0, double tole=0.0) const`

### 29.58.1 Detailed Description

Composite of two bounding boxes. The inner box is supposed to be a bounding box for the interior of an object, while the edge box bounds the outer edges. When requests are made, the `CompositeBox` is treated as a single axis-aligned box, but tolerances can be given for both sub-boxes separately. A `CompositeBox` object can have any number of dimensions.

Definition at line 57 of file `CompositeBox.h`.

### 29.58.2 Constructor & Destructor Documentation

**29.58.2.1** `template<typename RandomAccessIterator > Go::CompositeBox::CompositeBox ( RandomAccessIterator start, int dim, int num_u, int num_v ) [inline]`

Constructor using `setFromArray()`

Definition at line 62 of file `CompositeBox.h`.

**29.58.2.2** `Go::CompositeBox::CompositeBox ( const Point & low, const Point & high ) [inline]`

Creates a `CompositeBox` with the `Point` `low` specifying the lower bound in all dimensions and `high` specifying the upper bound. The inner and edge boxes are equal.

Definition at line 73 of file `CompositeBox.h`.

### 29.58.2.3 Go::CompositeBox::~~CompositeBox ( )

Do not inherit from this class – nonvirtual destructor.

## 29.58.3 Member Function Documentation

### 29.58.3.1 bool Go::CompositeBox::containsBox ( const CompositeBox & *box*, double *toli* = 0.0, double *tole* = 0.0 ) const

Returns true if this box contain the box passed as a parameter, up to tolerances. Tolerances may be specified separately for inner and edge boxes.

### 29.58.3.2 bool Go::CompositeBox::containsPoint ( const Point & *pt*, double *toli* = 0.0, double *tole* = 0.0 ) const

Returns true if the point *pt* is inside the box, up to tolerances. Tolerances may be specified separately for inner and edge boxes.

### 29.58.3.3 int Go::CompositeBox::dimension ( ) const [inline]

The dimension of the composite box.

Definition at line 180 of file CompositeBox.h.

### 29.58.3.4 const BoundingBox& Go::CompositeBox::edge ( ) const [inline]

The edge box.

Definition at line 201 of file CompositeBox.h.

### 29.58.3.5 bool Go::CompositeBox::getOverlap ( const CompositeBox & *box*, double & *overlap*, double *toli* = 0.0, double *tole* = 0.0 ) const

Get the overlap between the two boxes. Tolerances may be specified separately for inner and edge boxes.

### 29.58.3.6 Point Go::CompositeBox::high ( double *toli* = 0.0, double *tole* = 0.0 ) const

The upper bound of the composite box.

### 29.58.3.7 const BoundingBox& Go::CompositeBox::inner ( ) const [inline]

The inner box.

Definition at line 196 of file CompositeBox.h.

29.58.3.8 **Point** Go::CompositeBox::low ( **double** *tol* = 0.0, **double** *tole* = 0.0 ) **const**

The lower bound of the composite box.

29.58.3.9 **bool** Go::CompositeBox::overlaps ( **const** CompositeBox & *box*, **double** *tol* = 0.0, **double** *tole* = 0.0 ) **const**

Returns true if the two boxes overlap, up to tolerances. Tolerances may be specified separately for inner and edge boxes.

29.58.3.10 **void** Go::CompositeBox::read ( **std::istream** & *is* )

Read a composite box from a standard istream.

29.58.3.11 **template**<typename RandomAccessIterator > **void** Go::CompositeBox::setFromArray ( RandomAccessIterator *start*, **int** *dim*, **int** *num\_u*, **int** *num\_v* ) **[inline]**

Given an array of dim-dimensional points stored as doubles or floats, makes the smallest composite box containing all points in the array. The array must be like a control point grid, with num\_u points in the fastest running direction, and num\_v points in the other direction. For curves, use num\_v = 1.

Definition at line 96 of file CompositeBox.h.

29.58.3.12 **void** Go::CompositeBox::setFromPoints ( **const** Point & *low*, **const** Point & *high* ) **[inline]**

Makes the bounding box have lower bounds as specified in low and upper bounds as specified in high.

Definition at line 82 of file CompositeBox.h.

29.58.3.13 **void** Go::CompositeBox::write ( **std::ostream** & *os* ) **const**

Write a composite box to a standard ostream.

## Additional Inherited Members

### 29.59.1 Detailed Description

A composite curve including topological information

Definition at line 66 of file CompositeCurve.h.

### 29.59.2 Constructor & Destructor Documentation

**29.59.2.1** `Go::CompositeCurve::CompositeCurve ( double gap, double neighbour, double kink, double bend, std::vector< shared_ptr< ParamCurve > > &curves )`

Constructor. The sequence of the input curves will be kept, but a permutation array will sort the curves according to continuity

#### Parameters

|                  |                                                                                                                 |
|------------------|-----------------------------------------------------------------------------------------------------------------|
| <i>gap</i>       | If the distance between two points is less than 'gap' they are viewed as identical.                             |
| <i>neighbour</i> | Maximum distance between curves viewed as adjacent.                                                             |
| <i>kink</i>      | If two adjacent curves meet with an angle less than 'kink', they are seen as G1 continuous. (angles in radians) |
| <i>bend</i>      | If two curves meet with an angle larger than 'bend', there is an intentional corner. (angles in radians)        |
| <i>curves</i>    | A vector of curves.                                                                                             |

### 29.59.2.2 `Go::CompositeCurve::~~CompositeCurve ( )`

Destructor.

## 29.59.3 Member Function Documentation

### 29.59.3.1 `void Go::CompositeCurve::append ( shared_ptr< ParamCurve > curve )`

Append a new curve to the composite curve. The curve is included in the topological structure.

#### Parameters

|              |                |
|--------------|----------------|
| <i>curve</i> | The new curve. |
|--------------|----------------|

### 29.59.3.2 `virtual BoundingBox Go::CompositeCurve::boundingBox ( ) [virtual]`

Bounding box of the entire composite curve

#### Returns

Bounding box

Implements [Go::CompositeModel](#).

### 29.59.3.3 `virtual BoundingBox Go::CompositeCurve::boundingBox ( int idx ) const [virtual]`

Bounding box corresponding to one curve

#### Parameters

|            |                |
|------------|----------------|
| <i>idx</i> | Index of curve |
|------------|----------------|

#### Returns

Bounding box of curve with index *idx*.

Implements [Go::CompositeModel](#).

### 29.59.3.4 `virtual CompositeCurve* Go::CompositeCurve::clone ( ) const [virtual]`

Make a copy of the current model

#### Returns

Pointer to the composite curve

Reimplemented from [Go::CompositeModel](#).

29.59.3.5 `virtual void Go::CompositeCurve::closestPoint ( Point & pnt, Point & clo_pnt, int & idx, double clo_par[], double & dist )` [virtual]

Closest point between a given point and this composite curve Returns one point

#### Parameters

|            |             |
|------------|-------------|
| <i>pnt</i> | Input point |
|------------|-------------|

#### Return values

|                   |                                                      |
|-------------------|------------------------------------------------------|
| <i>clo_pnt</i>    | Found closest point                                  |
| <i>idx</i>        | Index of curve where the closest point is found      |
| <i>clo_par</i> [] | Parameter value corresponding to the closest point   |
| <i>dist</i>       | Distance between input point and found closest point |

Implements [Go::CompositeModel](#).

29.59.3.6 `PointOnCurve Go::CompositeCurve::closestPoint ( Point & pnt )`

Closest point between a given point and this composite curve Returns one point

#### Parameters

|            |             |
|------------|-------------|
| <i>pnt</i> | Input point |
|------------|-------------|

#### Returns

Closest point

29.59.3.7 `virtual double Go::CompositeCurve::curvature ( int idx, double * par ) const` [virtual]

[Curvature](#) of a curve

#### Parameters

|            |                                               |
|------------|-----------------------------------------------|
| <i>idx</i> | Index of curve                                |
| <i>par</i> | Parameter value at which to compute curvature |

#### Returns

The curvature.

Implements [Go::CompositeModel](#).

29.59.3.8 virtual void Go::CompositeCurve::evaluate ( int *idx*, double *par*[], Point & *pnt* ) const [virtual]

Evaluate position

## Parameters

|              |                 |
|--------------|-----------------|
| <i>idx</i>   | Index of curve  |
| <i>par[]</i> | Parameter value |

## Return values

|            |        |
|------------|--------|
| <i>pnt</i> | Result |
|------------|--------|

Implements [Go::CompositeModel](#).

**29.59.3.9** `virtual void Go::CompositeCurve::evaluate ( int idx, double par[], int nder, std::vector< Point > & der ) const`  
 [virtual]

Evaluate position and a number of derivatives The sequence is position, first derivative, second derivative, etc.

## Parameters

|             |                                                   |
|-------------|---------------------------------------------------|
| <i>idx</i>  | Index of curve                                    |
| <i>par</i>  | Parameter value                                   |
| <i>nder</i> | Number of derivatives to compute, 0=only position |

## Return values

|            |        |
|------------|--------|
| <i>der</i> | Result |
|------------|--------|

Implements [Go::CompositeModel](#).

**29.59.3.10** `void Go::CompositeCurve::evaluateCurve ( double par, Point & pnt ) const`

Evaluate with respect to the composite curve. Evaluate position

## Parameters

|            |                 |
|------------|-----------------|
| <i>par</i> | Parameter value |
|------------|-----------------|

## Return values

|            |        |
|------------|--------|
| <i>pnt</i> | Result |
|------------|--------|

**29.59.3.11** `void Go::CompositeCurve::evaluateCurve ( double par, int nder, std::vector< Point > & der ) const`

Evaluate position and a number of derivatives The sequence is position, first derivative, second derivative, etc.

## Parameters

|             |                                                   |
|-------------|---------------------------------------------------|
| <i>par</i>  | Parameter value                                   |
| <i>nder</i> | Number of derivatives to compute, 0=only position |

## Return values

|            |        |
|------------|--------|
| <i>der</i> | Result |
|------------|--------|

29.59.3.12 `virtual void Go::CompositeCurve::extremalPoint ( Point & dir, Point & ext_pnt, int & idx, double ext_par[] )`  
[virtual]

Extremal point(s) in a given direction

## Parameters

|            |           |
|------------|-----------|
| <i>dir</i> | Direction |
|------------|-----------|

## Return values

|                  |                                                  |
|------------------|--------------------------------------------------|
| <i>ext_pnt</i>   | Found extremal point                             |
| <i>idx</i>       | Index of curve where the extremal point is found |
| <i>ext_par[]</i> | Parameter value of extremal point                |

Implements [Go::CompositeModel](#).

29.59.3.13 `shared_ptr<ParamCurve> Go::CompositeCurve::getCurve ( int idx ) const`

Return one curve. Note that the index corresponds to the sequence of which the curves are added to the [CompositeCurve](#), not the position in the composite curve

## Parameters

|            |                 |
|------------|-----------------|
| <i>idx</i> | Index of curve. |
|------------|-----------------|

## Returns

Pointer to the curve.

29.59.3.14 `double Go::CompositeCurve::getGlobalPar ( int idx, double par ) const`

Conversion between parameter settings

## Parameters

|            |                        |
|------------|------------------------|
| <i>idx</i> | Index of sub curve     |
| <i>par</i> | Parameter in sub curve |

## Returns

the global parameter corresponding to a sub curve parameter

**29.59.3.15** `int Go::CompositeCurve::getIndex ( ParamCurve * curve ) const`

Given a curve in the composite curve, return the index of this curve

## Parameters

|              |                  |
|--------------|------------------|
| <i>curve</i> | Pointer to curve |
|--------------|------------------|

## Returns

Index to curve

**29.59.3.16** `void Go::CompositeCurve::getLocalPar ( double global_par, int & idx, double & local_par ) const`

Return the sub curve parameter corresponding to a global parameter. At joints, the first sub curve parameter will be returned.

## Parameters

|                   |                                  |
|-------------------|----------------------------------|
| <i>global_par</i> | Parameter in composite curve     |
| <i>idx</i>        | Index of corresponding sub curve |

## Return values

|                  |                        |
|------------------|------------------------|
| <i>local_par</i> | Parameter in sub curve |
|------------------|------------------------|

**29.59.3.17** `bool Go::CompositeCurve::hit ( const Point & point, const Point & dir, PointOnCurve & result )`

Test if a line with direction 'dir' through the point 'point' hits this composite curve. If it hits, return 'true' and the intersection point closest to 'point'.

## Parameters

|              |                    |
|--------------|--------------------|
| <i>point</i> | Point on the line. |
| <i>dir</i>   | Line direction.    |

## Return values

|               |                             |
|---------------|-----------------------------|
| <i>result</i> | Closest intersection point. |
|---------------|-----------------------------|

## Returns

Whether the line hits or not.

29.59.3.18 `virtual shared_ptr<IntResultsModel> Go::CompositeCurve::intersect ( const ftLine & line ) [virtual]`

Intersection with a line. Expected output is points, probably one point. Curves can occur in special configurations. The function makes most sense in 2D, otherwise it is very dependent on the tolerance.

## Parameters

|             |           |
|-------------|-----------|
| <i>line</i> | The line. |
|-------------|-----------|

## Returns

Pointer to an [IntResultsModel](#).

Implements [Go::CompositeModel](#).

29.59.3.19 `virtual shared_ptr<IntResultsModel> Go::CompositeCurve::intersect_plane ( const ftPlane & plane ) [virtual]`

Intersection with a plane.

## Parameters

|              |            |
|--------------|------------|
| <i>plane</i> | The plane. |
|--------------|------------|

## Returns

Pointer to an [IntResultsModel](#).

Implements [Go::CompositeModel](#).

29.59.3.20 `virtual bool Go::CompositeCurve::isDegenerate ( int idx ) const [virtual]`

Whether one particular curve is degenerated

## Parameters

|            |                |
|------------|----------------|
| <i>idx</i> | Index of curve |
|------------|----------------|

**Returns**

Whether the curve is degenerated

Implements [Go::CompositeModel](#).

29.59.3.21 `virtual int Go::CompositeCurve::nmbEntities ( ) const [virtual]`

Number of simple entities

**Returns**

Number of simple entities

Implements [Go::CompositeModel](#).

29.59.3.22 `void Go::CompositeCurve::parameterRange ( double & start, double & end ) const`

Get the parameter range.

**Return values**

|              |                  |
|--------------|------------------|
| <i>start</i> | Parameter start. |
| <i>end</i>   | Parameter end.   |

29.59.3.23 `virtual void Go::CompositeCurve::tessellate ( std::vector< shared_ptr< GeneralMesh > > & meshes ) const [virtual]`

Tessellate with respect to a default parameter

**Return values**

|               |                   |
|---------------|-------------------|
| <i>meshes</i> | Tessellated model |
|---------------|-------------------|

Implements [Go::CompositeModel](#).

29.59.3.24 `virtual void Go::CompositeCurve::tessellate ( int resolution[], std::vector< shared_ptr< GeneralMesh > > & meshes ) const [virtual]`

Tessellate with respect to a given resolution

**Parameters**

|                     |                                                |
|---------------------|------------------------------------------------|
| <i>resolution[]</i> | All curves are tessellated with resolution[0]. |
|---------------------|------------------------------------------------|

## Return values

|               |                  |
|---------------|------------------|
| <i>meshes</i> | Tesselated model |
|---------------|------------------|

Implements [Go::CompositeModel](#).

29.59.3.25 `void Go::CompositeCurve::tessellate ( const std::vector< shared_ptr< ParamCurve > > & curves, int resolution[], std::vector< shared_ptr< GeneralMesh > > & meshes ) const`

Tesselate specified curves with respect to a given resolution

## Parameters

|                     |                                                      |
|---------------------|------------------------------------------------------|
| <i>curves</i>       | Specified curves                                     |
| <i>resolution[]</i> | Specified curves are tessellated with resolution[0]. |

## Return values

|               |                  |
|---------------|------------------|
| <i>meshes</i> | Tesselated model |
|---------------|------------------|

29.59.3.26 `virtual void Go::CompositeCurve::tessellate ( double density, std::vector< shared_ptr< GeneralMesh > > & meshes ) const [virtual]`

Tesselate with respect to a given tessellation density

## Parameters

|                |                      |
|----------------|----------------------|
| <i>density</i> | Tessellation density |
|----------------|----------------------|

## Return values

|               |                  |
|---------------|------------------|
| <i>meshes</i> | Tesselated model |
|---------------|------------------|

Implements [Go::CompositeModel](#).

29.59.3.27 `void Go::CompositeCurve::tessellate ( const std::vector< shared_ptr< ParamCurve > > & curves, double density, std::vector< shared_ptr< GeneralMesh > > & meshes ) const`

Tesselate specified curves with respect to a given tessellation density

## Parameters

|                |                      |
|----------------|----------------------|
| <i>curves</i>  | Specified curves     |
| <i>density</i> | Tessellation density |

## Return values

|               |                  |
|---------------|------------------|
| <i>meshes</i> | Tesselated model |
|---------------|------------------|

29.59.3.28 virtual void Go::CompositeCurve::tesselatedCtrPolygon ( std::vector< shared\_ptr< LineCloud > > & *ctr\_pol* ) const [virtual]

Return a tessellation of the control polygon of this composite curve

## Return values

|                |                                                    |
|----------------|----------------------------------------------------|
| <i>ctr_pol</i> | Tesselated control polygon of this composite curve |
|----------------|----------------------------------------------------|

Implements [Go::CompositeModel](#).

29.59.3.29 void Go::CompositeCurve::tesselatedCtrPolygon ( const std::vector< shared\_ptr< ParamCurve > > & *curves*, std::vector< shared\_ptr< LineCloud > > & *ctr\_pol* ) const

Return a tessellation of the control polygon of specified curves

## Parameters

|               |                  |
|---------------|------------------|
| <i>curves</i> | Specified curves |
|---------------|------------------|

## Return values

|                |                                               |
|----------------|-----------------------------------------------|
| <i>ctr_pol</i> | Tesselated control polygon of specified curve |
|----------------|-----------------------------------------------|

29.59.3.30 virtual void Go::CompositeCurve::turn ( int *idx* ) [virtual]

Turn parameter direction of one curve. An update in the topology structures is required.

## Parameters

|            |                |
|------------|----------------|
| <i>idx</i> | Index of curve |
|------------|----------------|

Implements [Go::CompositeModel](#).

29.59.3.31 virtual void Go::CompositeCurve::turn ( ) [virtual]

Turn parameter directions of all curves. An update in the topology structures is required.

Implements [Go::CompositeModel](#).

The documentation for this class was generated from the following file:

#### 29.60.1 Detailed Description

Abstract base class for a surface model or a curve model.

Definition at line 72 of file CompositeModel.h.

#### 29.60.2 Constructor & Destructor Documentation

##### 29.60.2.1 Go::CompositeModel::CompositeModel ( double gap, double neighbour, double kink, double bend )

Constructor with topology tolerances

##### Parameters

|                  |                                                                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>gap</i>       | If the distance between two points are less than 'gap' they are viewed as identical.                                                                                                                                                                                                                  |
| <i>neighbour</i> | Maximum distance between curves or surfaces viewed as adjacent.                                                                                                                                                                                                                                       |
| <i>kink</i>      | If two adjacent curves or surfaces meet with an angle less than 'kink', they are seen as G1 continuous. (Angles in radians)                                                                                                                                                                           |
| <i>bend</i>      | If two surfaces meet along a common boundary and corresponding surface normals form an angle which is larger than 'bend', there is an intentional sharp edge between the surfaces. Similarly if two curves meet with an angle larger than 'bend', there is an intentional corner. (Angles in radians) |

##### 29.60.2.2 virtual Go::CompositeModel::~~CompositeModel ( ) [virtual]

Destructor.

### 29.60.3 Member Function Documentation

29.60.3.1 `virtual SurfaceModel* Go::CompositeModel::asSurfaceModel ( ) [inline],[virtual]`

Return surface model pointer

#### Returns

Pointer to surface model

Reimplemented in [Go::SurfaceModel](#).

Definition at line 112 of file CompositeModel.h.

29.60.3.2 `virtual BoundingBox Go::CompositeModel::boundingBox ( ) [pure virtual]`

Bounding box of the entire model

#### Returns

Bounding box

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

29.60.3.3 `virtual BoundingBox Go::CompositeModel::boundingBox ( int idx ) const [pure virtual]`

Bounding box corresponding to one entity

#### Parameters

|            |                 |
|------------|-----------------|
| <i>idx</i> | Index of entity |
|------------|-----------------|

#### Returns

Bounding box

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

29.60.3.4 `bool Go::CompositeModel::boxExtreme ( const BoundingBox & box, const Point & dir, const Point & curr_pnt ) const [protected]`

29.60.3.5 `double Go::CompositeModel::boxVecDist ( const BoundingBox & b, const Point & v ) const [protected]`

29.60.3.6 `virtual CompositeModel* Go::CompositeModel::clone ( ) const [inline],[virtual]`

Make a copy of the current model

**Returns**

Pointer to new [CompositeModel](#)

Reimplemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

Definition at line 119 of file `CompositeModel.h`.

```
29.60.3.7 virtual void Go::CompositeModel::closestPoint (Point & pnt, Point & clo_pnt, int & idx, double clo_par[],
double & dist) [pure virtual]
```

Compute one closest point

**Parameters**

|            |             |
|------------|-------------|
| <i>pnt</i> | Input point |
|------------|-------------|

**Return values**

|                   |                                                            |
|-------------------|------------------------------------------------------------|
| <i>clo_pnt</i>    | Found closest point                                        |
| <i>idx</i>        | Index of curve or surface where the closest point is found |
| <i>clo_par</i> [] | Parameter value corresponding to the closest point         |
| <i>dist</i>       | Distance between input point and found closest point       |

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

```
29.60.3.8 virtual double Go::CompositeModel::curvature (int idx, double * par) const [pure virtual]
```

[Curvature](#) of an entity (Curve or Surface), Only Curve is implemented yet.

**Parameters**

|            |                                               |
|------------|-----------------------------------------------|
| <i>idx</i> | Index of entity                               |
| <i>par</i> | Parameter value at which to compute curvature |

**Returns**

The curvature.

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

```
29.60.3.9 virtual void Go::CompositeModel::evaluate (int idx, double par[], Point & pnt) const [pure virtual]
```

Evaluate position

## Parameters

|              |                 |
|--------------|-----------------|
| <i>idx</i>   | Index of curve  |
| <i>par[]</i> | Parameter value |

## Return values

|            |        |
|------------|--------|
| <i>pnt</i> | Result |
|------------|--------|

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

```
29.60.3.10 virtual void Go::CompositeModel::evaluate (int idx, double par[], int nder, std::vector< Point > & der) const
 [pure virtual]
```

Evaluate position and a number of derivatives

## Parameters

|              |                                                   |
|--------------|---------------------------------------------------|
| <i>idx</i>   | Index                                             |
| <i>par[]</i> | Parameter value                                   |
| <i>nder</i>  | Number of derivatives to compute, 0=only position |

## Return values

|            |        |
|------------|--------|
| <i>der</i> | Result |
|------------|--------|

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

```
29.60.3.11 virtual void Go::CompositeModel::extremalPoint (Point & dir, Point & ext_pnt, int & idx, double ext_par[])
 [pure virtual]
```

Extremal point(s) in a given direction

## Parameters

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <i>dir</i>       | Direction                                                   |
| <i>ext_pnt</i>   | Found extremal point                                        |
| <i>idx</i>       | Index of curve or surface where the extremal point is found |
| <i>ext_par[]</i> | Parameter value of extremal point                           |

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

```
29.60.3.12 tpTolerances Go::CompositeModel::getTolerances () [inline]
```

Return topology tolerances.

Definition at line 105 of file CompositeModel.h.

29.60.3.13 `virtual shared_ptr<IntResultsModel> Go::CompositeModel::intersect ( const ftLine & line ) [pure virtual]`

Intersection with a line. Expected output is points, probably one point. Curves can occur in special configurations.

#### Parameters

|             |           |
|-------------|-----------|
| <i>line</i> | The line. |
|-------------|-----------|

#### Returns

Pointer to an [IntResultsModel](#).

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

29.60.3.14 `virtual shared_ptr<IntResultsModel> Go::CompositeModel::intersect_plane ( const ftPlane & plane ) [pure virtual]`

Intersection with a plane.

#### Parameters

|              |            |
|--------------|------------|
| <i>plane</i> | The plane. |
|--------------|------------|

#### Returns

Pointer to an [IntResultsModel](#).

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

29.60.3.15 `virtual bool Go::CompositeModel::isDegenerate ( int idx ) const [pure virtual]`

Whether one particular entity is degenerate

#### Parameters

|            |                 |
|------------|-----------------|
| <i>idx</i> | Index of entity |
|------------|-----------------|

#### Returns

Whether the curve is degenerated

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

29.60.3.16 `virtual int Go::CompositeModel::nmbEntities ( ) const [pure virtual]`

Number of simple entities

**Returns**

Number of simple entities

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

29.60.3.17 `void Go::CompositeModel::setTolerances ( double gap, double neighbour, double kink, double bend )`

Set or reset topology tolerances

**Parameters**

|                  |                                                                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>gap</i>       | If the distance between two points are less than 'gap' they are viewed as identical.                                                                                                                                                                                                                  |
| <i>neighbour</i> | Maximum distance between curves or surfaces viewed as adjacent.                                                                                                                                                                                                                                       |
| <i>kink</i>      | If two adjacent curves or surfaces meet with an angle less than 'kink', they are seen as G1 continuous. (Angles in radians)                                                                                                                                                                           |
| <i>bend</i>      | If two surfaces meet along a common boundary and corresponding surface normals form an angle which is larger than 'bend', there is an intentional sharp edge between the surfaces. Similarly if two curves meet with an angle larger than 'bend', there is an intentional corner. (Angles in radians) |

29.60.3.18 `virtual void Go::CompositeModel::tessellate ( std::vector< shared_ptr< GeneralMesh > > & meshes ) const`  
`[pure virtual]`

Tessellate model with respect to a default parameter

**Return values**

|               |                  |
|---------------|------------------|
| <i>meshes</i> | Tesselated model |
|---------------|------------------|

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

29.60.3.19 `virtual void Go::CompositeModel::tessellate ( int resolution[], std::vector< shared_ptr< GeneralMesh > > & meshes ) const`  
`[pure virtual]`

Tessellate model with respect to a given resolution

**Parameters**

|                      |                  |
|----------------------|------------------|
| <i>resolution</i> [] | Given resolution |
|----------------------|------------------|

**Return values**

|               |                  |
|---------------|------------------|
| <i>meshes</i> | Tesselated model |
|---------------|------------------|

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

29.60.3.20 `virtual void Go::CompositeModel::tessellate ( double density, std::vector< shared_ptr< GeneralMesh > > & meshes ) const` [pure virtual]

Tessellate model with respect to a given tessellation density

#### Parameters

|                |                      |
|----------------|----------------------|
| <i>density</i> | Tessellation density |
|----------------|----------------------|

#### Return values

|               |                  |
|---------------|------------------|
| <i>meshes</i> | Tesselated model |
|---------------|------------------|

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

29.60.3.21 `virtual void Go::CompositeModel::tesselatedCtrPolygon ( std::vector< shared_ptr< LineCloud > > & ctr_pol ) const` [pure virtual]

Return a tessellation of the control polygon of this entity

#### Return values

|                |                                           |
|----------------|-------------------------------------------|
| <i>ctr_pol</i> | Tesselated control polygon of this entity |
|----------------|-------------------------------------------|

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

29.60.3.22 `virtual void Go::CompositeModel::turn ( int idx )` [pure virtual]

Turn parameter directions of one entity

#### Parameters

|            |                 |
|------------|-----------------|
| <i>idx</i> | Index of entity |
|------------|-----------------|

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

29.60.3.23 `virtual void Go::CompositeModel::turn ( )` [pure virtual]

Turn parameter directions of all entities.

Implemented in [Go::SurfaceModel](#), [Go::CompositeCurve](#), [Go::CurveModel](#), and [Go::VolumeModel](#).

## 29.60.4 Member Data Documentation

29.60.4.1 `int Go::CompositeModel::closest_idx_` [mutable], [protected]

### 29.61.1 Detailed Description

[Factory](#) class for creating children of [CompositeModel](#)

Definition at line 63 of file CompositeModelFactory.h.

### 29.61.2 Constructor & Destructor Documentation

29.61.2.1 **Go::CompositeModelFactory::CompositeModelFactory ( *double approx\_tol*, *double gap*, *double neighbour*, *double kink*, *double bend* )**

Constructor.

29.61.2.2 **Go::CompositeModelFactory::~~CompositeModelFactory ( )**

Destructor.

### 29.61.3 Member Function Documentation

29.61.3.1 **CompositeCurve\* Go::CompositeModelFactory::createCircularArc ( *Point centre*, *Point start\_pt*, *double angle*, *Point axis* )**

Create a circular arc centre : [Circle](#) centre start\_pt : Start point of arc angle : Angle of arc axis : Axis of the plane in which the circle lies

29.61.3.2 **CompositeCurve\* Go::CompositeModelFactory::createEllipticArc ( *Point centre*, *Point direction*, *double r1*, *double r2*, *double startpar*, *double angle*, *Point axis* )**

Create an elliptic arc centre : [Ellipse](#) centre direction : Direction of major ellips axis r1 : Major radius r2 : Minor radius startpar : Start parameter of segment angle : Angle of arc axis : Axis of the plane in which the ellipse lies

29.61.3.3 **SurfaceModel\* Go::CompositeModelFactory::createEmpty ( )**

Create an empty model.

29.61.3.4 **SurfaceModel\* Go::CompositeModelFactory::createFromBox ( *Point corner*, *Point side\_vec*, *Point plane\_vec*, *double side1\_length*, *double side2\_length*, *double side3\_length* )**

Make surface model from a box Input is one box corner, the vector from this corner towards another corner in the same box side, yet another vector in the plane defining this box side and the lengths of the box sides. The first length corresponds to the vector defining the box side, the second to the other side in the defined plane and the third defines the depth of the box. The lengths may be negative.

29.61.3.5 **SurfaceModel\*** Go::CompositeModelFactory::createFromCylinder ( **Point** *bottom\_pos*, **Point** *cylinder\_axis*, **Point** *major\_axis*, **Point** *minor\_axis* )

Make surface model from truncated cylinder *bottom\_pos* : centre of cylinder at bottom *cylinder\_axis* : [Cylinder](#) axis. The length of the vector defines the cylinder height *major\_axis* : Major axis in ellipse at cylinder bottom. The vector length defines the major radius *minor\_axis* : Minor axis in ellipse at cylinder bottom. The vector length defines the minor radius

29.61.3.6 **CompositeModel\*** Go::CompositeModelFactory::createFromG2 ( **std::istream** & *is*, **bool** *prefer\_surfacemodel = true* )

Read G2 file One model is produced

29.61.3.7 **CompositeModel\*** Go::CompositeModelFactory::createFromIges ( **std::istream** & *is*, **bool** *use\_filetol = false*, **bool** *prefer\_surfacemodel = true* )

Read IGES file One model is produced

29.61.3.8 **SurfaceModel\*** Go::CompositeModelFactory::createFromSisl ( **std::vector**< **SISLSurf** \* > & *surfaces* )

Read a vector of sisl surfaces.

29.61.3.9 **CompositeCurve\*** Go::CompositeModelFactory::createFromSisl ( **std::vector**< **SISLCurve** \* > & *curves* )

Read a vector of sisl curves.

29.61.3.10 **SurfaceModel\*** Go::CompositeModelFactory::createFromSphere ( **Point** *centre*, **double** *radius* )

Make surface model from sphere Input is sphere center and radius

29.61.3.11 **SurfaceModel\*** Go::CompositeModelFactory::createFromSphere ( **Point** *centre*, **Point** *axis*, **Point** *equator*, **int** *latitude*, **int** *longitude* )

Make surface model from octants of a sphere Input is sphere center, axis toward north pole, vector from centre to point on equator and the number of octants. The length on the equator vector gives the sphere radius *latitude* = 1 : Octants in northern hemisphere *latitude* = 2 : Octants in both hemispheres *longitude* = 1 : Octants in first quadrant *longitude* = 2 : Octants in first and second quadrant *longitude* = 3 : Octants in first, second and third quadrant *longitude* = 4 : Octants in all quadrants

29.61.3.12 **CompositeCurve\*** Go::CompositeModelFactory::createLineSegment ( **Point** *startpt*, **Point** *endpt* )

Create line segment between the two points *startpt* and *endpt*.

29.61.3.13 `std::vector<shared_ptr<CompositeModel>> Go::CompositeModelFactory::getModelsFromG2 ( std::istream & is, bool use_filetol = false )`

Get all connected models in the g2 file.

29.61.3.14 `std::vector<shared_ptr<CompositeModel>> Go::CompositeModelFactory::getModelsFromIges ( std::istream & is, bool use_filetol = false )`

Get all connected models in the IGES file.

29.61.3.15 `SurfaceModel* Go::CompositeModelFactory::interpolateCurves ( const std::vector< shared_ptr< SplineCurve >> & curves, std::vector< double > & parvals, int open, int degree = 3 )`

Interpolate a set of positional curves. Automatic parameterization. The parameter values corresponding to the curves are given as output

29.61.3.16 `SurfaceModel* Go::CompositeModelFactory::interpolateCurves ( const std::vector< shared_ptr< SplineCurve >> & curves, std::vector< int > & crv_type, std::vector< double > & parvals, int open, int degree = 3 )`

Interpolate a set of positional curves where a tangent curve may be added.

positional curves are given as output NB! [Rational](#) input curves are not handled

29.61.3.17 `SurfaceModel* Go::CompositeModelFactory::interpolateCurves2 ( const std::vector< shared_ptr< SplineCurve >> & curves, std::vector< double > & param, int open, int degree = 3 )`

Interpolate a set of positional curves. Parameterization is given. If a closed surface is specified, one extra parameter value must be specified

29.61.3.18 `SurfaceModel* Go::CompositeModelFactory::interpolateCurves2 ( const std::vector< shared_ptr< SplineCurve >> & curves, std::vector< int > & crv_type, std::vector< double > & param, int open, int degree = 3 )`

Interpolate a set of positional curves where a tangent curve may be added. Parameterization is given and corresponds to the positional curves. NB! [Rational](#) input curves are not handled

### 29.63.1 Detailed Description

Brief description. Detailed description.

Definition at line 52 of file CompositeSurface.h.

### 29.63.2 Constructor & Destructor Documentation

#### 29.63.2.1 Go::CompositeSurface::CompositeSurface ( ) [inline]

Definition at line 55 of file CompositeSurface.h.

29.63.2.2 `Go::CompositeSurface::CompositeSurface ( const std::vector< SplineSurface > & domain_maps, const SplineSurface & surf ) [inline]`

Definition at line 57 of file CompositeSurface.h.

29.63.2.3 `virtual Go::CompositeSurface::~~CompositeSurface ( ) [inline],[virtual]`

Virtual destructor, enables safe inheritance.

Definition at line 109 of file CompositeSurface.h.

### 29.63.3 Member Function Documentation

29.63.3.1 `virtual std::vector<CurveLoop> Go::CompositeSurface::allBoundaryLoops ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [inline],[virtual]`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

#### Parameters

|                           |                                                            |
|---------------------------|------------------------------------------------------------|
| <i>degenerate_epsilon</i> | edges whose length is smaller than this value are ignored. |
|---------------------------|------------------------------------------------------------|

#### Returns

a vector containing CurveLoops. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

Definition at line 159 of file CompositeSurface.h.

29.63.3.2 `virtual double Go::CompositeSurface::area ( double tol ) const [inline],[virtual]`

Compute the total area of this surface up to some tolerance

#### Parameters

|            |                                                                                                                            |
|------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>tol</i> | the relative tolerance when approximating the area, i.e. stop iteration when error becomes smaller than tol/(surface area) |
|------------|----------------------------------------------------------------------------------------------------------------------------|

#### Returns

the area calculated

Implements [Go::ParamSurface](#).

Definition at line 418 of file CompositeSurface.h.

29.63.3.3 `virtual BoundingBox Go::CompositeSurface::boundingBox ( ) const [inline],[virtual]`

Return the object's bounding box.

Implements [Go::GeomObject](#).

Definition at line 92 of file CompositeSurface.h.

29.63.3.4 `static ClassType Go::CompositeSurface::classType ( ) [inline],[static]`

Return the class type identifier of a given class derived from [GeomObject](#).

Definition at line 104 of file CompositeSurface.h.

29.63.3.5 `virtual CompositeSurface* Go::CompositeSurface::clone ( ) const [inline],[virtual]`

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

Returns

pointer to cloned object

Implements [Go::ParamSurface](#).

Definition at line 115 of file CompositeSurface.h.

29.63.3.6 `virtual void Go::CompositeSurface::closestBoundaryPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * rd = NULL, double * seed = 0 ) const [inline],[virtual]`

Iterates to the closest point to pt on the boundary of the surface.

See also

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

Definition at line 346 of file CompositeSurface.h.

29.63.3.7 `virtual Point Go::CompositeSurface::closestInDomain ( double u, double v ) const [inline],[virtual]`

Fetch the parameter value in the parameter domain of the surface closest to the parameter pair (u,v)

Implements [Go::ParamSurface](#).

Definition at line 438 of file CompositeSurface.h.

29.63.3.8 `virtual void Go::CompositeSurface::closestPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * domain_of_interest = NULL, double * seed = 0 ) const [inline],[virtual]`

Iterates to the closest point to pt on the surface.

## Parameters

|                           |                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>                 | the point to find the closest point to                                                                                       |
| <i>clo_u</i>              | u parameter of the closest point                                                                                             |
| <i>clo_v</i>              | v parameter of the closest point                                                                                             |
| <i>clo_pt</i>             | the geometric position of the closest point                                                                                  |
| <i>clo_dist</i>           | the distance between pt and clo_pt                                                                                           |
| <i>epsilon</i>            | parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)                    |
| <i>domain_of_interest</i> | pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched. |
| <i>seed</i>               | pointer to parameter values where iteration starts.                                                                          |

Reimplemented from [Go::ParamSurface](#).

Definition at line 333 of file CompositeSurface.h.

**29.63.3.9** virtual **CompositeBox** **Go::CompositeSurface::compositeBox** ( ) const [inline],[virtual]

Creates a composite box enclosing the surface. The composite box consists of an inner and an edge box. The inner box is supposed to be made from the interior of the surface, while the edge box is made from the boundary curves. The default implementation simply makes both boxes identical to the regular bounding box.

## Returns

the [CompositeBox](#) of the surface, as specified above

Reimplemented from [Go::ParamSurface](#).

Definition at line 186 of file CompositeSurface.h.

**29.63.3.10** virtual **std::vector<shared\_ptr<ParamCurve>>** **Go::CompositeSurface::constParamCurves** ( double *parameter*, bool *pardir\_is\_u* ) const [inline],[virtual]

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

## Parameters

|                    |                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>parameter</i>   | parameter value for the constant parameter (either u or v)                                                                                   |
| <i>pardir_is_u</i> | specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one. |

## Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

Definition at line 278 of file CompositeSurface.h.

29.63.3.11 `virtual RectDomain Go::CompositeSurface::containingDomain ( ) const [inline],[virtual]`

Get a rectangular parameter domain that is guaranteed to contain the surface's [parameterDomain\(\)](#). It may be the same. There is no guarantee that this is the smallest domain containing the actual domain.

Returns

a [RectDomain](#) that is guaranteed to include the surface's total parameter domain.

Implements [Go::ParamSurface](#).

Definition at line 130 of file `CompositeSurface.h`.

29.63.3.12 `virtual int Go::CompositeSurface::dimension ( ) const [inline],[virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

Definition at line 96 of file `CompositeSurface.h`.

29.63.3.13 `virtual void Go::CompositeSurface::getBoundaryInfo ( Point & pt1, Point & pt2, double epsilon, SplineCurve *& cv, SplineCurve *& crosscv, double knot_tol = 1e-05 ) const [inline],[virtual]`

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

Parameters

|                 |                                                                                                                                                                                                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pt1</i>      | the first point on the boundary, given by the user                                                                                                                                                                                                                                                                                 |
| <i>pt2</i>      | the second point on the boundary, given by the user                                                                                                                                                                                                                                                                                |
| <i>epsilon</i>  | the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.                                                                                                                                                                           |
| <i>cv</i>       | upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.                                                   |
| <i>crosscv</i>  | upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary. |
| <i>knot_tol</i> | tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.                                                                                                                                                                                |

Implements [Go::ParamSurface](#).

Definition at line 381 of file `CompositeSurface.h`.

29.63.3.14 `virtual void Go::CompositeSurface::getCornerPoints ( std::vector< std::pair< Point, Point > > & corners ) const [inline],[virtual]`

Return surface corners, geometric and parametric points in that sequence

Implements [Go::ParamSurface](#).

Definition at line 357 of file CompositeSurface.h.

```
29.63.3.15 virtual void Go::CompositeSurface::getDegenerateCorners (std::vector< Point > & deg_corners, double tol)
 const [inline],[virtual]
```

Check for parallel and anti-parallel partial derivatives in surface corners.

Implements [Go::ParamSurface](#).

Definition at line 443 of file CompositeSurface.h.

```
29.63.3.16 virtual bool Go::CompositeSurface::inDomain (double u, double v, double eps = 1.0e-4) const
 [inline],[virtual]
```

Check if a parameter pair lies inside the domain of this surface.

Implements [Go::ParamSurface](#).

Definition at line 423 of file CompositeSurface.h.

```
29.63.3.17 virtual int Go::CompositeSurface::inDomain2 (double u, double v, double eps = 1.0e-4) const
 [inline],[virtual]
```

Check if a parameter pair lies inside the domain of this surface return value = 0: outside = 1: internal = 2: at the boundary

Implements [Go::ParamSurface](#).

Definition at line 428 of file CompositeSurface.h.

```
29.63.3.18 virtual ClassType Go::CompositeSurface::instanceType () const [inline],[virtual]
```

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

Definition at line 100 of file CompositeSurface.h.

```
29.63.3.19 virtual bool Go::CompositeSurface::isDegenerate (bool & b, bool & r, bool & t, bool & l, double tolerance)
 const [inline],[virtual]
```

The order of the edge indicators (bottom, right, top, left) matches the edge\_number of edgeCurve(). Query whether any of the four boundary curves are degenerate (zero length) within a certain tolerance. In the below, we refer to 'u' as the first parameter and 'v' as the second.

## Parameters

|                  |                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------|
| <i>b</i>         | 'true' upon return of function if the boundary ( $v = v_{\min}$ ) is degenerate                    |
| <i>r</i>         | 'true' upon return of function if the boundary ( $v = v_{\max}$ ) is degenerate                    |
| <i>t</i>         | 'true' upon return of function if the boundary ( $u = u_{\min}$ ) is degenerate                    |
| <i>l</i>         | 'true' upon return of function if the boundary ( $u = u_{\max}$ ) is degenerate                    |
| <i>tolerance</i> | boundaries are considered degenerate if their length is shorter than this value, given by the user |

## Returns

'true' if at least one boundary curve was found to be degenerate, 'false' otherwise.

Reimplemented from [Go::ParamSurface](#).

Definition at line 414 of file CompositeSurface.h.

```
29.63.3.20 virtual double Go::CompositeSurface::nextSegmentVal (int dir, double par, bool forward, double tol) const
 [inline], [virtual]
```

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

## Parameters

|                |                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------|
| <i>dir</i>     | the parameter direction in which we search for the next segment (0 or 1)                             |
| <i>par</i>     | the parameter value starting from which we search for the start value of the next segment            |
| <i>forward</i> | define whether we shall move forward ('true') or backwards when searching along this parameter       |
| <i>tol</i>     | tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value |

## Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

Definition at line 318 of file CompositeSurface.h.

```
29.63.3.21 virtual void Go::CompositeSurface::normal (Point & n, double upar, double vpar) const [inline],
 [virtual]
```

Evaluate the surface's position and a certain number of derivatives at a given parameter.

## Parameters

|               |                                 |
|---------------|---------------------------------|
| <i>upar</i>   | the first parameter             |
| <i>vpar</i>   | the second parameter            |
| <i>derivs</i> | number of requested derivatives |

**Returns**

the vector containing the evaluated values. Its size will be equal to  $(\text{derivs}+1) * (\text{derivs}+2) / 2$ . Its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives. Evaluates the surface normal for a given parameter pair

**Parameters**

|             |                                                      |
|-------------|------------------------------------------------------|
| <i>n</i>    | the computed normal will be written to this variable |
| <i>upar</i> | the first parameter                                  |
| <i>vpar</i> | the second parameter                                 |

Implements [Go::ParamSurface](#).

Definition at line 253 of file CompositeSurface.h.

**29.63.3.22** virtual **DirectionCone** Go::CompositeSurface::normalCone ( ) const [inline],[virtual]

Creates a [DirectionCone](#) covering all normals to this surface.

**Returns**

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

Definition at line 166 of file CompositeSurface.h.

**29.63.3.23** virtual **bool** Go::CompositeSurface::onBoundary ( double *u*, double *v*, double *eps* = 1.0e-4 ) const [inline],[virtual]

Check if a parameter pair lies at the boundary of this surface.

Implements [Go::ParamSurface](#).

Definition at line 433 of file CompositeSurface.h.

**29.63.3.24** virtual **CurveLoop** Go::CompositeSurface::outerBoundaryLoop ( double *degenerate\_epsilon* = DEFAULT\_SPACE\_EPSILON ) const [inline],[virtual]

Returns the anticlockwise, outer boundary loop of the surface.

**Parameters**

|                           |                                                            |
|---------------------------|------------------------------------------------------------|
| <i>degenerate_epsilon</i> | edges whose length is smaller than this value are ignored. |
|---------------------------|------------------------------------------------------------|

**Returns**

a [CurveLoop](#) describing the anticlockwise, outer boundary loop of the surface.

Implements [Go::ParamSurface](#).

Definition at line 147 of file CompositeSurface.h.

**29.63.3.25** `virtual const RectDomain& Go::CompositeSurface::parameterDomain ( ) const` `[inline],[virtual]`

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

**Returns**

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

Definition at line 122 of file CompositeSurface.h.

**29.63.3.26** `virtual void Go::CompositeSurface::point ( Point & pt, double upar, double vpar ) const` `[inline],[virtual]`

Evaluates the surface's position for a given parameter pair.

**Parameters**

|             |                                              |
|-------------|----------------------------------------------|
| <i>pt</i>   | the result of the evaluation is written here |
| <i>upar</i> | the first parameter                          |
| <i>vpar</i> | the second parameter                         |

Implements [Go::ParamSurface](#).

Definition at line 193 of file CompositeSurface.h.

**29.63.3.27** `virtual void Go::CompositeSurface::point ( std::vector< Point > & pts, double upar, double vpar, int derivs, bool u_from_right = true, bool v_from_right = true, double resolution = 1.0e-12 ) const` `[inline],[virtual]`

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

**Parameters**

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pts</i> | the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives. |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Parameters

|                     |                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>upar</i>         | the first parameter                                                                                                                                              |
| <i>vpar</i>         | the second parameter                                                                                                                                             |
| <i>derivs</i>       | number of requested derivatives                                                                                                                                  |
| <i>u_from_right</i> | specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')                           |
| <i>v_from_right</i> | specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')                          |
| <i>resolution</i>   | tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects). |

Implements [Go::ParamSurface](#).

Definition at line 230 of file CompositeSurface.h.

```
29.63.3.28 virtual void Go::CompositeSurface::read (std::istream & is) [inline],[virtual]
```

read object from stream

## Parameters

|           |                                  |
|-----------|----------------------------------|
| <i>is</i> | stream from which object is read |
|-----------|----------------------------------|

Implements [Go::Streamable](#).

Definition at line 69 of file CompositeSurface.h.

```
29.63.3.29 virtual void Go::CompositeSurface::reverseParameterDirection (bool direction_is_u) [inline],[virtual]
```

Reverses the direction of the basis in input direction.

## Parameters

|                       |                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>direction_is_u</i> | if 'true', the first parameter direction will be reversed, otherwise, the second parameter direction will be reversed |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------|

Implements [Go::ParamSurface](#).

Definition at line 393 of file CompositeSurface.h.

```
29.63.3.30 void Go::CompositeSurface::setParameterDomain (double u1, double u2, double v1, double v2) [inline],[virtual]
```

set the parameter domain to a given rectangle

## Parameters

|           |                                         |
|-----------|-----------------------------------------|
| <i>u1</i> | new min. value of first parameter span  |
| <i>u2</i> | new max. value of first parameter span  |
| <i>v1</i> | new min. value of second parameter span |
| <i>v2</i> | new max. value of second parameter span |

Reimplemented from [Go::ParamSurface](#).

Definition at line 138 of file CompositeSurface.h.

```
29.63.3.31 virtual std::vector<shared_ptr<ParamSurface>> Go::CompositeSurface::subSurfaces (double from_upar,
double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON
) const [inline],[virtual]
```

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

## Parameters

|                  |                                                                       |
|------------------|-----------------------------------------------------------------------|
| <i>from_upar</i> | lower value for the first parameter in the subdomain                  |
| <i>from_vpar</i> | lower value for the second parameter in the subdomain                 |
| <i>to_upar</i>   | upper value for the first parameter in the subdomain                  |
| <i>to_vpar</i>   | upper value for the second parameter in the subdomain                 |
| <i>fuzzy</i>     | tolerance used when determining intersection with interior boundaries |

## Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

Definition at line 295 of file CompositeSurface.h.

```
29.63.3.32 virtual void Go::CompositeSurface::swapParameterDirection () [inline],[virtual]
```

Swaps the two parameter directions.

Implements [Go::ParamSurface](#).

Definition at line 397 of file CompositeSurface.h.

```
29.63.3.33 virtual DirectionCone Go::CompositeSurface::tangentCone (bool pdir_is_u) const [inline],
[virtual]
```

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

## Parameters

|                                |                                                                                                                                                                                                  |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>pardir_is↔<br/>_u</code> | if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used. |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

Definition at line 176 of file CompositeSurface.h.

**29.63.3.34** `virtual void Go::CompositeSurface::turnOrientation ( ) [inline],[virtual]`

Turns the direction of the normal of the surface.

Implements [Go::ParamSurface](#).

Definition at line 387 of file CompositeSurface.h.

**29.63.3.35** `virtual void Go::CompositeSurface::write ( std::ostream & os ) const [inline],[virtual]`

write object to stream

## Parameters

|                 |                                   |
|-----------------|-----------------------------------|
| <code>os</code> | stream to which object is written |
|-----------------|-----------------------------------|

Implements [Go::Streamable](#).

Definition at line 81 of file CompositeSurface.h.

### 29.66.1 Detailed Description

Class that represents a cone. It is a subclass of [ElementarySurface](#), and thus has a parametrization and is non-selfintersecting.

A [Cone](#) has a natural parametrization in terms of the angle  $u$  and distance  $v$ :  $\mathbf{p}(u, v) = \mathbf{C} + (R + v \tan \alpha)((\cos u) \mathbf{x} + (\sin u) \mathbf{y}) + v \mathbf{z}$ , where  $\mathbf{C}$  is a position vector,  $R$  is the radius,  $\mathbf{x}$ ,  $\mathbf{y}$  and  $\mathbf{z}$  are the (local) axes, and  $\alpha$  is the cone angle. The parametrization is bounded by:  $0 \leq u \leq 2\pi$ ,  $-\infty < v < \infty$ . The dimension is 3.

Definition at line 69 of file Cone.h.

### 29.66.2 Constructor & Destructor Documentation

#### 29.66.2.1 `Go::Cone::Cone( ) [inline]`

Default constructor. Constructs an uninitialized [Cone](#) which can only be assigned to or read into.

Definition at line 74 of file Cone.h.

#### 29.66.2.2 `Go::Cone::Cone( double radius, Point location, Point z_axis, Point x_axis, double cone_angle, bool isSwapped = false )`

Constructor. Input is the radius, the location, the direction of the z-axis and the (possibly approximate) x-axis. The local coordinate axes are normalized even if `z_axis` and/or `x_axis` are not unit vectors.

#### 29.66.2.3 `virtual Go::Cone::~~Cone( ) [virtual]`

Virtual destructor - ensures safe inheritance.

### 29.66.3 Member Function Documentation

#### 29.66.3.1 `std::vector<CurveLoop> Go::Cone::allBoundaryLoops( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [virtual]`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

##### Parameters

|                                 |                                                            |
|---------------------------------|------------------------------------------------------------|
| <code>degenerate_epsilon</code> | edges whose length is smaller than this value are ignored. |
|---------------------------------|------------------------------------------------------------|

##### Returns

a vector containing `CurveLoops`. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

29.66.3.2 `virtual BoundingBox Go::Cone::boundingBox( ) const [virtual]`

Return empty box if infinite cone.

Implements [Go::GeomObject](#).

29.66.3.3 `static ClassType Go::Cone::classType( ) [inline],[static]`

Definition at line 101 of file Cone.h.

29.66.3.4 `virtual Cone* Go::Cone::clone( ) const [virtual]`

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

Returns

pointer to cloned object

Implements [Go::ElementarySurface](#).

29.66.3.5 `void Go::Cone::closestBoundaryPoint( const Point &pt, double &clo_u, double &clo_v, Point &clo_pt, double &clo_dist, double epsilon, const RectDomain *rd=NULL, double *seed=0 ) const [virtual]`

Iterates to the closest point to pt on the boundary of the surface.

See also

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

29.66.3.6 `void Go::Cone::closestPoint( const Point &pt, double &clo_u, double &clo_v, Point &clo_pt, double &clo_dist, double epsilon, const RectDomain *domain_of_interest=NULL, double *seed=0 ) const [virtual]`

Iterates to the closest point to pt on the surface.

Parameters

|                             |                                                                                                                              |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>                   | the point to find the closest point to                                                                                       |
| <i>clo_u</i>                | u parameter of the closest point                                                                                             |
| <i>clo_v</i>                | v parameter of the closest point                                                                                             |
| <i>clo_pt</i>               | the geometric position of the closest point                                                                                  |
| <i>clo_dist</i>             | the distance between pt and clo_pt                                                                                           |
| <i>epsilon</i>              | parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)                    |
| <i>domain_of_interest</i>   | pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched. |
| <b>Generated by Doxygen</b> |                                                                                                                              |
| <i>seed</i>                 | pointer to parameter values where iteration starts.                                                                          |

Reimplemented from [Go::ParamSurface](#).

29.66.3.7 `shared_ptr<ParamCurve> Go::Cone::constParamCurve ( double parameter, bool pardir_is_u, double from, double to ) const`

29.66.3.8 `std::vector<shared_ptr<ParamCurve> > Go::Cone::constParamCurves ( double parameter, bool pardir_is_u ) const` [virtual]

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

#### Parameters

|                    |                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>parameter</i>   | parameter value for the constant parameter (either u or v)                                                                                   |
| <i>pardir_is_u</i> | specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one. |

#### Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

29.66.3.9 `virtual SplineSurface* Go::Cone::createSplineSurface ( ) const` [virtual]

Create a [SplineSurface](#) representation of the cone.

Implements [Go::ElementarySurface](#).

29.66.3.10 `virtual int Go::Cone::dimension ( ) const` [virtual]

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.66.3.11 `virtual SplineSurface* Go::Cone::geometrySurface ( ) const` [virtual]

Create a [SplineSurface](#) representation of the cone.

Implements [Go::ElementarySurface](#).

29.66.3.12 `void Go::Cone::getBoundaryInfo ( Point & pt1, Point & pt2, double epsilon, SplineCurve *& cv, SplineCurve *& crosscv, double knot_tol=1e-05 ) const` [virtual]

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

## Parameters

|                 |                                                                                                                                                                                                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pt1</i>      | the first point on the boundary, given by the user                                                                                                                                                                                                                                                                                 |
| <i>pt2</i>      | the second point on the boundary, given by the user                                                                                                                                                                                                                                                                                |
| <i>epsilon</i>  | the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.                                                                                                                                                                           |
| <i>cv</i>       | upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.                                                   |
| <i>crosscv</i>  | upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary. |
| <i>knot_tol</i> | tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.                                                                                                                                                                                |

Implements [Go::ParamSurface](#).

29.66.3.13 `shared_ptr<Circle> Go::Cone::getCircle ( double par ) const`

29.66.3.14 `double Go::Cone::getConeAngle ( ) const [inline]`

The opening angle of the cone.

Definition at line 192 of file Cone.h.

29.66.3.15 `void Go::Cone::getCoordinateAxes ( Point & x_axis, Point & y_axis, Point & z_axis ) const [inline]`

Local coordinate axes. The *z\_axis* corresponds to the cone axis.

Definition at line 184 of file Cone.h.

29.66.3.16 `virtual void Go::Cone::getDegenerateCorners ( std::vector< Point > & deg_corners, double tol ) const [virtual]`

Check for parallel and anti parallel partial derivatives in surface corners.

Implements [Go::ParamSurface](#).

29.66.3.17 `shared_ptr<ElementaryCurve> Go::Cone::getElementaryParamCurve ( ElementaryCurve * space_crv, double tol, const Point * start_par_pt = NULL, const Point * end_par_pt = NULL ) const [virtual]`

Fetch the parameter curve in the domain of the elementary surface corresponding to a given elementary curve in geometry space if this curve has a simpler elementary representation. Otherwise, nothing is returned

Reimplemented from [Go::ElementarySurface](#).

29.66.3.18 `shared_ptr<Line> Go::Cone::getLine ( double upar ) const`

29.66.3.19 `Point Go::Cone::getLocation ( ) const [inline]`

[Point](#) on cone axis.

Definition at line 180 of file Cone.h.

29.66.3.20 `double Go::Cone::getRadius ( ) const [inline]`

Radius at the location.

Definition at line 176 of file Cone.h.

29.66.3.21 `virtual ClassType Go::Cone::instanceType ( ) const [virtual]`

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.66.3.22 `virtual bool Go::Cone::isAxisRotational ( Point & centre, Point & axis, Point & vec, double & angle ) [virtual]`

Check if the surface is axis rotational. Only true if a connection to an axis rotational elementary surface exist The axis and rotational angle is only specified if the surface is actually rotational

Reimplemented from [Go::ParamSurface](#).

29.66.3.23 `bool Go::Cone::isBounded ( ) const [virtual]`

Query if parametrization is bounded. Only the *v* parameter direction is queried. The *u* parameter is always bounded.

Returns

*true* if bounded, *false* otherwise

Reimplemented from [Go::ElementarySurface](#).

29.66.3.24 `bool Go::Cone::isClosed ( bool & closed_dir_u, bool & closed_dir_v ) const [virtual]`

Check if the surface is closed.

Reimplemented from [Go::ElementarySurface](#).

29.66.3.25 `bool Go::Cone::isDegenerate ( bool & b, bool & r, bool & t, bool & l, double tolerance ) const [virtual]`

The order of the edge indicators (bottom, right, top, left) matches the `edge_number` of `edgeCurve()`. Query whether any of the four boundary curves are degenerate (zero length) within a certain tolerance. In the below, we refer to 'u' as the first parameter and 'v' as the second.

## Parameters

|                  |                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------|
| <i>b</i>         | 'true' upon return of function if the boundary ( $v = v\_min$ ) is degenerate                      |
| <i>r</i>         | 'true' upon return of function if the boundary ( $v = v\_max$ ) is degenerate                      |
| <i>t</i>         | 'true' upon return of function if the boundary ( $u = u\_min$ ) is degenerate                      |
| <i>l</i>         | 'true' upon return of function if the boundary ( $u = u\_max$ ) is degenerate                      |
| <i>tolerance</i> | boundaries are considered degenerate if their length is shorter than this value, given by the user |

## Returns

'true' if at least one boundary curve was found to be degenerate, 'false' otherwise.

Reimplemented from [Go::ParamSurface](#).

**29.66.3.26** `double Go::Cone::nextSegmentVal ( int dir, double par, bool forward, double tol ) const` [virtual]

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

## Parameters

|                |                                                                                                |
|----------------|------------------------------------------------------------------------------------------------|
| <i>dir</i>     | the parameter direction in which we search for the next segment (0 or 1)                       |
| <i>par</i>     | the parameter value starting from which we search for the start value of the next segment      |
| <i>forward</i> | define whether we shall move forward ('true') or backwards when searching along this parameter |
| <i>tol</i>     | tolerance used for determining whether the 'par' is already located on the next segment value  |

## Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

**29.66.3.27** `void Go::Cone::normal ( Point & n, double upar, double vpar ) const` [virtual]

Evaluates the surface normal for a given parameter pair

## Parameters

|             |                                                      |
|-------------|------------------------------------------------------|
| <i>n</i>    | the computed normal will be written to this variable |
| <i>upar</i> | the first parameter                                  |
| <i>vpar</i> | the second parameter                                 |

Implements [Go::ParamSurface](#).

29.66.3.28 **DirectionCone** Go::Cone::normalCone ( ) const [virtual]

Creates a [DirectionCone](#) covering all normals to this surface.

Returns

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

29.66.3.29 **const RectDomain&** Go::Cone::parameterDomain ( ) const [virtual]

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

Returns

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

29.66.3.30 **void** Go::Cone::point ( **Point & pt**, **double upar**, **double vpar** ) const [virtual]

Evaluates the surface's position for a given parameter pair.

Parameters

|             |                                              |
|-------------|----------------------------------------------|
| <i>pt</i>   | the result of the evaluation is written here |
| <i>upar</i> | the first parameter                          |
| <i>vpar</i> | the second parameter                         |

Implements [Go::ParamSurface](#).

29.66.3.31 **void** Go::Cone::point ( **std::vector< Point > & pts**, **double upar**, **double vpar**, **int derivs**, **bool u\_from\_right = true**, **bool v\_from\_right = true**, **double resolution = 1.0e-12** ) const [virtual]

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

Parameters

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pts</i>  | the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives. |
| <i>upar</i> | the first parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>vpar</i> | the second parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Parameters

|                     |                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>derivs</i>       | number of requested derivatives                                                                                                                                  |
| <i>u_from_right</i> | specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')                           |
| <i>v_from_right</i> | specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')                          |
| <i>resolution</i>   | tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects). |

Implements [Go::ParamSurface](#).

**29.66.3.32** virtual void Go::Cone::read ( std::istream & *is* ) [virtual]

read object from stream

## Parameters

|           |                                  |
|-----------|----------------------------------|
| <i>is</i> | stream from which object is read |
|-----------|----------------------------------|

Implements [Go::Streamable](#).

**29.66.3.33** void Go::Cone::setCoordinateAxes ( ) [protected]

**29.66.3.34** void Go::Cone::setParamBoundsU ( double *from\_upar*, double *to\_upar* )

Set parameter bounds in the *u* direction. *u* is the "angular" direction.

**29.66.3.35** virtual void Go::Cone::setParamBoundsV ( double *from\_vpar*, double *to\_vpar* ) [virtual]

Set parameter bounds in the *v* direction. *v* is the "linear" direction.

**29.66.3.36** void Go::Cone::setParameterBounds ( double *from\_upar*, double *from\_vpar*, double *to\_upar*, double *to\_vpar* ) [virtual]

Limit the cone surface by limiting the parameter domain.

Implements [Go::ElementarySurface](#).

**29.66.3.37** Cone\* Go::Cone::subSurface ( double *from\_upar*, double *from\_vpar*, double *to\_upar*, double *to\_vpar*, double *fuzzy* = DEFAULT\_PARAMETER\_EPSILON ) const

Return the part of the cone surface limited by the parameter bounds.

**29.66.3.38** std::vector<shared\_ptr<ParamSurface>> Go::Cone::subSurfaces ( double *from\_upar*, double *from\_vpar*, double *to\_upar*, double *to\_vpar*, double *fuzzy* = DEFAULT\_PARAMETER\_EPSILON ) const [virtual]

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

## Parameters

|                  |                                                                       |
|------------------|-----------------------------------------------------------------------|
| <i>from_upar</i> | lower value for the first parameter in the subdomain                  |
| <i>from_vpar</i> | lower value for the second parameter in the subdomain                 |
| <i>to_upar</i>   | upper value for the first parameter in the subdomain                  |
| <i>to_vpar</i>   | upper value for the second parameter in the subdomain                 |
| <i>fuzzy</i>     | tolerance used when determining intersection with interior boundaries |

## Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

**29.66.3.39** `DirectionCone Go::Cone::tangentCone ( bool pardir_is_u ) const` [virtual]

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

## Parameters

|                    |                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pardir_is_u</i> | if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used. |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

**29.66.3.40** `virtual void Go::Cone::write ( std::ostream & os ) const` [virtual]

write object to stream

## Parameters

|           |                                   |
|-----------|-----------------------------------|
| <i>os</i> | stream to which object is written |
|-----------|-----------------------------------|

Implements [Go::Streamable](#).

## 29.67 Go::ConeVolume Class Reference

Class that represents a solid cone. It is a subclass of [ElementaryVolume](#), and has a natural parametrization in terms of a radius  $u$ , an angle  $v$ , and distance  $w$ :  $\mathbf{p}(u, v, w) = \mathbf{C} + u (R + w \tan \alpha)((\cos v) \mathbf{x} + (\sin v) \mathbf{y}) + w \mathbf{z}$ , where  $\mathbf{C}$  is the cone apex,  $R$  is the radius when  $w = 0$ ,  $\alpha$  is the cone angle, and  $\mathbf{x}$ ,  $\mathbf{y}$  and  $\mathbf{z}$  are the (local) axes. The parametrization is bounded by:  $0 \leq u \leq 1$ ,  $0 \leq v \leq 2\pi$ ,  $-\infty < w < \infty$ . The dimension is 3.

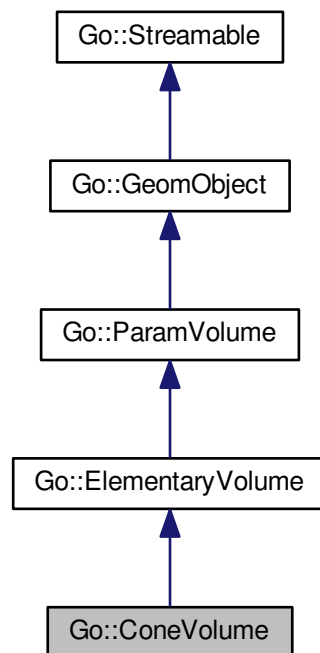

```
#include <ConeVolume.h>

#### 29.67.1 Detailed Description

Class that represents a solid cone. It is a subclass of [ElementaryVolume](#), and has a natural parametrization in terms of a radius  $u$ , an angle  $v$ , and distance  $w$ :  $\mathbf{p}(u, v, w) = \mathbf{C} + u (R + w \tan \alpha)((\cos v) \mathbf{x} + (\sin v) \mathbf{y}) + w \mathbf{z}$ , where  $\mathbf{C}$  is the cone apex,  $R$  is the radius when  $w = 0$ ,  $\alpha$  is the cone angle, and  $\mathbf{x}$ ,  $\mathbf{y}$  and  $\mathbf{z}$  are the (local) axes. The parametrization is bounded by:  $0 \leq u \leq 1$ ,  $0 \leq v \leq 2\pi$ ,  $-\infty < w < \infty$ . The dimension is 3.

Definition at line 65 of file [ConeVolume.h](#).

#### 29.67.2 Constructor & Destructor Documentation

##### 29.67.2.1 `Go::ConeVolume::ConeVolume ( ) [inline]`

Default constructor. Constructs an uninitialized [ConeVolume](#) which can only be assigned to or read into.

Definition at line 70 of file [ConeVolume.h](#).

##### 29.67.2.2 `Go::ConeVolume::ConeVolume ( double radius, Point location, Point z_axis, Point x_axis, double cone_angle )`

Constructor. Input is the radius, the location, the direction of the z-axis and the (possibly approximate) x-axis.

##### 29.67.2.3 `virtual Go::ConeVolume::~~ConeVolume ( ) [virtual]`

Virtual destructor - ensures safe inheritance.

### 29.67.3 Member Function Documentation

29.67.3.1 virtual **BoundingBox** Go::ConeVolume::boundingBox ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.67.3.2 static **ClassType** Go::ConeVolume::classType ( ) [inline],[static]

Definition at line 96 of file ConeVolume.h.

29.67.3.3 virtual **ConeVolume\*** Go::ConeVolume::clone ( ) const [virtual]

make a clone of this volume and return a pointer to it (user is responsible for clearing up memory afterwards).

#### Returns

pointer to cloned object

Implements [Go::ElementaryVolume](#).

29.67.3.4 void Go::ConeVolume::closestPoint ( const **Point** & *pt*, double & *clo\_u*, double & *clo\_v*, double & *clo\_w*, **Point** & *clo\_pt*, double & *clo\_dist*, double *epsilon*, double \* *seed* = 0 ) const [virtual]

Iterates to the closest point to *pt* on the volume.

#### Parameters

|                 |                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>       | the point to find the closest point to                                                                               |
| <i>clo_u</i>    | u parameter of the closest point                                                                                     |
| <i>clo_v</i>    | v parameter of the closest point                                                                                     |
| <i>clo_w</i>    | w parameter of the closest point                                                                                     |
| <i>clo_pt</i>   | the geometric position of the closest point                                                                          |
| <i>clo_dist</i> | the distance between <i>pt</i> and <i>clo_pt</i>                                                                     |
| <i>epsilon</i>  | parameter tolerance (will in any case not be higher than $\sqrt{\text{machine\_precision}}$ x magnitude of solution) |
| <i>seed</i>     | pointer to parameter values where iteration starts.                                                                  |

Implements [Go::ParamVolume](#).

29.67.3.5 virtual int Go::ConeVolume::dimension ( ) const [virtual]

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.67.3.6 **SplineVolume\*** `Go::ConeVolume::geometryVolume ( ) const` [virtual]

Make a NURBS representation of the object.

Implements [Go::ElementaryVolume](#).

29.67.3.7 `std::vector<shared_ptr<ParamSurface>>` `Go::ConeVolume::getAllBoundarySurfaces ( ) const`  
[virtual]

Fetch all boundary surfaces corresponding to the volume.

Implements [Go::ParamVolume](#).

29.67.3.8 **virtual ClassType** `Go::ConeVolume::instanceType ( ) const` [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.67.3.9 **double** `Go::ConeVolume::nextSegmentVal ( int dir, double par, bool forward, double tol ) const`  
[virtual]

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

|                |                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------|
| <i>dir</i>     | the parameter direction in which we search for the next segment (0, 1 or 2)                          |
| <i>par</i>     | the parameter value starting from which we search for the start value of the next segment            |
| <i>forward</i> | define whether we shall move forward ('true') or backwards when searching along this parameter       |
| <i>tol</i>     | tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value |

#### Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamVolume](#).

29.67.3.10 **const Array<double,6>** `Go::ConeVolume::parameterSpan ( ) const` [virtual]

Return the parameter domain of the volume. This is an array containing the start and end parameter values. The spline's parameter *i* has its start value at the array position (2*i*) and its end parameter value at the array position (2*i*+1)

#### Returns

An array describing the parametric domain of the volume

Implements [Go::ParamVolume](#).

29.67.3.11 `void Go::ConeVolume::point ( Point & pt, double upar, double vpar, double wpar ) const` `[virtual]`

Evaluates the volume's position for a given parameter triple.

#### Parameters

|             |                                              |
|-------------|----------------------------------------------|
| <i>pt</i>   | the result of the evaluation is written here |
| <i>upar</i> | the first parameter                          |
| <i>vpar</i> | the second parameter                         |
| <i>wpar</i> | the third parameter                          |

Implements [Go::ParamVolume](#).

29.67.3.12 `void Go::ConeVolume::point ( std::vector< Point > & pts, double upar, double vpar, double wpar, int derivs, bool u_from_right = true, bool v_from_right = true, bool w_from_right = true, double resolution = 1.0e-12 ) const` `[virtual]`

Evaluates the volume's position and a certain number of derivatives for a given parameter triple.

#### Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pts</i>          | the vector containing the evaluated values. Its size must be set by the user prior to calling this function. Upon completion of the function, its first entry is the volume's position at the given parameter pair. Then, if ' <i>derivs</i> ' > 0, the two next entries will be the volume tangents along the first, second and third parameter direction. The next three entries are the second- and cross derivatives, in the order ( <i>du</i> <sup>2</sup> , <i>dudv</i> , <i>dudw</i> , <i>dv</i> <sup>2</sup> , <i>dvdw</i> , <i>dw</i> <sup>2</sup> ), and similar for even higher derivatives. |
| <i>upar</i>         | the first parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>vpar</i>         | the second parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>wpar</i>         | the third parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>derivs</i>       | number of requested derivatives                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>u_from_right</i> | specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>v_from_right</i> | specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>w_from_right</i> | specify whether derivatives along the third parameter are to be calculated from the right ('true', default) or from the left ('false')                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>resolution</i>   | tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Implements [Go::ParamVolume](#).

29.67.3.13 `virtual void Go::ConeVolume::read ( std::istream & is )` `[virtual]`

read object from stream

#### Parameters

|           |                                  |
|-----------|----------------------------------|
| <i>is</i> | stream from which object is read |
|-----------|----------------------------------|

Implements [Go::Streamable](#).

29.67.3.14 void `Go::ConeVolume::reverseParameterDirection ( int pardir )` [virtual]

Reverses the direction of the basis in input direction.

#### Parameters

|               |                                      |
|---------------|--------------------------------------|
| <i>pardir</i> | which parameter direction to reverse |
|---------------|--------------------------------------|

Implements [Go::ParamVolume](#).

29.67.3.15 void `Go::ConeVolume::setParameters ( double from_par, double to_par, int pardir )`

Restrict the size of the torus in one parameter direction.

29.67.3.16 void `Go::ConeVolume::swapParameterDirection ( int pardir1, int pardir2 )` [virtual]

Swaps two parameter directions

#### Parameters

|                |                                                           |
|----------------|-----------------------------------------------------------|
| <i>pardir1</i> | One of the parameter directions (0, 1 or 2) to be swapped |
| <i>pardir2</i> | The other parameter direction (0, 1 or 2) to be swapped   |

Implements [Go::ParamVolume](#).

29.67.3.17 **DirectionCone** `Go::ConeVolume::tangentCone ( int pardir ) const` [virtual]

Creates a [DirectionCone](#) covering all tangents to this volume along a given parameter direction.

#### Parameters

|               |                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pardir</i> | if 1, the <a href="#">DirectionCone</a> will be defined on basis of the volume's tangents along the first parameter direction. If 2, the second parameter direction will be used. If 3, the third parameter direction will be used. |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this volume along the specified parameter direction.

Implements [Go::ParamVolume](#).

29.67.3.18 virtual void Go::ConeVolume::translate ( const Point & vec ) [virtual]

Translate.

Implements [Go::ParamVolume](#).

29.67.3.19 void Go::ConeVolume::useCentreDegen ( ) [inline]

swept linearly and shrunked or extended

A NURBS representation will be a disc with degeneracy in the centre

Definition at line 154 of file ConeVolume.h.

29.67.3.20 void Go::ConeVolume::useCornerDegen ( ) [inline]

occur if the cone tip is included in the volume.

A NURBS representation will be a disc with degenerate corners swept linearly and shrunked or extended. Note that extra degeneracies

Definition at line 160 of file ConeVolume.h.

29.67.3.21 virtual void Go::ConeVolume::write ( std::ostream & os ) const [virtual]

write object to stream

Parameters

|    |                                   |
|----|-----------------------------------|
| os | stream to which object is written |
|----|-----------------------------------|

Implements [Go::Streamable](#).

## 29.72 Go::CPUclock Class Reference

A class for measuring CPU time in programs.

```
#include <CPUclock.h>
```

### Public Member Functions

- [CPUclock \(\)](#)  
*The constructor initializes the time of last call.*
- [double getInterval \(\)](#)
- [void initTime \(\)](#)
- [double getTime \(\)](#)  
*Returns time in seconds since January 1, 1970.*

### 29.72.1 Detailed Description

A class for measuring CPU time in programs.

Definition at line 49 of file CPUclock.h.

### 29.72.2 Constructor & Destructor Documentation

#### 29.72.2.1 Go::CPUclock::CPUclock ( )

The constructor initializes the time of last call.

### 29.72.3 Member Function Documentation

#### 29.72.3.1 double Go::CPUclock::getInterval ( )

The increase in time (seconds) since last call to [getInterval\(\)](#) or to [initTime \(\)](#).

#### 29.72.3.2 double Go::CPUclock::getTime ( )

Returns time in seconds since January 1, 1970.

#### 29.72.3.3 void Go::CPUclock::initTime ( ) `[inline]`

Start measuring the length of an interval (typically called prior to the computational job to be measured).

Definition at line 69 of file CPUclock.h.

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/utills/CPUclock.h](#)

## 29.73 Go::Creator Class Reference

```
#include <Factory.h>
```

Inheritance diagram for Go::Creator:

### Public Member Functions

- virtual [GeomObject](#) \* `create` ()=0
- virtual `~Creator` ()

#### 29.73.1 Detailed Description

Abstract base class for Creators. These are policy classes for generating objects derived from [GeomObject](#). This class is only intended for internal use by the [Factory](#) class. The user should not have to worry about it.

Definition at line 53 of file [Factory.h](#).

#### 29.73.2 Constructor & Destructor Documentation

29.73.2.1 `virtual Go::Creator::~~Creator ( )` [[inline](#)], [[virtual](#)]

Definition at line 57 of file [Factory.h](#).

#### 29.73.3 Member Function Documentation

29.73.3.1 `virtual GeomObject* Go::Creator::create ( )` [[pure virtual](#)]

Implemented in [Go::ConcreteCreator< T >](#).

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/geometry/Factory.h](#)

## 29.74 Go::CrossesValue Class Reference

IntersectionPoolUtils. predicate for STL function.

```
#include <IntersectionPoolUtils.h>
```

### Public Types

- typedef `const shared_ptr< IntersectionLink > argument_type`
- typedef `bool result_type`

### Public Member Functions

- `CrossesValue` (int *par\_dir*, double *value*, double *eps*)
- `bool operator()` (`const shared_ptr< IntersectionLink > &l`) `const`

#### 29.74.1 Detailed Description

IntersectionPoolUtils. predicate for STL function.

Definition at line 128 of file IntersectionPoolUtils.h.

#### 29.74.2 Member Typedef Documentation

29.74.2.1 `typedef const shared_ptr<IntersectionLink> Go::CrossesValue::argument_type`

Definition at line 157 of file IntersectionPoolUtils.h.

29.74.2.2 `typedef bool Go::CrossesValue::result_type`

Definition at line 158 of file IntersectionPoolUtils.h.

#### 29.74.3 Constructor & Destructor Documentation

### 29.75.1 Detailed Description

This curve represent an offset curve from a given space curve, along a direction obtained by blending two 'cross-tangent curves', and with an offset distance which is a linear function interpolating the cross-tangent length at the start and end of the curve.

Definition at line 57 of file CrossTangentOffset.h.

### 29.75.2 Constructor & Destructor Documentation

**29.75.2.1** `Go::CrossTangentOffset::CrossTangentOffset ( shared_ptr< SplineCurve > & poscurve, shared_ptr< SplineCurve > & tangcv1, shared_ptr< SplineCurve > & tangcv2, shared_ptr< SplineCurve > & blend1, shared_ptr< SplineCurve > & blend2 )`

Constructor, taking a curve from which we take the offset, and four other curves used to calculate the offset direction and magnitude. Two of these curves are the cross-tangent curves and the two other are blending functions (dimension 1). To find the offset direction at a given point, the two cross-tangent curves are evaluated at the specified parameter, multiplied by their respective blending functions and added together. The offset length is computed by linearly interpolating the length of this blended cross-tangent at the start and end parameter of the curve.

#### Parameters

|                 |                                                          |
|-----------------|----------------------------------------------------------|
| <i>poscurve</i> | the curve from which we take the offset                  |
| <i>tangcv1</i>  | the first cross-tangent curve                            |
| <i>tangcv2</i>  | the second cross-tangent curve                           |
| <i>blend1</i>   | the blending function for the first cross-tangent curve  |
| <i>blend2</i>   | the blending function for the second cross-tangent curve |

**29.75.2.2** `virtual Go::CrossTangentOffset::~~CrossTangentOffset ( ) [virtual]`

virtual destructor enables safe inheritance

### 29.75.3 Member Function Documentation

**29.75.3.1** `virtual bool Go::CrossTangentOffset::approximationOK ( double par, Point approxpos, double tol1, double tol2 ) const [virtual]`

Inherited from [EvalCurve::approximationOK\(\)](#). For this class, both tolerances are used.

#### Parameters

|                  |                                                                                                                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>par</i>       | the parameter at which to check the curve                                                                                                                                                                                                                                                                         |
| <i>approxpos</i> | the position we want to check whether or not the curve approximates for parameter 'par'.                                                                                                                                                                                                                          |
| <i>tol1</i>      | spatial approximation tolerance. If the evaluated position is outside this tolerance, 'false' is returned. If it inside this tolerance "by far", 'true' is returned. Otherwise, 'tol2' is taken into account.                                                                                                     |
| <i>tol2</i>      | This tolerance is taken into account when the evaluated point is within 'tol1' from 'approxpos', but not convincingly so. In that case this tolerance is used to check whether the evaluated cross tangent lies in the plane spanned by the tangent curves at this point. (It is thus an <i>angle</i> tolerance). |

**Returns**

'true' if the curve approximates the point at the parameter, 'false' otherwise.

Implements [Go::EvalCurve](#).

**29.75.3.2** `virtual int Go::CrossTangentOffset::dim ( ) const [virtual]`

Get the dimension of the space in which the curve lies.

**Returns**

the space dimension of the curve.

Implements [Go::EvalCurve](#).

**29.75.3.3** `virtual double Go::CrossTangentOffset::end ( ) const [virtual]`

Get the end parameter of the curve.

**Returns**

the end parameter of the curve.

Implements [Go::EvalCurve](#).

**29.75.3.4** `virtual Point Go::CrossTangentOffset::eval ( double t ) const [virtual]`

Evaluate a point on the curve for a given parameter

**Parameters**

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
|----------|------------------------------------------------|

**Returns**

the evaluated point

Implements [Go::EvalCurve](#).

**29.75.3.5** `virtual void Go::CrossTangentOffset::eval ( double t, int n, Point der[] ) const [virtual]`

Evaluate a point and a certain number of derivatives on the curve for a given parameter.

**Parameters**

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
| <i>n</i> | the number of derivatives (0 or more)          |

## Return values

|            |                                                                                                                                                                                                                                                                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>der</i> | pointer to an array of Points where the result will be written. The position will be stored first, then the first derivative (tangent), then the second, etc.. <b>NB:</b> For most (all) derived classes of 'EvalCurve', the implementation actually only supports the computation of one derivative, i.e. if $n > 1$ , only one derivative will be computed anyway. |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Implements [Go::EvalCurve](#).

29.75.3.6 `virtual double Go::CrossTangentOffset::start ( ) const [virtual]`

Get the start parameter of the curve.

## Returns

the start parameter of the curve.

Implements [Go::EvalCurve](#).

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/creators/CrossTangentOffset.h](#)

### 29.76.1 Detailed Description

This class defines an evaluator-based offset-curve. We're blending between a set of curves seen as an evaluator based curve.

Definition at line 55 of file CrossTanOffDist.h.

### 29.76.2 Constructor & Destructor Documentation

- 29.76.2.1 `Go::CrossTanOffDist::CrossTanOffDist` (`shared_ptr< SplineCurve > &poscurve`, `shared_ptr< SplineCurve > &tangcv1`, `shared_ptr< SplineCurve > &tangcv2`, `shared_ptr< SplineCurve > &blend1`, `shared_ptr< SplineCurve > &blend2`, `shared_ptr< SplineCurve > &opposite1`, `shared_ptr< SplineCurve > &opposite2`, `double factor`)

Constructor

Parameters

|                 |                                     |
|-----------------|-------------------------------------|
| <i>poscurve</i> | the curve to offset from.           |
| <i>tangcv1</i>  | tangent curve along poscurve.       |
| <i>tangcv2</i>  | cross tangent curve along poscurve. |

## Parameters

|                  |                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>blend1</i>    | 1-dimensional blending function for tangcv1.                                                                                                            |
| <i>blend2</i>    | 1-dimensional blending function for tangcv2.                                                                                                            |
| <i>opposite1</i> | space curve corresponding to poscurve, parametrized in the opposite direction.                                                                          |
| <i>opposite2</i> | space curve corresponding to poscurve, parametrized in the opposite direction. May be equal to opposite1.                                               |
| <i>factor</i>    | if != 1.0 the poscurve, opposite1 & opposite2 will be used to define the opposite curve, so as to minimize differences in parametrization along the cv. |

29.76.2.2 virtual Go::CrossTanOffDist::~~CrossTanOffDist ( ) [virtual]

Destructor.

### 29.76.3 Member Function Documentation

29.76.3.1 virtual bool Go::CrossTanOffDist::approximationOK ( double *par*, Point *approxpos*, double *tol1*, double *tol2* ) const [virtual]

Check if the curve, evaluated at a given parameter, approximates a given position within a given tolerance.

## Parameters

|                  |                                                                                          |
|------------------|------------------------------------------------------------------------------------------|
| <i>par</i>       | the parameter at which to check the curve                                                |
| <i>approxpos</i> | the position we want to check whether or not the curve approximates for parameter 'par'. |
| <i>tol1</i>      | approximation tolerance,                                                                 |
| <i>tol2</i>      | another approximation tolerance (its use is defined by some of the derived classes.      |

## Returns

'true' if the curve approximates the point at the parameter, 'false' otherwise.

Implements [Go::EvalCurve](#).

29.76.3.2 virtual int Go::CrossTanOffDist::dim ( ) const [virtual]

Get the dimension of the space in which the curve lies.

## Returns

the space dimension of the curve.

Implements [Go::EvalCurve](#).

29.76.3.3 `virtual double Go::CrossTanOffDist::end ( ) const [virtual]`

Get the end parameter of the curve.

#### Returns

the end parameter of the curve.

Implements [Go::EvalCurve](#).

29.76.3.4 `virtual Point Go::CrossTanOffDist::eval ( double t ) const [virtual]`

Evaluate a point on the curve for a given parameter

#### Parameters

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
|----------|------------------------------------------------|

#### Returns

the evaluated point

Implements [Go::EvalCurve](#).

29.76.3.5 `virtual void Go::CrossTanOffDist::eval ( double t, int n, Point der[] ) const [virtual]`

Evaluate a point and a certain number of derivatives on the curve for a given parameter.

#### Parameters

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
| <i>n</i> | the number of derivatives (0 or more)          |

#### Return values

|            |                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>der</i> | pointer to an array of Points where the result will be written. The position will be stored first, then the first derivative (tangent), then the second, etc.. <b>NB:</b> For most (all) derived classes of ' <a href="#">EvalCurve</a> ', the implementation actually only supports the computation of one derivative, i.e. if $n > 1$ , only one derivative will be computed anyway. |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Implements [Go::EvalCurve](#).

29.76.3.6 `virtual double Go::CrossTanOffDist::start ( ) const [virtual]`

Get the start parameter of the curve.

**Returns**

the start parameter of the curve.

Implements [Go::EvalCurve](#).

### 29.79.1 Detailed Description

A 2D parameter domain represented by its boundaries. The domain is not necessarily connected.

Definition at line 56 of file [CurveBoundedDomain.h](#).

### 29.79.2 Constructor & Destructor Documentation

#### 29.79.2.1 Go::CurveBoundedDomain::CurveBoundedDomain ( ) [inline]

Constructor generating an empty domain.

Definition at line 60 of file [CurveBoundedDomain.h](#).

#### 29.79.2.2 Go::CurveBoundedDomain::CurveBoundedDomain ( std::vector< shared\_ptr< [CurveLoop](#) > > loops )

The curve loop must contain either 2D [ParamCurve](#) objects or ?D [CurveOnSurface](#) objects. One of the loops (the first, preferably) should be ccw, the rest cw. Constructor generating a domain specified by one or more 2D [CurveLoops](#).

##### Parameters

|              |                                                                                                                                                                                                                                                      |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>loops</i> | The loops defining the domain to be created. The domain is defined as the union of the interior of these loops. The <a href="#">CurveLoop</a> s must contain either 2D <a href="#">ParamCurve</a> objects XD <a href="#">CurveOnSurface</a> objects. |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### 29.79.2.3 Go::CurveBoundedDomain::CurveBoundedDomain ( shared\_ptr< [CurveLoop](#) > ccw\_loop )

Constructor generating a (connected) domain specified by a [CurveLoop](#)

##### Parameters

|                 |                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------|
| <i>ccw_loop</i> | the curve loop specifying the domain. The domain will represent the interior of this (supposedly counterclockwise loop). |
|-----------------|--------------------------------------------------------------------------------------------------------------------------|

#### 29.79.2.4 virtual Go::CurveBoundedDomain::~~CurveBoundedDomain ( ) [virtual]

Virtual destructor, enables safe inheritance.

### 29.79.3 Member Function Documentation

29.79.3.1 `void Go::CurveBoundedDomain::clipWithDomain ( int pardir, double parval, double tolerance, shared_ptr< ParamSurface > srf, std::vector< shared_ptr< CurveOnSurface > > & trim_pieces ) const`

On the 2D parameter plane, consider the (iso)curve defined by fixing one of the parameters at a certain value. Now, pick those parts of this curve that are covered by 'this' [CurveBoundedDomain](#). Then, lift these (parameter) curves into 3D space by means of a [SplineSurface](#). This function will return the [CurveOnSurface](#) s defined by this procedure.

#### Parameters

|                  |                                                                                                                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pardir</i>    | this parameter specifies which of the two parameter directions that should be 'free' (the other will be fixed). 'pardir' should take the value of '1' or '2'. A value of '1' means that the <i>first</i> parameter direction will be free, while '2' means that the <i>second</i> parameter direction will be free. |
| <i>parval</i>    | the parameter value of the fixed parameter                                                                                                                                                                                                                                                                          |
| <i>tolerance</i> | the tolerance when determining which parts of the isoparameter curve are located inside 'this' <a href="#">CurveBoundedDomain</a> .                                                                                                                                                                                 |
| <i>srf</i>       | The surface used to 'lift' the resulting isoparameter curve intervals                                                                                                                                                                                                                                               |

#### Return values

|                    |                                                                   |
|--------------------|-------------------------------------------------------------------|
| <i>trim_pieces</i> | vector containing the resulting <a href="#">CurveOnSurface</a> s. |
|--------------------|-------------------------------------------------------------------|

29.79.3.2 `virtual void Go::CurveBoundedDomain::closestInDomain ( const Array< double, 2 > & point, Array< double, 2 > & clo_pt, double tolerance ) const` [virtual]

Find the parameter pair contained in the domain that is closest (using Euclidean distance in  $R^2$ ) to a given parameter pair. If the given parameter pair is already in the domain, then the answer is obviously that parameter pair

#### Parameters

|              |                                                                                                                                    |
|--------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>point</i> | the (u,v) parameter pair that we want to find the closest parameter pair to <i>inside</i> the <a href="#">CurveBoundedDomain</a> . |
|--------------|------------------------------------------------------------------------------------------------------------------------------------|

#### Return values

|               |                                        |
|---------------|----------------------------------------|
| <i>clo_pt</i> | the resulting closest parameter point. |
|---------------|----------------------------------------|

#### Parameters

|                  |                                                                                      |
|------------------|--------------------------------------------------------------------------------------|
| <i>tolerance</i> | the tolerance used in defining whether the given point is already inside the domain. |
|------------------|--------------------------------------------------------------------------------------|

Implements [Go::Domain](#).

29.79.3.3 `virtual void Go::CurveBoundedDomain::closestOnBoundary ( const Array< double, 2 > & point, Array< double, 2 > & clo_bd_pt, double tolerance ) const [virtual]`

Find the parameter pair on the boundary of the domain that is closest (using Euclidean distance in  $R^2$ ) to a given parameter pair. If the point is already considered *on* the boundary, then the answer is obviously the same point.

#### Parameters

|              |                                                                                                                                     |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <i>point</i> | the (u,v) parameter pair that we want to find to closest parameter pair to <i>on</i> the <a href="#">CurveBoundedDomain</a> border. |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------|

#### Return values

|                  |                                  |
|------------------|----------------------------------|
| <i>clo_bd_pt</i> | the closest point on the border. |
|------------------|----------------------------------|

#### Parameters

|                  |                                                           |
|------------------|-----------------------------------------------------------|
| <i>tolerance</i> | the tolerance used in defining whether the given point is |
|------------------|-----------------------------------------------------------|

Implements [Go::Domain](#).

29.79.3.4 `RectDomain Go::CurveBoundedDomain::containingDomain ( ) const`

Get a rectangular domain that is guaranteed to contain the [CurveBoundedDomain](#).

#### Returns

a [RectDomain](#) that contains this [CurveBoundedDomain](#). If the loops defining the [CurveBoundedDomain](#) are specified by 2D parameter curves, the [RectDomain](#) will be the smallest rectangular domain containing all the control points of the boundary curves. In the opposite case, the loops are assumed to be [CurveOnSurface](#)s, and the returned [RectDomain](#) will be that of the underlying surface.

29.79.3.5 `void Go::CurveBoundedDomain::findPcurveInsideSegments ( const SplineCurve & curve, double tolerance, std::vector< double > & params_start_end_interval ) const`

Given a curve in the 2D parameter plane, determine those parts of the curve that are contained inside 'this' [CurveBoundedDomain](#).

#### Parameters

|                  |                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>curve</i>     | this is the 2D curve that we want to examine                                                                                 |
| <i>tolerance</i> | this is the tolerance used when determining which parts of of 'curve' are inside 'this' <a href="#">CurveBoundedDomain</a> . |

## Return values

|                                  |                                                                                                                                                                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>params_start_end_interval</i> | a vector containing the start- and end parameters of the curve segments that were found to be inside this domain. An even indexed entry marks the start parameter of a curve segment, while the following, odd indexed entry marks the end parameter of the same curve segment. |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

29.79.3.6 void Go::CurveBoundedDomain::findPcurveInsideSegments ( const SplineCurve & *curve*, double *tolerance*, std::vector< double > & *params\_start\_end\_interval*, std::vector< double > & *boundary\_params*, std::vector< int > & *boundary\_loops*, std::vector< int > & *boundary\_curves* ) const

Given a curve in the 2D parameter plane, determine those parts of the curve that are contained inside 'this' [CurveBoundedDomain](#). Also store positional information about the intersections with the boundary curves

## Parameters

|                  |                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>curve</i>     | this is the 2D curve that we want to examine                                                                                 |
| <i>tolerance</i> | this is the tolerance used when determining which parts of of 'curve' are inside 'this' <a href="#">CurveBoundedDomain</a> . |

## Return values

|                                  |                                                                                                                                                                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>params_start_end_interval</i> | a vector containing the start- and end parameters of the curve segments that were found to be inside this domain. An even indexed entry marks the start parameter of a curve segment, while the following, odd indexed entry marks the end parameter of the same curve segment. |
| <i>boundary_params</i>           | a vector containing the parameters on the boundary curves in the same order as in <i>params_start_end_interval</i>                                                                                                                                                              |
| <i>boundary_loops</i>            | a vector containing the loop index of the boundary curves in the same order as in <i>params_start_end_interval</i>                                                                                                                                                              |
| <i>boundary_curves</i>           | a vector containing the boundary curve position among the curves in the same loop, in the same order as in <i>params_start_end_interval</i>                                                                                                                                     |

29.79.3.7 void Go::CurveBoundedDomain::getInsideIntervals ( int *pardir*, double *parval1*, double *parval2*, double *tolerance*, std::vector< std::pair< double, double > > & *insideInts* ) const

Fetch all intervals in one parameter direction going through a specific point lying inside the bounded domain.

29.79.3.8 void Go::CurveBoundedDomain::getInternalPoint ( double & *upar*, double & *vpar* ) const

Return an arbitrary internal parameter point in the domain (not on the boundary)

29.79.3.9 virtual bool Go::CurveBoundedDomain::isInDomain ( const Array< double, 2 > & *point*, double *tolerance* ) const [virtual]

Query whether a given parameter pair is inside the domain or not.

## Parameters

|                  |                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>point</i>     | array containing the parameter pair                                                                                                                                                                                                                     |
| <i>tolerance</i> | the tolerance to be used. In order to be considered 'inside', the point must be located inside one of the defining <a href="#">CurveLoop</a> s, as well as being at a distance more than 'tolerance' from any point on that <a href="#">CurveLoop</a> . |

## Returns

'true' if the point is found to be inside the domain, 'false' otherwise.

Implements [Go::Domain](#).

```
29.79.3.10 virtual int Go::CurveBoundedDomain::isInDomain2 (const Array< double, 2 > & point, double tolerance)
 const [virtual]
```

Query whether a given parameter pair is inside the domain or not.

## Parameters

|                  |                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>point</i>     | array containing the parameter pair                                                                                                                                                                                                                     |
| <i>tolerance</i> | the tolerance to be used. In order to be considered 'inside', the point must be located inside one of the defining <a href="#">CurveLoop</a> s, as well as being at a distance more than 'tolerance' from any point on that <a href="#">CurveLoop</a> . |

## Returns

'1' if the point is found to be inside the domain, '2' if it is found to be on the boundary '0' otherwise.

Implements [Go::Domain](#).

```
29.79.3.11 virtual bool Go::CurveBoundedDomain::isOnBoundary (const Array< double, 2 > & point, double tolerance
) const [virtual]
```

check whether a given parameter pair is located *on* the domain boundary

## Parameters

|                  |                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>point</i>     | array containing the parameter pair                                                                                   |
| <i>tolerance</i> | the tolerance used. (how 'far' from the boundary our parameter pair can be and still be considered 'on' the boundary. |

## Returns

'true' if the parameter pair is considered to be on the boundary, 'false' otherwise.

Implements [Go::Domain](#).

29.79.3.12 `bool Go::CurveBoundedDomain::isOnCorner ( const Array< double, 2 > &point, double tolerance ) const`

Check if the given parameter pair is located on the endpoint of some curve in the curve loop

29.79.3.13 `int Go::CurveBoundedDomain::positionPointInDomain ( int pdir, double parval1, double parval2, double tolerance ) const`

Check the position of a parameter point in the domain. Return value: -1 : Outside of outer loop 0 : Inside domain  $j > 0$  : Inside hole number  $j$ , i.e. inside loop number  $j$

The documentation for this class was generated from the following file:

### 29.80.1 Detailed Description

[CurveLoop](#) represents a closed loop defined by the composition of a set of curves. The start point of curve (i+1) should coincide (within a certain tolerance) with the end point of curve (i), and the end point of the last curve should coincide with the start point of the first curve. CurveLoops are useful in, for example, describing the boundary of a surface.

Definition at line 107 of file CurveLoop.h.

### 29.80.2 Constructor & Destructor Documentation

#### 29.80.2.1 Go::CurveLoop::CurveLoop ( )

Create an empty loop.

#### 29.80.2.2 Go::CurveLoop::CurveLoop ( const std::vector< shared\_ptr< ParamCurve > > & curves, double space\_epsilon )

Create a loop based on a given set of curves.

##### Parameters

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>curves</i>        | a vector with shared pointers to the curves defining the <a href="#">CurveLoop</a> . The start point of each curve should match the end point of the previous curve within the given tolerance. The same is the same for the start point on the first curve and the end point on the last curve). Moreover, it is expected that all curves are of the same type, and that they all lie in the same space (ie. have the same dimension). |
| <i>space_epsilon</i> | the given tolerance for defining coincidence between start/end points on curves.                                                                                                                                                                                                                                                                                                                                                        |

#### 29.80.2.3 virtual Go::CurveLoop::~CurveLoop ( ) [virtual]

Virtual destructor allows safe inheritance.

### 29.80.3 Member Function Documentation

#### 29.80.3.1 std::vector< shared\_ptr< ParamCurve > >::const\_iterator Go::CurveLoop::begin ( ) const [inline]

Get a const iterator to the first curve in the [CurveLoop](#)

##### Returns

a const iterator to the first curve in the [CurveLoop](#)

Definition at line 161 of file CurveLoop.h.

29.80.3.2 `std::vector< shared_ptr<ParamCurve> >::iterator Go::CurveLoop::begin ( )` `[inline]`

Get a iterator to the first curve in the [CurveLoop](#)

Returns

a iterator to the first curve in the [CurveLoop](#)

Definition at line 171 of file CurveLoop.h.

29.80.3.3 `void Go::CurveLoop::closestParPoint ( const Point & pt, int & clo_ind, double & clo_par, Point & clo_pt, double & clo_dist ) const`

View the loop as a curve in the parameter space and compute the closest point in the loop. This function is only interesting if the curves constituting the [CurveLoop](#) are of type "CurveOnSurface". In that case, the curves have a 2D representation in the parametric domain of the surface, as well as a 3D representation in geometric space. This function will search for the closest point in *parametric* space to a *parametric* (2D) point specified by the user.

Parameters

|                 |                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>       | The point given by the user. It should be a 2D point referring to the parametric domain of a surface. We want to determine the closest point to this on the <a href="#">CurveLoop</a> . |
| <i>clo_ind</i>  | Upon return: the index of the curve segment on which the closest point was found.                                                                                                       |
| <i>clo_par</i>  | Upon return: the parameter of the detected closest point on the curve segment containing it (a scalar value)                                                                            |
| <i>clo_pt</i>   | Upon return: the curve segment's closest point represented as a 2D parameter pair in the domain of the underlying surface.                                                              |
| <i>clo_dist</i> | Upon return: the distance between the point given by the user and the found closest point, measured in the parametric domain of the underlying surface.                                 |

29.80.3.4 `void Go::CurveLoop::closestPoint ( const Point & pt, int & clo_ind, double & clo_par, Point & clo_pt, double & clo_dist ) const`

Find the closest point on the curve loop to a point specified by the user.

Parameters

|                 |                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------|
| <i>pt</i>       | The point given by the user. We want to determine the closest point to this on the <a href="#">CurveLoop</a> . |
| <i>clo_ind</i>  | Upon return: the index of the curve segment on which the closest point was found.                              |
| <i>clo_par</i>  | Upon return: the parameter of the detected closest point on the curve containing it.                           |
| <i>clo_pt</i>   | Upon return: the geometric position of the detected closest point                                              |
| <i>clo_dist</i> | Upon return: the distance to the detected closest point.                                                       |

29.80.3.5 `std::vector< shared_ptr<ParamCurve> >::const_iterator Go::CurveLoop::end ( ) const` `[inline]`

Get a const iterator to one-past-the-last curve in the [CurveLoop](#)

**Returns**

a const iterator to the one-past-the-last curve in the [CurveLoop](#)

Definition at line 166 of file CurveLoop.h.

**29.80.3.6** `std::vector< shared_ptr<ParamCurve> >::iterator Go::CurveLoop::end ( )` `[inline]`

Get a iterator to one-past-the-last curve in the [CurveLoop](#)

**Returns**

a iterator to the one-past-the-last curve in the [CurveLoop](#)

Definition at line 176 of file CurveLoop.h.

**29.80.3.7** `bool Go::CurveLoop::fixInvalidLoop ( double & max_gap )`

If loop is invalid, we try to fix loop. If we fail we alter nothing. Return value is true if loop is valid. `max_gap` is set to the largest gap in the loop.

**29.80.3.8** `std::vector<Point> Go::CurveLoop::getCorners ( ) const`

Return joint points between curves.

**29.80.3.9** `std::vector<shared_ptr<ParamCurve> > Go::CurveLoop::getCurves ( )` `[inline]`

Return the curves in the loop as a vector.

Definition at line 222 of file CurveLoop.h.

**29.80.3.10** `double Go::CurveLoop::getMaxCurveDist ( ) const` `[inline]`

Maximum distance between subsequent curves.

Definition at line 249 of file CurveLoop.h.

**29.80.3.11** `void Go::CurveLoop::getSmoothCurves ( std::vector< std::vector< shared_ptr< ParamCurve > > > & curves, double angtol )`

Collect curves with smooth connections.

**29.80.3.12** `double Go::CurveLoop::getSpaceEpsilon ( ) const`

Get the tolerance value (used to determine whether the start/end points on curves are coincident).

**29.80.3.13** `bool Go::CurveLoop::isValid ( ) const`

If the curves do not form a simple loop within the input tolerance, the object is invalid.

**29.80.3.14** `shared_ptr<ParamCurve> Go::CurveLoop::operator[] ( int index ) const`

Get a shared pointer to the i'th curve in the [CurveLoop](#)

## Parameters

|              |                                  |
|--------------|----------------------------------|
| <i>index</i> | the index of the requested curve |
|--------------|----------------------------------|

## Returns

a shared pointer to the requested curve.

29.80.3.15 void Go::CurveLoop::setCurves ( const std::vector< shared\_ptr< ParamCurve > > & curves )

Reset the [CurveLoop](#) based on a given vector of curves. (But keep the previously set tolerance value.)

## Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>curves</i> | a vector with shared pointers to the curves defining the <a href="#">CurveLoop</a> . The start point of each curve should match the end point of the previous curve within the given tolerance. The same is the same for the start point on the first curve and the end point on the last curve). Moreover, it is expected that all curves are of the same type, and that they all lie in the same space (ie. have the same dimension). |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

29.80.3.16 void Go::CurveLoop::setSpaceEpsilon ( const double space\_epsilon )

Set the tolerance (used to determine whether the start/end points on curves are coincident) to a given value

## Parameters

|                      |                                 |
|----------------------|---------------------------------|
| <i>space_epsilon</i> | set the tolerance to this value |
|----------------------|---------------------------------|

29.80.3.17 bool Go::CurveLoop::simplify ( double tol, double ang\_tol, double & max\_dist )

Simplify this curve loop if possible by reducing the number of curves.

29.80.3.18 int Go::CurveLoop::size ( ) const [inline]

Query the number of curves constituting the [CurveLoop](#)

## Returns

the number of curves constituting the [CurveLoop](#)

Definition at line 157 of file CurveLoop.h.

29.80.3.19 void Go::CurveLoop::swap ( CurveLoop & other )

Quick swap of one [CurveLoop](#) with another.

29.80.3.20 void Go::CurveLoop::turnOrientation ( )

Reverse the direction of all curves and their mutual order.

The documentation for this class was generated from the following file:

## Additional Inherited Members

### 29.81.1 Detailed Description

A curve model including topological information

Definition at line 65 of file [CurveModel.h](#).

### 29.81.2 Constructor & Destructor Documentation

**29.81.2.1** `Go::CurveModel::CurveModel ( double gap, double neighbour, double kink, double bend, std::vector< shared_ptr< ParamCurve > > & curves )`

Constructor The sequence of the input curves will be kept, but a permutation array will sort the curves according to continuity

#### Parameters

|                  |                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------|
| <i>gap</i>       | If the distance between two points is less than 'gap' they are viewed as identical.                            |
| <i>neighbour</i> | Maximum distance between curves viewed as adjacent.                                                            |
| <i>kink</i>      | If two adjacent curves meet with an angle less than 'kink', they are seen as G1 continous. (angles in radians) |
| <i>bend</i>      | If two curves meet with an angle larger than 'bend', there is an intentional corner. (angles in radians)       |
| <i>curves</i>    | A vector of curves.                                                                                            |

### 29.81.2.2 Go::CurveModel::~~CurveModel ( )

Destructor.

## 29.81.3 Member Function Documentation

### 29.81.3.1 virtual BoundingBox Go::CurveModel::boundingBox ( ) [virtual]

Bounding box of the entire composite curve

#### Returns

Bounding box

Implements [Go::CompositeModel](#).

### 29.81.3.2 virtual BoundingBox Go::CurveModel::boundingBox ( int *idx* ) const [virtual]

Bounding box corresponding to one curve

#### Parameters

|            |                |
|------------|----------------|
| <i>idx</i> | Index of curve |
|------------|----------------|

#### Returns

Bounding box

Implements [Go::CompositeModel](#).

### 29.81.3.3 virtual CurveModel\* Go::CurveModel::clone ( ) const [virtual]

Make a copy of the current model

#### Returns

Pointer to a copy of this [CurveModel](#)

Reimplemented from [Go::CompositeModel](#).

### 29.81.3.4 virtual void Go::CurveModel::closestPoint ( Point & *pnt*, Point & *clo\_pnt*, int & *idx*, double *clo\_par*[], double & *dist* ) [virtual]

Closest point between a given point and this composite curve Returns one point We could think of specifying a function that returns all global closest points, only for global search. It is also possible to return closest points within a given range from the best closest point, but only one point for each curve in the model.

## Parameters

|            |             |
|------------|-------------|
| <i>pnt</i> | Input point |
|------------|-------------|

## Return values

|                  |                                                      |
|------------------|------------------------------------------------------|
| <i>clo_pnt</i>   | Found closest point                                  |
| <i>idx</i>       | Index of curve where the closest point is found      |
| <i>clo_par[]</i> | Parameter value corresponding to the closest point   |
| <i>dist</i>      | Distance between input point and found closest point |

Implements [Go::CompositeModel](#).

29.81.3.5 `virtual double Go::CurveModel::curvature ( int idx, double * par ) const` [virtual]

Curvature of a curve

## Parameters

|            |                                               |
|------------|-----------------------------------------------|
| <i>idx</i> | Index of curve                                |
| <i>par</i> | Parameter value at which to compute curvature |

## Returns

The curvature.

Implements [Go::CompositeModel](#).

29.81.3.6 `virtual void Go::CurveModel::evaluate ( int idx, double par[], Point & pnt ) const` [virtual]

Evaluate position

## Parameters

|              |                 |
|--------------|-----------------|
| <i>idx</i>   | Index of curve  |
| <i>par[]</i> | Parameter value |

## Return values

|            |        |
|------------|--------|
| <i>pnt</i> | Result |
|------------|--------|

Implements [Go::CompositeModel](#).

29.81.3.7 `virtual void Go::CurveModel::evaluate ( int idx, double par[], int nder, std::vector< Point > & der ) const`  
 [virtual]

Evaluate position and a number of derivatives The sequence is position, first derivative, second derivative, etc.

#### Parameters

|               |                                                   |
|---------------|---------------------------------------------------|
| <i>idx</i>    | Index                                             |
| <i>par</i> [] | Parameter value                                   |
| <i>nder</i>   | Number of derivatives to compute, 0=only position |

#### Return values

|            |        |
|------------|--------|
| <i>der</i> | Result |
|------------|--------|

Implements [Go::CompositeModel](#).

29.81.3.8 `virtual void Go::CurveModel::extremalPoint ( Point & dir, Point & ext_pnt, int & idx, double ext_par[])`  
 [virtual]

Extremal point(s) in a given direction.

#### Parameters

|            |           |
|------------|-----------|
| <i>dir</i> | Direction |
|------------|-----------|

#### Return values

|                   |                                                  |
|-------------------|--------------------------------------------------|
| <i>ext_pnt</i>    | Found extremal point                             |
| <i>idx</i>        | Index of curve where the extremal point is found |
| <i>ext_par</i> [] | Parameter value of extremal point                |

Implements [Go::CompositeModel](#).

29.81.3.9 `std::vector<shared_ptr<CompositeCurve>> Go::CurveModel::fetchCompositeCurves ( ) const`

Fetch all uniquely connected composite curves

#### Returns

Vector of pointers to the composite curves

29.81.3.10 `shared_ptr<ParamCurve> Go::CurveModel::getCurve ( int idx ) const`

Return one curve Note that the index corresponds to the sequence of which the curves are added to the [CurveModel](#), not the position in the composite curve

## Parameters

|            |                |
|------------|----------------|
| <i>idx</i> | Index of curve |
|------------|----------------|

## Returns

Pointer to curve

29.81.3.11 `int Go::CurveModel::getIndex ( ParamCurve * curve ) const`

Given a curve in the composite curve, return the index of this curve

## Parameters

|              |                  |
|--------------|------------------|
| <i>curve</i> | Pointer to curve |
|--------------|------------------|

## Returns

Index to curve

29.81.3.12 `virtual shared_ptr<IntResultsModel> Go::CurveModel::intersect ( const ftLine & line ) [virtual]`

Intersection with a line. Expected output is points, probably one point. Curves can occur in special configurations.

## Parameters

|             |           |
|-------------|-----------|
| <i>line</i> | The line. |
|-------------|-----------|

## Returns

Pointer to an [IntResultsModel](#).

Implements [Go::CompositeModel](#).

29.81.3.13 `virtual shared_ptr<IntResultsModel> Go::CurveModel::intersect_plane ( const ftPlane & plane ) [virtual]`

Intersection with a plane.

## Parameters

|              |            |
|--------------|------------|
| <i>plane</i> | The plane. |
|--------------|------------|

**Returns**

Pointer to an [IntResultsModel](#).

Implements [Go::CompositeModel](#).

**29.81.3.14** `virtual bool Go::CurveModel::isDegenerate ( int idx ) const [virtual]`

Whether one particular curve is degenerated

**Parameters**

|            |                |
|------------|----------------|
| <i>idx</i> | Index of curve |
|------------|----------------|

**Returns**

Whether the curve is degenerated

Implements [Go::CompositeModel](#).

**29.81.3.15** `virtual int Go::CurveModel::nmbEntities ( ) const [virtual]`

Number of simple entities

**Returns**

Number of simple entities

Implements [Go::CompositeModel](#).

**29.81.3.16** `virtual void Go::CurveModel::tessellate ( std::vector< shared_ptr< GeneralMesh > > & meshes ) const [virtual]`

Tessellate all curves with respect to a default resolution

**Return values**

|               |                  |
|---------------|------------------|
| <i>meshes</i> | Tesselated model |
|---------------|------------------|

Implements [Go::CompositeModel](#).

**29.81.3.17** `virtual void Go::CurveModel::tessellate ( int resolution[], std::vector< shared_ptr< GeneralMesh > > & meshes ) const [virtual]`

Tessellate all curves with respect to a given resolution

## Parameters

|                      |                                               |
|----------------------|-----------------------------------------------|
| <i>resolution</i> [] | All curves are tessellated with resolution[0] |
|----------------------|-----------------------------------------------|

## Return values

|               |                   |
|---------------|-------------------|
| <i>meshes</i> | Tessellated model |
|---------------|-------------------|

Implements [Go::CompositeModel](#).

29.81.3.18 `virtual void Go::CurveModel::tessellate ( double density, std::vector< shared_ptr< GeneralMesh > > & meshes ) const` [virtual]

Tessellate all curves with respect to a given tessellation density

## Parameters

|                |                      |
|----------------|----------------------|
| <i>density</i> | Tessellation density |
|----------------|----------------------|

## Return values

|               |                   |
|---------------|-------------------|
| <i>meshes</i> | Tessellated model |
|---------------|-------------------|

Implements [Go::CompositeModel](#).

29.81.3.19 `virtual void Go::CurveModel::tessellatedCtrPolygon ( std::vector< shared_ptr< LineCloud > > & ctr_pol ) const` [virtual]

Tessellate the control polygon of all curves.

## Return values

|                |                                                    |
|----------------|----------------------------------------------------|
| <i>ctr_pol</i> | Tessellation of the control polygon of all curves. |
|----------------|----------------------------------------------------|

Implements [Go::CompositeModel](#).

29.81.3.20 `virtual void Go::CurveModel::turn ( int idx )` [virtual]

Turn parameter direction of one curve. An update in the topology structures is required.

## Parameters

|            |                |
|------------|----------------|
| <i>idx</i> | Index of curve |
|------------|----------------|

Implements [Go::CompositeModel](#).

29.81.3.21 virtual void Go::CurveModel::turn ( ) [virtual]

Turn parameter directions of all curves. An update in the topology structures is required.

Implements [Go::CompositeModel](#).

The documentation for this class was generated from the following file:

- [compositemodel/include/GoTools/compositemodel/CurveModel.h](#)

## 29.82 Go::CurveOnSurface Class Reference

A curve living on a parametric surface. It either has got information about the curve in geometry space and in the parameter domain of the surface or the ability to compute the other representation given one. The curve may have information on whether it is a constant parameter or boundary curve on the surface.

```
#include <CurveOnSurface.h>
```

Inheritance diagram for Go::CurveOnSurface:

#### 29.82.1 Detailed Description

A curve living on a parametric surface. It either has got information about the curve in geometry space and in the parameter domain of the surface or the ability to compute the other representation given one. The curve may have information on whether it is a constant parameter or boundary curve on the surface.

Definition at line 62 of file CurveOnSurface.h.

#### 29.82.2 Constructor & Destructor Documentation

##### 29.82.2.1 Go::CurveOnSurface::CurveOnSurface ( )

Define an empty `CurveOnSurface` that can be assigned or `read()` into

##### 29.82.2.2 Go::CurveOnSurface::CurveOnSurface ( shared\_ptr< ParamSurface > surf, shared\_ptr< ParamCurve > curve, bool preferparameter )

Construct a `CurveOnSurface` by specifying the surface and either a space curve or a curve in the parameter plane. Does not clone any of the input, just sets (smart) pointers.

## Parameters

|                        |                                                                                                                                                                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>surf</i>            | pointer to the underlying surface                                                                                                                                                                                                                                                        |
| <i>curve</i>           | pointer to the curve specifying the <a href="#">CurveOnSurface</a> . This curve may either be in the parametric domain of the surface (2D curve), or a space curve that the user has assured to be coincident with the surface. 'preferparameter' specifies which kind of curve this is. |
| <i>preferparameter</i> | if this is set to 'true', then 'curve' is assumed to be a curve in the parametric domain of the surface. Otherwise, it is assumed to be a space (3D) curve.                                                                                                                              |

29.82.2.3 `Go::CurveOnSurface::CurveOnSurface ( shared_ptr< ParamSurface > surf, shared_ptr< ParamCurve > curve, int constdir, double constpar, int boundary )`

Constructor for constant parameter curves.

29.82.2.4 `Go::CurveOnSurface::CurveOnSurface ( shared_ptr< ParamSurface > surf, int constdir, double constpar, double par1, double par2, int boundary )`

Constructor for constant parameter curves. The curve is to be restricted to the parameter interval [par1, par2].

29.82.2.5 `Go::CurveOnSurface::CurveOnSurface ( shared_ptr< ParamSurface > surf, shared_ptr< ParamCurve > pcurve, shared_ptr< ParamCurve > spacecurve, bool preferparameter, int ccm, int constdir, double constpar, int boundary, bool same_orientation )`

Constructor with all information.

29.82.2.6 `Go::CurveOnSurface::CurveOnSurface ( shared_ptr< ParamSurface > surf, shared_ptr< ParamCurve > pcurve, shared_ptr< ParamCurve > spacecurve, bool preferparameter, int ccm = 0 )`

Construct a [CurveOnSurface](#) by specifying the surface, the space curve and the curve in the parameter plane. The arguments are checked for consistency, and if they appear incoherent, an exception will be thrown. Does not clone any of the input, just sets (smart) pointers.

## Parameters

|                        |                                                                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>surf</i>            | pointer to the underlying surface                                                                                                                                                                 |
| <i>pcurve</i>          | pointer to the curve representing the <a href="#">CurveOnSurface</a> in the parametric domain of the surface.                                                                                     |
| <i>spacecurve</i>      | pointer to the curve that is the spatial (3D) representation of the <a href="#">CurveOnSurface</a> .                                                                                              |
| <i>preferparameter</i> | specify whether the parametric curve or the space curve are preferred for internal computations.                                                                                                  |
| <i>ccm</i>             | curve creation method. Specify how curve was created. 0 = undefined, 1 = projection onto surface, 2 = intersection of two surfaces, 3 = isoparametric curve (i.e. either a u-curve or a v-curve). |

29.82.2.7 `Go::CurveOnSurface::CurveOnSurface ( const CurveOnSurface & surface_curve )`

Copy constructor. The copy constructor will not `clone()` the underlying surface, but it will `clone()` both the parametric and the spatial curve.

Parameters

|                      |                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------|
| <i>surface_curve</i> | the <a href="#">CurveOnSurface</a> to copy into 'this' <a href="#">CurveOnSurface</a> . |
|----------------------|-----------------------------------------------------------------------------------------|

29.82.2.8 `virtual Go::CurveOnSurface::~~CurveOnSurface ( ) [virtual]`

Destructor. Trivial because memory is managed by `shared_ptr`.

### 29.82.3 Member Function Documentation

29.82.3.1 `virtual void Go::CurveOnSurface::appendCurve ( ParamCurve * cv, bool reparam = true ) [virtual]`

append a curve to this curve, with eventual reparametrization NB: This virtual member function currently only works for `SplineCurves` and `CurveOnSurfaces`. Moreover, 'this' curve and the 'cv' curve must be of the same type.

Parameters

|                |                                                          |
|----------------|----------------------------------------------------------|
| <i>cv</i>      | the curve to append to 'this' curve.                     |
| <i>reparam</i> | specify whether or not there should be reparametrization |

Implements [Go::ParamCurve](#).

29.82.3.2 `virtual void Go::CurveOnSurface::appendCurve ( ParamCurve * cv, int continuity, double & dist, bool reparam = true ) [virtual]`

append a curve to this curve, with eventual reparametrization

Parameters

|                   |                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------|
| <i>cv</i>         | the curve to append to 'this' curve.                                                                  |
| <i>continuity</i> | the required continuity at the transition. Can be $G^{(-1)}$ and upwards.                             |
| <i>dist</i>       | a measure of the local distorsion around the transition in order to achieve the specified continuity. |
| <i>reparam</i>    | specify whether or not there should be reparametrization                                              |

Implements [Go::ParamCurve](#).

29.82.3.3 `virtual BoundingBox Go::CurveOnSurface::boundingBox ( ) const [virtual]`

Axis align box surrounding this object Computed with respect to the space curve if this one exists, otherwise the underlying surface

Implements [Go::GeomObject](#).

29.82.3.4 `static ClassType Go::CurveOnSurface::classType ( ) [inline],[static]`

Definition at line 159 of file CurveOnSurface.h.

29.82.3.5 `virtual CurveOnSurface* Go::CurveOnSurface::clone ( ) const [inline],[virtual]`

The clone-function is inherited from [GeomObject](#), but overridden here to get a covariant return type (for those compilers that allow this).

Implements [Go::ParamCurve](#).

Definition at line 174 of file CurveOnSurface.h.

29.82.3.6 `virtual void Go::CurveOnSurface::closestPoint ( const Point & pt, double tmin, double tmax, double & clo_t, Point & clo_pt, double & clo_dist, double const * seed = 0 ) const [virtual]`

Compute the closest point from an interval of this curve to a specified point.

Parameters

|                 |                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>       | point we want to find the closest point to                                                                                               |
| <i>tmin</i>     | start parameter of search interval                                                                                                       |
| <i>tmax</i>     | end parameter of search interval                                                                                                         |
| <i>clo_t</i>    | upon function return, 'clo_t' will contain the parameter value of the closest point found.                                               |
| <i>clo_pt</i>   | upon function return, 'clo_pt' will contain the position of the closest point found.                                                     |
| <i>clo_dist</i> | upon function return, 'clo_dist' will contain the distance between 'pt' and the closest point found.                                     |
| <i>seed</i>     | pointer to initial guess value, provided by the user (can be 0, for which the algorithm will determine a (hopefully) reasonable choice). |

Implements [Go::ParamCurve](#).

29.82.3.7 `RectDomain Go::CurveOnSurface::containingDomain ( ) const`

Get the rectangle enclosing the underlying surface's parametric domain.

Returns

the [RectDomain](#) for the underlying surface.

29.82.3.8 `int Go::CurveOnSurface::curveCreationMethod ( ) const`

Return curve creation method 0 = undefined, 1 = projection onto surface, 2 = intersection of two surfaces, 3 = isoparametric curve (i.e. either a u-curve or a v-curve).

29.82.3.9 `virtual int Go::CurveOnSurface::dimension ( ) const [virtual]`

Dimension of geometry space.

Implements [Go::GeomObject](#).

29.82.3.10 `virtual DirectionCone Go::CurveOnSurface::directionCone ( ) const [virtual]`

[Cone](#) surrounding the set of tangent directions corresponding to the surface. Only computed if the space curve exists

Implements [Go::ParamCurve](#).

29.82.3.11 `void Go::CurveOnSurface::enableSameOrientation ( )`

Make sure that the curves have the same orientation.

29.82.3.12 `virtual double Go::CurveOnSurface::endparam ( ) const [virtual]`

Query the end parameter of the curve

Returns

the curve's end parameter

Implements [Go::ParamCurve](#).

29.82.3.13 `bool Go::CurveOnSurface::ensureParCrvExistence ( double epsgeo, const RectDomain * domain_of_interest = NULL, const Point * start_par_pt = NULL, const Point * end_par_pt = NULL )`

Generate parameter curve if it doesn't exist Optionally include start and/or end parameter point.

29.82.3.14 `bool Go::CurveOnSurface::ensureSpaceCrvExistence ( double tol )`

Generate space curve if it doesn't exist.

29.82.3.15 `Point Go::CurveOnSurface::faceParameter ( double crv_par, const RectDomain * domain_of_interest = NULL ) const`

Fetch the surface parameter corresponding to a curve parameter.

29.82.3.16 virtual **SplineCurve\*** Go::CurveOnSurface::geometryCurve ( ) [virtual]

If the definition of this [ParamCurve](#) contains a [SplineCurve](#) describing its spatial shape, then this function will return a pointer to this [SplineCurve](#). Otherwise it will return a null pointer. The returned curve is NEWed, so the user is responsible for deleting it. This function may have side-effects.

#### Returns

a pointer to a [SplineCurve](#) representation of the [ParamCurve](#), if it exists. Null pointer otherwise.

Implements [Go::ParamCurve](#).

29.82.3.17 void Go::CurveOnSurface::getConstantCurveInfo ( int & *constdir*, double & *constval*, int & *bd*, bool & *same\_orientation* ) const [inline]

Fetch recorded constant curve information.

Definition at line 417 of file CurveOnSurface.h.

29.82.3.18 int Go::CurveOnSurface::getCurveTypeInfo ( ) [inline]

Definition at line 323 of file CurveOnSurface.h.

29.82.3.19 virtual **ClassType** Go::CurveOnSurface::instanceType ( ) const [virtual]

Type of current object.

Implements [Go::GeomObject](#).

29.82.3.20 virtual **bool** Go::CurveOnSurface::isAxisRotational ( **Point** & *centre*, **Point** & *axis*, **Point** & *vec*, double & *angle* ) [virtual]

Check if the curve is axis rotational. Only true if a connection to an axis rotational elementary curve exist The axis and rotational angle is only specified if the curve is actually rotational

Reimplemented from [Go::ParamCurve](#).

29.82.3.21 **bool** Go::CurveOnSurface::isConstantCurve ( ) const [inline]

Check if the curve is a constant parameter curve and marked as such.

Definition at line 407 of file CurveOnSurface.h.

29.82.3.22 **bool** Go::CurveOnSurface::isConstantCurve ( double *tol*, int & *pardir*, double & *parval* ) const

Check if the curve is a constant parameter curve with regard to the parameter tol

29.82.3.23 virtual **bool** Go::CurveOnSurface::isDegenerate ( double *degenerate\_epsilon* ) [virtual]

Query whether the curve is degenerate (collapsed into a single point).

## Parameters

|                           |                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>degenerate_epsilon</i> | the tolerance used in determine whether the curve is degenerate. A curve is considered degenerate if its total length is shorter than this value. |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

## Returns

`true` if the curve is degenerate, `false` otherwise.

Implements [Go::ParamCurve](#).

**29.82.3.24** `virtual bool Go::CurveOnSurface::isInPlane ( const Point & loc, const Point & axis, double eps, Point & normal ) const` `[virtual]`

Check if the curve lies in a plane passing through a given axis.

Reimplemented from [Go::ParamCurve](#).

**29.82.3.25** `virtual bool Go::CurveOnSurface::isInPlane ( const Point & norm, double eps, Point & pos ) const` `[virtual]`

Check if the curve lies in a plane with a given normal.

Reimplemented from [Go::ParamCurve](#).

**29.82.3.26** `virtual bool Go::CurveOnSurface::isLinear ( Point & dir, double tol )` `[virtual]`

Check if the curve is linear.

Reimplemented from [Go::ParamCurve](#).

**29.82.3.27** `virtual double Go::CurveOnSurface::length ( double tol )` `[virtual]`

Compute the total length of this curve up to some tolerance

## Parameters

|            |                                                                                                                                           |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <i>tol</i> | the relative tolerance when approximating the length, i.e. stop iteration when error becomes smaller than <code>tol/(curve length)</code> |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------|

## Returns

the length calculated

Implements [Go::ParamCurve](#).

29.82.3.28 void Go::CurveOnSurface::makeCurvesConsistent ( bool *prefer\_parameter* )

29.82.3.29 bool Go::CurveOnSurface::makeParameterCurve ( double *tol*, const Point & *par1*, const Point & *par2* )

Make parameter curve between given end parameters.

29.82.3.30 double Go::CurveOnSurface::maxTraceDiff ( int *nmb\_sample* = 5 ) const

Maximum distance between curve represented by parameter curve and space curve in a number of sampling points

29.82.3.31 virtual double Go::CurveOnSurface::nextSegmentVal ( double *par*, bool *forward*, double *tol* ) const  
[virtual]

Inherited from [ParamCurve](#). If the parametric curve is set to be the 'preferred' one, this function will return the next segment value for the parametric curve; otherwise it will return the next segment value for the spatial 3D curve. See also [ParamCurve::nextSegmentVal\(\)](#)

Reimplemented from [Go::ParamCurve](#).

29.82.3.32 CurveOnSurface& Go::CurveOnSurface::operator= ( const CurveOnSurface & *other* )

Assignment operator. Like the copy constructor, the assignment operator [clone\(\)](#)s the curves, and not the surface.

Parameters

|              |                                                                                         |
|--------------|-----------------------------------------------------------------------------------------|
| <i>other</i> | the <a href="#">CurveOnSurface</a> to copy into 'this' <a href="#">CurveOnSurface</a> . |
|--------------|-----------------------------------------------------------------------------------------|

29.82.3.33 shared\_ptr<ParamCurve> Go::CurveOnSurface::parameterCurve ( ) [inline]

Get a shared pointer to the curve in the parameter domain.

Returns

a shared pointer to the curve in the parameter domain

Definition at line 360 of file CurveOnSurface.h.

29.82.3.34 shared\_ptr<const ParamCurve> Go::CurveOnSurface::parameterCurve ( ) const [inline]

Get a constant, shared pointer to the curve in the parameter domain.

Returns

a const-pointer to the curve in the parameter domain.

Definition at line 375 of file CurveOnSurface.h.

29.82.3.35 `bool Go::CurveOnSurface::parPref ( ) const [inline]`

Query whether the parameter curve or the space curve is preferred for computation in this object.

Definition at line 385 of file CurveOnSurface.h.

29.82.3.36 `virtual void Go::CurveOnSurface::point ( Point & pt, double tpar ) const [virtual]`

Evaluate the curve's position at a given parameter

Parameters

|             |                                                                      |
|-------------|----------------------------------------------------------------------|
| <i>pt</i>   | the evaluated position will be written to this <a href="#">Point</a> |
| <i>tpar</i> | the parameter for which we wish to evaluate the curve                |

Implements [Go::ParamCurve](#).

29.82.3.37 `virtual void Go::CurveOnSurface::point ( std::vector< Point > & pts, double tpar, int derivs, bool from_right = true ) const [virtual]`

Inherited from [ParamCurve](#). Only works for 'derivs' = 0 or 1.

See also

[ParamCurve::point\(\)](#)

Implements [Go::ParamCurve](#).

29.82.3.38 `virtual void Go::CurveOnSurface::read ( std::istream & is ) [virtual]`

read object from stream

Parameters

|           |                                  |
|-----------|----------------------------------|
| <i>is</i> | stream from which object is read |
|-----------|----------------------------------|

Implements [Go::Streamable](#).

29.82.3.39 `virtual void Go::CurveOnSurface::reverseParameterDirection ( bool switchparam = false ) [virtual]`

Set the parameter direction of the curve. The curve's parameter interval will always remain constant, but by flipping the parameter direction, the curve will be traced the opposite way when moving a parameter over the parameter interval.

## Parameters

|                    |                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>switchparam</i> | if true, and the curve is 2D, the x and y coordinates should be swapped. This is used when turning the orientation of bounded (trimmed) surfaces. |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

Implements [Go::ParamCurve](#).

**29.82.3.40** `bool Go::CurveOnSurface::sameCurve ( double tol, int nmb_sample = 5 ) const`

Legality test regarding the consistence of geometry and parameter curve. Check if the two curves represent identical curves with respect to the tolerance tol. Pointwise check.

**29.82.3.41** `bool Go::CurveOnSurface::sameOrientation ( ) const`

Legality test regarding the consistence of geometry and parameter curve. Check if the two curves have the same orientation

**29.82.3.42** `bool Go::CurveOnSurface::sameParameterDomain ( ) const`

Legality test regarding the consistence of geometry and parameter curve. Check if the curves have got the same parameter domain

**29.82.3.43** `bool Go::CurveOnSurface::sameTrace ( double tol, int nmb_sample = 5 ) const`

Legality test regarding the consistence of geometry and parameter curve. Check if the two curves describe the same trace with respect to the tolerance tol. Pointwise check.

**29.82.3.44** `void Go::CurveOnSurface::setCurves ( shared_ptr< ParamCurve > spacecurve, shared_ptr< ParamCurve > parametercurve ) [inline]`

Replace the curves describing the curve on surface. The curve preference is not changed

Definition at line 253 of file CurveOnSurface.h.

**29.82.3.45** `void Go::CurveOnSurface::setCurveTypeInfo ( int ccm ) [inline]`

Set curve information.

Definition at line 318 of file CurveOnSurface.h.

**29.82.3.46** `bool Go::CurveOnSurface::setDomainParCrv ( double umin, double umax, double vmin, double vmax, double uminprev, double umaxprev, double vminprev, double vmaxprev )`

Represent the parameter curve associated with this surface curve on a different domain

29.82.3.47 `void Go::CurveOnSurface::setParameterCurve ( shared_ptr< ParamCurve > parametercurve ) [inline]`

Replace the parameter curve corresponding to this curve on surface curve. Used for instance in relation to reparameterizations of the related surface. Use with care!

Definition at line 270 of file CurveOnSurface.h.

29.82.3.48 `virtual void Go::CurveOnSurface::setParameterInterval ( double t1, double t2 ) [virtual]`

Linear reparametrization. The meaning is changed for elementary curves.

Implements [Go::ParamCurve](#).

29.82.3.49 `void Go::CurveOnSurface::setParPref ( bool prefer ) [inline]`

Definition at line 388 of file CurveOnSurface.h.

29.82.3.50 `void Go::CurveOnSurface::setSpaceCurve ( shared_ptr< ParamCurve > spacecurve ) [inline]`

Replace the space curve corresponding to this curve on surface curve. Use with care!

Definition at line 262 of file CurveOnSurface.h.

29.82.3.51 `void Go::CurveOnSurface::setUnderlyingSurface ( shared_ptr< ParamSurface > surface ) [inline]`

Set the underlying surface to the one pointed to by the argument

#### Parameters

|                |                                                                                                |
|----------------|------------------------------------------------------------------------------------------------|
| <i>surface</i> | the pointer to the surface we will set as underlying for this <a href="#">CurveOnSurface</a> . |
|----------------|------------------------------------------------------------------------------------------------|

Definition at line 248 of file CurveOnSurface.h.

29.82.3.52 `shared_ptr<ParamCurve> Go::CurveOnSurface::spaceCurve ( ) [inline]`

Get a shared pointer to the space curve

#### Returns

a shared pointer to the space curve.

Definition at line 365 of file CurveOnSurface.h.

29.82.3.53 `shared_ptr<const ParamCurve> Go::CurveOnSurface::spaceCurve ( ) const` `[inline]`

Get a constant, shared pointer to the space curve

#### Returns

a const-shared pointer to the space curve.

Definition at line 380 of file CurveOnSurface.h.

29.82.3.54 `virtual std::vector<shared_ptr<ParamCurve> > Go::CurveOnSurface::split ( double param, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const` `[virtual]`

Split curve in a specified parameter value.

Reimplemented from [Go::ParamCurve](#).

29.82.3.55 `virtual double Go::CurveOnSurface::startparam ( ) const` `[virtual]`

Query the start parameter of the curve

#### Returns

the curve's start parameter

Implements [Go::ParamCurve](#).

29.82.3.56 `virtual CurveOnSurface* Go::CurveOnSurface::subCurve ( double from_par, double to_par, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const` `[virtual]`

Returns a curve which is a part of this curve. The result is NEWed, so the user is responsible for deleting it. NB: It is not guaranteed that the [ParamCurve](#) that is returned is of the same type as the curve itself. Thus, the returned curve might be a [SplineCurve](#).

#### Parameters

|                 |                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>from_par</i> | start value of parameter interval that will define the subcurve                                                                                                                                   |
| <i>to_par</i>   | end value of parameter interval that will define the subcurve                                                                                                                                     |
| <i>fuzzy</i>    | since subCurve works on those curves who are spline-based, this tolerance defines how close the start and end parameter must be to an existing knot in order to be considered <i>on</i> the knot. |

#### Returns

a pointer to a new subcurve which represents the part of the curve between 'from\_par' and 'to\_par'. It will be spline-based and have a k-regular knotvector. The user is responsible for deleting this subcurve when it is no longer needed.

Implements [Go::ParamCurve](#).

29.82.3.57 **bool** Go::CurveOnSurface::translateParameterCurve ( **const Point & dir** )

Translate an existing parameter curve in a given direction Return value: Whether or not the translation was possible

29.82.3.58 **bool** Go::CurveOnSurface::translateSwapParameterCurve ( **const Point & dir, double sgn, int pdir** )

Translate an existing parameter curve in a given direction and swap sign is specified Return value: Whether or not the translation was possible

29.82.3.59 **shared\_ptr<ParamSurface>** Go::CurveOnSurface::underlyingSurface ( ) `[inline]`

Get a shared pointer to the underlying surface

#### Returns

a shared pointer to the underlying surface

Definition at line 355 of file CurveOnSurface.h.

29.82.3.60 **shared\_ptr<const ParamSurface>** Go::CurveOnSurface::underlyingSurface ( ) **const** `[inline]`

Get a constant, shared pointer to the underlying surface

#### Returns

a const-pointer to the underlying surface

Definition at line 370 of file CurveOnSurface.h.

29.82.3.61 **void** Go::CurveOnSurface::unsetParameterCurve ( ) `[inline]`

Remove parameter curve information.

Definition at line 276 of file CurveOnSurface.h.

29.82.3.62 **void** Go::CurveOnSurface::unsetSpaceCurve ( ) `[inline]`

Remove space curve information.

Definition at line 308 of file CurveOnSurface.h.

29.82.3.63 **bool** Go::CurveOnSurface::updateCurves ( **double epsge** )

Update curves. Reapproximate the dependent curve within the tolerance epsge.

29.82.3.64 `bool Go::CurveOnSurface::updateCurves ( Point vx1, Point vx2, double epsge )`

Update curves.

29.82.3.65 `bool Go::CurveOnSurface::updateIsoCurves ( )`

Update constant parameter curves.

29.82.3.66 `bool Go::CurveOnSurface::updateIsoCurves ( int constdir, double constpar, int boundary )`

Update constant parameter curves. New constant parameter curve information is provided. Used in for instance change of parameter directions in the associated surface

29.82.3.67 `int Go::CurveOnSurface::whichBoundary ( double tol, bool & same_orientation ) const`

Check if this curve lies at a surface boundary, in that case which one -1 = none, 0 = umin, 1 = umax, 2 = vmin, 3 = vmax NB! same\_orientation is set only if the curve is defined to lie at constant parameter curve. Set to 'false' if direction is opposite that of the surface.

29.82.3.68 `virtual void Go::CurveOnSurface::write ( std::ostream & os ) const [virtual]`

write object to stream

Parameters

|                 |                                   |
|-----------------|-----------------------------------|
| <code>os</code> | stream to which object is written |
|-----------------|-----------------------------------|

Implements [Go::Streamable](#).

The documentation for this class was generated from the following file:

- `gotools-core/include/GoTools/geometry/CurveOnSurface.h`

## 29.83 Go::CurveOnVolume Class Reference

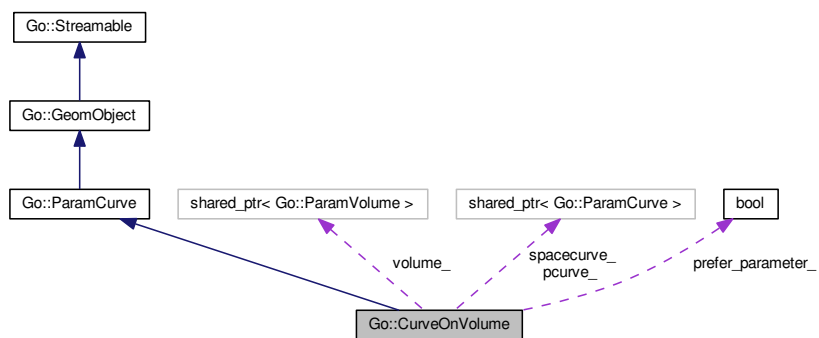

A curve living on a parametric volume. It either has got information about the curve in geometry space and in the parameter domain of the volume or the ability to compute the other representation given one.

```
#include <CurveOnVolume.h>
```

Inheritance diagram for Go::CurveOnVolume:

### 29.83.1 Detailed Description

A curve living on a parametric volume. It either has got information about the curve in geometry space and in the parameter domain of the volume or the ability to compute the other representation given one.

Definition at line 60 of file CurveOnVolume.h.

### 29.83.2 Constructor & Destructor Documentation

#### 29.83.2.1 Go::CurveOnVolume::CurveOnVolume ( )

Define an empty [CurveOnVolume](#) that can be assigned or [read\(\)](#) into

#### 29.83.2.2 Go::CurveOnVolume::CurveOnVolume ( shared\_ptr< ParamVolume > vol, shared\_ptr< ParamCurve > curve, bool preferparameter )

Construct a [CurveOnVolume](#) by specifying the volume and either a space curve or a curve in the parameter plane. Does not clone any of the input, just sets (smart) pointers.

#### Parameters

|                        |                                                                                                                                                                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vol</i>             | pointer to the underlying volume                                                                                                                                                                                                                                                      |
| <i>curve</i>           | pointer to the curve specifying the <a href="#">CurveOnVolume</a> . This curve may either be in the parametric domain of the volume (3D curve), or a space curve that the user has assured to be coincident with the volume. 'preferparameter' specifies which kind of curve this is. |
| <i>preferparameter</i> | if this is set to 'true', then 'curve' is assumed to be a curve in the parametric domain of the surface. Otherwise, it is assumed to be a space (3D) curve.                                                                                                                           |

#### 29.83.2.3 Go::CurveOnVolume::CurveOnVolume ( shared\_ptr< ParamVolume > vol, shared\_ptr< ParamCurve > pcurve, shared\_ptr< ParamCurve > spacecurve, bool preferparameter )

#### 29.83.2.4 Go::CurveOnVolume::CurveOnVolume ( const CurveOnVolume & volume\_curve )

Copy constructor. The copy constructor will not [clone\(\)](#) the underlying volume, but it will [clone\(\)](#) both the parametric and the spatial curve.

## Parameters

|                     |                                                                                       |
|---------------------|---------------------------------------------------------------------------------------|
| <i>volume_curve</i> | the <a href="#">CurveOnVolume</a> to copy into 'this' <a href="#">CurveOnVolume</a> . |
|---------------------|---------------------------------------------------------------------------------------|

29.83.2.5 `virtual Go::CurveOnVolume::~~CurveOnVolume ( ) [virtual]`

Destructor. Trivial because memory is managed by `shared_ptr`.

### 29.83.3 Member Function Documentation

29.83.3.1 `virtual void Go::CurveOnVolume::appendCurve ( ParamCurve * cv, bool reparam = true ) [virtual]`

append a curve to this curve, with eventual reparametrization NB: This virtual member function currently only works for `SplineCurves` and `CurveOnSurfaces`. Moreover, 'this' curve and the 'cv' curve must be of the same type.

## Parameters

|                |                                                          |
|----------------|----------------------------------------------------------|
| <i>cv</i>      | the curve to append to 'this' curve.                     |
| <i>reparam</i> | specify whether or not there should be reparametrization |

Implements [Go::ParamCurve](#).

29.83.3.2 `virtual void Go::CurveOnVolume::appendCurve ( ParamCurve * cv, int continuity, double & dist, bool reparam = true ) [virtual]`

append a curve to this curve, with eventual reparametrization

## Parameters

|                   |                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------|
| <i>cv</i>         | the curve to append to 'this' curve.                                                                  |
| <i>continuity</i> | the required continuity at the transition. Can be $G^{(-1)}$ and upwards.                             |
| <i>dist</i>       | a measure of the local distortion around the transition in order to achieve the specified continuity. |
| <i>reparam</i>    | specify whether or not there should be reparametrization                                              |

Implements [Go::ParamCurve](#).

29.83.3.3 `virtual BoundingBox Go::CurveOnVolume::boundingBox ( ) const [virtual]`

Axis align box surrounding this object Computed with respect to the space curve if this one exists, otherwise the underlying surface

Implements [Go::GeomObject](#).

29.83.3.4 **static ClassType** Go::CurveOnVolume::classType ( ) [inline],[static]

Definition at line 124 of file CurveOnVolume.h.

29.83.3.5 **virtual CurveOnVolume\*** Go::CurveOnVolume::clone ( ) const [inline],[virtual]

The clone-function is inherited from [GeomObject](#), but overridden here to get a covariant return type (for those compilers that allow this).

Implements [Go::ParamCurve](#).

Definition at line 130 of file CurveOnVolume.h.

29.83.3.6 **virtual void** Go::CurveOnVolume::closestPoint ( const Point & pt, double tmin, double tmax, double & clo\_t, Point & clo\_pt, double & clo\_dist, double const \* seed = 0 ) const [virtual]

Compute the closest point from an interval of this curve to a specified point.

Parameters

|                 |                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>       | point we want to find the closest point to                                                                                               |
| <i>tmin</i>     | start parameter of search interval                                                                                                       |
| <i>tmax</i>     | end parameter of search interval                                                                                                         |
| <i>clo_t</i>    | upon function return, 'clo_t' will contain the parameter value of the closest point found.                                               |
| <i>clo_pt</i>   | upon function return, 'clo_pt' will contain the position of the closest point found.                                                     |
| <i>clo_dist</i> | upon function return, 'clo_dist' will contain the distance between 'pt' and the closest point found.                                     |
| <i>seed</i>     | pointer to initial guess value, provided by the user (can be 0, for which the algorithm will determine a (hopefully) reasonable choice). |

Implements [Go::ParamCurve](#).

29.83.3.7 **RectDomain** Go::CurveOnVolume::containingDomain ( ) const

Get the rectangle enclosing the underlying volume's parametric domain.

Returns

the [RectDomain](#) for the underlying volume.

29.83.3.8 **virtual int** Go::CurveOnVolume::dimension ( ) const [virtual]

Dimension of geometry space.

Implements [Go::GeomObject](#).

29.83.3.9 virtual **DirectionCone** Go::CurveOnVolume::directionCone ( ) const [virtual]

**Cone** surrounding the set of tangent directions corresponding to the surface. Only computed if the space curve exists

Implements [Go::ParamCurve](#).

29.83.3.10 virtual **double** Go::CurveOnVolume::endparam ( ) const [virtual]

Query the end parameter of the curve

Returns

the curve's end parameter

Implements [Go::ParamCurve](#).

29.83.3.11 virtual **SplineCurve\*** Go::CurveOnVolume::geometryCurve ( ) [virtual]

If the definition of this [ParamCurve](#) contains a [SplineCurve](#) describing its spatial shape, then this function will return a pointer to this [SplineCurve](#). Otherwise it will return a null pointer. The returned curve is NEWed, so the user is responsible for deleting it. This function may have side-effects.

Returns

a pointer to a [SplineCurve](#) representation of the [ParamCurve](#), if it exists. Null pointer otherwise.

Implements [Go::ParamCurve](#).

29.83.3.12 virtual **ClassType** Go::CurveOnVolume::instanceType ( ) const [virtual]

Type of current object.

Implements [Go::GeomObject](#).

29.83.3.13 virtual **bool** Go::CurveOnVolume::isDegenerate ( **double** *degenerate\_epsilon* ) [virtual]

Query whether the curve is degenerate (collapsed into a single point).

Parameters

|                           |                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>degenerate_epsilon</i> | the tolerance used in determine whether the curve is degenerate. A curve is considered degenerate if its total length is shorter than this value. |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

`true` if the curve is degenerate, `false` otherwise.

Implements [Go::ParamCurve](#).

**29.83.3.14** `virtual double Go::CurveOnVolume::length ( double tol ) [virtual]`

Compute the total length of this curve up to some tolerance

**Parameters**

|            |                                                                                                                                           |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <i>tol</i> | the relative tolerance when approximating the length, i.e. stop iteration when error becomes smaller than <code>tol/(curve length)</code> |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

the length calculated

Implements [Go::ParamCurve](#).

**29.83.3.15** `virtual double Go::CurveOnVolume::nextSegmentVal ( double par, bool forward, double tol ) const [virtual]`

Inherited from [ParamCurve](#). If the parametric curve is set to be the 'preferred' one, this function will return the next segment value for the parametric curve; otherwise it will return the next segment value for the spatial 3D curve. See also [ParamCurve::nextSegmentVal\(\)](#)

Reimplemented from [Go::ParamCurve](#).

**29.83.3.16** `CurveOnVolume& Go::CurveOnVolume::operator= ( const CurveOnVolume & other )`

Assignment operator. Like the copy constructor, the assignment operator [clone\(\)](#)s the curves, and not the volume.

**Parameters**

|              |                                                                                       |
|--------------|---------------------------------------------------------------------------------------|
| <i>other</i> | the <a href="#">CurveOnVolume</a> to copy into 'this' <a href="#">CurveOnVolume</a> . |
|--------------|---------------------------------------------------------------------------------------|

**29.83.3.17** `shared_ptr<ParamCurve> Go::CurveOnVolume::parameterCurve ( ) [inline]`

Get a shared pointer to the curve in the parameter domain.

**Returns**

a shared pointer to the curve in the parameter domain

Definition at line 252 of file [CurveOnVolume.h](#).

29.83.3.18 `shared_ptr<const ParamCurve> Go::CurveOnVolume::parameterCurve ( ) const [inline]`

Get a constant, shared pointer to the curve in the parameter domain.

#### Returns

a const-pointer to the curve in the parameter domain.

Definition at line 267 of file CurveOnVolume.h.

29.83.3.19 `bool Go::CurveOnVolume::parPref ( ) const [inline]`

Query whether the parameter curve or the space curve is preferred for computation in this object.

Definition at line 277 of file CurveOnVolume.h.

29.83.3.20 `virtual void Go::CurveOnVolume::point ( Point & pt, double tpar ) const [virtual]`

Evaluate the curve's position at a given parameter

#### Parameters

|             |                                                                      |
|-------------|----------------------------------------------------------------------|
| <i>pt</i>   | the evaluated position will be written to this <a href="#">Point</a> |
| <i>tpar</i> | the parameter for which we wish to evaluate the curve                |

Implements [Go::ParamCurve](#).

29.83.3.21 `virtual void Go::CurveOnVolume::point ( std::vector< Point > & pts, double tpar, int derivs, bool from_right = true ) const [virtual]`

Inherited from [ParamCurve](#). Only works for 'derivs' = 0 or 1.

#### See also

[ParamCurve::point\(\)](#)

Implements [Go::ParamCurve](#).

29.83.3.22 `virtual void Go::CurveOnVolume::read ( std::istream & is ) [virtual]`

read object from stream

#### Parameters

|           |                                  |
|-----------|----------------------------------|
| <i>is</i> | stream from which object is read |
|-----------|----------------------------------|

Implements [Go::Streamable](#).

29.83.3.23 `virtual void Go::CurveOnVolume::reverseParameterDirection ( bool switchparam = false ) [virtual]`

Set the parameter direction of the curve. The curve's parameter interval will always remain constant, but by flipping the parameter direction, the curve will be traced the opposite way when moving a parameter over the parameter interval.

#### Parameters

|                    |                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>switchparam</i> | if true, and the curve is 2D, the x and y coordinates should be swapped. This is used when turning the orientation of bounded (trimmed) surfaces. |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

Implements [Go::ParamCurve](#).

29.83.3.24 `void Go::CurveOnVolume::setCurves ( shared_ptr< ParamCurve > spacecurve, shared_ptr< ParamCurve > parametercurve ) [inline]`

Replace the curves describing the curve on volume. The curve preference is not changed

Definition at line 201 of file CurveOnVolume.h.

29.83.3.25 `void Go::CurveOnVolume::setParameterCurve ( shared_ptr< ParamCurve > parametercurve ) [inline]`

Replace the parameter curve corresponding to this curve on volume curve. Used for instance in relation to reparameterizations of the related volume. Use with care!

Definition at line 218 of file CurveOnVolume.h.

29.83.3.26 `virtual void Go::CurveOnVolume::setParameterInterval ( double t1, double t2 ) [virtual]`

Linear reparametrization. The meaning is changed for elementary curves.

Implements [Go::ParamCurve](#).

29.83.3.27 `void Go::CurveOnVolume::setParPref ( bool prefer ) [inline]`

Definition at line 280 of file CurveOnVolume.h.

29.83.3.28 `void Go::CurveOnVolume::setSpaceCurve ( shared_ptr< ParamCurve > spacecurve ) [inline]`

Replace the space curve corresponding to this curve on volume curve. Use with care!

Definition at line 210 of file CurveOnVolume.h.

29.83.3.29 `void Go::CurveOnVolume::setUnderlyingVolume ( shared_ptr< ParamVolume > volume ) [inline]`

Set the underlying surface to the one pointed to by the argument

## Parameters

|                |                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------|
| <i>surface</i> | the pointer to the surface we will set as underlying for this <a href="#">CurveOnVolume</a> . |
|----------------|-----------------------------------------------------------------------------------------------|

Definition at line 196 of file CurveOnVolume.h.

**29.83.3.30** `shared_ptr<ParamCurve> Go::CurveOnVolume::spaceCurve ( ) [inline]`

Get a shared pointer to the space curve

## Returns

a shared pointer to the space curve.

Definition at line 257 of file CurveOnVolume.h.

**29.83.3.31** `shared_ptr<const ParamCurve> Go::CurveOnVolume::spaceCurve ( ) const [inline]`

Get a constant, shared pointer to the space curve

## Returns

a const-shared pointer to the space curve.

Definition at line 272 of file CurveOnVolume.h.

**29.83.3.32** `virtual std::vector<shared_ptr<ParamCurve>> Go::CurveOnVolume::split ( double param, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [virtual]`

Split curve in a specified parameter value.

Reimplemented from [Go::ParamCurve](#).

**29.83.3.33** `virtual double Go::CurveOnVolume::startparam ( ) const [virtual]`

Query the start parameter of the curve

## Returns

the curve's start parameter

Implements [Go::ParamCurve](#).

**29.83.3.34** `virtual CurveOnVolume* Go::CurveOnVolume::subCurve ( double from_par, double to_par, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [virtual]`

Returns a curve which is a part of this curve. The result is NEWed, so the user is responsible for deleting it. NB: It is not guaranteed that the [ParamCurve](#) that is returned is of the same type as the curve itself. Thus, the returned curve might be a [SplineCurve](#).

## Parameters

|                 |                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>from_par</i> | start value of parameter interval that will define the subcurve                                                                                                                                   |
| <i>to_par</i>   | end value of parameter interval that will define the subcurve                                                                                                                                     |
| <i>fuzzy</i>    | since subCurve works on those curves who are spline-based, this tolerance defines how close the start and end parameter must be to an existing knot in order to be considered <i>on</i> the knot. |

## Returns

a pointer to a new subcurve which represents the part of the curve between 'from\_par' and 'to\_par'. It will be spline-based and have a k-regular knotvector. The user is responsible for deleting this subcurve when it is no longer needed.

Implements [Go::ParamCurve](#).

**29.83.3.35** `shared_ptr<ParamVolume> Go::CurveOnVolume::underlyingVolume ( ) [inline]`

Get a shared pointer to the underlying volume

## Returns

a shared pointer to the underlying volume

Definition at line 247 of file CurveOnVolume.h.

**29.83.3.36** `shared_ptr<const ParamVolume> Go::CurveOnVolume::underlyingVolume ( ) const [inline]`

Get a constant, shared pointer to the underlying volume

## Returns

a const-pointer to the underlying volume

Definition at line 262 of file CurveOnVolume.h.

**29.83.3.37** `void Go::CurveOnVolume::unsetParameterCurve ( ) [inline]`

Remove parameter curve information.

Definition at line 224 of file CurveOnVolume.h.

**29.83.3.38** `void Go::CurveOnVolume::unsetSpaceCurve ( ) [inline]`

Remove space curve information.

Definition at line 231 of file CurveOnVolume.h.

**29.83.3.39** `Point Go::CurveOnVolume::volumeParameter ( double crv_par, const RectDomain * domain_of_interest = NULL ) const`

Fetch the volume parameter corresponding to a curve parameter.

**29.83.3.40** `virtual void Go::CurveOnVolume::write ( std::ostream & os ) const [virtual]`

write object to stream

## Parameters

|           |                                   |
|-----------|-----------------------------------|
| <i>os</i> | stream to which object is written |
|-----------|-----------------------------------|

Implements [Go::Streamable](#).

## 29.83.4 Member Data Documentation

**29.83.4.1** `shared_ptr<ParamCurve> Go::CurveOnVolume::pcurve_` [protected]

The 2D curve in the parameter domain of the volume. May point to null.

Definition at line 297 of file CurveOnVolume.h.

**29.83.4.2** `bool Go::CurveOnVolume::prefer_parameter_` [protected]

Which representation to prefer if both exist.

Definition at line 301 of file CurveOnVolume.h.

**29.83.4.3** `shared_ptr<ParamCurve> Go::CurveOnVolume::spacecurve_` [protected]

An instance of the curve in the volume. May point to null.

Definition at line 299 of file CurveOnVolume.h.

**29.83.4.4** `shared_ptr<ParamVolume> Go::CurveOnVolume::volume_` [protected]

The underlying volume.

Definition at line 294 of file CurveOnVolume.h.

*Set tessellation resolution (number of points to evaluate)*
- void [getRes](#) (int &n)  
*Fetch info about resolution.*

### 29.85.1 Detailed Description

Tesselate curve to produce a linear approximation of the curve for visualization purposed

Definition at line 53 of file CurveTesselator.h.

### 29.85.2 Constructor & Destructor Documentation

29.85.2.1 `Go::CurveTesselator::CurveTesselator ( const ParamCurve & curve )` [`inline`]

Constructor.

Definition at line 57 of file CurveTesselator.h.

29.85.2.2 `virtual Go::CurveTesselator::~~CurveTesselator ( )` [`virtual`]

Destructor.

### 29.85.3 Member Function Documentation

29.85.3.1 `void Go::CurveTesselator::changeRes ( int n )` `[inline]`

Set tessellation resolution (number of points to evaluate)

Definition at line 84 of file CurveTesselator.h.

29.85.3.2 `shared_ptr<LineStrip> Go::CurveTesselator::getMesh ( )` `[inline]`

Fetch the linear approximation represented as a [LineStrip](#).

Definition at line 70 of file CurveTesselator.h.

29.85.3.3 `void Go::CurveTesselator::getRes ( int & n )` `[inline]`

Fetch info about resolution.

Definition at line 90 of file CurveTesselator.h.

29.85.3.4 `virtual void Go::CurveTesselator::tessellate ( )` `[virtual]`

Perform tessellation. The density depends on the resolution.

Implements [Go::Tesselator](#).

The documentation for this class was generated from the following file:

- `gtools-core/include/GoTools/tesselator/CurveTesselator.h`

## 29.86 Go::CvCvIntersector Class Reference

Class that performs intersection between two parametric curves.

```
#include <CvCvIntersector.h>
```

Inheritance diagram for Go::CvCvIntersector:

Collaboration diagram for `Go::CvCvIntersector`:

## Public Member Functions

- `CvCvIntersector` (`shared_ptr< ParamGeomInt > curve1`, `shared_ptr< ParamGeomInt > curve2`, `double epsge`, `Intersector *prev=0`, `int eliminated_parameter=-1`, `double eliminated_value=0`)

## Additional Inherited Members

### 29.86.1 Detailed Description

Class that performs intersection between two parametric curves.

Definition at line 52 of file `CvCvIntersector.h`.

### 29.86.2 Constructor & Destructor Documentation

29.86.2.1 `Go::CvCvIntersector::CvCvIntersector` (`shared_ptr< ParamGeomInt > curve1`, `shared_ptr< ParamGeomInt > curve2`, `double epsge`, `Intersector * prev = 0`, `int eliminated_parameter = -1`, `double eliminated_value = 0` )

Constructor. The last two variables pertains only if the parent has one more parameter than the `Intersector` to be constructed.

## Parameters

|                             |                                                                           |
|-----------------------------|---------------------------------------------------------------------------|
| <i>curve1</i>               | of type <a href="#">ParamCurveInt</a> .                                   |
| <i>curve2</i>               | of type <a href="#">ParamCurveInt</a> .                                   |
| <i>epsge</i>                | the associated tolerance.                                                 |
| <i>prev</i>                 | the "parent" <a href="#">Intersector</a> (0 if there is no parent).       |
| <i>eliminated_parameter</i> | the index of the parameter that was removed from the parent <i>prev</i> . |
| <i>eliminated_value</i>     | the value of the parameter that was removed from the parent <i>prev</i> . |

**29.86.2.2** `Go::CvCvIntersector::CvCvIntersector ( shared_ptr< ParamGeomInt > curve1, shared_ptr< ParamGeomInt > curve2, shared_ptr< GeoTol > epsge, Intersector * prev = 0, int eliminated_parameter = -1, double eliminated_value = 0 )`

Constructor. The last two variables pertains only if the parent has one more parameter than the [Intersector](#) to be constructed.

## Parameters

|                             |                                                                           |
|-----------------------------|---------------------------------------------------------------------------|
| <i>curve1</i>               | of type <a href="#">ParamCurveInt</a> .                                   |
| <i>curve2</i>               | of type <a href="#">ParamCurveInt</a> .                                   |
| <i>epsge</i>                | the associated tolerance.                                                 |
| <i>prev</i>                 | the "parent" <a href="#">Intersector</a> (0 if there is no parent).       |
| <i>eliminated_parameter</i> | the index of the parameter that was removed from the parent <i>prev</i> . |
| <i>eliminated_value</i>     | the value of the parameter that was removed from the parent <i>prev</i> . |

**29.86.2.3** `virtual Go::CvCvIntersector::~~CvCvIntersector ( ) [virtual]`

Destructor.

**29.86.3 Member Function Documentation**

**29.86.3.1** `virtual int Go::CvCvIntersector::checkCoincidence ( ) [protected],[virtual]`

Implements [Go::Intersector2Obj](#).

**29.86.3.2** `virtual int Go::CvCvIntersector::doSubdivide ( ) [protected],[virtual]`

Implements [Go::Intersector2Obj](#).

**29.86.3.3** `virtual bool Go::CvCvIntersector::foundIntersectionNearBoundary ( ) [protected],[virtual]`

Reimplemented from [Go::Intersector2Obj](#).

29.86.3.4 `virtual int Go::CvCvIntersector::linearCase ( ) [protected],[virtual]`

Implements [Go::Intersector2Obj](#).

29.86.3.5 `virtual shared_ptr<Intersector> Go::CvCvIntersector::lowerOrderIntersector ( shared_ptr< ParamGeomInt > obj1, shared_ptr< ParamGeomInt > obj2, Intersector * prev = 0, int eliminated_parameter = -1, double eliminated_value = 0 ) [protected],[virtual]`

Implements [Go::Intersector2Obj](#).

29.86.3.6 `virtual void Go::CvCvIntersector::microCase ( ) [protected],[virtual]`

Implements [Go::Intersector2Obj](#).

29.86.3.7 `virtual int Go::CvCvIntersector::numParams ( ) const [inline],[virtual]`

Return the number of parameter directions for the intersection.

#### Returns

The number of parameter directions for the intersection.

Implements [Go::Intersector](#).

Definition at line 103 of file CvCvIntersector.h.

29.86.3.8 `virtual int Go::CvCvIntersector::performRotatedBoxTest ( double eps1, double eps2 ) [protected],[virtual]`

Reimplemented from [Go::Intersector2Obj](#).

29.86.3.9 `virtual int Go::CvCvIntersector::repairIntersections ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Definition at line 128 of file CvCvIntersector.h.

29.86.3.10 `virtual int Go::CvCvIntersector::simpleCase2 ( Point & axis1, Point & axis2 ) [protected],[virtual]`

Reimplemented from [Go::Intersector2Obj](#).

29.86.3.11 `virtual int Go::CvCvIntersector::updateIntersections ( ) [protected],[virtual]`

Implements [Go::Intersector2Obj](#).

29.86.3.12 virtual void Go::CvCvIntersector::writeOut ( ) [protected],[virtual]

Reimplemented from [Go::Intersector2Obj](#).

The documentation for this class was generated from the following file:

- intersections/include/GoTools/intersections/[CvCvIntersector.h](#)

### 29.87.1 Detailed Description

This class performs intersection between a parametric curve and a point.

Definition at line 53 of file `CvPtIntersector.h`.

### 29.87.2 Constructor & Destructor Documentation

**29.87.2.1** `Go::CvPtIntersector::CvPtIntersector ( shared_ptr< ParamGeomInt > obj1, shared_ptr< ParamGeomInt > obj2, shared_ptr< GeoTol > epsge, Intersector * prev = 0, int eliminated_parameter = -1, double eliminated_value = 0 )`

Constructor. One of the objects should refer to a curve, the other a point (this is not checked compile-time, so we rely on the user to obey this rule). The last two variables are relevant only if the parent has one more parameter than the [Intersector](#) to be constructed.

#### Parameters

|                             |                                                                                                                    |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>obj1</i>                 | either of type <a href="#">ParamCurveInt</a> or <a href="#">ParamPointInt</a> .                                    |
| <i>obj2</i>                 | either of type <a href="#">ParamPointInt</a> or <a href="#">ParamCurveInt</a> (not the same type as <i>obj1</i> ). |
| <i>epsg</i>                 | the associated tolerance.                                                                                          |
| <i>prev</i>                 | the "parent" <a href="#">Intersector</a> (0 if there is no parent).                                                |
| <i>eliminated_parameter</i> | the index (0) of the parameter that was removed from the parent <i>prev</i> .                                      |
| <i>eliminated_value</i>     | the value of the parameter that was removed from the parent <i>prev</i> .                                          |

**29.87.2.2** `Go::CvPtIntersector::CvPtIntersector ( shared_ptr< ParamGeomInt > obj1, shared_ptr< ParamGeomInt > obj2, double epsge, Intersector * prev = 0, int eliminated_parameter = -1, double eliminated_value = 0 )`

Constructor. One of the objects should refer a curve, the other a point (this is not checked compile-time, so we rely on the user to obey this rule). The last two variables are relevant only if the parent has one more parameter than the [Intersector](#) to be constructed.

#### Parameters

|             |                                                                                 |
|-------------|---------------------------------------------------------------------------------|
| <i>obj1</i> | either of type <a href="#">ParamCurveInt</a> or <a href="#">ParamPointInt</a> . |
|-------------|---------------------------------------------------------------------------------|

## Parameters

|                             |                                                                                                                    |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>obj2</i>                 | either of type <a href="#">ParamPointInt</a> or <a href="#">ParamCurveInt</a> (not the same type as <i>obj1</i> ). |
| <i>epsge</i>                | the associated tolerance.                                                                                          |
| <i>prev</i>                 | the "parent" <a href="#">Intersector</a> (0 if there is no parent).                                                |
| <i>eliminated_parameter</i> | the index (0) of the parameter that was removed from the parent <i>prev</i> .                                      |
| <i>eliminated_value</i>     | the value of the parameter that was removed from the parent <i>prev</i> .                                          |

29.87.2.3 `virtual Go::CvPtIntersector::~~CvPtIntersector ( ) [virtual]`

Destructor.

### 29.87.3 Member Function Documentation

29.87.3.1 `virtual int Go::CvPtIntersector::checkCoincidence ( ) [protected],[virtual]`

### 29.89.1 Detailed Description

Class that represents a cylinder. It is a subclass of [ElementarySurface](#), and thus has a parametrization and is non-selfintersecting.

A [Cylinder](#) has a natural parametrization in terms of the angle  $u$  and distance  $v$ :  $\mathbf{p}(u, v) = \mathbf{C} + R(\cos(u) \mathbf{x} + \sin(u) \mathbf{y}) + v \mathbf{z}$ , where  $\mathbf{C}$  is a position vector,  $R$  is the radius, and  $\mathbf{x}$ ,  $\mathbf{y}$  and  $\mathbf{z}$  are the (local) axes. The parametrization is bounded by:  $0 \leq u \leq 2\pi$ ,  $-\infty < v < \infty$ . The dimension is 3.

Definition at line 69 of file Cylinder.h.

### 29.89.2 Constructor & Destructor Documentation

#### 29.89.2.1 `Go::Cylinder::Cylinder ( ) [inline]`

Default constructor. Constructs an uninitialized [Cylinder](#) which can only be assigned to or read into.

Definition at line 74 of file Cylinder.h.

#### 29.89.2.2 `Go::Cylinder::Cylinder ( double radius, Point location, Point z_axis, Point x_axis, bool isSwapped = false )`

Constructor. Input is the radius, the location, the direction of the z-axis and the (possibly approximate) x-axis. The local coordinate axes are normalized even if `z_axis` and/or `x_axis` are not unit vectors.

#### 29.89.2.3 `virtual Go::Cylinder::~~Cylinder ( ) [virtual]`

Virtual destructor - ensures safe inheritance.

### 29.89.3 Member Function Documentation

#### 29.89.3.1 `std::vector<CurveLoop> Go::Cylinder::allBoundaryLoops ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [virtual]`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

## Parameters

|                           |                                                            |
|---------------------------|------------------------------------------------------------|
| <i>degenerate_epsilon</i> | edges whose length is smaller than this value are ignored. |
|---------------------------|------------------------------------------------------------|

## Returns

a vector containing CurveLoops. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

**29.89.3.2** virtual **BoundingBox** Go::Cylinder::boundingBox ( ) const [virtual]

Return empty box if infinite cylinder.

Implements [Go::GeomObject](#).

**29.89.3.3** static **ClassType** Go::Cylinder::classType ( ) [inline],[static]

Definition at line 101 of file Cylinder.h.

**29.89.3.4** virtual **Cylinder\*** Go::Cylinder::clone ( ) const [virtual]

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

## Returns

pointer to cloned object

Implements [Go::ElementarySurface](#).

**29.89.3.5** void Go::Cylinder::closestBoundaryPoint ( const Point & *pt*, double & *clo\_u*, double & *clo\_v*, Point & *clo\_pt*, double & *clo\_dist*, double *epsilon*, const RectDomain \* *rd* = NULL, double \* *seed* = 0 ) const [virtual]

Iterates to the closest point to *pt* on the boundary of the surface.

## See also

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

**29.89.3.6** void Go::Cylinder::closestPoint ( const Point & *pt*, double & *clo\_u*, double & *clo\_v*, Point & *clo\_pt*, double & *clo\_dist*, double *epsilon*, const RectDomain \* *domain\_of\_interest* = NULL, double \* *seed* = 0 ) const [virtual]

Iterates to the closest point to *pt* on the surface.

## Parameters

|                           |                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>                 | the point to find the closest point to                                                                                       |
| <i>clo_u</i>              | u parameter of the closest point                                                                                             |
| <i>clo_v</i>              | v parameter of the closest point                                                                                             |
| <i>clo_pt</i>             | the geometric position of the closest point                                                                                  |
| <i>clo_dist</i>           | the distance between pt and clo_pt                                                                                           |
| <i>epsilon</i>            | parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)                    |
| <i>domain_of_interest</i> | pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched. |
| <i>seed</i>               | pointer to parameter values where iteration starts.                                                                          |

Reimplemented from [Go::ParamSurface](#).

29.89.3.7 `shared_ptr<ParamCurve> Go::Cylinder::constParamCurve ( double parameter, bool pdir_is_u, double from, double to ) const`

29.89.3.8 `std::vector<shared_ptr<ParamCurve> > Go::Cylinder::constParamCurves ( double parameter, bool pdir_is_u ) const [virtual]`

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

## Parameters

|                  |                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>parameter</i> | parameter value for the constant parameter (either u or v)                                                                                   |
| <i>pdir_is_u</i> | specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one. |

## Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

29.89.3.9 `virtual SplineSurface* Go::Cylinder::createSplineSurface ( ) const [virtual]`

Create a [SplineSurface](#) representation of the cylinder.

Implements [Go::ElementarySurface](#).

29.89.3.10 `virtual int Go::Cylinder::dimension ( ) const [virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.89.3.11 `virtual SplineSurface* Go::Cylinder::geometrySurface ( ) const` [virtual]

Create a [SplineSurface](#) representation of the cylinder.

Implements [Go::ElementarySurface](#).

29.89.3.12 `void Go::Cylinder::getBoundaryInfo ( Point & pt1, Point & pt2, double epsilon, SplineCurve *& cv, SplineCurve *& crosscv, double knot_tol = 1e-05 ) const` [virtual]

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

#### Parameters

|                 |                                                                                                                                                                                                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pt1</i>      | the first point on the boundary, given by the user                                                                                                                                                                                                                                                                                 |
| <i>pt2</i>      | the second point on the boundary, given by the user                                                                                                                                                                                                                                                                                |
| <i>epsilon</i>  | the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.                                                                                                                                                                           |
| <i>cv</i>       | upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.                                                   |
| <i>crosscv</i>  | upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary. |
| <i>knot_tol</i> | tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.                                                                                                                                                                                |

Implements [Go::ParamSurface](#).

29.89.3.13 `shared_ptr<Circle> Go::Cylinder::getCircle ( double par ) const`

Get the circle that is given by fixing  $v$  ( $u$  if swapped) at the value  $par$ . Bounds in the  $u$ -direction ( $v$ -direction if swapped) will be preserved - thus the "circle" might be a circular arc.

#### Parameters

|            |                                                |
|------------|------------------------------------------------|
| <i>par</i> | angular parameter where the circle is computed |
|------------|------------------------------------------------|

#### Returns

Pointer to circle or circular arc

29.89.3.14 `void Go::Cylinder::getCoordinateAxes ( Point & x_axis, Point & y_axis, Point & z_axis ) const` [inline]

Local coordinate axes. The  $z\_axis$  corresponds to the cylinder axis.

Definition at line 189 of file Cylinder.h.

```
29.89.3.15 virtual void Go::Cylinder::getDegenerateCorners (std::vector< Point > & deg_corners, double tol) const
[virtual]
```

Check for parallel and anti parallel partial derivatives in surface corners.

Implements [Go::ParamSurface](#).

```
29.89.3.16 virtual shared_ptr<ElementaryCurve> Go::Cylinder::getElementaryParamCurve (ElementaryCurve *
space_crv, double tol, const Point * start_par_pt = NULL, const Point * end_par_pt = NULL) const
[virtual]
```

Fetch the parameter curve in the domain of the elementary surface corresponding to a given elementary curve in geometry space if this curve has a simpler elementary representation. Otherwise, nothing is returned

Reimplemented from [Go::ElementarySurface](#).

```
29.89.3.17 Point Go::Cylinder::getLocation () const [inline]
```

[Point](#) on cylinder axis.

Definition at line 185 of file Cylinder.h.

```
29.89.3.18 double Go::Cylinder::getRadius () const [inline]
```

[Cylinder](#) radius.

Definition at line 181 of file Cylinder.h.

```
29.89.3.19 virtual ClassType Go::Cylinder::instanceType () const [virtual]
```

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

```
29.89.3.20 virtual bool Go::Cylinder::isAxisRotational (Point & centre, Point & axis, Point & vec, double & angle)
[virtual]
```

Confirm that this surface is axis rotational.

Reimplemented from [Go::ParamSurface](#).

```
29.89.3.21 bool Go::Cylinder::isBounded () const [virtual]
```

Query if parametrization is bounded. All four parameter bounds must be finite for this to be true.

Returns

*true* if bounded, *false* otherwise

Reimplemented from [Go::ElementarySurface](#).

29.89.3.22 `bool Go::Cylinder::isClosed ( bool & closed_dir_u, bool & closed_dir_v ) const` [virtual]

Check if the surface is closed.

Reimplemented from [Go::ElementarySurface](#).

29.89.3.23 `bool Go::Cylinder::isDegenerate ( bool & b, bool & r, bool & t, bool & l, double tolerance ) const`  
[virtual]

The order of the edge indicators (bottom, right, top, left) matches the `edge_number` of `edgeCurve()`. Query whether any of the four boundary curves are degenerate (zero length) within a certain tolerance. In the below, we refer to 'u' as the first parameter and 'v' as the second.

#### Parameters

|                  |                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------|
| <i>b</i>         | 'true' upon return of function if the boundary ( $v = v_{\min}$ ) is degenerate                    |
| <i>r</i>         | 'true' upon return of function if the boundary ( $v = v_{\max}$ ) is degenerate                    |
| <i>t</i>         | 'true' upon return of function if the boundary ( $u = u_{\min}$ ) is degenerate                    |
| <i>l</i>         | 'true' upon return of function if the boundary ( $u = u_{\max}$ ) is degenerate                    |
| <i>tolerance</i> | boundaries are considered degenerate if their length is shorter than this value, given by the user |

#### Returns

'true' if at least one boundary curve was found to be degenerate, 'false' otherwise.

Reimplemented from [Go::ParamSurface](#).

29.89.3.24 `virtual bool Go::Cylinder::isLinear ( Point & dir1, Point & dir2, double tol )` [virtual]

The surface is linear in one direction. Fetch it.

Reimplemented from [Go::ParamSurface](#).

29.89.3.25 `double Go::Cylinder::nextSegmentVal ( int dir, double par, bool forward, double tol ) const` [virtual]

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

|                |                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------|
| <i>dir</i>     | the parameter direction in which we search for the next segment (0 or 1)                             |
| <i>par</i>     | the parameter value starting from which we search for the start value of the next segment            |
| <i>forward</i> | define whether we shall move forward ('true') or backwards when searching along this parameter       |
| <i>tol</i>     | tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value |

**Returns**

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

**29.89.3.26** `void Go::Cylinder::normal ( Point & n, double upar, double vpar ) const` [virtual]

Evaluates the surface normal for a given parameter pair

**Parameters**

|             |                                                      |
|-------------|------------------------------------------------------|
| <i>n</i>    | the computed normal will be written to this variable |
| <i>upar</i> | the first parameter                                  |
| <i>vpar</i> | the second parameter                                 |

Implements [Go::ParamSurface](#).

**29.89.3.27** `DirectionCone Go::Cylinder::normalCone ( ) const` [virtual]

Creates a [DirectionCone](#) covering all normals to this surface.

**Returns**

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

**29.89.3.28** `const RectDomain& Go::Cylinder::parameterDomain ( ) const` [virtual]

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

**Returns**

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

**29.89.3.29** `void Go::Cylinder::point ( Point & pt, double upar, double vpar ) const` [virtual]

Evaluates the surface's position for a given parameter pair.

**Parameters**

|             |                                              |
|-------------|----------------------------------------------|
| <i>pt</i>   | the result of the evaluation is written here |
| <i>upar</i> | the first parameter                          |
| <i>vpar</i> | the second parameter                         |

Implements [Go::ParamSurface](#).

```
29.89.3.30 void Go::Cylinder::point (std::vector< Point > & pts, double upar, double vpar, int derivs, bool u_from_right
= true, bool v_from_right = true, double resolution = 1.0e-12) const [virtual]
```

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

#### Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pts</i>          | the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives. |
| <i>upar</i>         | the first parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>vpar</i>         | the second parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>derivs</i>       | number of requested derivatives                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>u_from_right</i> | specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>v_from_right</i> | specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>resolution</i>   | tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).                                                                                                                                                                                                                                                                                                                                                                           |

Implements [Go::ParamSurface](#).

```
29.89.3.31 virtual void Go::Cylinder::read (std::istream & is) [virtual]
```

read object from stream

#### Parameters

|           |                                  |
|-----------|----------------------------------|
| <i>is</i> | stream from which object is read |
|-----------|----------------------------------|

Implements [Go::Streamable](#).

```
29.89.3.32 void Go::Cylinder::rotate (double rot_ang_rad)
```

Rotate the cylinder (moving the seam given by the parametrization).

```
29.89.3.33 void Go::Cylinder::setCoordinateAxes () [protected]
```

```
29.89.3.34 void Go::Cylinder::setParamBoundsU (double from_upar, double to_upar)
```

Set parameter bounds in the *u* direction. *u* is the "angular" direction.

29.89.3.35 void Go::Cylinder::setParamBoundsV ( double *from\_vpar*, double *to\_vpar* )

Set parameter bounds in the *v* direction. *v* is the "linear" direction.

29.89.3.36 virtual void Go::Cylinder::setParameterBounds ( double *from\_upar*, double *from\_vpar*, double *to\_upar*, double *to\_vpar* ) [virtual]

Limit the cylinder surface by limiting the parameter domain.

Implements [Go::ElementarySurface](#).

29.89.3.37 Cylinder\* Go::Cylinder::subSurface ( double *from\_upar*, double *from\_vpar*, double *to\_upar*, double *to\_vpar*, double *fuzzy* = DEFAULT\_PARAMETER\_EPSILON ) const

29.89.3.38 std::vector<shared\_ptr<ParamSurface>> Go::Cylinder::subSurfaces ( double *from\_upar*, double *from\_vpar*, double *to\_upar*, double *to\_vpar*, double *fuzzy* = DEFAULT\_PARAMETER\_EPSILON ) const [virtual]

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

#### Parameters

|                  |                                                                       |
|------------------|-----------------------------------------------------------------------|
| <i>from_upar</i> | lower value for the first parameter in the subdomain                  |
| <i>from_vpar</i> | lower value for the second parameter in the subdomain                 |
| <i>to_upar</i>   | upper value for the first parameter in the subdomain                  |
| <i>to_vpar</i>   | upper value for the second parameter in the subdomain                 |
| <i>fuzzy</i>     | tolerance used when determining intersection with interior boundaries |

#### Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

29.89.3.39 DirectionCone Go::Cylinder::tangentCone ( bool *pardir\_is\_u* ) const [virtual]

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

#### Parameters

|                    |                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pardir_is_u</i> | if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used. |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

**29.89.3.40** `virtual void Go::Cylinder::write ( std::ostream & os ) const` [virtual]

write object to stream

**Parameters**

|                 |                                   |
|-----------------|-----------------------------------|
| <code>os</code> | stream to which object is written |
|-----------------|-----------------------------------|

Implements [Go::Streamable](#).

### 29.90.1 Detailed Description

Class for cylindrical algebraic intersection objects.

Definition at line 56 of file `CylinderInt.h`.

### 29.90.2 Constructor & Destructor Documentation

#### 29.90.2.1 `Go::CylinderInt::CylinderInt ( )`

Constructor. Used when reading from file.

#### 29.90.2.2 `Go::CylinderInt::CylinderInt ( Point ax\_pt, Point ax\_dir, double radius )`

Constructor.

#### Parameters

|               |                                                      |
|---------------|------------------------------------------------------|
| <i>ax_pt</i>  | reference point on the center axis of the cylinder.  |
| <i>ax_dir</i> | direction vector of the center axis of the cylinder. |
| <i>radius</i> | the radius of the cylinder.                          |

#### 29.90.2.3 `virtual Go::CylinderInt::~~CylinderInt ( )` [virtual]

Destructor.

### 29.90.3 Member Function Documentation

#### 29.90.3.1 `Point Go::CylinderInt::ax_dir ( )` const

Get the axis direction vector..

**Returns**

the axis direction vector.

**29.90.3.2 Point Go::CylinderInt::ax\_pt ( ) const**

Get the axis reference point.

**Returns**

the axis reference point.

**29.90.3.3 double Go::CylinderInt::radius ( ) const**

Get the radius of the cylinder.

**Returns**

the radius of the cylinder.

**29.90.3.4 void Go::CylinderInt::read ( std::istream & is )**

Read a cylinder description from file.

**Parameters**

|           |                                                 |
|-----------|-------------------------------------------------|
| <i>is</i> | the stream containing the cylinder description. |
|-----------|-------------------------------------------------|

**29.90.3.5 SplineSurface\* Go::CylinderInt::surface ( Point *bottom\_pos*, double *height* ) const**

Get a [SplineSurface](#) representing the cylinder. This can be used to visualize the object. Since the object is to be tessellated we make sure it is bounded.

**Parameters**

|                   |                                         |
|-------------------|-----------------------------------------|
| <i>bottom_pos</i> | the lowest point on the direction axis. |
| <i>height</i>     | the height of the cylinder.             |

**Returns**

The spline surface of the cylinder.

## 29.91 Go::CylinderVolume Class Reference

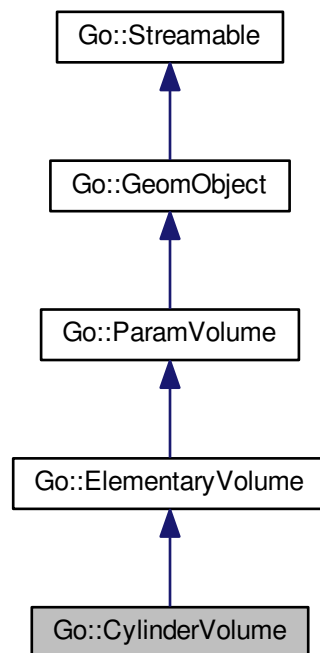

Class that represents a solid cylinder, maybe with empty interior like a straight tube. It is a subclass of [ElementaryVolume](#), and has a natural parametrization in terms of a radius  $u$ , an angle  $v$ , and distance  $w$ :  $\mathbf{p}(u, v, w) = \mathbf{C} + u(\cos(v) \mathbf{x} + \sin(v) \mathbf{y}) + w \mathbf{z}$ , where  $\mathbf{C}$  is a position vector, and  $\mathbf{x}$ ,  $\mathbf{y}$  and  $\mathbf{z}$  are the (local) axes. The parametrization is bounded by:  $R \leq u \leq S$ ,  $0 \leq v \leq 2\pi$ ,  $-\infty < w < \infty$ , where  $R$  and  $S$  are the inner and outer radius. The dimension is 3.

```
#include <CylinderVolume.h>
```

#### 29.91.1 Detailed Description

Class that represents a solid cylinder, maybe with empty interior like a straight tube. It is a subclass of [ElementaryVolume](#), and has a natural parametrization in terms of a radius  $u$ , an angle  $v$ , and distance  $w$ :  $\mathbf{p}(u, v, w) = \mathbf{C} + u(\cos(v) \mathbf{x} + \sin(v) \mathbf{y}) + w \mathbf{z}$ , where  $\mathbf{C}$  is a position vector, and  $\mathbf{x}$ ,  $\mathbf{y}$  and  $\mathbf{z}$  are the (local) axes. The parametrization is bounded by:  $R \leq u \leq S$ ,  $0 \leq v \leq 2\pi$ ,  $-\infty < w < \infty$ , where  $R$  and  $S$  are the inner and outer radius. The dimension is 3.

Definition at line 66 of file [CylinderVolume.h](#).

#### 29.91.2 Constructor & Destructor Documentation

##### 29.91.2.1 [Go::CylinderVolume::CylinderVolume](#) ( ) [[inline](#)]

Default constructor. Constructs an uninitialized [CylinderVolume](#) which can only be assigned to or read into.

Definition at line 71 of file [CylinderVolume.h](#).

##### 29.91.2.2 [Go::CylinderVolume::CylinderVolume](#) ( [Point](#) *centre*, [double](#) *radius*, [Point](#) *normal*, [Point](#) *x\_axis* )

Constructor. Input is the centre, outer radius, the normal and the `x_axis` (possibly approximate). The inner radius is set to 0, and the cylinder is set to have infinite length in both directions

##### 29.91.2.3 [virtual Go::CylinderVolume::~~CylinderVolume](#) ( ) [[virtual](#)]

Virtual destructor - ensures safe inheritance.

### 29.91.3 Member Function Documentation

29.91.3.1 virtual **BoundingBox** Go::CylinderVolume::boundingBox ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.91.3.2 static **ClassType** Go::CylinderVolume::classType ( ) [inline],[static]

Definition at line 96 of file CylinderVolume.h.

29.91.3.3 virtual **CylinderVolume\*** Go::CylinderVolume::clone ( ) const [virtual]

make a clone of this volume and return a pointer to it (user is responsible for clearing up memory afterwards).

#### Returns

pointer to cloned object

Implements [Go::ElementaryVolume](#).

29.91.3.4 virtual void Go::CylinderVolume::closestPoint ( const **Point** & *pt*, double & *clo\_u*, double & *clo\_v*, double & *clo\_w*, **Point** & *clo\_pt*, double & *clo\_dist*, double *epsilon*, double \* *seed* = 0 ) const [virtual]

Iterates to the closest point to *pt* on the volume.

#### Parameters

|                 |                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>       | the point to find the closest point to                                                                               |
| <i>clo_u</i>    | u parameter of the closest point                                                                                     |
| <i>clo_v</i>    | v parameter of the closest point                                                                                     |
| <i>clo_w</i>    | w parameter of the closest point                                                                                     |
| <i>clo_pt</i>   | the geometric position of the closest point                                                                          |
| <i>clo_dist</i> | the distance between <i>pt</i> and <i>clo_pt</i>                                                                     |
| <i>epsilon</i>  | parameter tolerance (will in any case not be higher than $\sqrt{\text{machine\_precision}}$ x magnitude of solution) |
| <i>seed</i>     | pointer to parameter values where iteration starts.                                                                  |

Implements [Go::ParamVolume](#).

29.91.3.5 virtual int Go::CylinderVolume::dimension ( ) const [virtual]

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.91.3.6 **SplineVolume\*** `Go::CylinderVolume::geometryVolume ( ) const` [virtual]

Make a NURBS representation of the object.

Implements [Go::ElementaryVolume](#).

29.91.3.7 `virtual std::vector<shared_ptr<ParamSurface> > Go::CylinderVolume::getAllBoundarySurfaces ( ) const`  
[virtual]

Fetch all boundary surfaces corresponding to the volume.

Implements [Go::ParamVolume](#).

29.91.3.8 `virtual ClassType Go::CylinderVolume::instanceType ( ) const` [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.91.3.9 `double Go::CylinderVolume::nextSegmentVal ( int dir, double par, bool forward, double tol ) const`  
[virtual]

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

|                |                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------|
| <i>dir</i>     | the parameter direction in which we search for the next segment (0, 1 or 2)                          |
| <i>par</i>     | the parameter value starting from which we search for the start value of the next segment            |
| <i>forward</i> | define whether we shall move forward ('true') or backwards when searching along this parameter       |
| <i>tol</i>     | tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value |

#### Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamVolume](#).

29.91.3.10 `const Array<double,6> Go::CylinderVolume::parameterSpan ( ) const` [virtual]

Return the parameter domain of the volume. This is an array containing the start and end parameter values. The spline's parameter *i* has its start value at the array position (2*i*) and its end parameter value at the array position (2*i*+1)

#### Returns

An array describing the parametric domain of the volume

Implements [Go::ParamVolume](#).

29.91.3.11 `void Go::CylinderVolume::point ( Point & pt, double upar, double vpar, double wpar ) const` [virtual]

Evaluates the volume's position for a given parameter triple.

#### Parameters

|             |                                              |
|-------------|----------------------------------------------|
| <i>pt</i>   | the result of the evaluation is written here |
| <i>upar</i> | the first parameter                          |
| <i>vpar</i> | the second parameter                         |
| <i>wpar</i> | the third parameter                          |

Implements [Go::ParamVolume](#).

29.91.3.12 `void Go::CylinderVolume::point ( std::vector< Point > & pts, double upar, double vpar, double wpar, int derivs, bool u_from_right = true, bool v_from_right = true, bool w_from_right = true, double resolution = 1.0e-12 ) const` [virtual]

Evaluates the volume's position and a certain number of derivatives for a given parameter triple.

#### Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pts</i>          | the vector containing the evaluated values. Its size must be set by the user prior to calling this function. Upon completion of the function, its first entry is the volume's position at the given parameter pair. Then, if ' <i>derivs</i> ' > 0, the two next entries will be the volume tangents along the first, second and third parameter direction. The next three entries are the second- and cross derivatives, in the order ( <i>du</i> <sup>2</sup> , <i>dudv</i> , <i>dudw</i> , <i>dv</i> <sup>2</sup> , <i>dvdw</i> , <i>dw</i> <sup>2</sup> ), and similar for even higher derivatives. |
| <i>upar</i>         | the first parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>vpar</i>         | the second parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>wpar</i>         | the third parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>derivs</i>       | number of requested derivatives                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>u_from_right</i> | specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>v_from_right</i> | specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>w_from_right</i> | specify whether derivatives along the third parameter are to be calculated from the right ('true', default) or from the left ('false')                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>resolution</i>   | tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Implements [Go::ParamVolume](#).

29.91.3.13 `virtual void Go::CylinderVolume::read ( std::istream & is )` [virtual]

read object from stream

#### Parameters

|           |                                  |
|-----------|----------------------------------|
| <i>is</i> | stream from which object is read |
|-----------|----------------------------------|

Implements [Go::Streamable](#).

29.91.3.14 void `Go::CylinderVolume::reverseParameterDirection ( int pardir )` [virtual]

Reverses the direction of the basis in input direction.

#### Parameters

|               |                                      |
|---------------|--------------------------------------|
| <i>pardir</i> | which parameter direction to reverse |
|---------------|--------------------------------------|

Implements [Go::ParamVolume](#).

29.91.3.15 void `Go::CylinderVolume::setParameters ( double from_par, double to_par, int pardir )`

Restrict the size of the torus in one parameter direction.

29.91.3.16 void `Go::CylinderVolume::swapParameterDirection ( int pardir1, int pardir2 )` [virtual]

Swaps two parameter directions

#### Parameters

|                |                                                           |
|----------------|-----------------------------------------------------------|
| <i>pardir1</i> | One of the parameter directions (0, 1 or 2) to be swapped |
| <i>pardir2</i> | The other parameter direction (0, 1 or 2) to be swapped   |

Implements [Go::ParamVolume](#).

29.91.3.17 **DirectionCone** `Go::CylinderVolume::tangentCone ( int pardir ) const` [virtual]

Creates a [DirectionCone](#) covering all tangents to this volume along a given parameter direction.

#### Parameters

|               |                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pardir</i> | if 1, the <a href="#">DirectionCone</a> will be defined on basis of the volume's tangents along the first parameter direction. If 2, the second parameter direction will be used. If 3, the third parameter direction will be used. |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this volume along the specified parameter direction.

Implements [Go::ParamVolume](#).

29.91.3.18 virtual void Go::CylinderVolume::translate ( const Point & vec ) [virtual]

Translate.

Implements [Go::ParamVolume](#).

29.91.3.19 void Go::CylinderVolume::useCentreDegen ( ) [inline]

A NURBS representation will be a disc with degeneracy in the centre swept linearly

Definition at line 154 of file CylinderVolume.h.

29.91.3.20 void Go::CylinderVolume::useCornerDegen ( ) [inline]

A NURBS representation will be a disc with degenerate corners swept linearly

Definition at line 159 of file CylinderVolume.h.

29.91.3.21 virtual void Go::CylinderVolume::write ( std::ostream & os ) const [virtual]

write object to stream

Parameters

|    |                                   |
|----|-----------------------------------|
| os | stream to which object is written |
|----|-----------------------------------|

Implements [Go::Streamable](#).

### 29.93.1 Detailed Description

**Dart** class for the half-edge data structure.

See [Application Programming Interface to TTL \(API\)](#) for a detailed description of how the member functions should be implemented.

This is how the dart class is implemented for the half-edge data structure:

Definition at line 58 of file `ttlDart.h`.

## 29.93.2 Constructor & Destructor Documentation

### 29.93.2.1 `hetriang::Dart::Dart( )` `[inline]`

Default constructor.

Definition at line 63 of file `ttlDart.h`.

### 29.93.2.2 `hetriang::Dart::Dart( Edge * edge, bool dir = true )` `[inline]`

Constructor.

Definition at line 65 of file `ttlDart.h`.

### 29.93.2.3 `hetriang::Dart::Dart( const Dart & dart )` `[inline]`

Copy constructor.

Definition at line 67 of file `ttlDart.h`.

### 29.93.2.4 `hetriang::Dart::~Dart( )` `[inline]`

Destructor.

Definition at line 69 of file `ttlDart.h`.

## 29.93.3 Member Function Documentation

### 29.93.3.1 `Dart& hetriang::Dart::alpha0( )` `[inline]`

Maps the dart to a different node.

Definition at line 90 of file `ttlDart.h`.

### 29.93.3.2 `Dart& hetriang::Dart::alpha1( )` `[inline]`

Maps the dart to a different edge.

Definition at line 92 of file `ttlDart.h`.

### 29.93.3.3 `Dart& hetriang::Dart::alpha2( )` `[inline]`

Maps the dart to a different triangle. **Note:** the dart is not changed if it is at the boundary!

Definition at line 104 of file `ttlDart.h`.

29.93.3.4 `void hetriang::Dart::controllConstDart ( Dart & dart ) [inline]`

controllConstDart is a function who are supposed to check if the dart representing dstart or dend has been changed during a swap. It's implemented so that this is compared to a specified copy *dart*. In Half-Edge datastructure this is an impossible situation, and the function is therefore empty

Definition at line 130 of file ttIDart.h.

29.93.3.5 `Edge* hetriang::Dart::getEdge ( ) const [inline]`

Definition at line 123 of file ttIDart.h.

29.93.3.6 `shared_ptr<Node> hetriang::Dart::getNode ( ) const [inline]`

## 29.94 DataHandler Class Reference

```
#include <DataHandler.h>
```

Inheritance diagram for DataHandler:

Collaboration diagram for DataHandler:

## Public Member Functions

- [DataHandler \(\)](#)
- virtual [~DataHandler \(\)](#)
- virtual void [create](#) (shared\_ptr< [Go::GeomObject](#) > obj, const [gvColor](#) &col, int id)=0
- shared\_ptr< [Go::Tesselator](#) > [tesselator](#) ()
- shared\_ptr< [gvPaintable](#) > [paintable](#) ()
- shared\_ptr< [gvPropertySheet](#) > [propertySheet](#) ()
- void [clear](#) ()

## Protected Attributes

- shared\_ptr< [Go::Tesselator](#) > [tesselator\\_](#)
- shared\_ptr< [gvPaintable](#) > [paintable\\_](#)
- shared\_ptr< [gvPropertySheet](#) > [property\\_sheet\\_](#)

### 29.94.1 Detailed Description

This class connects the four inheritance trees descending from [gvTesselator](#), [gvPaintable](#), [gvPropertySheet](#) and [GeomObject](#).

Definition at line 62 of file [DataHandler.h](#).

### 29.94.2 Constructor & Destructor Documentation

#### 29.94.2.1 DataHandler::DataHandler ( )

Default constructor. In inherited classes, it should Initialize factory (by registering classes).

29.94.2.2 virtual DataHandler::~DataHandler ( ) [virtual]

### 29.94.3 Member Function Documentation

29.94.3.1 void DataHandler::clear ( ) [inline]

Definition at line 87 of file DataHandler.h.

29.94.3.2 virtual void DataHandler::create ( shared\_ptr< Go::GeomObject > obj, const gvColor & col, int id )  
[pure virtual]

Implemented in [DefaultDataHandler](#), and [DataHandlerVolAndLR](#).

29.94.3.3 shared\_ptr<gvPaintable> DataHandler::paintable ( ) [inline]

Definition at line 78 of file DataHandler.h.

29.94.3.4 shared\_ptr<gvPropertySheet> DataHandler::propertySheet ( ) [inline]

Definition at line 82 of file DataHandler.h.

29.94.3.5 shared\_ptr<Go::Tesselator> DataHandler::tesselator ( ) [inline]

Definition at line 74 of file DataHandler.h.

### 29.94.4 Member Data Documentation

29.94.4.1 shared\_ptr<gvPaintable> DataHandler::paintable\_ [protected]

Definition at line 96 of file DataHandler.h.

29.94.4.2 shared\_ptr<gvPropertySheet> DataHandler::property\_sheet\_ [protected]

Definition at line 97 of file DataHandler.h.

29.94.4.3 shared\_ptr<Go::Tesselator> DataHandler::tesselator\_ [protected]

Definition at line 95 of file DataHandler.h.

The documentation for this class was generated from the following file:

- [viewlib/include/GoTools/viewlib/DataHandler.h](#)

## 29.95 DataHandlerVolAndLR Class Reference

```
#include <DataHandlerVolAndLR.h>
```

Inheritance diagram for DataHandlerVolAndLR:

Collaboration diagram for DataHandlerVolAndLR:

### Public Member Functions

- [DataHandlerVolAndLR \(\)](#)  
*Default constructor. Initializes factory (by registering classes).*
- virtual [~DataHandlerVolAndLR \(\)](#)
- virtual void [create](#) (shared\_ptr< [Go::GeomObject](#) > obj, const [gvColor](#) &col, int id)

### Additional Inherited Members

#### 29.95.1 Detailed Description

Definition at line 45 of file DataHandlerVolAndLR.h.

## 29.95.2 Constructor & Destructor Documentation

### 29.95.2.1 DataHandlerVolAndLR::DataHandlerVolAndLR ( )

Default constructor. Initializes factory (by registering classes).

### 29.95.2.2 virtual DataHandlerVolAndLR::~DataHandlerVolAndLR ( ) [virtual]

## 29.95.3 Member Function Documentation

### 29.95.3.1 virtual void DataHandlerVolAndLR::create ( shared\_ptr< Go::GeomObject > obj, const gvColor & col, int id ) [virtual]

Reimplemented from [DefaultDataHandler](#).

The documentation for this class was generated from the following file:

- [viewlib/include/GoTools/viewlib/vol\\_and\\_lr/DataHandlerVolAndLR.h](#)

## 29.96 DefaultDataHandler Class Reference

```
#include <DefaultDataHandler.h>
```

Inheritance diagram for DefaultDataHandler:

Collaboration diagram for DefaultDataHandler:

## Public Member Functions

- [DefaultDataHandler](#) ()  
*Default constructor. Initializes factory (by registering classes).*
- virtual [~DefaultDataHandler](#) ()
- virtual void [create](#) (shared\_ptr< [Go::GeomObject](#) > obj, const [gvColor](#) &col, int id)

## Additional Inherited Members

### 29.96.1 Detailed Description

[DefaultDataHandler](#): etc

Definition at line 49 of file [DefaultDataHandler.h](#).

### 29.96.2 Constructor & Destructor Documentation

#### 29.96.2.1 [DefaultDataHandler::DefaultDataHandler](#) ( )

Default constructor. Initializes factory (by registering classes).

#### 29.96.2.2 virtual [DefaultDataHandler::~~DefaultDataHandler](#) ( ) [virtual]

### 29.96.3 Member Function Documentation

#### 29.96.3.1 virtual void [DefaultDataHandler::create](#) ( shared\_ptr< [Go::GeomObject](#) > obj, const [gvColor](#) & col, int id ) [virtual]

Implements [DataHandler](#).

Reimplemented in [DataHandlerVolAndLR](#).

The documentation for this class was generated from the following file:

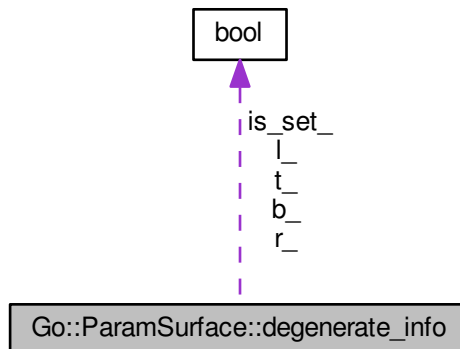

- [viewlib/include/GoTools/viewlib/DefaultDataHandler.h](#)

## 29.97 Go::ParamSurface::degenerate\_info Struct Reference

Degeneracy information regarding one boundary surface of the current surface.

```
#include <ParamSurface.h>
```

Collaboration diagram for Go::ParamSurface::degenerate\_info:

### Public Member Functions

- [degenerate\\_info](#) ()  
*Default constructor. The information is not computed.*

### Public Attributes

- [bool is\\_set\\_](#)  
*Whether or not the degeneracy information is computed.*
- [double tol\\_](#)  
*Tolerance used in computations.*
- [bool b\\_](#)
- [bool r\\_](#)
- [bool t\\_](#)
- [bool l\\_](#)

### 29.97.1 Detailed Description

Degeneracy information regarding one boundary surface of the current surface.

Definition at line 500 of file ParamSurface.h.

## 29.97.2 Constructor & Destructor Documentation

### 29.97.2.1 Go::ParamSurface::degenerate\_info ( ) [inline]

Default constructor. The information is not computed.

Definition at line 511 of file ParamSurface.h.

## 29.97.3 Member Data Documentation

### 29.97.3.1 bool Go::ParamSurface::degenerate\_info::b\_

Indicates if the surface has degenerate boundaries, b\_ = bottom (vmin), r\_ = right (umax), t\_ = top (vmax), l\_ = left (umin)

Definition at line 508 of file ParamSurface.h.

### 29.97.3.2 bool Go::ParamSurface::degenerate\_info::is\_set\_

Whether or not the degeneracy information is computed.

Definition at line 503 of file ParamSurface.h.

### 29.97.3.3 bool Go::ParamSurface::degenerate\_info::l\_

Definition at line 508 of file ParamSurface.h.

### 29.97.3.4 bool Go::ParamSurface::degenerate\_info::r\_

Definition at line 508 of file ParamSurface.h.

### 29.97.3.5 bool Go::ParamSurface::degenerate\_info::t\_

Definition at line 508 of file ParamSurface.h.

### 29.97.3.6 double Go::ParamSurface::degenerate\_info::tol\_

Tolerance used in computations.

Definition at line 505 of file ParamSurface.h.

The documentation for this struct was generated from the following file:

- [gotools-core/include/GoTools/geometry/ParamSurface.h](#)

## 29.98 Go::DegeneratedIntersectionCurve Class Reference

[IntersectionCurve](#) that is degenerated into a single point.

```
#include <IntersectionCurve.h>
```

Inheritance diagram for Go::DegeneratedIntersectionCurve:

Collaboration diagram for Go::DegeneratedIntersectionCurve:

### Public Member Functions

- virtual [~DegeneratedIntersectionCurve](#) ()
- virtual [shared\\_ptr< ParamCurve > getCurve](#) () const
- virtual [shared\\_ptr< ParamCurve > getParamCurve](#) (int obj\_nmb) const
- virtual [bool isIsocurve](#) () const
- virtual [bool isDegenerated](#) () const
- virtual void [getParamSpan](#) (double &start, double &end) const
- virtual void [refine](#) (const double &pos\_tol, const double &angle\_tol)
- virtual void [evaluateAt](#) (double pval, [Point](#) &pos, [Point](#) &tan)

## Friends

- `template<class iterator >`  
`shared_ptr< IntersectionCurve > constructIntersectionCurve (const iterator begin, const iterator end)`

## Additional Inherited Members

### 29.98.1 Detailed Description

[IntersectionCurve](#) that is degenerated into a single point.

Definition at line 221 of file `IntersectionCurve.h`.

### 29.98.2 Constructor & Destructor Documentation

29.98.2.1 `virtual Go::DegeneratedIntersectionCurve::~~DegeneratedIntersectionCurve ( ) [virtual]`

### 29.98.3 Member Function Documentation

29.98.3.1 `virtual void Go::DegeneratedIntersectionCurve::evaluateAt ( double pval, Point & pos, Point & tan ) [inline], [virtual]`

Evaluate the [IntersectionCurve](#) at parameter value *pval*. Its position at this parameter value will be returned in *pos* and its tangent direction will be returned in *tan*.

#### Parameters

|             |                                                                                                                                                                                      |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pval</i> | the parameter value for which to evaluate the <a href="#">IntersectionCurve</a> . It should be within the parametric span (which can be obtained from <code>GetParamSpan()</code> ). |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Return values

|            |                                                                              |
|------------|------------------------------------------------------------------------------|
| <i>pos</i> | the calculated position of the point on the curve at parameter <i>pval</i> . |
|------------|------------------------------------------------------------------------------|

#### Parameters

|            |                                                                |
|------------|----------------------------------------------------------------|
| <i>tan</i> | the calculated tangent of the curve at parameter <i>pval</i> . |
|------------|----------------------------------------------------------------|

Implements [Go::IntersectionCurve](#).

Definition at line 247 of file `IntersectionCurve.h`.

29.98.3.2 `virtual shared_ptr<ParamCurve> Go::DegeneratedIntersectionCurve::getCurve ( ) const [virtual]`

Get out a (shared) pointer to a parametric curve that approximates this [IntersectionCurve](#).

Implements [Go::IntersectionCurve](#).

29.98.3.3 `virtual shared_ptr<ParamCurve> Go::DegeneratedIntersectionCurve::getParamCurve ( int obj_nmb ) const`  
`[virtual]`

Get out a (shared) pointer to the curve in the parametric plane of the first or second object. Should only be called when the concerned object is 2-parametric.

#### Parameters

|                |                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------|
| <i>obj_nmb</i> | should be either 1 or 2, depending on whether you want to get the parametric curve in object 1 or object 2. |
|----------------|-------------------------------------------------------------------------------------------------------------|

#### Returns

a shared pointer to a curve that approximates the intersection curve in the parametric domain of the specified object.

Implements [Go::IntersectionCurve](#).

29.98.3.4 `virtual void Go::DegeneratedIntersectionCurve::getParamSpan ( double & start, double & end ) const`  
`[inline],[virtual]`

Get the start and end value for the parametric span of the [IntersectionCurve](#).

#### Return values

|              |                                                                                         |
|--------------|-----------------------------------------------------------------------------------------|
| <i>start</i> | upon function return this variable will contain the start value of the parametric span. |
| <i>end</i>   | upon function return this variable will contain the end value of the parametric span.   |

Implements [Go::IntersectionCurve](#).

Definition at line 236 of file `IntersectionCurve.h`.

29.98.3.5 `virtual bool Go::DegeneratedIntersectionCurve::isDegenerated ( ) const` `[inline],[virtual]`

Determine if the [IntersectionCurve](#) is in fact a degenerated curve (a single point in space).

#### Returns

'true' if the [IntersectionCurve](#) is degenerated. 'false' otherwise.

Implements [Go::IntersectionCurve](#).

Definition at line 233 of file `IntersectionCurve.h`.

29.98.3.6 `virtual bool Go::DegeneratedIntersectionCurve::isIsocurve ( ) const` `[inline],[virtual]`

Determine if the [IntersectionCurve](#) is in fact representing an isoparametric intersection.

#### Returns

'true' if the [IntersectionCurve](#) is part of an isocurve for one of the objects, 'false' otherwise.

Implements [Go::IntersectionCurve](#).

Definition at line 230 of file `IntersectionCurve.h`.

29.98.3.7 `virtual void Go::DegeneratedIntersectionCurve::refine ( const double & pos_tol, const double & angle_tol )`  
`[inline],[virtual]`

Refine the curve (which means to increase the number of [IntersectionPoint](#) s defining it), so that the curve matches a specific positional and angle tolerance.

#### Parameters

|                        |                                                                                    |
|------------------------|------------------------------------------------------------------------------------|
| <code>pos_tol</code>   | the positional tolerance that the curve should match after refinement.             |
| <code>angle_tol</code> | the angular tolerance that the tangent of the curve should match after refinement. |

Implements [Go::IntersectionCurve](#).

Definition at line 242 of file `IntersectionCurve.h`.

## 29.98.4 Friends And Related Function Documentation

29.98.4.1 `template<class iterator > shared_ptr<IntersectionCurve> constructIntersectionCurve ( const iterator begin, const iterator end )` `[friend]`

Definition at line 601 of file `IntersectionCurve.h`.

The documentation for this class was generated from the following file:

- `intersections/include/GoTools/intersections/IntersectionCurve.h`

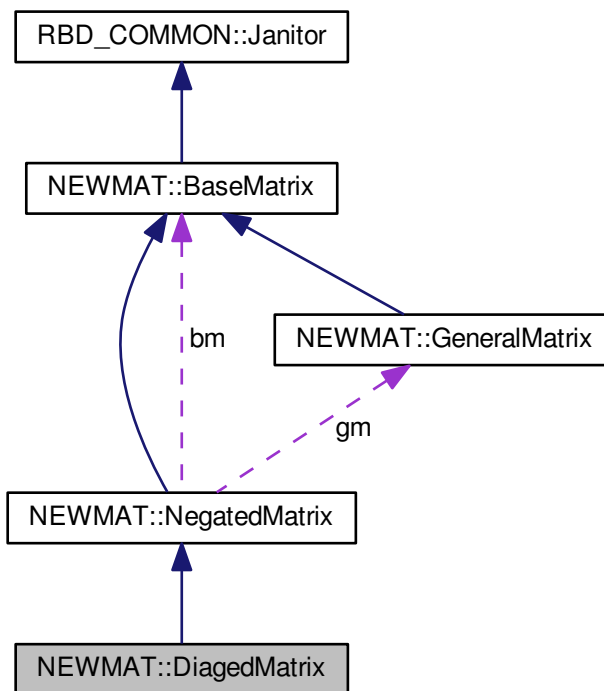

## 29.99 NEWMAT::DiagedMatrix Class Reference

### 29.101.1 Detailed Description

[Dijkstra](#) Class implementing the [Dijkstra](#) algorithm

Definition at line 76 of file [PrDijkstra.h](#).

### 29.101.2 Constructor & Destructor Documentation

#### 29.101.2.1 [Dijkstra::Dijkstra](#) ( )

Constructor.

#### 29.101.2.2 [Dijkstra::~~Dijkstra](#) ( )

Destructor.

### 29.101.3 Member Function Documentation

#### 29.101.3.1 `int Dijkstra::closestNeighbour ( int node_idx )`

Get the index of the closest neighbour to the node '*node\_idx*'. Does not give a valid answer until the [Dijkstra](#) algorithm has been [run\(\)](#).

#### 29.101.3.2 `double Dijkstra::getDistance ( int node_idx ) [inline]`

Get the distance associated with the node '*node\_idx*'. Does not give a valid answer until the [Dijkstra](#) algorithm has been [run\(\)](#).

Definition at line 120 of file PrDijkstra.h.

#### 29.101.3.3 `double Dijkstra::getDistance ( int node_idx, int neighbour ) [inline]`

Compute the euclidean distance between two nodes, supposedly neighbours. If they are boundary nodes, their mutual distance will be set to a very large number.

Definition at line 156 of file PrDijkstra.h.

#### 29.101.3.4 `void Dijkstra::initialize ( )`

Initialize internal data structures. Must be done after '[setGraph\(\)](#)' has been called.

#### 29.101.3.5 `void Dijkstra::insertInCandidates ( int node_idx ) [inline],[protected]`

Definition at line 148 of file PrDijkstra.h.

#### 29.101.3.6 `int Dijkstra::isFinished ( int node_idx ) [inline],[protected]`

Definition at line 140 of file PrDijkstra.h.

#### 29.101.3.7 `void Dijkstra::run ( )`

Run the algorithm. Compute the associated distance for all nodes in the graph.

#### 29.101.3.8 `void Dijkstra::run ( double radius )`

Run the algorithm. Compute the associated distance for all nodes in the graph. Edges longer than '*radius*' will be ignored.

29.101.3.9 void Dijkstra::run ( int *target* )

Run the algorithm. Compute the associated distance for nodes in the graph until the distance for the 'target' node has been found. Then skip further computations.

29.101.3.10 void Dijkstra::setFinished ( int *node\_idx* ) [inline],[protected]

Definition at line 133 of file PrDijkstra.h.

29.101.3.11 void Dijkstra::setGraph ( const GraphType \* *tri* ) [inline]

Set the graph to run the algorithm on. Must be run before 'initialize()'.  
[Initialize\(\)](#)

Definition at line 98 of file PrDijkstra.h.

29.101.3.12 void Dijkstra::setSource ( int *node\_idx*, double *dist* = 0 )

Set a 'source' for the algorithm. This is a node for which the associated minimum distance is known. At least one source must be set for the algorithm to work properly.

#### Parameters

|                 |                                                    |
|-----------------|----------------------------------------------------|
| <i>node_idx</i> | the index of the node to be designated as a source |
| <i>dist</i>     | the distance at this node (typically 0).           |

### 29.102.1 Detailed Description

Class representing a direction cone in Euclidian N-space The direction cone is characterised by a central direction and an angle 'alpha'. All directions whose angle with the central direction is less than 'alpha' is considered to be covered by the cone. If ever 'alpha' equals or exceeds 180 degrees, any possible direction will end up being covered by the cone.

Definition at line 57 of file DirectionCone.h.

## 29.102.2 Constructor & Destructor Documentation

### 29.102.2.1 Go::DirectionCone::DirectionCone ( ) [inline]

Constructor making an undefined direction cone.

Definition at line 60 of file DirectionCone.h.

### 29.102.2.2 Go::DirectionCone::DirectionCone ( const Point & *pt* ) [inline]

Constructor making a direction cone whose central direction is given by 'pt', and whose angle is zero. The length of 'pt' should be assured to be greater than zero, if not, then the [DirectionCone](#) will not be well defined.

Definition at line 66 of file DirectionCone.h.

### 29.102.2.3 Go::DirectionCone::DirectionCone ( const Point & *centre*, double *angle* ) [inline]

Constructor making a direction cone whose central direction is given by 'centre', and whose angle (in radians) is 'angle'. The length of 'centre' should be assured to be greater than zero; if not, then the [DirectionCone](#) will not be well defined.

Definition at line 77 of file DirectionCone.h.

### 29.102.2.4 Go::DirectionCone::~~DirectionCone ( ) [inline]

Do not inherit from this class – nonvirtual destructor.

Definition at line 86 of file DirectionCone.h.

## 29.102.3 Member Function Documentation

### 29.102.3.1 void Go::DirectionCone::addUnionWith ( const Point & *pt* )

If necessary, increase the angle of the [DirectionCone](#) so that it covers the direction represented by 'pt'.

### 29.102.3.2 void Go::DirectionCone::addUnionWith ( const DirectionCone & *cone* )

If necessary, increase the angle of the [DirectionCone](#) so that it covers all directions covered by 'cone'.

### 29.102.3.3 double Go::DirectionCone::angle ( ) const [inline]

Return the angle of the [DirectionCone](#).

Definition at line 105 of file DirectionCone.h.

29.102.3.4 `const Point& Go::DirectionCone::centre ( ) const [inline]`

Return the central direction of the [DirectionCone](#).

Definition at line 102 of file `DirectionCone.h`.

29.102.3.5 `bool Go::DirectionCone::containsDirection ( const Point & pt, double tol = 0.0 ) const`

Return 'true' if the direction specified by 'pt' is contained within the [DirectionCone](#).

29.102.3.6 `int Go::DirectionCone::dimension ( ) const [inline]`

Return the dimension of the Euclidean space in which this [DirectionCone](#) is defined

Definition at line 99 of file `DirectionCone.h`.

29.102.3.7 `int Go::DirectionCone::greaterThanPi ( ) const [inline]`

Inform if the [DirectionCone](#)'s angle is greater than PI. If this is the case, then naturally ANY spatial direction is included in the cone.

Definition at line 110 of file `DirectionCone.h`.

29.102.3.8 `bool Go::DirectionCone::overlaps ( const DirectionCone & cone ) const`

Return 'true' if there exists at least one direction that is covered by both 'this' and the 'cone' [DirectionCone](#)s.

29.102.3.9 `bool Go::DirectionCone::perpendicularOverlaps ( const DirectionCone & cone ) const`

Return 'true' if there exist a direction in one cone that is perpendicular to a direction in the other cone.

29.102.3.10 `void Go::DirectionCone::read ( std::istream & is )`

Read [DirectionCone](#) from stream.

29.102.3.11 `void Go::DirectionCone::setFromArray ( const double * start, const double * end, int dim )`

Re-define an already-existing [DirectionCone](#) from an array of 'dim'-dimensional vectors stored in the memory area between 'start' and 'end'. The first vector in this range will define the central direction of the [DirectionCone](#), and cone's angle will be set wide enough to contain all the other directions given. NB: the length of the range (end - start) must be an exact multiplum of 'dim'.

29.102.3.12 void Go::DirectionCone::write ( std::ostream & os ) const

Write [DirectionCone](#) to stream.

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/utis/DirectionCone.h](#)

## 29.103 Go::Disc Class Reference

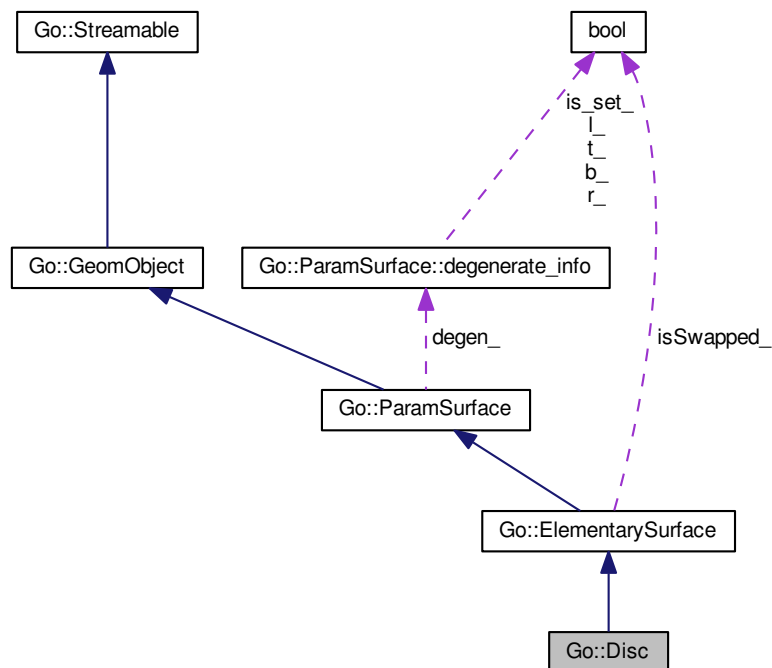

Class that represents a circular disc. It is a subclass of [ElementarySurface](#), and has a natural parametrization by polar coordinates in terms of a radius  $r$  and angle  $v$ :  $\mathbf{p}(r, v) = \mathbf{C} + r(\cos v) \mathbf{x} + (\sin v) \mathbf{y}$ , where  $\mathbf{C}$  is the centre position vector and  $\mathbf{x}$  and  $\mathbf{y}$  are the (local) axes. The parametrization is bounded by:  $0 \leq r \leq R$  and  $0 \leq v \leq 2\pi$ , where  $R$  is the disc radius. The dimension is 2 or 3.

```
#include <Disc.h>
```

#### 29.103.1 Detailed Description

Class that represents a circular disc. It is a subclass of [ElementarySurface](#), and has a natural parametrization by polar coordinates in terms of a radius  $r$  and angle  $v$ :  $\mathbf{p}(r, v) = \mathbf{C} + r((\cos v) \mathbf{x} + (\sin v) \mathbf{y})$ , where  $\mathbf{C}$  is the centre position vector and  $\mathbf{x}$  and  $\mathbf{y}$  are the (local) axes. The parametrization is bounded by:  $0 \leq r \leq R$  and  $0 \leq v \leq 2\pi$ , where  $R$  is the disc radius. The dimension is 2 or 3.

A disc also holds degeneracy information for representing it as a [SplineSurface](#) object. There are two ways to parametrize:

1. **Polar coordinates:** The parametrization of the [SplineSurface](#) object almost coincides with the one for the [Disc](#) object itself, i.e. `this->point()` gives almost the same as `geometrySurface()->point()`. The only degeneracy point then is the centre. Note that the corresponding [SplineSurface](#) representation is not an identity mapping of the [Disc](#) because of a reparametrization in the angular direction. This is the default [SplineSurface](#) representation.
2. **Rounded square:** Done by splitting the boundary into four curves that become the boundary curves of the spline surface. Then the four meeting points of the curves become degeneracy points.

Definition at line 83 of file `Disc.h`.

## 29.103.2 Constructor & Destructor Documentation

### 29.103.2.1 `Go::Disc::Disc ( ) [inline]`

Default constructor. Constructs an uninitialized `Disc` which can only be assigned to or read into.

Definition at line 90 of file `Disc.h`.

### 29.103.2.2 `Go::Disc::Disc ( Point centre, double radius, Point x_axis, Point normal, bool isSwapped = false )`

Constructor. Input is the disc centre, disc radius, the `x_axis` and the normal (possibly approximate, only dummy in two-dimensional space). The local coordinate axes are normalized even if `x_axis` and/or `normal` are not unit vectors.

### 29.103.2.3 `virtual Go::Disc::~~Disc ( ) [inline],[virtual]`

Virtual destructor - ensures safe inheritance.

Definition at line 101 of file `Disc.h`.

## 29.103.3 Member Function Documentation

### 29.103.3.1 `std::vector<CurveLoop> Go::Disc::allBoundaryLoops ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [virtual]`

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

#### Parameters

|                                 |                                                            |
|---------------------------------|------------------------------------------------------------|
| <code>degenerate_epsilon</code> | edges whose length is smaller than this value are ignored. |
|---------------------------------|------------------------------------------------------------|

#### Returns

a vector containing `CurveLoops`. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

### 29.103.3.2 `virtual BoundingBox Go::Disc::boundingBox ( ) const [virtual]`

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.103.3.3 `static ClassType Go::Disc::classType ( ) [inline],[static]`

Definition at line 121 of file Disc.h.

29.103.3.4 `virtual Disc* Go::Disc::clone ( ) const [virtual]`

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

Returns

pointer to cloned object

Implements [Go::ElementarySurface](#).

29.103.3.5 `void Go::Disc::closestBoundaryPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * rd = NULL, double * seed = 0 ) const [virtual]`

Iterates to the closest point to pt on the boundary of the surface.

See also

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

29.103.3.6 `void Go::Disc::closestPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * domain_of_interest = NULL, double * seed = 0 ) const [virtual]`

Iterates to the closest point to pt on the surface.

Parameters

|                           |                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>                 | the point to find the closest point to                                                                                       |
| <i>clo_u</i>              | u parameter of the closest point                                                                                             |
| <i>clo_v</i>              | v parameter of the closest point                                                                                             |
| <i>clo_pt</i>             | the geometric position of the closest point                                                                                  |
| <i>clo_dist</i>           | the distance between pt and clo_pt                                                                                           |
| <i>epsilon</i>            | parameter tolerance (will in any case not be higher than sqrt(machine_precision) x magnitude of solution)                    |
| <i>domain_of_interest</i> | pointer to parameter domain in which to search for closest point. If a NULL pointer is used, the entire surface is searched. |
| <i>seed</i>               | pointer to parameter values where iteration starts.                                                                          |

Reimplemented from [Go::ParamSurface](#).

29.103.3.7 `std::vector<shared_ptr<ParamCurve>> Go::Disc::constParamCurves ( double parameter, bool paddir_is_u ) const [virtual]`

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint curves.

#### Parameters

|                    |                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>parameter</i>   | parameter value for the constant parameter (either u or v)                                                                                   |
| <i>paddir_is_u</i> | specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one. |

#### Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

29.103.3.8 `virtual SplineSurface* Go::Disc::createSplineSurface ( ) const [virtual]`

Create a [SplineSurface](#) representation of the [Disc](#).

Implements [Go::ElementarySurface](#).

29.103.3.9 `virtual int Go::Disc::dimension ( ) const [virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.103.3.10 `virtual SplineSurface* Go::Disc::geometrySurface ( ) const [virtual]`

Create a [SplineSurface](#) representation of the [Disc](#).

Implements [Go::ElementarySurface](#).

## Parameters

---

```
29.103.3.11 void Go::Disc::getBoundaryInfo (Point & pt1, Point & pt2, double epsilon, SplineCurve *& cv,
 SplineCurve *& crosscv, double knot_tol = 1e-05) const [virtual]
```

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

## Parameters

|                 |                                                                                                                                                                                                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pt1</i>      | the first point on the boundary, given by the user                                                                                                                                                                                                                                                                                 |
| <i>pt2</i>      | the second point on the boundary, given by the user                                                                                                                                                                                                                                                                                |
| <i>epsilon</i>  | the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.                                                                                                                                                                           |
| <i>cv</i>       | upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.                                                   |
| <i>crosscv</i>  | upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary. |
| <i>knot_tol</i> | tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.                                                                                                                                                                                |

Implements [Go::ParamSurface](#).

```
29.103.3.12 virtual void Go::Disc::getDegenerateCorners (std::vector< Point > & deg_corners, double tol) const
 [virtual]
```

Check for parallel and anti parallel partial derivatives in surface corners.

Implements [Go::ParamSurface](#).

```
29.103.3.13 virtual ClassType Go::Disc::instanceType () const [virtual]
```

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

```
29.103.3.14 bool Go::Disc::isBounded () const [virtual]
```

Query if parametrization is bounded. All four parameter bounds must be finite for this to be true.

## Returns

*true* if bounded, *false* otherwise

Reimplemented from [Go::ElementarySurface](#).

---

29.103.3.15 **bool** Go::Disc::isClosed ( **bool** & *closed\_dir\_u*, **bool** & *closed\_dir\_v* ) **const** [virtual]

Check if the surface is closed.

Reimplemented from [Go::ElementarySurface](#).

29.103.3.16 **bool** Go::Disc::isDegenerate ( **bool** & *b*, **bool** & *r*, **bool** & *t*, **bool** & *l*, **double** *tolerance* ) **const** [virtual]

The order of the edge indicators (bottom, right, top, left) matches the *edge\_number* of *edgeCurve()*. Query whether any of the four boundary curves are degenerate (zero length) within a certain tolerance. In the below, we refer to 'u' as the first parameter and 'v' as the second.

#### Parameters

|                  |                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------|
| <i>b</i>         | 'true' upon return of function if the boundary ( $v = v_{\min}$ ) is degenerate                    |
| <i>r</i>         | 'true' upon return of function if the boundary ( $v = v_{\max}$ ) is degenerate                    |
| <i>t</i>         | 'true' upon return of function if the boundary ( $u = u_{\min}$ ) is degenerate                    |
| <i>l</i>         | 'true' upon return of function if the boundary ( $u = u_{\max}$ ) is degenerate                    |
| <i>tolerance</i> | boundaries are considered degenerate if their length is shorter than this value, given by the user |

#### Returns

'true' if at least one boundary curve was found to be degenerate, 'false' otherwise.

Reimplemented from [Go::ParamSurface](#).

29.103.3.17 **double** Go::Disc::nextSegmentVal ( **int** *dir*, **double** *par*, **bool** *forward*, **double** *tol* ) **const** [virtual]

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

|                |                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------|
| <i>dir</i>     | the parameter direction in which we search for the next segment (0 or 1)                             |
| <i>par</i>     | the parameter value starting from which we search for the start value of the next segment            |
| <i>forward</i> | define whether we shall move forward ('true') or backwards when searching along this parameter       |
| <i>tol</i>     | tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value |

#### Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

29.103.3.18 `void Go::Disc::normal ( Point & n, double upar, double vpar ) const [virtual]`

Evaluates the surface normal for a given parameter pair

#### Parameters

|             |                                                      |
|-------------|------------------------------------------------------|
| <i>n</i>    | the computed normal will be written to this variable |
| <i>upar</i> | the first parameter                                  |
| <i>vpar</i> | the second parameter                                 |

Implements [Go::ParamSurface](#).

29.103.3.19 `DirectionCone Go::Disc::normalCone ( ) const [virtual]`

Creates a [DirectionCone](#) covering all normals to this surface.

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

29.103.3.20 `const RectDomain& Go::Disc::parameterDomain ( ) const [virtual]`

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

#### Returns

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

29.103.3.21 `void Go::Disc::point ( Point & pt, double upar, double vpar ) const [virtual]`

Evaluates the surface's position for a given parameter pair.

#### Parameters

|             |                                              |
|-------------|----------------------------------------------|
| <i>pt</i>   | the result of the evaluation is written here |
| <i>upar</i> | the first parameter                          |
| <i>vpar</i> | the second parameter                         |

Implements [Go::ParamSurface](#).

```
29.103.3.22 void Go::Disc::point (std::vector< Point > & pts, double upar, double vpar, int derivs, bool u_from_right = true, bool v_from_right = true, double resolution = 1.0e-12) const [virtual]
```

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

#### Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pts</i>          | the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives. |
| <i>upar</i>         | the first parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>vpar</i>         | the second parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>derivs</i>       | number of requested derivatives                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>u_from_right</i> | specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>v_from_right</i> | specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>resolution</i>   | tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).                                                                                                                                                                                                                                                                                                                                                                           |

Implements [Go::ParamSurface](#).

```
29.103.3.23 virtual void Go::Disc::read (std::istream & is) [virtual]
```

read object from stream

#### Parameters

|           |                                  |
|-----------|----------------------------------|
| <i>is</i> | stream from which object is read |
|-----------|----------------------------------|

Implements [Go::Streamable](#).

```
29.103.3.24 virtual void Go::Disc::setParameterBounds (double from_upar, double from_vpar, double to_upar, double to_vpar) [virtual]
```

Limit the surface by limiting the parameter domain.

Implements [Go::ElementarySurface](#).

```
29.103.3.25 Disc* Go::Disc::subSurface (double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON) const
```

Return the part of the surface limited by the given parameter bounds.

```
29.103.3.26 std::vector<shared_ptr<ParamSurface> > Go::Disc::subSurfaces (double from_upar, double from_vpar,
double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON) const
 [virtual]
```

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

#### Parameters

|                  |                                                                       |
|------------------|-----------------------------------------------------------------------|
| <i>from_upar</i> | lower value for the first parameter in the subdomain                  |
| <i>from_vpar</i> | lower value for the second parameter in the subdomain                 |
| <i>to_upar</i>   | upper value for the first parameter in the subdomain                  |
| <i>to_vpar</i>   | upper value for the second parameter in the subdomain                 |
| <i>fuzzy</i>     | tolerance used when determining intersection with interior boundaries |

#### Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

```
29.103.3.27 DirectionCone Go::Disc::tangentCone (bool padir_is_u) const [virtual]
```

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

#### Parameters

|                   |                                                                                                                                                                                                  |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>padir_is_u</i> | if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used. |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

```
29.103.3.28 void Go::Disc::useCentreDegen () [inline]
```

The NURBS representation of the disc will have degeneracy in the centre.

Definition at line 212 of file Disc.h.

```
29.103.3.29 void Go::Disc::useCornerDegen () [inline]
```

The NURBS representation of the disc will have degenerate corners.

Definition at line 216 of file Disc.h.

29.103.3.30 `virtual void Go::Disc::write ( std::ostream & os ) const [virtual]`

write object to stream

#### Parameters

|                 |                                   |
|-----------------|-----------------------------------|
| <code>os</code> | stream to which object is written |
|-----------------|-----------------------------------|

Implements [Go::Streamable](#).

The documentation for this class was generated from the following file:

- [gtools-core/include/GoTools/geometry/Disc.h](#)

## 29.104 Go::Domain Class Reference

```
#include <Domain.h>
```

Inheritance diagram for Go::Domain:

### Public Member Functions

- `virtual ~Domain ()`  
*virtual destructor ensures safe inheritance*
- `virtual bool isInDomain (const Array< double, 2 > &point, double tolerance) const =0`
- `virtual int isInDomain2 (const Array< double, 2 > &point, double tolerance) const =0`
- `virtual bool isOnBoundary (const Array< double, 2 > &point, double tolerance) const =0`
- `virtual void closestInDomain (const Array< double, 2 > &point, Array< double, 2 > &clo_pt, double tolerance) const =0`
- `virtual void closestOnBoundary (const Array< double, 2 > &point, Array< double, 2 > &clo_bd_pt, double tolerance) const =0`

#### 29.104.1 Detailed Description

Abstract base class representing a 2D parameter domain.

Definition at line 54 of file Domain.h.

## 29.104.2 Constructor & Destructor Documentation

29.104.2.1 `virtual Go::Domain::~~Domain ( ) [inline], [virtual]`

virtual destructor ensures safe inheritance

Definition at line 58 of file Domain.h.

## 29.104.3 Member Function Documentation

29.104.3.1 `virtual void Go::Domain::closestInDomain ( const Array< double, 2 > & point, Array< double, 2 > & clo_pt, double tolerance ) const [pure virtual]`

Find the (u, v) point in the [Domain](#) that is closest (using Euclidean distance in  $R^2$ ) to a given (u, v) point. If the given point is in the domain, then the answer is obviously the same point.

### Parameters

|                  |                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>point</i>     | the (u,v) parameter pair that we want to find the closest parameter pair to <i>inside</i> <a href="#">Domain</a> . |
| <i>clo_pt</i>    | the resulting closest parameter point.                                                                             |
| <i>tolerance</i> | the tolerance used in defining whether the given point is already inside the domain.                               |

Implemented in [Go::CurveBoundedDomain](#), and [Go::RectDomain](#).

29.104.3.2 `virtual void Go::Domain::closestOnBoundary ( const Array< double, 2 > & point, Array< double, 2 > & clo_bd_pt, double tolerance ) const [pure virtual]`

Find the (u, v) point on the boundary of the [Domain](#) that is closest (using Euclidean distance in  $R^2$ ) to a given (u, v) point. If the point is already considered *on* the boundary, then the answer is obviously the same point.

### Parameters

|                  |                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>point</i>     | the (u,v) parameter pair that we want to find to closest parameter pair to <i>on</i> the <a href="#">Domain</a> border. |
| <i>clo_bd_pt</i> | the resulting closest border point.                                                                                     |
| <i>tolerance</i> | the tolerance used in defining whether the given point is                                                               |

Implemented in [Go::CurveBoundedDomain](#), and [Go::RectDomain](#).

29.104.3.3 `virtual bool Go::Domain::isInDomain ( const Array< double, 2 > & point, double tolerance ) const [pure virtual]`

check whether a given parameter pair is located inside the domain

### Parameters

|                  |                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------|
| <i>point</i>     | the (u,v)-pair that we want to test.                                                             |
| <i>tolerance</i> | the tolerance used (ruling what to do when 'point' is located very near the edge of the domain). |

**Returns**

'true' if 'point' is inside the domain, or within 'tolerance' from being inside the domain, 'false' otherwise'.

Implemented in [Go::CurveBoundedDomain](#), and [Go::RectDomain](#).

```
29.104.3.4 virtual int Go::Domain::isInDomain2 (const Array< double, 2 > & point, double tolerance) const [pure virtual]
```

Query whether a given parameter pair is inside the domain or not.

**Parameters**

|                  |                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>point</i>     | array containing the parameter pair                                                                                                                                                                                                                     |
| <i>tolerance</i> | the tolerance to be used. In order to be considered 'inside', the point must be located inside one of the defining <a href="#">CurveLoop</a> s, as well as being at a distance more than 'tolerance' from any point on that <a href="#">CurveLoop</a> . |

**Returns**

'1' if the point is found to be inside the domain, '2' if it is found to be on the boundary '0' otherwise.

Implemented in [Go::CurveBoundedDomain](#), and [Go::RectDomain](#).

```
29.104.3.5 virtual bool Go::Domain::isOnBoundary (const Array< double, 2 > & point, double tolerance) const [pure virtual]
```

check whether a given parameter pair is located on the domain boundary

**Parameters**

|                  |                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------|
| <i>point</i>     | the (u,v)-pair that we want to test                                                                               |
| <i>tolerance</i> | the tolerance used (how 'far' from the boundary our (u,v) pair can be and still be considered 'on' the boundary). |

**Returns**

'true' if the point is considered to be on the boundary (within 'tolerance', 'false' otherwise).

Implemented in [Go::CurveBoundedDomain](#), and [Go::RectDomain](#).

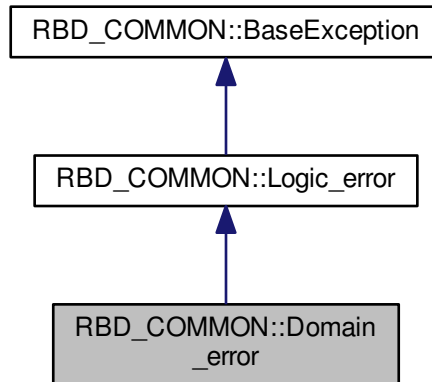

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/geometry/Domain.h](#)

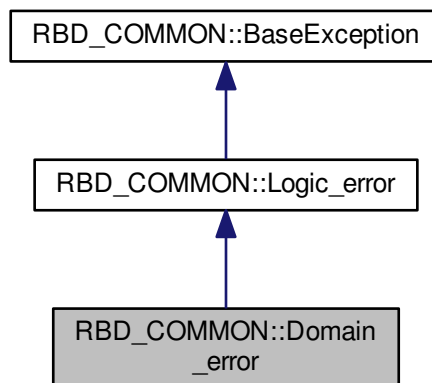

## 29.105 RBD\_COMMON::Domain\_error Class Reference

### 29.107.1 Detailed Description

**Edge** class in the in the half-edge data structure.

Definition at line 152 of file HeTriang.h.

### 29.107.2 Constructor & Destructor Documentation

#### 29.107.2.1 `hed::Edge::Edge( )` [inline]

Constructor.

Definition at line 165 of file HeTriang.h.

#### 29.107.2.2 `hed::Edge::~~Edge( )` [inline]

Destructor.

Definition at line 169 of file HeTriang.h.

### 29.107.3 Member Function Documentation

#### 29.107.3.1 `Edge* hed::Edge::getNextEdgeInFace( ) const` [inline]

Returns the next edge in face.

Definition at line 197 of file HeTriang.h.

#### 29.107.3.2 `Node* hed::Edge::getSourceNode( )` [inline]

Returns the source node.

Definition at line 200 of file HeTriang.h.

#### 29.107.3.3 `Node* hed::Edge::getTargetNode( )` [inline]

Returns the target node.

Definition at line 203 of file HeTriang.h.

#### 29.107.3.4 `Edge* hed::Edge::getTwinEdge( ) const` [inline]

Returns the twin edge.

Definition at line 194 of file HeTriang.h.

29.107.3.5 `bool hed::Edge::isConstrained ( ) const [inline]`

Checks if an edge is constrained.

Definition at line 191 of file HeTriang.h.

29.107.3.6 `bool hed::Edge::isLeadingEdge ( ) const [inline]`

Checks if an edge is a leading edge.

Definition at line 184 of file HeTriang.h.

29.107.3.7 `void hed::Edge::setAsLeadingEdge ( bool val = true ) [inline]`

Sets the edge as a leading edge.

Definition at line 181 of file HeTriang.h.

29.107.3.8 `void hed::Edge::setConstrained ( bool val = true ) [inline]`

Sets the edge as a constrained edge.

Definition at line 187 of file HeTriang.h.

29.107.3.9 `void hed::Edge::setNextEdgeInFace ( Edge * edge ) [inline]`

Sets the next edge in face.

Definition at line 175 of file HeTriang.h.

29.107.3.10 `void hed::Edge::setSourceNode ( Node * node ) [inline]`

Sets the source node.

Definition at line 172 of file HeTriang.h.

29.107.3.11 `void hed::Edge::setTwinEdge ( Edge * edge ) [inline]`

Sets the twin edge.

Definition at line 178 of file HeTriang.h.

## 29.107.4 Member Data Documentation

29.107.4.1 `bool hed::Edge::isConstrained_`

Definition at line 160 of file HeTriang.h.

#### 29.107.4.2 bool hed::Edge::isLeadingEdge\_

Definition at line 159 of file HeTriang.h.

The documentation for this class was generated from the following file:

### 29.110.1 Detailed Description

Represents the radial edge structure in a non-manifold. Edges in a volume model setting. This entity corresponds to [Vertex](#) in the surface model setting.

Definition at line 63 of file [EdgeVertex.h](#).

### 29.110.2 Constructor & Destructor Documentation

#### 29.110.2.1 Go::EdgeVertex::EdgeVertex ( std::vector< [ftEdge](#) \* > edges )

Constructor given a number of adjacent half edges.

29.110.2.2 `Go::EdgeVertex::EdgeVertex ( ftEdge * edge )`

Constructor given one half edge.

29.110.2.3 `Go::EdgeVertex::~~EdgeVertex ( )`

Destructor.

### 29.110.3 Member Function Documentation

29.110.3.1 `void Go::EdgeVertex::addEdge ( ftEdge * edge )`

Add another half edge to this radial edge. Used in topology build for volume models

29.110.3.2 `void Go::EdgeVertex::addEdgeVertex ( EdgeVertex * other )`

Join the content of two edge vertex instances.

29.110.3.3 `std::vector<ftEdge*> Go::EdgeVertex::allEdges ( ) const`

Returns all edges meeting in this vertex including twins.

29.110.3.4 `std::vector<ftEdge*> Go::EdgeVertex::allEdges ( Body * bd )`

Returns all edges belonging to a given body meeting in this vertex including twins

29.110.3.5 `void Go::EdgeVertex::averageSplineEdges ( double eps )`

Average coefficients of all spline surfaces meeting in this radial edge

29.110.3.6 `bool Go::EdgeVertex::checkRadialEdgeTopology ( )`

Debug functionality.

29.110.3.7 `void Go::EdgeVertex::disconnectTwin ( ftEdge * e1, ftEdge * e2 )`

Disconnect twin edges collected into this edge vertex, also in this data structure. Called from [ftEdge](#).

29.110.3.8 `std::vector<Body*> Go::EdgeVertex::getAdjacentBodies ( ) const`

Get all adjacent bodies.

29.110.3.9 `std::vector<ftSurface*> Go::EdgeVertex::getAdjacentFaces ( ) const`

Get all adjacent faces.

29.110.3.10 `std::vector<ftSurface*> Go::EdgeVertex::getAdjacentFaces ( Body * bd ) const`

Get all adjacent faces belonging to a given body.

29.110.3.11 `ftEdge* Go::EdgeVertex::getEdge ( int idx ) [inline]`

Fetch a specified half edge, twins are counted once and an arbitrary member of a twin pair is returned

Definition at line 115 of file EdgeVertex.h.

29.110.3.12 `bool Go::EdgeVertex::hasEdge ( ftEdge * edge ) const`

Check if a half edge is collected in this radial edge.

29.110.3.13 `bool Go::EdgeVertex::hasEdgeSingle ( ftEdge * edge ) const`

Check if a half edge is collected in this radial edge and has no twin information

29.110.3.14 `int Go::EdgeVertex::nmbUniqueEdges ( ) [inline]`

Number of unique edges meeting in this radial edge, twin information is counted only once. The number coincides with the number of bodies meeting in this edge

Definition at line 104 of file EdgeVertex.h.

29.110.3.15 `int Go::EdgeVertex::nmbUniqueEdges ( Body * bd ) const`

Number of unique edges of one body meeting in this radial edge, twin information is counted only once.

29.110.3.16 `void Go::EdgeVertex::organizeTwins ( )`

Reset twin organization.

29.110.3.17 `void Go::EdgeVertex::removeEdge ( ftEdge * edge )`

Remove a half edge from this radial edge. Used in topology modifications for volume models

29.110.3.18 `void Go::EdgeVertex::reOrganize ( )`

Reorganize edges to get better pairs of twins.

29.110.3.19 `void Go::EdgeVertex::splitAtVertex ( shared_ptr< Vertex > v1, shared_ptr< Vertex > v2, shared_ptr< Vertex > split_vx )`

Split edge vertex.

29.110.3.20 `std::vector<ftEdge*> Go::EdgeVertex::uniqueEdges ( )`

Returns all geometrically unique edges meeting in this vertex. One edge is return for a pair of twins.

29.110.3.21 `std::vector<ftEdge*> Go::EdgeVertex::uniqueEdges ( Body * bd )`

Returns all geometrically unique edges belonging to a given body meeting in this vertex. One edge is return for a pair of twins.

The documentation for this class was generated from the following file:

- `compositemodel/include/GoTools/compositemodel/EdgeVertex.h`

## 29.111 Go::Element2D Class Reference

```
#include <Element2D.h>

29.111.3.1 void `Go::Element2D::addDataPoints` ( std::vector< double >::iterator start, std::vector< double >::iterator end, bool sort\_in\_u ) [inline]

Add data points to the element.

Definition at line 341 of file Element2D.h.

29.111.3.2 void `Go::Element2D::addDataPoints` ( std::vector< double >::iterator start, std::vector< double >::iterator end, int del, bool sort\_in\_u ) [inline]

Definition at line 349 of file Element2D.h.

29.111.3.3 void `Go::Element2D::addGhostPoints` ( std::vector< double >::iterator start, std::vector< double >::iterator end, bool sort\_in\_u ) [inline]

Definition at line 359 of file Element2D.h.

29.111.3.4 `void Go::Element2D::addGhostPoints ( std::vector< double >::iterator start, std::vector< double >::iterator end, int del, bool sort_in_u ) [inline]`

Definition at line 367 of file Element2D.h.

29.111.3.5 `void Go::Element2D::addSupportFunction ( LRBSpline2D * f )`

29.111.3.6 `double Go::Element2D::area ( ) const [inline]`

Definition at line 267 of file Element2D.h.

29.111.3.7 `bool Go::Element2D::contains ( double upar, double vpar ) [inline]`

Definition at line 281 of file Element2D.h.

29.111.3.8 `Element2D* Go::Element2D::copy ( )`

29.111.3.9 `SplineCurve* Go::Element2D::curveOnElement ( double start_u, double start_v, double end_u, double end_v ) const`

Get the Bezier curve (as a spline curve) given as the image of a line segment in the parameter space of the spline surface. The parameter domain of the curve will be [0, 1].

#### Parameters

|                            |                                                    |
|----------------------------|----------------------------------------------------|
| <code>start↔<br/>_u</code> | The u-value of the start point of the line segment |
| <code>start↔<br/>_v</code> | The v-value of the start point of the line segment |
| <code>end↔<br/>_u</code>   | The u-value of the start point of the line segment |
| <code>end↔<br/>_v</code>   | The v-value of the start point of the line segment |

#### Returns

The spline curve

29.111.3.10 `void Go::Element2D::eraseDataPoints ( ) [inline]`

Remove data points associated with the element.

Definition at line 321 of file Element2D.h.

29.111.3.11 `void Go::Element2D::eraseDataPoints ( std::vector< double >::iterator start, std::vector< double >::iterator end ) [inline]`

Definition at line 327 of file Element2D.h.

29.111.3.12 `void Go::Element2D::eraseGhostPoints ( ) [inline]`

Definition at line 334 of file Element2D.h.

29.111.3.13 `double Go::Element2D::getAccumulatedError ( ) [inline]`

Definition at line 461 of file Element2D.h.

29.111.3.14 `void Go::Element2D::getAccuracyInfo ( double & average_error, double & max_error, int & nmb_outside_tol ) [inline]`

Fetch accuracy information.

Definition at line 431 of file Element2D.h.

29.111.3.15 `double Go::Element2D::getAverageError ( ) [inline]`

Definition at line 452 of file Element2D.h.

29.111.3.16 `bool Go::Element2D::getDataBoundingBox ( double bb[ ] )`

29.111.3.17 `std::vector<double>& Go::Element2D::getDataPoints ( ) [inline]`

Fetch data points.

Definition at line 377 of file Element2D.h.

29.111.3.18 `std::vector<double>& Go::Element2D::getGhostPoints ( ) [inline]`

Fetch artificial data points intended for stabilization.

Definition at line 385 of file Element2D.h.

29.111.3.19 `void Go::Element2D::getLSMatrix ( double *& LSmat, double *& LSright, int & ncond ) [inline]`

Fetch local least squares arrays.

Definition at line 414 of file Element2D.h.

29.111.3.20 `double Go::Element2D::getMaxError ( ) [inline]`

Definition at line 470 of file Element2D.h.

29.111.3.21 `int Go::Element2D::getNmbOutsideTol ( ) [inline]`

Definition at line 443 of file Element2D.h.

29.111.3.22 `void Go::Element2D::getOutsideGhostPoints ( std::vector< double > & points, Direction2D d, bool & sort_in_u )`

29.111.3.23 `void Go::Element2D::getOutsidePoints ( std::vector< double > & points, Direction2D d, bool & sort_in_u )`

Split point set according to a modified size of the element and return the points lying outside the current element

29.111.3.24 `int Go::Element2D::getOverloadCount ( ) const [inline]`

Definition at line 297 of file Element2D.h.

Check if the element has accuracy information.

Definition at line 422 of file Element2D.h.

29.111.3.27 `bool Go::Element2D::hasDataPoints ( ) [inline]`

Check if the element is associated data points to be used in least squares approximation

Definition at line 306 of file Element2D.h.

29.111.3.28 `bool Go::Element2D::hasLSMatrix ( ) [inline]`

Check if a submatrix for least squares approximation exists.

Definition at line 401 of file Element2D.h.

29.111.3.29 `bool Go::Element2D::hasSupportFunction ( LRBSpline2D * f )`

29.111.3.30 `int Go::Element2D::incrementOverloadCount ( ) [inline]`

Definition at line 296 of file Element2D.h.

29.111.3.31 **bool** Go::Element2D::isModified ( ) [inline]

Check if the element has been modified lately.

Definition at line 515 of file Element2D.h.

29.111.3.32 **bool** Go::Element2D::isOverloaded ( ) const

29.111.3.33 **void** Go::Element2D::makeDataPoints3D ( )

29.111.3.34 **int** Go::Element2D::nmbBasisFunctions ( ) const [inline]

Definition at line 288 of file Element2D.h.

29.111.3.35 **int** Go::Element2D::nmbDataPoints ( )

Number of scattered data points.

29.111.3.36 **int** Go::Element2D::nmbGhostPoints ( )

Number of ghost points.

29.111.3.37 **void** Go::Element2D::removeSupportFunction ( LRBSpline2D \* f )

29.111.3.38 **void** Go::Element2D::resetAccuracyInfo ( ) [inline]

Definition at line 491 of file Element2D.h.

29.111.3.39 **void** Go::Element2D::resetModificationFlag ( ) [inline]

Reset modified flag.

Definition at line 521 of file Element2D.h.

29.111.3.40 **void** Go::Element2D::resetOverloadCount ( ) [inline]

Definition at line 295 of file Element2D.h.

29.111.3.41 **void** Go::Element2D::setAccuracyInfo ( *double accumulated\_error*, *double average\_error*, *double max\_error*,  
*int nmb\_outside\_tol* ) [inline]

Store accuracy information.

Definition at line 480 of file Element2D.h.

29.111.3.42 `void Go::Element2D::setLSMatrix ( )`

Create scratch to store local least squares approximation arrays

29.111.3.43 `void Go::Element2D::setModified ( )` [inline]

Set modified flag to true.

Definition at line 527 of file Element2D.h.

29.111.3.44 `void Go::Element2D::setUmax ( double u )` [inline]

Definition at line 291 of file Element2D.h.

29.111.3.45 `void Go::Element2D::setUmin ( double u )` [inline]

Definition at line 289 of file Element2D.h.

### 29.112.1 Detailed Description

[ElementaryCurve](#) is a base class for elementary curves like lines and circles. Such curves have natural parametrizations and [ElementaryCurve](#) is therefore a subclass of [ParamCurve](#).

Definition at line 54 of file [ElementaryCurve.h](#).

### 29.112.2 Constructor & Destructor Documentation

29.112.2.1 [Go::ElementaryCurve::ElementaryCurve](#) ( )

29.112.2.2 virtual [Go::ElementaryCurve::~~ElementaryCurve](#) ( ) [virtual]

Virtual destructor, enables safe inheritance.

### 29.112.3 Member Function Documentation

29.112.3.1 virtual [ElementaryCurve](#)\* [Go::ElementaryCurve::clone](#) ( ) const [pure virtual]

The clone-function is inherited from [GeomObject](#), but overridden here to get a covariant return type (for those compilers that allow this).

Implements [Go::ParamCurve](#).

Implemented in [Go::Line](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

29.112.3.2 virtual `SplineCurve*` `Go::ElementaryCurve::createSplineCurve ( ) const` `[pure virtual]`

Implemented in [Go::Circle](#), [Go::Line](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

29.112.3.3 void `Go::ElementaryCurve::getReversedParameter ( double & t ) const` `[protected]`

29.112.3.4 virtual `bool` `Go::ElementaryCurve::isReversed ( ) const` `[virtual]`

29.112.3.5 virtual void `Go::ElementaryCurve::reverseParameterDirection ( bool switchparam = false )` `[virtual]`

Set the parameter direction of the curve. The curve's parameter interval will always remain constant, but by flipping the parameter direction, the curve will be traced the opposite way when moving a parameter over the parameter interval.

#### Parameters

|                    |                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>switchparam</i> | if true, and the curve is 2D, the x and y coordinates should be swapped. This is used when turning the orientation of bounded (trimmed) surfaces. |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

Implements [Go::ParamCurve](#).

29.112.3.6 virtual void `Go::ElementaryCurve::setParamBounds ( double startpar, double endpar )` `[pure virtual]`

Set bounds for the parametrization of the curve

#### Parameters

|                 |                 |
|-----------------|-----------------|
| <i>startpar</i> | start parameter |
| <i>endpar</i>   | end parameter   |

Implemented in [Go::Circle](#), [Go::Ellipse](#), [Go::Line](#), [Go::Hyperbola](#), and [Go::Parabola](#).

29.112.3.7 virtual `ElementaryCurve*` `Go::ElementaryCurve::subCurve ( double from_par, double to_par, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const` `[pure virtual]`

Returns a curve which is a part of this curve. The result is NEWed, so the user is responsible for deleting it. NB: It is not guaranteed that the [ParamCurve](#) that is returned is of the same type as the curve itself. Thus, the returned curve might be a [SplineCurve](#).

#### Parameters

|                 |                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>from_par</i> | start value of parameter interval that will define the subcurve                                                                                                                                   |
| <i>to_par</i>   | end value of parameter interval that will define the subcurve                                                                                                                                     |
| <i>fuzzy</i>    | since subCurve works on those curves who are spline-based, this tolerance defines how close the start and end parameter must be to an existing knot in order to be considered <i>on</i> the knot. |

**Returns**

a pointer to a new subcurve which represents the part of the curve between 'from\_par' and 'to\_par'. It will be spline-based and have a k-regular knotvector. The user is responsible for deleting this subcurve when it is no longer needed.

Implements [Go::ParamCurve](#).

Implemented in [Go::Circle](#), [Go::Line](#), [Go::Hyperbola](#), [Go::Parabola](#), and [Go::Ellipse](#).

29.112.3.8 `virtual void Go::ElementaryCurve::swapParameters2D ( ) [pure virtual]`

Implemented in [Go::Circle](#), [Go::Ellipse](#), [Go::Line](#), [Go::Hyperbola](#), and [Go::Parabola](#).

29.112.3.9 `virtual void Go::ElementaryCurve::translateCurve ( const Point & dir ) [pure virtual]`

Implemented in [Go::Circle](#), [Go::Ellipse](#), [Go::Line](#), [Go::Parabola](#), and [Go::Hyperbola](#).

**29.112.4 Member Data Documentation**

29.112.4.1 `bool Go::ElementaryCurve::isReversed_ [protected]`

Definition at line 92 of file ElementaryCurve.h.

The documentation for this class was generated from the following file:

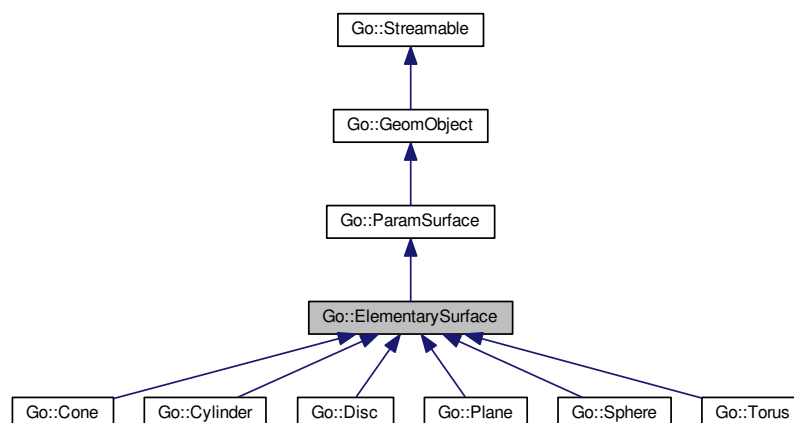

- [gtools-core/include/GoTools/geometry/ElementaryCurve.h](#)

**29.113 Go::ElementarySurface Class Reference**

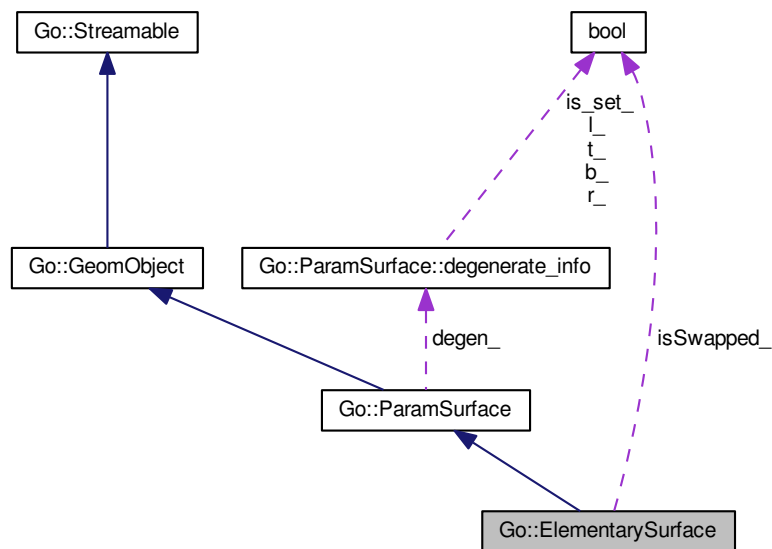

[ElementarySurface](#) is a base class for elementary surfaces like planes and cylinders. Such surfaces have natural parametrizations and [ElementarySurface](#) is therefore a subclass of [ParamSurface](#). These surfaces are non-self-intersecting.

```
#include <ElementarySurface.h>
```

#### 29.113.1 Detailed Description

[ElementarySurface](#) is a base class for elementary surfaces like planes and cylinders. Such surfaces have natural parametrizations and [ElementarySurface](#) is therefore a subclass of [ParamSurface](#). These surfaces are non-self-intersecting.

Definition at line 60 of file [ElementarySurface.h](#).

#### 29.113.2 Constructor & Destructor Documentation

29.113.2.1 `Go::ElementarySurface::ElementarySurface ( )`

29.113.2.2 `virtual Go::ElementarySurface::~~ElementarySurface ( ) [virtual]`

Virtual destructor, enables safe inheritance.

#### 29.113.3 Member Function Documentation

29.113.3.1 `virtual double Go::ElementarySurface::area ( double tol ) const [virtual]`

Compute the total area of this surface up to some tolerance

##### Parameters

|            |                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>tol</i> | the relative tolerance when approximating the area, i.e. stop iteration when error becomes smaller than $tol / (\text{surface area})$ |
|------------|---------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

the area calculated

Implements [Go::ParamSurface](#).

**29.113.3.2** `virtual SplineSurface* Go::ElementarySurface::asSplineSurface ( ) [virtual]`

Return the spline surface represented by this surface, if any.

Reimplemented from [Go::ParamSurface](#).

**29.113.3.3** `virtual ElementarySurface* Go::ElementarySurface::clone ( ) const [pure virtual]`

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

**Returns**

pointer to cloned object

Implements [Go::ParamSurface](#).

Implemented in [Go::Disc](#), [Go::Torus](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), and [Go::Sphere](#).

**29.113.3.4** `virtual Point Go::ElementarySurface::closestInDomain ( double u, double v ) const [virtual]`

Fetch the parameter value in the parameter domain of the surface closest to the parameter pair (u,v)

Implements [Go::ParamSurface](#).

**29.113.3.5** `RectDomain Go::ElementarySurface::containingDomain ( ) const [virtual]`

Get a rectangular parameter domain that is guaranteed to contain the surface's [parameterDomain\(\)](#). It may be the same. There is no guarantee that this is the smallest domain containing the actual domain.

**Returns**

a [RectDomain](#) that is guaranteed to include the surface's total parameter domain.

Implements [Go::ParamSurface](#).

**29.113.3.6** `virtual SplineSurface* Go::ElementarySurface::createSplineSurface ( ) const [pure virtual]`

Create a [SplineSurface](#) representation of the elementary surface.

Implemented in [Go::Torus](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Sphere](#), [Go::Plane](#), and [Go::Disc](#).

29.113.3.7 `virtual SplineSurface* Go::ElementarySurface::geometrySurface ( ) const` [pure virtual]

Implemented in [Go::Torus](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Sphere](#), [Go::Plane](#), and [Go::Disc](#).

29.113.3.8 `virtual void Go::ElementarySurface::getCornerPoints ( std::vector< std::pair< Point, Point > > & corners ) const` [virtual]

Return surface corners, geometric and parametric points in that sequence

Implements [Go::ParamSurface](#).

29.113.3.9 `virtual shared_ptr<ElementaryCurve> Go::ElementarySurface::getElementaryParamCurve ( ElementaryCurve * space_crv, double tol, const Point * start_par_pt=NULL, const Point * end_par_pt=NULL ) const` [virtual]

Fetch the parameter curve in the domain of the elementary surface corresponding to a given elementary curve in geometry space if this curve has a simpler elementary representation. Otherwise, nothing is returned

Reimplemented in [Go::Cone](#), [Go::Cylinder](#), and [Go::Sphere](#).

29.113.3.10 `void Go::ElementarySurface::getOrientedParameters ( double & u, double & v ) const` [protected]

29.113.3.11 `virtual bool Go::ElementarySurface::inDomain ( double u, double v, double eps = 1.0e-4 ) const` [virtual]

Check if a parameter pair lies inside the domain of this surface.

Implements [Go::ParamSurface](#).

29.113.3.12 `virtual int Go::ElementarySurface::inDomain2 ( double u, double v, double eps = 1.0e-4 ) const` [virtual]

Check if a parameter pair lies inside the domain of this surface return value = 0: outside = 1: internal = 2: at the boundary

Implements [Go::ParamSurface](#).

29.113.3.13 `virtual bool Go::ElementarySurface::isBounded ( ) const` [virtual]

Reimplemented in [Go::Plane](#), [Go::Cylinder](#), [Go::Cone](#), [Go::Disc](#), [Go::Torus](#), and [Go::Sphere](#).

29.113.3.14 `virtual bool Go::ElementarySurface::isClosed ( bool & closed_dir_u, bool & closed_dir_v ) const` [virtual]

Reimplemented in [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Disc](#), [Go::Torus](#), and [Go::Sphere](#).

29.113.3.15 `virtual bool Go::ElementarySurface::isSwapped ( ) const [virtual]`

29.113.3.16 `virtual bool Go::ElementarySurface::onBoundary ( double u, double v, double eps = 1.0e-4 ) const [virtual]`

Check if a parameter pair lies at the boundary of this surface.

Implements [Go::ParamSurface](#).

29.113.3.17 `virtual CurveLoop Go::ElementarySurface::outerBoundaryLoop ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const [virtual]`

Returns the anticlockwise, outer boundary loop of the surface.

Parameters

|                           |                                                            |
|---------------------------|------------------------------------------------------------|
| <i>degenerate_epsilon</i> | edges whose length is smaller than this value are ignored. |
|---------------------------|------------------------------------------------------------|

Returns

a [CurveLoop](#) describing the anticlockwise, outer boundary loop of the surface. A negative *degenerate\_epsilon* indicates that all curves, also the degenerate ones are wanted

Implements [Go::ParamSurface](#).

29.113.3.18 `virtual void Go::ElementarySurface::reverseParameterDirection ( bool direction_is_u ) [virtual]`

Reverses the direction of the basis in input direction.

Parameters

|                       |                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>direction_is_u</i> | if 'true', the first parameter direction will be reversed, otherwise, the second parameter direction will be reversed |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------|

Implements [Go::ParamSurface](#).

29.113.3.19 `virtual void Go::ElementarySurface::setParameterBounds ( double from_upar, double from_vpar, double to_upar, double to_vpar ) [pure virtual]`

Limit the surface by limiting the parameter domain.

Implemented in [Go::Torus](#), [Go::Disc](#), [Go::Sphere](#), [Go::Plane](#), [Go::Cylinder](#), and [Go::Cone](#).

29.113.3.20 `virtual void Go::ElementarySurface::swapParameterDirection ( ) [virtual]`

Swaps the two parameter directions.

Implements [Go::ParamSurface](#).

29.113.3.21 `virtual void Go::ElementarySurface::turnOrientation ( ) [virtual]`

Turns the direction of the normal of the surface.

Implements [Go::ParamSurface](#).

#### 29.113.4 Member Data Documentation

29.113.4.1 `bool Go::ElementarySurface::isSwapped_ [protected]`

Definition at line 135 of file `ElementarySurface.h`.

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/geometry/ElementarySurface.h](#)

### 29.114 Go::ElementaryVolume Class Reference

[ElementaryVolume](#) is a base class for elementary volumes like boxes and solid cylinders. Such volumes have natural parametrizations and `ElementaryVolume` is therefore a subclass of [ParamVolume](#). These volumes are non-self-intersecting.

```
#include <ElementaryVolume.h>
```

### 29.114.1 Detailed Description

[ElementaryVolume](#) is a base class for elementary volumes like boxes and solid cylinders. Such volumes have natural parametrizations and [ElementaryVolume](#) is therefore a subclass of [ParamVolume](#). These volumes are non-self-intersecting.

Definition at line 58 of file [ElementaryVolume.h](#).

### 29.114.2 Constructor & Destructor Documentation

29.114.2.1 virtual [Go::ElementaryVolume::~ElementaryVolume](#) ( ) [[inline](#)],[[virtual](#)]

Virtual destructor, enables safe inheritance.

Definition at line 64 of file [ElementaryVolume.h](#).

### 29.114.3 Member Function Documentation

29.114.3.1 `virtual ElementaryVolume* Go::ElementaryVolume::clone ( ) const` [pure virtual]

make a clone of this volume and return a pointer to it (user is responsible for clearing up memory afterwards).

#### Returns

pointer to cloned object

Implements [Go::ParamVolume](#).

Implemented in [Go::TorusVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), [Go::SphereVolume](#), and [Go::↔Parallelepiped](#).

29.114.3.2 `virtual SplineVolume* Go::ElementaryVolume::geometryVolume ( ) const` [pure virtual]

Make a NURBS representation of the object.

Implemented in [Go::TorusVolume](#), [Go::SphereVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), and [Go::↔Parallelepiped](#).

The documentation for this class was generated from the following file:

- [trivariate/include/GoTools/trivariate/ElementaryVolume.h](#)

### 29.116.1 Detailed Description

Class that represents an ellipse. It is a subclass of [ElementaryCurve](#) and thus has a parametrization.

An ellipse has a natural parametrization in terms of its values:  $f(t) = C + (R_1 * \cos(t))*x + (R_2 * \sin(t)) * y$ . This parametrization is bounded:  $0 \leq t \leq 360$  (degrees).

Definition at line 57 of file [Ellipse.h](#).

## 29.116.2 Constructor & Destructor Documentation

### 29.116.2.1 `Go::Ellipse::Ellipse ( ) [inline]`

Default constructor. Constructs an uninitialized [Ellipse](#) which can only be assigned to or read into.

Definition at line 62 of file `Ellipse.h`.

### 29.116.2.2 `Go::Ellipse::Ellipse ( Point centre, Point direction, Point normal, double r1, double r2, bool isReversed = false )`

Constructor. Input is point, axis direction and lengths of the two semi-axis.

### 29.116.2.3 `virtual Go::Ellipse::~~Ellipse ( ) [virtual]`

virtual destructor - ensures safe inheritance

## 29.116.3 Member Function Documentation

### 29.116.3.1 `virtual void Go::Ellipse::appendCurve ( ParamCurve * cv, bool reparam = true ) [virtual]`

append a curve to this curve, with eventual reparametrization NB: This virtual member function currently only works for `SplineCurves` and `CurveOnSurfaces`. Moreover, 'this' curve and the 'cv' curve must be of the same type.

#### Parameters

|                |                                                          |
|----------------|----------------------------------------------------------|
| <i>cv</i>      | the curve to append to 'this' curve.                     |
| <i>reparam</i> | specify whether or not there should be reparametrization |

Implements [Go::ParamCurve](#).

### 29.116.3.2 `virtual void Go::Ellipse::appendCurve ( ParamCurve * cv, int continuity, double & dist, bool reparam = true ) [virtual]`

append a curve to this curve, with eventual reparametrization

#### Parameters

|                   |                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------|
| <i>cv</i>         | the curve to append to 'this' curve.                                                                  |
| <i>continuity</i> | the required continuity at the transition. Can be $G^{(-1)}$ and upwards.                             |
| <i>dist</i>       | a measure of the local distortion around the transition in order to achieve the specified continuity. |
| <i>reparam</i>    | specify whether or not there should be reparametrization                                              |

Implements [Go::ParamCurve](#).

29.116.3.3 `virtual BoundingBox Go::Ellipse::boundingBox ( ) const [virtual]`

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.116.3.4 `static ClassType Go::Ellipse::classType ( ) [static]`

29.116.3.5 `virtual Ellipse* Go::Ellipse::clone ( ) const [virtual]`

The clone-function is herited from [GeomObject](#), but overridden here to get a covariant return type (for those compilers that allow this).

Implements [Go::ElementaryCurve](#).

29.116.3.6 `virtual void Go::Ellipse::closestPoint ( const Point & pt, double tmin, double tmax, double & clo_t, Point & clo_pt, double & clo_dist, double const * seed = 0 ) const [virtual]`

Compute the closest point from an interval of this curve to a specified point.

Parameters

|                 |                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pt</i>       | point we want to find the closest point to                                                                                               |
| <i>tmin</i>     | start parameter of search interval                                                                                                       |
| <i>tmax</i>     | end parameter of search interval                                                                                                         |
| <i>clo_t</i>    | upon function return, 'clo_t' will contain the parameter value of the closest point found.                                               |
| <i>clo_pt</i>   | upon function return, 'clo_pt' will contain the position of the closest point found.                                                     |
| <i>clo_dist</i> | upon function return, 'clo_dist' will contain the distance between 'pt' and the closest point found.                                     |
| <i>seed</i>     | pointer to initial guess value, provided by the user (can be 0, for which the algorithm will determine a (hopefully) reasonable choice). |

Implements [Go::ParamCurve](#).

29.116.3.7 `virtual SplineCurve* Go::Ellipse::createSplineCurve ( ) const [virtual]`

Create the spline representation of this curve.

Implements [Go::ElementaryCurve](#).

29.116.3.8 `virtual int Go::Ellipse::dimension ( ) const [virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.116.3.9 `virtual DirectionCone Go::Ellipse::directionCone ( ) const [virtual]`

Creates a [DirectionCone](#) which covers all tangent directions of this curve.

**Returns**

the smallest [DirectionCone](#) containing all tangent directions of this curve.

Implements [Go::ParamCurve](#).

29.116.3.10 `virtual double Go::Ellipse::endparam ( ) const [virtual]`

Query the end parameter of the curve

**Returns**

the curve's end parameter

Implements [Go::ParamCurve](#).

29.116.3.11 `virtual SplineCurve* Go::Ellipse::geometryCurve ( ) [virtual]`

If the definition of this [ParamCurve](#) contains a [SplineCurve](#) describing its spatial shape, then this function will return a pointer to this [SplineCurve](#). Otherwise it will return a null pointer. The returned curve is NEWed, so the user is responsible for deleting it. This function may have side-effects.

**Returns**

a pointer to a [SplineCurve](#) representation of the [ParamCurve](#), if it exists. Null pointer otherwise.

Implements [Go::ParamCurve](#).

29.116.3.12 `Point Go::Ellipse::getCentre ( ) const [inline]`

Definition at line 140 of file Ellipse.h.

29.116.3.13 `Point Go::Ellipse::getNormal ( ) const [inline]`

Definition at line 145 of file Ellipse.h.

29.116.3.14 `double Go::Ellipse::getRadius1 ( ) const [inline]`

Definition at line 155 of file Ellipse.h.

29.116.3.15 **double** Go::Ellipse::getRadius2 ( ) const [inline]

Definition at line 160 of file Ellipse.h.

29.116.3.16 **Point** Go::Ellipse::getXAxis ( ) const [inline]

Definition at line 150 of file Ellipse.h.

29.116.3.17 **virtual ClassType** Go::Ellipse::instanceType ( ) const [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.116.3.18 **bool** Go::Ellipse::isClosed ( ) const

29.116.3.19 **virtual bool** Go::Ellipse::isDegenerate ( **double** *degenerate\_epsilon* ) [virtual]

Query whether the curve is degenerate (collapsed into a single point).

#### Parameters

|                           |                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>degenerate_epsilon</i> | the tolerance used in determine whether the curve is degenerate. A curve is considered degenerate if its total length is shorter than this value. |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

#### Returns

`true` if the curve is degenerate, `false` otherwise.

Implements [Go::ParamCurve](#).

29.116.3.20 **virtual bool** Go::Ellipse::isInPlane ( **const Point &** *norm*, **double** *eps*, **Point &** *pos* ) const [virtual]

Check if the ellipse lies in a plane with a given normal.

Reimplemented from [Go::ParamCurve](#).

29.116.3.21 **virtual double** Go::Ellipse::length ( **double** *tol* ) [virtual]

Compute the total length of this curve up to some tolerance

#### Parameters

|            |                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>tol</i> | the relative tolerance when approximating the length, i.e. stop iteration when error becomes smaller than $tol/(curve\ length)$ |
|------------|---------------------------------------------------------------------------------------------------------------------------------|

**Returns**

the length calculated

Implements [Go::ParamCurve](#).

29.116.3.22 `virtual void Go::Ellipse::point ( Point & pt, double tpar ) const` [virtual]

Evaluate the curve's position at a given parameter

**Parameters**

|             |                                                                      |
|-------------|----------------------------------------------------------------------|
| <i>pt</i>   | the evaluated position will be written to this <a href="#">Point</a> |
| <i>tpar</i> | the parameter for which we wish to evaluate the curve                |

Implements [Go::ParamCurve](#).

29.116.3.23 `virtual void Go::Ellipse::point ( std::vector< Point > & pts, double tpar, int derivs, bool from_right = true ) const` [virtual]

Evaluate the curve's position and a certain number of derivatives at a given parameter.

**Parameters**

|                   |                                                                                                                                                                                                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pts</i>        | the evaluated position and derivatives (tangent, curvature vector, etc.) will be written to this vector. The first entry will be the position, the second entry will be the first derivative, etc. The size of this vector must be set to ' <i>derivs</i> + 1' prior to calling this function. |
| <i>tpar</i>       | the parameter for which we want to evaluate the curve                                                                                                                                                                                                                                          |
| <i>derivs</i>     | the number of derivatives we want to have calculated                                                                                                                                                                                                                                           |
| <i>from_right</i> | specify whether we should calculate derivatives 'from the right' or 'from the left' (default is from the right). This matters only when the curve presents discontinuities in its derivatives.                                                                                                 |

Implements [Go::ParamCurve](#).

29.116.3.24 `virtual void Go::Ellipse::read ( std::istream & is )` [virtual]

Read object from stream

**Parameters**

|           |                                  |
|-----------|----------------------------------|
| <i>is</i> | stream from which object is read |
|-----------|----------------------------------|

Implements [Go::Streamable](#).

29.116.3.25 `virtual void Go::Ellipse::setParamBounds ( double startpar, double endpar )` [virtual]

Set bounds for the parametrization of the [Ellipse](#).

## Parameters

|                 |                 |
|-----------------|-----------------|
| <i>startpar</i> | start parameter |
| <i>endpar</i>   | end parameter   |

Implements [Go::ElementaryCurve](#).

29.116.3.26 `virtual void Go::Ellipse::setParameterInterval ( double t1, double t2 ) [virtual]`

Limit the curve by limiting the parameter domain.

Implements [Go::ParamCurve](#).

29.116.3.27 `void Go::Ellipse::setSpanningVectors ( ) [protected]`

29.116.3.28 `virtual double Go::Ellipse::startparam ( ) const [virtual]`

Query the start parameter of the curve

## Returns

the curve's start parameter

Implements [Go::ParamCurve](#).

29.116.3.29 `virtual Ellipse* Go::Ellipse::subCurve ( double from_par, double to_par, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [virtual]`

Returns a curve which is a part of this curve. The result is NEWed, so the user is responsible for deleting it. NB: It is not guaranteed that the [ParamCurve](#) that is returned is of the same type as the curve itself. Thus, the returned curve might be a [SplineCurve](#).

## Parameters

|                 |                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>from_par</i> | start value of parameter interval that will define the subcurve                                                                                                                                   |
| <i>to_par</i>   | end value of parameter interval that will define the subcurve                                                                                                                                     |
| <i>fuzzy</i>    | since subCurve works on those curves who are spline-based, this tolerance defines how close the start and end parameter must be to an existing knot in order to be considered <i>on</i> the knot. |

## Returns

a pointer to a new subcurve which represents the part of the curve between 'from\_par' and 'to\_par'. It will be spline-based and have a k-regular knotvector. The user is responsible for deleting this subcurve when it is no longer needed.

Implements [Go::ElementaryCurve](#).

29.116.3.30 `virtual void Go::Ellipse::swapParameters2D ( ) [virtual]`

If the curve is 2 dimensional, x and y coordinates will be swapped. Used when curve is a parameter curve.

Implements [Go::ElementaryCurve](#).

29.116.3.31 `virtual void Go::Ellipse::translateCurve ( const Point & dir ) [virtual]`

Implements [Go::ElementaryCurve](#).

29.116.3.32 `virtual void Go::Ellipse::write ( std::ostream & os ) const [virtual]`

Write object to stream

Parameters

|                 |                                   |
|-----------------|-----------------------------------|
| <code>os</code> | stream to which object is written |
|-----------------|-----------------------------------|

Implements [Go::Streamable](#).

- virtual `void write (std::ostream &out) const`

### 29.119.1 Detailed Description

This is the abstract base class of a curve type that can be evaluated. Representing the exact geometry, typically used when iteratively approximating the curve.

Definition at line 55 of file EvalCurve.h.

### 29.119.2 Constructor & Destructor Documentation

29.119.2.1 virtual Go::EvalCurve::~EvalCurve ( ) [virtual]

virtual destructor ensures save inheritance

### 29.119.3 Member Function Documentation

29.119.3.1 virtual bool Go::EvalCurve::approximationOK ( double *par*, Point *approxpos*, double *tol1*, double *tol2* ) const [pure virtual]

Check if the curve, evaluated at a given parameter, approximates a given position within a given tolerance.

#### Parameters

|                  |                                                                                          |
|------------------|------------------------------------------------------------------------------------------|
| <i>par</i>       | the parameter at which to check the curve                                                |
| <i>approxpos</i> | the position we want to check whether or not the curve approximates for parameter 'par'. |
| <i>tol1</i>      | approximation tolerance.                                                                 |
| <i>tol2</i>      | another approximation tolerance (its use is defined by some of the derived classes.      |

#### Returns

'true' if the curve approximates the point at the parameter, 'false' otherwise.

Implemented in [Go::CrossTanOffDist](#), [Go::VolumeParameterCurve](#), [Go::ProjectCurve](#), [Go::CrossTangentOffset](#), [Go::ProjectIntersectionCurve](#), [Go::VolumeSpaceCurve](#), [Go::SpaceIntCrv](#), [Go::EvalFunctorCurve](#), [Go::LiftCurve](#), and [Go::EvalParamCurve](#).

29.119.3.2 virtual int Go::EvalCurve::dim ( ) const [pure virtual]

Get the dimension of the space in which the curve lies.

#### Returns

the space dimension of the curve.

Implemented in [Go::CrossTanOffDist](#), [Go::VolumeParameterCurve](#), [Go::ProjectCurve](#), [Go::ProjectIntersectionCurve](#), [Go::SpaceIntCrv](#), [Go::VolumeSpaceCurve](#), [Go::CrossTangentOffset](#), [Go::EvalFunctorCurve](#), [Go::LiftCurve](#), and [Go::EvalParamCurve](#).

29.119.3.3 `virtual double Go::EvalCurve::end ( ) const [pure virtual]`

Get the end parameter of the curve.

#### Returns

the end parameter of the curve.

Implemented in [Go::CrossTanOffDist](#), [Go::VolumeParameterCurve](#), [Go::ProjectCurve](#), [Go::ProjectIntersectionCurve](#), [Go::SpaceIntCrv](#), [Go::VolumeSpaceCurve](#), [Go::CrossTangentOffset](#), [Go::EvalFunctorCurve](#), [Go::LiftCurve](#), and [Go::EvalParamCurve](#).

29.119.3.4 `virtual Point Go::EvalCurve::eval ( double t ) const [pure virtual]`

Evaluate a point on the curve for a given parameter

#### Parameters

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
|----------|------------------------------------------------|

#### Returns

the evaluated point

Implemented in [Go::ProjectCurve](#), [Go::CrossTanOffDist](#), [Go::CrossTangentOffset](#), [Go::ProjectIntersectionCurve](#), [Go::SpaceIntCrv](#), [Go::VolumeParameterCurve](#), [Go::LiftCurve](#), [Go::VolumeSpaceCurve](#), [Go::EvalParamCurve](#), and [Go::EvalFunctorCurve](#).

29.119.3.5 `virtual void Go::EvalCurve::eval ( double t, int n, Point der[] ) const [pure virtual]`

Evaluate a point and a certain number of derivatives on the curve for a given parameter.

#### Parameters

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
| <i>n</i> | the number of derivatives (0 or more)          |

#### Return values

|            |                                                                                                                                                                                                                                                                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>der</i> | pointer to an array of Points where the result will be written. The position will be stored first, then the first derivative (tangent), then the second, etc.. <b>NB:</b> For most (all) derived classes of 'EvalCurve', the implementation actually only supports the computation of one derivative, i.e. if $n > 1$ , only one derivative will be computed anyway. |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Implemented in [Go::CrossTanOffDist](#), [Go::ProjectCurve](#), [Go::VolumeParameterCurve](#), [Go::ProjectIntersectionCurve](#), [Go::SpaceIntCrv](#), [Go::CrossTangentOffset](#), [Go::VolumeSpaceCurve](#), [Go::EvalFunctorCurve](#), [Go::LiftCurve](#), and [Go::EvalParamCurve](#).

29.119.3.6 virtual double Go::EvalCurve::start ( ) const [pure virtual]

Get the start parameter of the curve.

#### Returns

the start parameter of the curve.

Implemented in [Go::CrossTanOffDist](#), [Go::ProjectCurve](#), [Go::VolumeParameterCurve](#), [Go::ProjectIntersectionCurve](#), [Go::SpaceIntCrv](#), [Go::VolumeSpaceCurve](#), [Go::CrossTangentOffset](#), [Go::EvalFuncorCurve](#), [Go::LiftCurve](#), and [Go::EvalParamCurve](#).

29.119.3.7 virtual void Go::EvalCurve::write ( std::ostream & out ) const [virtual]

Reimplemented in [Go::EvalParamCurve](#).

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/creators/EvalCurve.h](#)

## 29.120 Go::EvalCurveSet Class Reference

### 29.120.1 Detailed Description

This abstract class provides an interface to a set of curves that can be evaluated. Representing the actual geometry, typically used when iteratively approximating the set of curves on the same basis.

Definition at line 55 of file EvalCurveSet.h.

### 29.120.2 Constructor & Destructor Documentation

29.120.2.1 `virtual Go::EvalCurveSet::~EvalCurveSet ( ) [inline],[virtual]`

virtual destructor ensures safe inheritance

Definition at line 59 of file EvalCurveSet.h.

### 29.120.3 Member Function Documentation

29.120.3.1 `virtual bool Go::EvalCurveSet::approximationOK ( double par, const std::vector< Point > & approxpos, double tol1, double tol2 ) [pure virtual]`

Whether the approximation is within tolerances in input parameter.

#### Parameters

|                  |                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------|
| <i>par</i>       | parameter in which to evaluate.                                                                                |
| <i>approxpos</i> | whether the input points are within tolerance from the evaluated points (as given by <a href="#">eval()</a> ). |
| <i>tol1</i>      | tolerance used to decide approximation accuracy.                                                               |
| <i>tol2</i>      | tolerance used to decide approximation accuracy.                                                               |

#### Returns

whether the approximation is within tolerances in input parameter.

Implemented in [Go::TrimCurve](#), [Go::IntCrvEvaluator](#), and [Go::SmoothTransition](#).

29.120.3.2 `virtual int Go::EvalCurveSet::dim ( ) [pure virtual]`

The geometric dimension of the spline curves.

#### Returns

geometric dimension of the space.

Implemented in [Go::ProjectCurveAndCrossTan](#), [Go::SmoothTransition](#), [Go::TrimCurve](#), and [Go::IntCrvEvaluator](#).

29.120.3.3 virtual double Go::EvalCurveSet::end ( ) [pure virtual]

End parameter of domain.

#### Returns

end parameter of the spline space.

Implemented in [Go::ProjectCurveAndCrossTan](#), [Go::SmoothTransition](#), [Go::TrimCurve](#), and [Go::IntCrvEvaluator](#).

29.120.3.4 virtual std::vector<Point> Go::EvalCurveSet::eval ( double *t* ) [pure virtual]

Evaluate the curves.

#### Parameters

|          |                                 |
|----------|---------------------------------|
| <i>t</i> | parameter in which to evaluate. |
|----------|---------------------------------|

#### Returns

the evaluated points for the curve set.

Implemented in [Go::ProjectCurveAndCrossTan](#), [Go::SmoothTransition](#), [Go::TrimCurve](#), and [Go::IntCrvEvaluator](#).

29.120.3.5 virtual void Go::EvalCurveSet::eval ( double *t*, int *n*, std::vector< std::vector< Point > > & *der* ) [pure virtual]

Evaluate the curve derivatives.

#### Parameters

|            |                                                                   |
|------------|-------------------------------------------------------------------|
| <i>t</i>   | parameter in which to evaluate.                                   |
| <i>n</i>   | number of derivatives to compute.                                 |
| <i>der</i> | the evaluated points up to the n'th derivative for the curve set. |

Implemented in [Go::SmoothTransition](#), [Go::TrimCurve](#), and [Go::IntCrvEvaluator](#).

29.120.3.6 virtual int Go::EvalCurveSet::nmbCvs ( ) [pure virtual]

The number of curves in the curve set.

#### Returns

the number of curves in the curve set.

Implemented in [Go::ProjectCurveAndCrossTan](#), [Go::TrimCurve](#), [Go::IntCrvEvaluator](#), and [Go::SmoothTransition](#).

29.120.3.7 `virtual void Go::EvalCurveSet::resetErr ( ) [inline],[virtual]`

Reset intermediate error.

Reimplemented in [Go::IntCrvEvaluator](#).

Definition at line 100 of file EvalCurveSet.h.

29.120.3.8 `virtual double Go::EvalCurveSet::start ( ) [pure virtual]`

Start parameter of domain.

Returns

start parameter of the spline space.

Implemented in [Go::ProjectCurveAndCrossTan](#), [Go::SmoothTransition](#), [Go::TrimCurve](#), and [Go::IntCrvEvaluator](#).

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/creators/EvalCurveSet.h](#)

### 29.121.1 Detailed Description

Definition at line 54 of file EvalFunctorCurve.h.

### 29.121.2 Constructor & Destructor Documentation

29.121.2.1 [Go::EvalFunctorCurve::EvalFunctorCurve](#) ( [BdCondFunctor](#) \* fbd, [shared\\_ptr](#)< [SplineCurve](#) > geo\_curve, int dimension )

29.121.2.2 virtual [Go::EvalFunctorCurve::~EvalFunctorCurve](#) ( ) [virtual]

### 29.121.3 Member Function Documentation

29.121.3.1 virtual [bool](#) [Go::EvalFunctorCurve::approximationOK](#) ( double par, [Point](#) approxpos, double tol1, double tol2 ) const [virtual]

Check if the curve, evaluated at a given parameter, approximates a given position within a given tolerance.

#### Parameters

|                  |                                                                                          |
|------------------|------------------------------------------------------------------------------------------|
| <i>par</i>       | the parameter at which to check the curve                                                |
| <i>approxpos</i> | the position we want to check whether or not the curve approximates for parameter 'par'. |
| <i>tol1</i>      | approximation tolerance.                                                                 |
| <i>tol2</i>      | another approximation tolerance (its use is defined by some of the derived classes.      |

#### Returns

'true' if the curve approximates the point at the parameter, 'false' otherwise.

Implements [Go::EvalCurve](#).

29.121.3.2 virtual int [Go::EvalFunctorCurve::dim](#) ( ) const [virtual]

Get the dimension of the space in which the curve lies.

#### Returns

the space dimension of the curve.

Implements [Go::EvalCurve](#).

29.121.3.3 `virtual double Go::EvalFunctorCurve::end ( ) const` [virtual]

Get the end parameter of the curve.

#### Returns

the end parameter of the curve.

Implements [Go::EvalCurve](#).

29.121.3.4 `virtual Point Go::EvalFunctorCurve::eval ( double t ) const` [virtual]

Evaluate a point on the curve for a given parameter

#### Parameters

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
|----------|------------------------------------------------|

#### Returns

the evaluated point

Implements [Go::EvalCurve](#).

29.121.3.5 `virtual void Go::EvalFunctorCurve::eval ( double t, int n, Point der[] ) const` [virtual]

Evaluate a point and a certain number of derivatives on the curve for a given parameter.

#### Parameters

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
| <i>n</i> | the number of derivatives (0 or more)          |

#### Return values

|            |                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>der</i> | pointer to an array of Points where the result will be written. The position will be stored first, then the first derivative (tangent), then the second, etc.. <b>NB:</b> For most (all) derived classes of ' <a href="#">EvalCurve</a> ', the implementation actually only supports the computation of one derivative, i.e. if $n > 1$ , only one derivative will be computed anyway. |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Implements [Go::EvalCurve](#).

29.121.3.6 `virtual double Go::EvalFunctorCurve::start ( ) const` [virtual]

Get the start parameter of the curve.

**Returns**

the start parameter of the curve.

Implements [Go::EvalCurve](#).

The documentation for this class was generated from the following file:

### 29.122.3 Member Function Documentation

29.122.3.1 `virtual bool Go::EvalFunctorSurface::approximationOK ( double par_u, double par_v, Point approxpos, double tol1, double tol2 ) const` [virtual]

Check if the surface, evaluated at a given parameter, approximates a given position within a given tolerance.

#### Parameters

|                  |                                                                                            |
|------------------|--------------------------------------------------------------------------------------------|
| <i>par</i>       | the parameter at which to check the surface                                                |
| <i>approxpos</i> | the position we want to check whether or not the surface approximates for parameter 'par'. |
| <i>tol1</i>      | approximation tolerance.                                                                   |
| <i>tol2</i>      | another approximation tolerance (its use is defined by some of the derived classes.        |

#### Returns

'true' if the surface approximates the point at the parameter, 'false' otherwise.

Implements [Go::EvalSurface](#).

29.122.3.2 `virtual int Go::EvalFunctorSurface::dim ( ) const` [virtual]

Get the dimension of the space in which the surface lies.

**Returns**

the space dimension of the surface.

Implements [Go::EvalSurface](#).

**29.122.3.3** `virtual double Go::EvalFunctorSurface::end_u( ) const [virtual]`

Get the end parameter of the surface.

**Returns**

the end parameter of the surface.

Implements [Go::EvalSurface](#).

**29.122.3.4** `virtual double Go::EvalFunctorSurface::end_v( ) const [virtual]`

Implements [Go::EvalSurface](#).

**29.122.3.5** `virtual Point Go::EvalFunctorSurface::eval( double u, double v ) const [virtual]`

Evaluate a point on the surface for a given parameter

**Parameters**

|          |                                                  |
|----------|--------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the surface. |
|----------|--------------------------------------------------|

**Returns**

the evaluated point

Implements [Go::EvalSurface](#).

**29.122.3.6** `virtual void Go::EvalFunctorSurface::eval( double u, double v, int n, Point der[] ) const [virtual]`

Evaluate a point and a certain number of derivatives on the surface for a given parameter.

**Parameters**

|          |                                                  |
|----------|--------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the surface. |
| <i>n</i> | the number of derivatives (0 or more)            |

## Return values

|            |                                                                                                                                                                                                                                                                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>der</i> | pointer to an array of Points where the result will be written. The position will be stored first, then the first derivative (tangent), then the second, etc.. <b>NB:</b> For most (all) derived classes of 'EvalSurface', the implementation actually only supports the computation of one derivative, i.e. if $n > 1$ , only one derivative will be computed anyway. |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Implements [Go::EvalSurface](#).

29.122.3.7 `virtual double Go::EvalFunctorSurface::start_u ( ) const [virtual]`

Get the start parameter of the surface.

## Returns

the start parameter of the surface.

Implements [Go::EvalSurface](#).

29.122.3.8 `virtual double Go::EvalFunctorSurface::start_v ( ) const [virtual]`

Implements [Go::EvalSurface](#).

29.123.3.1 virtual bool [Go::EvalOffsetSurface::approximationOK](#) ( double par\_u, double par\_v, [Point](#) approxpos, double tol1, double tol2 ) const [virtual]

Check if the curve, evaluated at a given parameter, approximates a given position within a given tolerance.

## Parameters

|                  |                                                                                          |
|------------------|------------------------------------------------------------------------------------------|
| <i>par</i>       | the parameter at which to check the curve                                                |
| <i>approxpos</i> | the position we want to check whether or not the curve approximates for parameter 'par'. |
| <i>tol1</i>      | approximation tolerance.                                                                 |
| <i>tol2</i>      | another approximation tolerance (its use is defined by some of the derived classes.      |

## Returns

'true' if the curve approximates the point at the parameter, 'false' otherwise.

Implements [Go::EvalSurface](#).

**29.123.3.2** `virtual int Go::EvalOffsetSurface::dim ( ) const [virtual]`

Get the dimension of the space in which the curve lies.

## Returns

the space dimension of the curve.

Implements [Go::EvalSurface](#).

**29.123.3.3** `virtual double Go::EvalOffsetSurface::end_u ( ) const [virtual]`

Get the end parameter of the curve.

## Returns

the end parameter of the curve.

Implements [Go::EvalSurface](#).

**29.123.3.4** `virtual double Go::EvalOffsetSurface::end_v ( ) const [virtual]`

Implements [Go::EvalSurface](#).

**29.123.3.5** `virtual Point Go::EvalOffsetSurface::eval ( double u, double v ) const [virtual]`

Evaluate a point on the surface for a given parameter

## Parameters

|          |                                                  |
|----------|--------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the surface. |
|----------|--------------------------------------------------|

**Returns**

the evaluated point

Implements [Go::EvalSurface](#).

29.123.3.6 `virtual void Go::EvalOffsetSurface::eval ( double u, double v, int n, Point der[ ] ) const` [virtual]

Evaluate a point and a certain number of derivatives on the surface for a given parameter.

**Parameters**

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
| <i>n</i> | the number of derivatives (0 or more)          |

**Return values**

|            |                                                                                                                                                                                                                                                                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>der</i> | pointer to an array of Points where the result will be written. The position will be stored first, then the first derivative (tangent), then the second, etc.. <b>NB:</b> For most (all) derived classes of 'EvalSurface', the implementation actually only supports the computation of one derivative, i.e. if $n > 1$ , only one derivative will be computed anyway. |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Implements [Go::EvalSurface](#).

29.123.3.7 `std::vector<shared_ptr<SplineCurve>> Go::EvalOffsetSurface::getProjKinkCurves ( std::vector<pair<shared_ptr<ParamCurve>, shared_ptr<ParamCurve>>> & par_cvs, std::vector<pair<shared_ptr<ParamSurface>, shared_ptr<ParamSurface>>> & sfs )`

29.123.3.8 `void Go::EvalOffsetSurface::gridKinks ( const HermiteGrid2D & grid, const std::vector<shared_ptr<SplineCurve>> & kink_cvs_2d, std::vector<int> & grid_kinks ) const`

29.123.3.9 `void Go::EvalOffsetSurface::gridSelfIntersections ( const HermiteGrid2D & grid, std::vector<int> & grid_self_intersections, std::vector<double> & radius_of_curv ) const`

29.123.3.10 `virtual double Go::EvalOffsetSurface::start_u ( ) const` [virtual]

Get the start parameter of the curve.

**Returns**

the start parameter of the curve.

Implements [Go::EvalSurface](#).

29.123.3.11 `virtual double Go::EvalOffsetSurface::start_v ( ) const` [virtual]

Implements [Go::EvalSurface](#).

The documentation for this class was generated from the following file:

### 29.124.1 Detailed Description

This class represents a interface to a [ParamCurve](#) to make it fit into the evaluator based curve concept

Definition at line 59 of file EvalParamCurve.h.

### 29.124.2 Constructor & Destructor Documentation

29.124.2.1 `Go::EvalParamCurve::EvalParamCurve ( shared_ptr< Go::ParamCurve > & crv )`

Constructor, taking a parametric curve.

29.124.2.2 `virtual Go::EvalParamCurve::~EvalParamCurve ( ) [virtual]`

virtual destructor enables safe inheritance

### 29.124.3 Member Function Documentation

29.124.3.1 `virtual bool Go::EvalParamCurve::approximationOK ( double par, Point approxpos, double tol1, double tol2 ) const [virtual]`

Inherited from [EvalCurve::approximationOK\(\)](#).

#### Parameters

|                  |                                                                                          |
|------------------|------------------------------------------------------------------------------------------|
| <i>par</i>       | the parameter at which to check the curve                                                |
| <i>approxpos</i> | the position we want to check whether or not the curve approximates for parameter 'par'. |
| <i>tol1</i>      | unused                                                                                   |
| <i>tol2</i>      | unused                                                                                   |

#### Returns

'true' if the curve approximates the point at the parameter (within the tolerance given in the constructor, 'eps-geo'). 'false' otherwise.

Implements [Go::EvalCurve](#).

29.124.3.2 `virtual int Go::EvalParamCurve::dim ( ) const [virtual]`

Dimension of the lifted curve (i.e. 3).

Implements [Go::EvalCurve](#).

29.124.3.3 `virtual double Go::EvalParamCurve::end ( ) const [virtual]`

Get the end parameter of the curve.

**Returns**

the end parameter of the curve.

Implements [Go::EvalCurve](#).

29.124.3.4 `virtual Point Go::EvalParamCurve::eval ( double t ) const [virtual]`

Evaluate a point on the curve for a given parameter

**Parameters**

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
|----------|------------------------------------------------|

**Returns**

the evaluated point

Implements [Go::EvalCurve](#).

29.124.3.5 `virtual void Go::EvalParamCurve::eval ( double t, int n, Point der[] ) const [virtual]`

Evaluate a point and a certain number of derivatives on the curve for a given parameter.

**Parameters**

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
| <i>n</i> | the number of derivatives (0 or more)          |

**Return values**

|            |                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>der</i> | pointer to an array of Points where the result will be written. The position will be stored first, then the first derivative (tangent), then the second, etc.. <b>NB:</b> For most (all) derived classes of ' <a href="#">EvalCurve</a> ', the implementation actually only supports the computation of one derivative, i.e. if $n > 1$ , only one derivative will be computed anyway. |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Implements [Go::EvalCurve](#).

29.124.3.6 `virtual double Go::EvalParamCurve::start ( ) const [virtual]`

Get the start parameter of the curve.

**Returns**

the start parameter of the curve.

Implements [Go::EvalCurve](#).

**29.124.3.7** `virtual void Go::EvalParamCurve::write ( std::ostream & out ) const` `[virtual]`

Reimplemented from [Go::EvalCurve](#).

The documentation for this class was generated from the following file:

- `gotools-core/include/GoTools/creators/EvalParamCurve.h`

## 29.125 Go::EvalSurface Class Reference

```
#include <EvalSurface.h>
```

Inheritance diagram for Go::EvalSurface:

**Public Member Functions**

- virtual `~EvalSurface ()`  
*virtual destructor ensures save inheritance*
- virtual `Point eval (double u, double v) const =0`
- virtual `void eval (double u, double v, int n, Point der[]) const =0`
- virtual `double start_u () const =0`
- virtual `double start_v () const =0`
- virtual `double end_u () const =0`
- virtual `double end_v () const =0`

- virtual `bool approximationOK (double par_u, double par_v, Point approxpos, double tol1, double tol2) const =0`
- virtual `void write (std::ostream &out) const`

### 29.125.1 Detailed Description

This is the abstract base class of a curve type that can be evaluated. Representing the exact geometry, typically used when iteratively approximating the curve.

Definition at line 56 of file EvalSurface.h.

### 29.125.2 Constructor & Destructor Documentation

29.125.2.1 `virtual Go::EvalSurface::~EvalSurface ( ) [virtual]`

virtual destructor ensures save inheritance

### 29.125.3 Member Function Documentation

29.125.3.1 `virtual bool Go::EvalSurface::approximationOK ( double par_u, double par_v, Point approxpos, double tol1, double tol2 ) const [pure virtual]`

Check if the curve, evaluated at a given parameter, approximates a given position within a given tolerance.

#### Parameters

|                  |                                                                                          |
|------------------|------------------------------------------------------------------------------------------|
| <i>par</i>       | the parameter at which to check the curve                                                |
| <i>approxpos</i> | the position we want to check whether or not the curve approximates for parameter 'par'. |
| <i>tol1</i>      | approximation tolerance.                                                                 |
| <i>tol2</i>      | another approximation tolerance (its use is defined by some of the derived classes.      |

#### Returns

'true' if the curve approximates the point at the parameter, 'false' otherwise.

Implemented in [Go::EvalOffsetSurface](#), and [Go::EvalFunctorSurface](#).

29.125.3.2 `virtual int Go::EvalSurface::dim ( ) const [pure virtual]`

Get the dimension of the space in which the curve lies.

#### Returns

the space dimension of the curve.

Implemented in [Go::EvalOffsetSurface](#), and [Go::EvalFunctorSurface](#).

29.125.3.3 `virtual double Go::EvalSurface::end_u ( ) const [pure virtual]`

Get the end parameter of the curve.

#### Returns

the end parameter of the curve.

Implemented in [Go::EvalOffsetSurface](#), and [Go::EvalFunctorSurface](#).

29.125.3.4 `virtual double Go::EvalSurface::end_v ( ) const [pure virtual]`

Implemented in [Go::EvalOffsetSurface](#), and [Go::EvalFunctorSurface](#).

29.125.3.5 `virtual Point Go::EvalSurface::eval ( double u, double v ) const [pure virtual]`

Evaluate a point on the surface for a given parameter

#### Parameters

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
|----------|------------------------------------------------|

#### Returns

the evaluated point

Implemented in [Go::EvalOffsetSurface](#), and [Go::EvalFunctorSurface](#).

29.125.3.6 `virtual void Go::EvalSurface::eval ( double u, double v, int n, Point der[] ) const [pure virtual]`

Evaluate a point and a certain number of derivatives on the surface for a given parameter.

#### Parameters

|          |                                                |
|----------|------------------------------------------------|
| <i>t</i> | the parameter for which to evaluate the curve. |
| <i>n</i> | the number of derivatives (0 or more)          |

#### Return values

|            |                                                                                                                                                                                                                                                                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>der</i> | pointer to an array of Points where the result will be written. The position will be stored first, then the first derivative (tangent), then the second, etc.. <b>NB:</b> For most (all) derived classes of 'EvalSurface', the implementation actually only supports the computation of one derivative, i.e. if $n > 1$ , only one derivative will be computed anyway. |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Implemented in [Go::EvalOffsetSurface](#), and [Go::EvalFunctorSurface](#).

29.125.3.7 `virtual double Go::EvalSurface::start_u( ) const` [pure virtual]

Get the start parameter of the curve.

#### Returns

the start parameter of the curve.

Implemented in [Go::EvalOffsetSurface](#), and [Go::EvalFunctorSurface](#).

29.125.3.8 `virtual double Go::EvalSurface::start_v( ) const` [pure virtual]

Implemented in [Go::EvalOffsetSurface](#), and [Go::EvalFunctorSurface](#).

29.125.3.9 `virtual void Go::EvalSurface::write ( std::ostream & out ) const` [virtual]

The documentation for this class was generated from the following file:

### 29.126.1 Detailed Description

```
template<class edgeType, class faceType>
class Go::FaceAdjacency< edgeType, faceType >
```

Compute adjacency information for a set of surfaces.

Definition at line 85 of file FaceAdjacency.h.

### 29.126.2 Constructor & Destructor Documentation

29.126.2.1 `template<class edgeType , class faceType > Go::FaceAdjacency< edgeType, faceType >::FaceAdjacency ( double tol_gap, double tol_neighbour, double tol_kink, double tol_bend ) [inline]`

Constructor.

## Parameters

|                      |                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------|
| <i>tol_gap</i>       | Tolerance for when two faces are assumed to be C0 continuous                                 |
| <i>tol_neighbour</i> | Tolerance for when two faces are assumed to be neighbours                                    |
| <i>tol_kink</i>      | Tolerance for when two adjacent faces are assumed to be C1 continous                         |
| <i>tol_bend</i>      | Tolerance for when two adjacent faces are assumed to have an intentionally smooth connection |

Definition at line 104 of file FaceAdjacency.h.

```
29.126.2.2 template<class edgeType , class faceType > Go::FaceAdjacency< edgeType, faceType >::FaceAdjacency (
 const tpTolerances & tol) [inline]
```

Constructor.

## Parameters

|            |                        |
|------------|------------------------|
| <i>tol</i> | Topological tolerances |
|------------|------------------------|

Definition at line 112 of file FaceAdjacency.h.

```
29.126.2.3 template<class edgeType , class faceType > Go::FaceAdjacency< edgeType, faceType
 >::~~FaceAdjacency () [inline]
```

Destructor. Detailed description.

Definition at line 120 of file FaceAdjacency.h.

## 29.126.3 Member Function Documentation

```
29.126.3.1 template<class edgeType , class faceType > void Go::FaceAdjacency< edgeType, faceType
 >::computeAdjacency (const std::vector< shared_ptr< faceType > > & faces, int first_idx) [inline]
```

Compute the adjacency between the given faces.

Definition at line 144 of file FaceAdjacency.h.

```
29.126.3.2 template<class edgeType , class faceType > void Go::FaceAdjacency< edgeType, faceType
 >::computeAdjacency (const std::vector< shared_ptr< faceType > > & faces, std::vector< std::pair<
 faceType *, faceType * > > & orient_inconsistent, int first_idx) [inline]
```

Compute the adjacency between the given faces

## Parameters

|                            |                                                                                      |
|----------------------------|--------------------------------------------------------------------------------------|
| <i>faces</i>               | The face set on which to compute adjacency                                           |
| <i>orient_inconsistent</i> | Information of adjacent faces where the direction of the face normal is inconsistent |

Definition at line 159 of file FaceAdjacency.h.

```
29.126.3.3 template<class edgeType , class faceType > void Go::FaceAdjacency< edgeType, faceType
>::computeFaceAdjacency (std::vector< shared_ptr< faceType > > faces, shared_ptr< faceType > new_face)
[inline]
```

Add one face to the topological structures of a face set

#### Parameters

|                 |                                                                |
|-----------------|----------------------------------------------------------------|
| <i>faces</i>    | The set of faces where all topological information is computed |
| <i>new_face</i> | The face to add to the face set                                |

Definition at line 438 of file FaceAdjacency.h.

```
29.126.3.4 template<class edgeType , class faceType > void Go::FaceAdjacency< edgeType, faceType
>::computeFaceAdjacency (std::vector< faceType * > faces, faceType * new_face) [inline]
```

Definition at line 446 of file FaceAdjacency.h.

```
29.126.3.5 template<class edgeType , class faceType > void Go::FaceAdjacency< edgeType, faceType
>::computeFaceAdjacency (std::vector< shared_ptr< faceType > > faces, shared_ptr< faceType > new_face,
std::vector< std::pair< faceType *, faceType * > > & orient_inconsistent) [inline]
```

Add one face to the topological structures of a face set

#### Parameters

|                            |                                                                                      |
|----------------------------|--------------------------------------------------------------------------------------|
| <i>faces</i>               | The set of faces where all topological information is computed                       |
| <i>new_face</i>            | The face to add to the face set                                                      |
| <i>orient_inconsistent</i> | Information of adjacent faces where the direction of the face normal is inconsistent |

Definition at line 460 of file FaceAdjacency.h.

```
29.126.3.6 template<class edgeType , class faceType > void Go::FaceAdjacency< edgeType, faceType
>::computeFaceAdjacency (std::vector< faceType * > faces, faceType * new_face, std::vector< std::pair<
faceType *, faceType * > > & orient_inconsistent) [inline]
```

Add one face to the topological structures of a face set

#### Parameters

|                            |                                                                                      |
|----------------------------|--------------------------------------------------------------------------------------|
| <i>faces</i>               | The set of faces where all topological information is computed                       |
| <i>new_face</i>            | The face to add to the face set                                                      |
| <i>orient_inconsistent</i> | Information of adjacent faces where the direction of the face normal is inconsistent |

Definition at line 590 of file FaceAdjacency.h.

```
29.126.3.7 template<class edgeType , class faceType > std::vector<edgeType*> Go::FaceAdjacency< edgeType,
faceType >::connectTwins (edgeType * e1, edgeType * e2, double min1, double max1, double min2,
double max2, int & status) [inline]
```

Returns pointer to (vector of) twin edges. Updates topological structure and, if necessary, splits edges.

Definition at line 331 of file FaceAdjacency.h.

```
29.126.3.8 template<class edgeType , class faceType > tpTolerances Go::FaceAdjacency< edgeType, faceType
>::getTolerances () [inline]
```

Fetch the topological tolerances used in the adjacency analysis.

Definition at line 135 of file FaceAdjacency.h.

```
29.126.3.9 template<class edgeType , class faceType > void Go::FaceAdjacency< edgeType, faceType
>::releaseFaceAdjacency (shared_ptr< faceType > face) [inline]
```

Remove one face from the topological structures of the face set it belongs to

Definition at line 389 of file FaceAdjacency.h.

```
29.126.3.10 template<class edgeType , class faceType > void Go::FaceAdjacency< edgeType, faceType
>::setConnectivity (const std::vector< shared_ptr< faceType > > & faces) [inline]
```

Fetch existing adjacency information between faces and set topological pointers representing this adjacency.

Definition at line 271 of file FaceAdjacency.h.

```
29.126.3.11 template<class edgeType , class faceType > void Go::FaceAdjacency< edgeType, faceType
>::setConnectivity (const std::vector< faceType * > & faces) [inline]
```

Fetch existing adjacency information between faces and set topological pointers representing this adjacency.

Definition at line 301 of file FaceAdjacency.h.

```
29.126.3.12 template<class edgeType , class faceType > void Go::FaceAdjacency< edgeType, faceType >::setTolerances
(const tpTolerances & tol) [inline]
```

Changes the tolerances used in adjacency analysis.

Definition at line 127 of file FaceAdjacency.h.

```
29.126.3.13 template<class edgeType , class faceType > void Go::FaceAdjacency< edgeType, faceType
>::updateConnectivity (edgeType * e1, edgeType * e2) [inline]
```

Update topological information related to two neighbouring faces, i.e. recompute information regarding the type of connectivity between the faces

Definition at line 719 of file FaceAdjacency.h.

#### 29.126.4 Member Data Documentation

```
29.126.4.1 template<class edgeType , class faceType > std::vector< shared_ptr<edgeType> > Go::FaceAdjacency<
edgeType, faceType >::new_edges_ [protected]
```

Definition at line 90 of file FaceAdjacency.h.

```
29.126.4.2 template<class edgeType , class faceType > tpTolerances Go::FaceAdjacency< edgeType, faceType
>::tol_ [protected]
```

Definition at line 89 of file FaceAdjacency.h.

The documentation for this class was generated from the following file:

### 29.127.1 Detailed Description

```
template<class edgeType>
struct Go::FaceConnectivity< edgeType >
```

A structure storing the connectivity information between two adjacent faces

Definition at line 54 of file FaceConnectivity.h.

### 29.127.2 Constructor & Destructor Documentation

29.127.2.1 `template<class edgeType > Go::FaceConnectivity< edgeType >::FaceConnectivity ( edgeType * e1, edgeType * e2 ) [inline]`

Constructor.

Definition at line 74 of file FaceConnectivity.h.

### 29.127.3 Member Function Documentation

29.127.3.1 `template<class edgeType > int Go::FaceConnectivity< edgeType >::BestStatus ( ) const [inline]`

The highest continuity between the two faces.

Definition at line 88 of file FaceConnectivity.h.

29.127.3.2 `template<class edgeType > void Go::FaceConnectivity< edgeType >::setEdges ( edgeType * e1, edgeType * e2 ) [inline]`

Reset edge info.

Definition at line 81 of file FaceConnectivity.h.

29.127.3.3 `template<class edgeType > int Go::FaceConnectivity< edgeType >::WorstStatus ( ) const [inline]`

The lowest continuity between the two faces.

Definition at line 97 of file FaceConnectivity.h.

## 29.127.4 Member Data Documentation

29.127.4.1 `template<class edgeType > edgeType* Go::FaceConnectivity< edgeType >::e1_`

Edge of first face along the common boundary.

Definition at line 58 of file FaceConnectivity.h.

29.127.4.2 `template<class edgeType > edgeType* Go::FaceConnectivity< edgeType >::e2_`

Edge of second face along the common boundary.

Definition at line 60 of file FaceConnectivity.h.

29.127.4.3 `template<class edgeType > vector< pair<double, double> > Go::FaceConnectivity< edgeType >::parameters_`

Parameter intervals limiting the areas of the found state of continuity.

Definition at line 71 of file FaceConnectivity.h.

29.127.4.4 `template<class edgeType > vector<int> Go::FaceConnectivity< edgeType >::status_`

The status is: 0 : edges join smoothly.  $G^1$ . 1 : edges join, but normals are slightly discontinuous. A kink. 2 : edges join, but the normals are discontinuous.  $G^0$ . 3 : edges almost join. A gap. 4 : edges are totally discontinuous. The minimal [tpTopologicalInfo](#) has a one-element status vector and a two-element parameters vector

Definition at line 69 of file FaceConnectivity.h.

The documentation for this struct was generated from the following file:

- [topology/include/GoTools/topology/FaceConnectivity.h](#)

## 29.128 Go::FaceConnectivityUtils< edgeType, faceType > Class Template Reference

Utilities used in adjacency computations of face sets.

```
#include <FaceConnectivityUtils.h>
```

- void [cornersAndKinks](#) (const std::vector< shared\_ptr< faceType > > &faces, std::vector< edgeType \* > &vec)
- void [smoothEdges](#) (const std::vector< shared\_ptr< faceType > > &faces, std::vector< edgeType \* > &vec)
- std::vector< edgeType \* > [edgesBoundingFace](#) (faceType \*face)
 

*Returns all edges bounding a specific face.*

### 29.128.1 Detailed Description

```
template<class edgeType, class faceType>
class Go::FaceConnectivityUtils< edgeType, faceType >
```

Utilities used in adjacency computations of face sets.

Definition at line 56 of file FaceConnectivityUtils.h.

### 29.128.2 Member Function Documentation

29.128.2.1 `template<class edgeType , class faceType > void Go::FaceConnectivityUtils< edgeType, faceType >::BoundaryLoops ( const std::vector< shared_ptr< faceType > > & faces, std::vector< std::vector< edgeType * > > & loopvec ) [inline]`

Returns all boundary loops. Edges are returned as pointers. Keep in mind that calling next() on elements on the boundary will not iterate around the boundary, but around the face the edge comes from.

Definition at line 66 of file FaceConnectivityUtils.h.

29.128.2.2 `template<class edgeType , class faceType > void Go::FaceConnectivityUtils< edgeType, faceType >::BoundaryLoops ( const std::vector< shared_ptr< faceType > > & faces, std::vector< std::vector< shared_ptr< edgeType > > > & loopvec ) [inline]`

Returns all boundary loops. Edges are returned as shared pointers.

Definition at line 117 of file FaceConnectivityUtils.h.

```
29.128.2.3 template<class edgeType , class faceType > void Go::FaceConnectivityUtils< edgeType, faceType
>::cornersAndKinks (const std::vector< shared_ptr< faceType > > & faces, std::vector< edgeType * > & vec
) [inline]
```

Gives the first of every pair of edges representing a corner edge or kink edge.

Definition at line 203 of file FaceConnectivityUtils.h.

```
29.128.2.4 template<class edgeType , class faceType > void Go::FaceConnectivityUtils< edgeType, faceType
>::disjointObjects (const std::vector< shared_ptr< faceType > > & faces, std::vector< std::vector< faceType
* > > & grouped_faces) [inline]
```

Separates objects which are not path connected.

Definition at line 178 of file FaceConnectivityUtils.h.

```
29.128.2.5 template<class edgeType , class faceType > std::vector<edgeType*> Go::FaceConnectivityUtils<
edgeType, faceType >::edgesBoundingFace (faceType * face) [inline]
```

Returns all edges bounding a specific face.

Definition at line 290 of file FaceConnectivityUtils.h.

```
29.128.2.6 template<class edgeType , class faceType > void Go::FaceConnectivityUtils< edgeType, faceType
>::smoothEdges (const std::vector< shared_ptr< faceType > > & faces, std::vector< edgeType * > & vec)
[inline]
```

Gives the first of every pair of edges representing a smooth edge (edges with gaps excluded)

Definition at line 247 of file FaceConnectivityUtils.h.

29.129.2.4 `virtual Go::FaceSetQuality::~FaceSetQuality ( ) [virtual]`

### 29.129.3 Member Function Documentation

29.129.3.1 `virtual void Go::FaceSetQuality::acuteEdgeAngle ( std::vector< std::pair< ftEdge *, ftEdge * > > & edge_acute ) [virtual]`

Uses existing topological entities.

Reimplemented from [Go::ModelQuality](#).

29.129.3.2 `virtual void Go::FaceSetQuality::acuteFaceAngle ( std::vector< std::pair< ftSurface *, ftSurface * > > & face_acute ) [virtual]`

Uses existing topological entities. Existing surfaces available.

Reimplemented from [Go::ModelQuality](#).

29.129.3.3 `void Go::FaceSetQuality::attach ( shared_ptr< SurfaceModel > smodel )`

29.129.3.4 `virtual void Go::FaceSetQuality::cvC1G1Discontinuity ( std::vector< shared_ptr< ParamCurve > > & c1_discont, std::vector< shared_ptr< ParamCurve > > & g1_discont ) [virtual]`

Contains curves fetched from topological entities.

Reimplemented from [Go::ModelQuality](#).

29.129.3.5 `virtual void Go::FaceSetQuality::cvCurvatureRadius ( std::vector< std::pair< shared_ptr< PointOnCurve >, double > > & small_curv_rad, std::pair< shared_ptr< PointOnCurve >, double > & minimum_curv_rad ) [virtual]`

Contains generated points and curves fetched from topological entities.

Reimplemented from [Go::ModelQuality](#).

```
29.129.3.6 virtual void Go::FaceSetQuality::degenerateSfCorners (std::vector< shared_ptr< ftPoint > > & deg_corners)
 [virtual]
```

Generates new points, pointers to existing surfaces.

Reimplemented from [Go::ModelQuality](#).

```
29.129.3.7 virtual void Go::FaceSetQuality::degenSurfaces (std::vector< shared_ptr< ParamSurface > > & deg_sfs)
 [virtual]
```

Does not generate new geometry.

Reimplemented from [Go::ModelQuality](#).

```
29.129.3.8 virtual void Go::FaceSetQuality::edgePosAndTangDiscontinuity (std::vector< std::pair< ftEdge *, ftEdge * >
 > & pos_disconts, std::vector< std::pair< ftEdge *, ftEdge * > > & tang_disconts) [virtual]
```

Uses existing topological entities.

Reimplemented from [Go::ModelQuality](#).

```
29.129.3.9 virtual void Go::FaceSetQuality::edgeVertexDistance (std::vector< std::pair< ftEdge *, shared_ptr< Vertex >
 > > & edge_vertices) [virtual]
```

Uses existing topological entities.

Reimplemented from [Go::ModelQuality](#).

```
29.129.3.10 virtual void Go::FaceSetQuality::faceEdgeDistance (std::vector< std::pair< ftSurface *, ftEdge * > > &
 face_edges) [virtual]
```

Existing topology. Partly generated geometry, existing surfaces.

Reimplemented from [Go::ModelQuality](#).

```
29.129.3.11 virtual void Go::FaceSetQuality::faceNormalConsistency (std::vector< shared_ptr< ftSurface > > &
 inconsistent_faces) [virtual]
```

Uses existing topological entities. Existing surfaces available.

Reimplemented from [Go::ModelQuality](#).

```
29.129.3.12 virtual void Go::FaceSetQuality::facePositionDiscontinuity (std::vector< std::pair< ftEdge *, ftEdge * > > &
 pos_disconts) [virtual]
```

Uses existing topological entities. Existing surfaces available.

Reimplemented from [Go::ModelQuality](#).

29.129.3.13 `virtual void Go::FaceSetQuality::faceTangentDiscontinuity ( std::vector< std::pair< ftEdge *, ftEdge * > > & tangent_disconts ) [virtual]`

Uses existing topological entities. Existing surfaces available.

Reimplemented from [Go::ModelQuality](#).

29.129.3.14 `virtual void Go::FaceSetQuality::faceVertexDistance ( std::vector< std::pair< ftSurface *, shared_ptr< Vertex > > > & face_vertices ) [virtual]`

Existing topology. Partly generated geometry, existing surfaces.

Reimplemented from [Go::ModelQuality](#).

29.129.3.15 `shared_ptr<SurfaceModel> Go::FaceSetQuality::getAssociatedSfModel ( ) [inline]`

Definition at line 178 of file FaceSetQuality.h.

29.129.3.16 `virtual void Go::FaceSetQuality::identicalOrEmbeddedEdges ( std::vector< std::pair< shared_ptr< ftEdge >, shared_ptr< ftEdge > > > & identical_edges, std::vector< std::pair< shared_ptr< ftEdge >, shared_ptr< ftEdge > > > & embedded_edges ) [virtual]`

Uses existing topological entities. May contain generated curves.

Reimplemented from [Go::ModelQuality](#).

29.129.3.17 `virtual void Go::FaceSetQuality::identicalOrEmbeddedFaces ( std::vector< std::pair< shared_ptr< ftSurface >, shared_ptr< ftSurface > > > & identical_faces, std::vector< std::pair< shared_ptr< ftSurface >, shared_ptr< ftSurface > > > & embedded_faces ) [virtual]`

Uses existing topological entities. Points to existing surfaces.

Reimplemented from [Go::ModelQuality](#).

29.129.3.18 `virtual void Go::FaceSetQuality::identicalVertices ( std::vector< std::pair< shared_ptr< Vertex >, shared_ptr< Vertex > > > & identical_vertices ) [virtual]`

Uses existing topological entity.

Reimplemented from [Go::ModelQuality](#).

29.129.3.19 `virtual void Go::FaceSetQuality::indistinctKnots ( std::vector< shared_ptr< ParamCurve > > & cv_knots, std::vector< shared_ptr< ParamSurface > > & sf_knots, double tol=1.0e-8 ) [virtual]`

Uses existing surface and possibly generated curves.

Reimplemented from [Go::ModelQuality](#).

29.129.3.20 `virtual void Go::FaceSetQuality::loopIntersection ( std::vector< std::pair< shared_ptr< PointOnEdge >, shared_ptr< PointOnEdge > > > & loop_intersection ) [virtual]`

Uses existing topological entities. Contains generated geometry.

Reimplemented from [Go::ModelQuality](#).

29.129.3.21 `virtual void Go::FaceSetQuality::loopOrientationConsistency ( std::vector< shared_ptr< Loop > > & inconsistent_loops ) [virtual]`

Uses existing topological entities.

Reimplemented from [Go::ModelQuality](#).

29.129.3.22 `virtual void Go::FaceSetQuality::loopSelfIntersection ( std::vector< std::pair< shared_ptr< PointOnEdge >, shared_ptr< PointOnEdge > > > & loop_self_intersection ) [virtual]`

Uses existing topological entities. Contains generated geometry.

Reimplemented from [Go::ModelQuality](#).

29.129.3.23 `virtual void Go::FaceSetQuality::miniEdges ( std::vector< shared_ptr< ftEdge > > & mini_edges ) [virtual]`

Uses existing topological entities.

Reimplemented from [Go::ModelQuality](#).

29.129.3.24 `virtual void Go::FaceSetQuality::miniSurfaces ( std::vector< shared_ptr< ftSurface > > & mini_surfaces ) [virtual]`

Uses existing topological entities. Points to existing surfaces.

Reimplemented from [Go::ModelQuality](#).

29.129.3.25 `virtual void Go::FaceSetQuality::narrowRegion ( std::vector< std::pair< shared_ptr< PointOnEdge >, shared_ptr< PointOnEdge > > > & narrow_regions ) [virtual]`

Uses existing topological entities. Contains generated geometry.

Reimplemented from [Go::ModelQuality](#).

29.129.3.26 `virtual void Go::FaceSetQuality::sfC1Discontinuity ( std::vector< shared_ptr< ftSurface > > & scont_sfs ) [virtual]`

Uses existing topological entities. Existing surfaces available.

Reimplemented from [Go::ModelQuality](#).

```
29.129.3.27 virtual void Go::FaceSetQuality::sfCurvatureRadius (std::vector< std::pair< shared_ptr< ftPoint >, double > > & small_curv_rad, std::pair< shared_ptr< ftPoint >, double > & minimum_curv_rad) [virtual]
```

Generates new points, pointers to existing surfaces.

Reimplemented from [Go::ModelQuality](#).

```
29.129.3.28 virtual void Go::FaceSetQuality::sfG1Discontinuity (std::vector< shared_ptr< ftSurface > > & discont_sfs) [virtual]
```

Uses existing topological entities. Existing surfaces available.

Reimplemented from [Go::ModelQuality](#).

```
29.129.3.29 virtual void Go::FaceSetQuality::sliverSurfaces (std::vector< shared_ptr< ParamSurface > > & sliver_sfs, double thickness, double factor = 2.0) [virtual]
```

Uses existing geometry.

Reimplemented from [Go::ModelQuality](#).

```
29.129.3.30 virtual void Go::FaceSetQuality::vanishingCurveTangent (std::vector< shared_ptr< PointOnCurve > > & sing_points, std::vector< std::pair< shared_ptr< PointOnCurve >, shared_ptr< PointOnCurve > > > & sing_curves) [virtual]
```

Contains generated points and curves fetched from topological entities.

Reimplemented from [Go::ModelQuality](#).

```
29.129.3.31 virtual void Go::FaceSetQuality::vanishingSurfaceNormal (std::vector< shared_ptr< ftPoint > > & singular_points, std::vector< shared_ptr< ftCurve > > & singular_curves) [virtual]
```

Returns ftPoints and ftCurves that will contain generated geometry.

Reimplemented from [Go::ModelQuality](#).

## 29.133 Go::Factory Class Reference

```
#include <Factory.h>
```

### Public Member Functions

- [~Factory](#) ()
- void [registerClass](#) ([ClassType](#) class\_type, [Creator](#) \*c)

### Static Public Member Functions

- static [GeomObject](#) \* [createObject](#) ([ClassType](#) class\_type)
- static [Factory](#) \* [globalFactory](#) ()

### 29.133.1 Detailed Description

This is the [Factory](#) for creating instances of [GeomObjects](#) of type requested by the user. There will be one, global [Factory](#) object, called `Go::global_factory_`. However, the user will not have to deal with this directly. The user need only interact with the [Factory](#) using the static member function '[createObject\(ClassType\)](#)' and the template [Register\(\)](#) function (or [Registrar](#) class, if the compiler misbehaves. In practice, this means calling '[GoTools::init\(\)](#)' early in the code.

Definition at line 83 of file [Factory.h](#).

### 29.133.2 Constructor & Destructor Documentation

#### 29.133.2.1 `Go::Factory::~~Factory ( )` `[inline]`

Definition at line 86 of file [Factory.h](#).

### 29.133.3 Member Function Documentation

#### 29.133.3.1 `static GeomObject* Go::Factory::createObject ( ClassType class_type )` `[inline]`, `[static]`

Makes a new [GeomObject](#) instance of the specified [ClassType](#) and returns a pointer to it. The user assumes ownership over the created object.

## Parameters

|                   |                                                                       |
|-------------------|-----------------------------------------------------------------------|
| <i>class_type</i> | the class type of the object that the user wants to have constructed. |
|-------------------|-----------------------------------------------------------------------|

Definition at line 97 of file Factory.h.

**29.133.3.2** `static Factory* Go::Factory::globalFactory( ) [inline],[static]`

This function returns a pointer to the unique, global [Factory](#).

## Returns

pointer to global [Factory](#).

Definition at line 118 of file Factory.h.

**29.133.3.3** `void Go::Factory::registerClass ( ClassType class_type, Creator * c ) [inline]`

Register a ClassType with the [Factory](#). This amounts to provide the [Factory](#) with the [Creator](#) object that is used to generate a new [GeomObject](#) of type ClassType. Usually, the user would not want to call this function directly, but through the (template) function [Register\(\)](#) or by using a [Registrar](#)

## Parameters

|                   |                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>class_type</i> | the ClassType for which we want the <a href="#">Factory</a> to associate a particular <a href="#">Creator</a> .                  |
| <i>c</i>          | pointer to the <a href="#">Creator</a> object to be used by the <a href="#">Factory</a> when creating objects of type ClassType. |

Definition at line 111 of file Factory.h.

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/geometry/Factory.h](#)

## 29.134 NEWMAT::FFT\_Controller Class Reference

### 29.139.1 Detailed Description

[ftChartSurface](#) - Short description. Detailed description.

Definition at line 52 of file [ftChartSurface.h](#).

## 29.139.2 Constructor & Destructor Documentation

29.139.2.1 `Go::ftChartSurface::ftChartSurface ( const std::vector< shared_ptr< ParamSurface > > & surfaces, tpTolerances & topeps, double approxeps, double curvature_tol, int m = 0, int n = 0 )`

Constructor.

29.139.2.2 `Go::ftChartSurface::~~ftChartSurface ( )`

Destructor.

## 29.139.3 Member Function Documentation

29.139.3.1 `ftMessage Go::ftChartSurface::createGrid ( RotationInfo * rot_info = NULL, ftCurve * outer_bd = NULL )`

User may choose to let `bd_edges` of all sfs in the topology be in correspondence through a rotation of the entire set. For all members of topology it is expected that both [createSurf\(\)](#) & [prepareGrid\(\)](#) have been called.

29.139.3.2 `virtual std::vector<shared_ptr<ftEdgeBase> > Go::ftChartSurface::createInitialEdges ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON, double kink = 0.00015, bool no_split = false ) [virtual]`

Warning! Assumes the return edges are taken care of, i.e. stored for further use. Otherwise `first_edges_` will be invalid! To be called when topology is set up; essentially performed from constructor.

Implements [Go::ftSurfaceSet](#).

29.139.3.3 `virtual ftMessage Go::ftChartSurface::createSurf ( double & max_error, double & mean_error ) [virtual]`

Merge the current surface patches to produce one [SplineSurface](#).

Implements [Go::ftSurfaceSet](#).

29.139.3.4 `std::vector<shared_ptr<ftSamplePoint> > Go::ftChartSurface::getEdgeGrid ( int edge_ind )`

The created grid is returned (copied). The pts are returned in ccw order. Ordering is: b, t, l, r

29.139.3.5 `virtual void Go::ftChartSurface::getError ( double & max_error, double & mean_error ) [virtual]`

Fetch the error due to approximations in `createSurf`. Not applicable in normal configurations

Implements [Go::ftSurfaceSet](#).

29.139.3.6 `vector<shared_ptr<FaceConnectivity<ftEdgeBase>>> Go::ftChartSurface::getInnerEdgeCont ( ) const`

29.139.3.7 `virtual ftTangPriority Go::ftChartSurface::getPrioType ( ) const [virtual]`

Priority type.

Implements [Go::ftSurfaceSet](#).

29.139.3.8 `bool Go::ftChartSurface::gridCreated ( int & m, int & n ) const`

We may also decide to add grid pts along an edge.

29.139.3.9 `virtual Point Go::ftChartSurface::normal ( double u, double v ) const [virtual]`

Evaluate surface normal.

Implements [Go::ftSurfaceSet](#).

29.139.3.10 `virtual Point Go::ftChartSurface::point ( double u, double v ) const [virtual]`

Evaluation and interrogation. Overridden from [ftFaceBase](#).

Implements [Go::ftSurfaceSet](#).

29.139.3.11 `Point Go::ftChartSurface::point ( double & u, double & v, shared_ptr< ftFaceBase > & face, double * seed = NULL, bool use_input_face = false ) const`

Given par values in surf\_, return corresponding par values in faces\_[i]. If use\_input\_face == true, we do not search in graph but go directly to face.

29.139.3.12 `ftMessage Go::ftChartSurface::prepareGrid ( RotationInfo * rot_info = NULL, ftCurve * outer_bd = NULL )`

Flicking on grid\_distr\_functions\_ so that they both agree along and towards common bd. For all members of topology it is expected that both [createSurf\(\)](#) has been called.

29.139.3.13 `virtual bool Go::ftChartSurface::sampleOnlyEdges ( ) const [protected],[virtual]`

Approximate only the edges in the group of surfaces.

Implements [Go::ftSurfaceSet](#).

29.139.3.14 void Go::ftChartSurface::setEdgeScales ( std::vector< std::pair< Point, double > > & edge\_scales )

29.139.3.15 void Go::ftChartSurface::setGridResolution ( int m, int n )

29.139.3.16 void Go::ftChartSurface::setPrioType ( ftTangPriority type )

29.139.3.17 void Go::ftChartSurface::setSymmDistrFunctions ( bool symm\_distr\_functions )

29.139.3.18 void Go::ftChartSurface::writeDebugGrid ( std::ostream & os ) const

Write to file [LineCloud](#) describing grid. Still awaiting exchange format.

29.139.3.19 void Go::ftChartSurface::writeGrid ( std::ostream & os ) const

## Protected Attributes

- [ftCurveType type\\_](#)
- `std::vector< ftCurveSegment > segments_`

### 29.140.1 Detailed Description

[ftCurve](#) - contains a number of (possibly disjoint) curve segments. The [ftCurve](#) class has interfaces for most operations (such as evaluation) that one might want to perform on them

#### Author

Atgeirr F Rasmussen [atgeirr@sintef.no](mailto:atgeirr@sintef.no)

Definition at line 236 of file [ftCurve.h](#).

### 29.140.2 Constructor & Destructor Documentation

#### 29.140.2.1 `Go::ftCurve::ftCurve ( )` `[inline]`

Constructor.

Definition at line 240 of file [ftCurve.h](#).

#### 29.140.2.2 `Go::ftCurve::ftCurve ( ftCurveType t )` `[inline]`

Constructor of curve given curve type -1 = no specified type, 0 = intersection curve, 1 = edge curve, 2 = kink curve, 3 = corner curve, 4 = gap curve, 5 = singularity curve

Definition at line 245 of file [ftCurve.h](#).

### 29.140.3 Member Function Documentation

#### 29.140.3.1 `void Go::ftCurve::appendCurve ( const ftCurve & cv )` `[inline]`

Append the [ftCurve](#) `cv` after this curve.

Definition at line 360 of file [ftCurve.h](#).

#### 29.140.3.2 `void Go::ftCurve::appendSegment ( const ftCurveSegment & seg )` `[inline]`

A new segment after this curve.

Definition at line 378 of file [ftCurve.h](#).

29.140.3.3 `double Go::ftCurve::arcLength ( double t1, int seg1, double t2, int seg2 ) const`

Curve length.

29.140.3.4 `void Go::ftCurve::chopOff ( const BoundingBox & box ) [inline]`

Remove the parts of this curve lying outside the specified bounding box.

Definition at line 408 of file ftCurve.h.

29.140.3.5 `ftCurveType Go::ftCurve::curveType ( ) const [inline]`

Type of curve -1 = no specified type, 0 = intersection curve, 1 = edge curve, 2 = kink curve, 3 = corner curve, 4 = gap curve, 5 = singularity curve

Definition at line 453 of file ftCurve.h.

29.140.3.6 `void Go::ftCurve::deleteSpaceCurveRepresentation ( ) [inline]`

Debug.

Definition at line 339 of file ftCurve.h.

29.140.3.7 `double Go::ftCurve::endOfSegment ( int segment ) const [inline]`

End parameter of segment number segment.

Definition at line 439 of file ftCurve.h.

29.140.3.8 `void Go::ftCurve::joinSegments ( double gap_tol, double neighbour_tol, double kink_tol, double bend_tol )`

Flag the connections between segments according to their continuity. This function assumes that the segments have already been sorted and oriented. Sorting and orienting of segments can be done with [orientSegments\(\)](#)

29.140.3.9 `tpJointType Go::ftCurve::jointAfter ( int segment ) const [inline]`

Type of joint between segment number segment and the next segment 0 = g1 continuity, 1 = not quite g1, 2 = g0 continuity, 3 = gap, 4 = discontinuous, 5 = last segment

Definition at line 460 of file ftCurve.h.

29.140.3.10 `void Go::ftCurve::normal ( double t, int segment, int side, Point & normal, double eps ) const [inline]`

Compute normal given segment number, parameter within segment and the number of the associated face

Definition at line 503 of file ftCurve.h.

29.140.3.11 `int Go::ftCurve::numDisjointSubcurves ( ) const [inline]`

Number of disjoint subcurves.

Definition at line 478 of file ftCurve.h.

29.140.3.12 `int Go::ftCurve::numSegments ( ) const [inline]`

Number of segments in [ftCurve](#).

Definition at line 425 of file ftCurve.h.

29.140.3.13 `ftCurve & Go::ftCurve::operator+=( const ftCurve & cv ) [inline]`

Append curve.

Definition at line 352 of file ftCurve.h.

29.140.3.14 `void Go::ftCurve::orientSegments ( double neighbour_tol, bool assume_manifold = true )`

Assures that the segments are consistently oriented and sorted such that the end point of segment 'k' is coincident (within the specified tolerance) with the start point of segment 'k+1' if those segments are connected. If we cannot a priori be sure that our curve is describing an 1-manifold (no 'branches' on the curve), the last argument should be set to 'false'. This may effect performance, though not severely unless the number of segments is very high.

29.140.3.15 `void Go::ftCurve::point ( double t, int segment, Point & pt ) const [inline]`

Compute position given segment number and parameter within segment.

Definition at line 489 of file ftCurve.h.

29.140.3.16 `void Go::ftCurve::prependCurve ( const ftCurve & cv ) [inline]`

Place the [ftCurve](#) cv before this curve.

Definition at line 369 of file ftCurve.h.

29.140.3.17 `void Go::ftCurve::prependSegment ( const ftCurveSegment & seg ) [inline]`

A new segment prior to this curve.

Definition at line 385 of file ftCurve.h.

29.140.3.18 void Go::ftCurve::reparametrize ( double *eps\_go* = 1.0e-6 )

Reparametrization.

The *eps\_go* argument is used as a tolerance if ever this function has to regenerate the spacecurve from its underlying surface and parametric curve

29.140.3.19 void Go::ftCurve::reverse ( ) [inline]

Reverse the curve and maintain correct joint types between segments.

Definition at line 392 of file ftCurve.h.

29.140.3.20 const ftCurveSegment & Go::ftCurve::segment ( int *segment* ) const [inline]

Fetch segment number segment.

Definition at line 446 of file ftCurve.h.

29.140.3.21 double Go::ftCurve::startOfSegment ( int *segment* ) const [inline]

Start parameter of segment number segment.

Definition at line 432 of file ftCurve.h.

29.140.3.22 void Go::ftCurve::tangent ( double *t*, int *segment*, Point & *tan* ) const [inline]

Compute tangent given segment number and parameter within segment.

Definition at line 496 of file ftCurve.h.

29.140.3.23 void Go::ftCurve::tessellate ( std::vector< shared\_ptr< LineStrip > > & *meshes* ) const

Tessellation with default number of line segments.

29.140.3.24 void Go::ftCurve::tessellate ( int *resolution*, std::vector< shared\_ptr< LineStrip > > & *meshes* ) const

Tessellation, number of line segments for each [ftCurveSegment](#) given.

29.140.3.25 void Go::ftCurve::tessellate ( double *density*, std::vector< shared\_ptr< LineStrip > > & *meshes* ) const

Tessellation, number of line segments for each [ftCurveSegment](#) depends on the length of the segment and the given density

29.140.3.26 `tpJointType Go::ftCurve::worstJointType ( ) const [inline]`

Least continuous joint between segments.

Definition at line 467 of file `ftCurve.h`.

29.140.3.27 `void Go::ftCurve::write ( std::ostream & os ) const`

Debug.

29.140.3.28 `void Go::ftCurve::writeSpaceCurve ( std::ostream & os ) const`

Debug.

## 29.140.4 Member Data Documentation

29.140.4.1 `std::vector<ftCurveSegment> Go::ftCurve::segments_ [protected]`

Definition at line 347 of file `ftCurve.h`.

### 29.141.1 Detailed Description

[ftCurveSegment](#) - One segment describing a curve lying on one or two surfaces. The curve can be of type intersection, edge curve, kink curve, corner curve or gap curve. The curve is an output of a computation corresponding to the curve type.

Definition at line 78 of file ftCurve.h.

### 29.141.2 Constructor & Destructor Documentation

29.141.2.1 `Go::ftCurveSegment::ftCurveSegment ( ftCurveType type, tpJointType joint, ftFaceBase * f0, ftFaceBase * f1, shared_ptr< ParamCurve > paramcv0, shared_ptr< ParamCurve > paramcv1, shared_ptr< ParamCurve > spacecv, double eps_geo = 1.0e-6 )`

Constructor. The segment owns the nurbscurves, but not the faces

### 29.141.3 Member Function Documentation

29.141.3.1 `double Go::ftCurveSegment::arcLength ( double t1, double t2 ) const`

The arc length of this curve segment limited by the interval [t1, t2].

29.141.3.2 `std::vector<ftCurveSegment> Go::ftCurveSegment::chopOff ( const BoundingBox & box, bool & eraseme )`

Internal use.

29.141.3.3 `void Go::ftCurveSegment::deleteSpaceCurveRepresentation ( ) [inline]`

Debug purpose.

Definition at line 160 of file ftCurve.h.

29.141.3.4 `double Go::ftCurveSegment::endOfSegment ( ) const`

Return end parameter of segment.

29.141.3.5 `Point Go::ftCurveSegment::endPoint ( ) const`

End point of segment.

29.141.3.6 `ftFaceBase * Go::ftCurveSegment::face ( int number ) const [inline]`

Fetch face number number associated with this curve segment.

Definition at line 208 of file ftCurve.h.

29.141.3.7 **tpJointType** Go::ftCurveSegment::jointAfter ( ) const [inline]

Fetch joint type between this curve segment and the next.

Definition at line 201 of file ftCurve.h.

29.141.3.8 void Go::ftCurveSegment::normal ( double t, int side, Point & normal, double eps ) const

The normal of the surface corresponding to this curve.

29.141.3.9 void Go::ftCurveSegment::paramcurvePoint ( int number, double t, Point & pt ) const

Comput point on curve in the parameter domain of face number in the parameter t. If the parameter curve does not exist, the closest point in the specified face to the space curve point corresponding to t is returned.

29.141.3.10 void Go::ftCurveSegment::paramcurveTangent ( int number, double t, Point & pt ) const

Tangent to the curve in the parameter domain of face number.

29.141.3.11 shared\_ptr< ParamCurve > Go::ftCurveSegment::parameterCurve ( int number ) const [inline]

Return the curve in the parameter domain of face number.

Definition at line 222 of file ftCurve.h.

29.141.3.12 void Go::ftCurveSegment::point ( double t, Point & pt ) const

Evaluate a point on the curve.

29.141.3.13 void Go::ftCurveSegment::redefineSpaceCurve ( double eps\_go ) [protected]

29.141.3.14 void Go::ftCurveSegment::reparametrize ( double eps\_go = 1.0e-6 )

The eps\_go argument is used as a tolerance if ever this function has to regenerate the spacecurve from its underlying surface and parametric curve

29.141.3.15 void Go::ftCurveSegment::reverse ( )

Reverse the direction of the curve segment. NB! The joint types will not be correct

**29.141.3.16** `ftCurveType` `Go::ftCurveSegment::segmentType ( ) const` `[inline]`

Fetch info about the type of this curve segment -1 = no specified type, 0 = intersection curve, 1 = edge curve, 2 = kink curve, 3 = corner curve, 4 = gap curve, 5 = singularity curve

Definition at line 187 of file `ftCurve.h`.

**29.141.3.17** `void` `Go::ftCurveSegment::setJointAfter ( tpJointType jt )` `[inline]`

Set joint type between this curve segment and the next 0 = g1 continuity, 1 = not quite g1, 2 = g0 continuity, 3 = gap, 4 = discontinuous, 5 = last segment

Definition at line 194 of file `ftCurve.h`.

**29.141.3.18** `shared_ptr< ParamCurve >` `Go::ftCurveSegment::spaceCurve ( ) const` `[inline]`

Return the space curve corresponding to this segment.

Definition at line 215 of file `ftCurve.h`.

**29.141.3.19** `double` `Go::ftCurveSegment::startOfSegment ( ) const`

Return start parameter of segment.

**29.141.3.20** `Point` `Go::ftCurveSegment::startPoint ( ) const`

Start point of segment.

**29.141.3.21** `void` `Go::ftCurveSegment::tangent ( double t, Point & tan ) const`

Get the curve tangent in a given parameter.

**29.141.3.22** `shared_ptr< LineStrip >` `Go::ftCurveSegment::tessellate ( int resolution ) const`

Tessellate curve segment to return a linear approximation.

## 29.141.4 Member Data Documentation

**29.141.4.1** `tpJointType` `Go::ftCurveSegment::joint_` `[protected]`

Definition at line 173 of file `ftCurve.h`.

29.141.4.2 `shared_ptr<ParamCurve> Go::ftCurveSegment::parameter_curve_[2]` [protected]

Curves in surface domain.

Definition at line 177 of file `ftCurve.h`.

29.141.4.3 `ftCurveType Go::ftCurveSegment::segment_type_` [protected]

Definition at line 172 of file `ftCurve.h`.

29.141.4.4 `shared_ptr<ParamCurve> Go::ftCurveSegment::space_curve_` [protected]

Curve in space.

Definition at line 179 of file `ftCurve.h`.

29.141.4.5 `ftFaceBase* Go::ftCurveSegment::underlying_face_[2]` [protected]

Surface(s) on which curve is lying.

Definition at line 175 of file `ftCurve.h`.

The documentation for this class was generated from the following file:

- `compositemodel/include/GoTools/compositemodel/ftCurve.h`

## 29.142 Go::ftEdge Class Reference

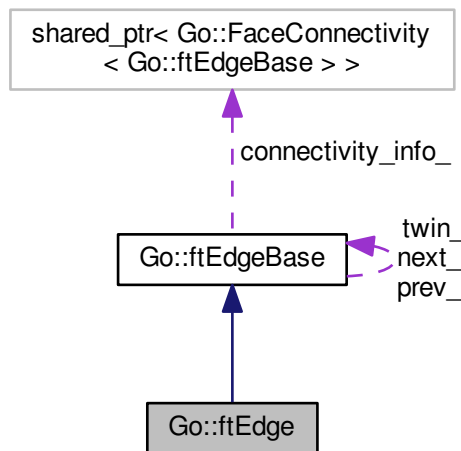

The `ftEdge` is a half-edge implementation of a topological data structure.

```
#include <ftEdge.h>
```

### 29.142.2 Constructor & Destructor Documentation

29.142.2.1 [Go::ftEdge::ftEdge \( \[ftFaceBase\]\(#\) \\* face, shared\\_ptr< \[ParamCurve\]\(#\) > cv, double tmin, double tmax, int entry\\_id = -1 \)](#)

Constructor. Detailed description.

29.142.2.2 `Go::ftEdge::ftEdge ( shared_ptr< ParamCurve > cv, double tmin, double tmax, int entry_id = -1 )`

Constructor. Input is the curve representing the geometry of the edge and parameter values for the two vertices. There is no reference to a face object.

29.142.2.3 `Go::ftEdge::ftEdge ( ftFaceBase * face, shared_ptr< ParamCurve > cv, shared_ptr< Vertex > v1, shared_ptr< Vertex > v2, bool is_reversed = false, int entry_id = -1 )`

Constructor.

Parameters

|                    |                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>face</i>        | the face to which this edge is associate                                                                              |
| <i>cv</i>          | geometric curve                                                                                                       |
| <i>v1</i>          | vertex in the start of the edge                                                                                       |
| <i>v2</i>          | vertex in the end of the edge                                                                                         |
| <i>is_reversed</i> | whether the geometric curve is reversed with respect to the start and end vertices. Needed to sort out closed curves. |

29.142.2.4 `Go::ftEdge::ftEdge ( shared_ptr< ParamCurve > cv, shared_ptr< Vertex > v1, shared_ptr< Vertex > v2, bool is_reversed = false, int entry_id = -1 )`

Constructor. Input is the curve representing the geometry of the edge and two vertices. There is no reference to a face object.

29.142.2.5 `Go::ftEdge::~ftEdge ( )`

Destructor.

### 29.142.3 Member Function Documentation

29.142.3.1 `void Go::ftEdge::addEdgeMultiplicityInstance ( ftEdge * other )`

Functionality related to non-manifold models.

29.142.3.2 `virtual BoundingBox Go::ftEdge::boundingBox ( ) [virtual]`

Bounding box surrounding this edge. The box may be too large.

Implements [Go::ftEdgeBase](#).

29.142.3.3 `bool Go::ftEdge::checkEdgeTopology ( )`

Debug functionality.

29.142.3.4 `virtual void Go::ftEdge::closeLoop ( ftEdgeBase * last ) [virtual]`

Closing of loop.

Reimplemented from [Go::ftEdgeBase](#).

29.142.3.5 `virtual void Go::ftEdge::closestPoint ( const Point & pt, double & clo_t, Point & clo_pt, double & clo_dist, double const * seed = 0 ) const [virtual]`

Closest point on edge to a given point.

Implements [Go::ftEdgeBase](#).

29.142.3.6 `bool Go::ftEdge::commonVertex ( ftEdge * other ) const [inline]`

Definition at line 369 of file ftEdge.h.

29.142.3.7 `virtual void Go::ftEdge::connectAfter ( ftEdgeBase * edge ) [virtual]`

Connect this edge to the given one.

Reimplemented from [Go::ftEdgeBase](#).

29.142.3.8 `virtual void Go::ftEdge::connectTwin ( ftEdgeBase * twin, int & status ) [virtual]`

Represent adjacency by connecting this edge to its twin edge on the adjace face

Reimplemented from [Go::ftEdgeBase](#).

29.142.3.9 `virtual void Go::ftEdge::disconnectThis ( ) [virtual]`

Disconnect this edge from its neighbours in the loop of edges limiting a face

Reimplemented from [Go::ftEdgeBase](#).

29.142.3.10 `virtual void Go::ftEdge::disconnectTwin ( ) [virtual]`

Remove twin information in this edge.

Reimplemented from [Go::ftEdgeBase](#).

29.142.3.11 `virtual int Go::ftEdge::entryId ( ) [inline],[virtual]`

Fetch Id corresponding to this edge. It is not necessarily uniquely set.

Implements [Go::ftEdgeBase](#).

Definition at line 162 of file ftEdge.h.

29.142.3.12 **double** Go::ftEdge::estimatedCurveLength ( )

Estimate the length of the curve corresponding to this edge.

29.142.3.13 **double** Go::ftEdge::estimatedCurveLength ( **double** *min\_par*, **double** *max\_par* )

Estimate the length of the curve corresponding to this edge limited by edge parameters

29.142.3.14 **virtual ftFaceBase\*** Go::ftEdge::face ( ) [virtual]

The face associated to this edge.

Implements [Go::ftEdgeBase](#).

29.142.3.15 **Point** Go::ftEdge::faceParameter ( **double** *t*, **double** \* *seed* = NULL ) const

Fetch the parameter in the associated face, given the edge parameter

29.142.3.16 **shared\_ptr<ParamCurve>** Go::ftEdge::geomCurve ( ) [inline]

Fetch the geometry curve associated with this edge.

Definition at line 219 of file ftEdge.h.

29.142.3.17 **virtual ftEdge\*** Go::ftEdge::geomEdge ( ) [virtual]

Return edge pointer.

Implements [Go::ftEdgeBase](#).

29.142.3.18 **std::vector<ftSurface\*>** Go::ftEdge::getAdjacentFaces ( ) const

Get all (up to 2) faces meeting in this edge.

29.142.3.19 **std::vector<ftSurface\*>** Go::ftEdge::getAllAdjacentFaces ( ) const

Get all faces meeting in this edge, including non-manifold cases.

29.142.3.20 **shared\_ptr<Vertex>** Go::ftEdge::getCommonVertex ( **ftEdge** \* *other* ) [inline]

Fetch the vertex that is common to this edge and the edge other. If no such vertex exist, an empty shared pointer is returned

Definition at line 287 of file ftEdge.h.

29.142.3.21 `int Go::ftEdge::getCurveIndex ( ) const`

Fetch index of geometry curve with respect to associated surface, if this information exists: -1 : No info or not a rectangular surface 0 : umin 1 : umax 2 : vmin 3 : vmax

29.142.3.22 `shared_ptr<EdgeVertex> Go::ftEdge::getEdgeMultiplicityInstance ( ) [inline]`

Fetch the radial edge to which this edge belongs.

Definition at line 328 of file ftEdge.h.

29.142.3.23 `shared_ptr<Vertex> Go::ftEdge::getOtherVertex ( const Vertex * vx ) [inline]`

Given one of the vertices belonging to this edge, fetch the other

Definition at line 274 of file ftEdge.h.

29.142.3.24 `shared_ptr<Vertex> Go::ftEdge::getVertex ( bool at_start )`

Access function for vertices. The function takes into account whether or not the orientation is reversed.

29.142.3.25 `void Go::ftEdge::getVertices ( shared_ptr< Vertex > & v1, shared_ptr< Vertex > & v2 ) [inline]`

Access function for vertices. This function does not take into account the orientation of the edge.

Definition at line 265 of file ftEdge.h.

29.142.3.26 `bool Go::ftEdge::hasCommonRadialEdge ( ftEdge * other ) const [inline]`

Check if this edge and the edge other have a common radial edge ([EdgeVertex](#))

Definition at line 380 of file ftEdge.h.

29.142.3.27 `bool Go::ftEdge::hasCommonVertices ( ftEdge * other ) const [inline]`

Check for common vertices between two edges.

Definition at line 360 of file ftEdge.h.

29.142.3.28 `bool Go::ftEdge::hasEdgeMultiplicity ( ) [inline]`

Check if this edge belongs to a radial edge ([EdgeVertex](#))

Definition at line 322 of file ftEdge.h.

29.142.3.29 **bool** Go::ftEdge::hasVertex ( **Vertex** \* vx ) [inline]

Check if the vertex vx belongs to this edge.

Definition at line 299 of file ftEdge.h.

29.142.3.30 **virtual bool** Go::ftEdge::isReversed ( ) [virtual]

Get the value of the flag indicating that the orientation of the edge is reversed with respect to the parametrization of the underlying [ParamCurve](#).

**Returns**

*true* if orientation is reversed, *false* otherwise

Implements [Go::ftEdgeBase](#).

29.142.3.31 **void** Go::ftEdge::joinEdgeVertex ( **shared\_ptr**< **EdgeVertex** > radial\_edge )

Connect to adjacent radial edges. Used in topology build for volumes

29.142.3.32 **void** Go::ftEdge::joinVertex ( **shared\_ptr**< **Vertex** > this\_vertex, **shared\_ptr**< **Vertex** > other\_vertex )

Connect to adjacent vertices including updating edge information.

29.142.3.33 **void** Go::ftEdge::joinVertices ( **ftEdgeBase** \* twin )

Update associated vertices when two edges are identified as twins.

29.142.3.34 **virtual Point** Go::ftEdge::normal ( **double** t ) **const** [virtual]

Evaluate normal of associated face given edge parameter.

Implements [Go::ftEdgeBase](#).

29.142.3.35 **virtual Point** Go::ftEdge::normal ( **double** t, **Point** & face\_par\_pt, **double** \* face\_seed ) **const** [virtual]

Evaluate normal of associated face given a seed to the search for the corresponding face parameter

Implements [Go::ftEdgeBase](#).

29.142.3.36 **virtual bool** Go::ftEdge::orientationOK ( ) **const** [virtual]

Compare orientation of curve and edge.

Reimplemented from [Go::ftEdgeBase](#).

29.142.3.37 **double** `Go::ftEdge::parAtVertex ( const Vertex * vx ) const`

Fetch the parameter of the curve associated to this edge at a given vertex

29.142.3.38 **virtual Point** `Go::ftEdge::point ( double t ) const` [virtual]

Evaluate position given edge parameter.

Implements [Go::ftEdgeBase](#).

29.142.3.39 **void** `Go::ftEdge::point ( double t, int der, std::vector< Point > & derivs ) const`

Evaluate this edge at the parameter t, including derivatives up to der

29.142.3.40 **void** `Go::ftEdge::removeEdgeVertex ( )`

Remove radial edge instance.

29.142.3.41 **void** `Go::ftEdge::replaceVertex ( shared_ptr< Vertex > & this_vertex, shared_ptr< Vertex > & other_vertex )`

Interchange one of this edge's vertex. Used in topology build.

29.142.3.42 **void** `Go::ftEdge::reverseGeomCurve ( )`

Reverse the geometric curve. A call to this function will reverse the direction of the geometry curve, swap the vertices, and change the 'is\_reversed' flag. The geometry curve will be cloned.

29.142.3.43 **void** `Go::ftEdge::setEdgeVertex ( shared_ptr< EdgeVertex > radial_edge )` [inline]

Assign a radial edge to this edge. Used in topology build for volumes

Definition at line 335 of file ftEdge.h.

29.142.3.44 **virtual void** `Go::ftEdge::setEntryId ( int id )` [inline],[virtual]

Set Id corresponding to this edge.

Implements [Go::ftEdgeBase](#).

Definition at line 165 of file ftEdge.h.

29.142.3.45 **virtual void** `Go::ftEdge::setFace ( ftFaceBase * face )` [inline],[virtual]

Set pointer to the face associated to this edge.

Implements [Go::ftEdgeBase](#).

Definition at line 136 of file ftEdge.h.

29.142.3.46 **void** `Go::ftEdge::setGeomCurve ( shared_ptr< ParamCurve > geom_curve )`

Convenience function to set or reset the geometry representation of the edge.

## Parameters

|                         |                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------|
| <code>geom_curve</code> | The curve representing the geometry of the edge. This will frequently be a <a href="#">CurveOnSurface</a> . |
|-------------------------|-------------------------------------------------------------------------------------------------------------|

29.142.3.47 `virtual void Go::ftEdge::setReversed ( bool is_reversed ) [virtual]`

Set a flag to indicate that the orientation of the edge is reversed with respect to the parametrization of the underlying [ParamCurve](#).

## Parameters

|                          |                               |
|--------------------------|-------------------------------|
| <code>is_reversed</code> | value of the orientation flag |
|--------------------------|-------------------------------|

Implements [Go::ftEdgeBase](#).

29.142.3.48 `void Go::ftEdge::setVertices ( shared_ptr< Vertex > v1, shared_ptr< Vertex > v2 )`

Assign vertices to this edge.

29.142.3.49 `virtual ftEdge* Go::ftEdge::split ( double t ) [virtual]`

Split edge in a given parameter.

Implements [Go::ftEdgeBase](#).

29.142.3.50 `shared_ptr<ftEdge> Go::ftEdge::split2 ( double t )`

Split edge and update associated edge loop.

29.142.3.51 `shared_ptr<ftEdge> Go::ftEdge::splitAtVertex ( shared_ptr< Vertex > vx )`

Split according to an already existing vertex.

29.142.3.52 `virtual Point Go::ftEdge::tangent ( double t ) const [virtual]`

Evaluate tangent of edge given edge parameter.

Implements [Go::ftEdgeBase](#).

29.142.3.53 `virtual double Go::ftEdge::tMax ( ) const [inline],[virtual]`

Maximum parameter of curve restricted to edge.

Implements [Go::ftEdgeBase](#).

Definition at line 115 of file `ftEdge.h`.

29.142.3.54 `virtual double Go::ftEdge::tMin ( ) const [inline],[virtual]`

Minimum parameter of curve restricted to edge.

Implements [Go::ftEdgeBase](#).

Definition at line 110 of file `ftEdge.h`.

29.142.3.55 `bool Go::ftEdge::updateEdgeInfo ( double tol )`

Update geometry info if possible.

29.142.3.56 `virtual void Go::ftEdge::updateGeomCurve ( double tol ) [virtual]`

Update pointer to geometry curve associated to this edge after changes to the associated face. To be used when topology changes are applied to a model.

The documentation for this class was generated from the following file:

- `compositemodel/include/GoTools/compositemodel/ftEdge.h`

## 29.143 Go::ftEdgeBase Class Reference

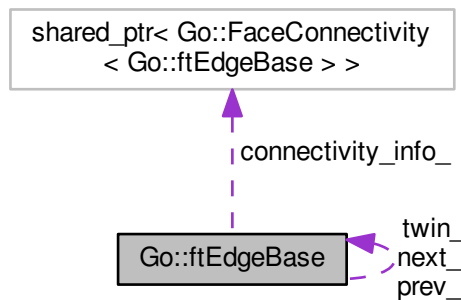

Base class for edges. Defines the interface used in topology analysis.

```
#include <ftEdgeBase.h>
```

### 29.143.1 Detailed Description

Base class for edges. Defines the interface used in topology analysis.

Definition at line 58 of file `ftEdgeBase.h`.

### 29.143.2 Constructor & Destructor Documentation

#### 29.143.2.1 `Go::ftEdgeBase::ftEdgeBase ( )`

Constructor.

29.143.2.2 `virtual Go::ftEdgeBase::~~ftEdgeBase ( ) [virtual]`

Destructor.

### 29.143.3 Member Function Documentation

29.143.3.1 `void Go::ftEdgeBase::adjacentEdges ( bool at_start_of_edge, std::vector< ftEdgeBase * > & adjacent, std::vector< bool > & at_start )`

Consider the 'node' or 'corner' implied by the startpoint (if *at\_start\_of\_edge* is true) or endpoint (if it is false). The vector *adjacent* is filled with all edges with that 'node' as a startpoint (indicated by a true at the corresponding place in the *at\_start* vector) or endpoint (false in *at\_start*). The edge originally asked for is not included.

29.143.3.2 `virtual Go::BoundingBox Go::ftEdgeBase::boundingBox ( ) [pure virtual]`

Coordinate box surrounding this edge.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

29.143.3.3 `tpJointType Go::ftEdgeBase::checkContinuity ( ftEdgeBase * nextedge, double neighbour, double gap, double bend, double kink ) const`

Compute the continuity between this edge and *nextedge* given the necessary continuity parameters. 0 = g1 continuity, 1 = not quite g1, 2 = g0 continuity, 3 = gap, 4 = discontinuous, 5 = last segment

29.143.3.4 `bool Go::ftEdgeBase::checkOverlap ( ftEdgeBase * other, double tol, int nmbsample, double & t1, double & t2, double & t3, double & t4, bool & same_dir, bool no_snap = true ) const`

Compute an eventual overlap between this edge and the edge *other*.

29.143.3.5 `virtual void Go::ftEdgeBase::closeLoop ( ftEdgeBase * last ) [virtual]`

Close edge loop by setting the appropriate pointers between this edge and last edge

Reimplemented in [Go::ftEdge](#).

29.143.3.6 `virtual void Go::ftEdgeBase::closestPoint ( const Go::Point & pt, double & clo_t, Go::Point & clo_pt, double & clo_dist, double const * seed = 0 ) const [pure virtual]`

Closest point on this edge to a given point.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

29.143.3.7 `virtual void Go::ftEdgeBase::connectAfter ( ftEdgeBase * edge ) [virtual]`

Add the edge `edge` to the edge loop after this edge.

Reimplemented in [Go::ftEdge](#).

29.143.3.8 `virtual void Go::ftEdgeBase::connectTwin ( ftEdgeBase * twin, int & status ) [virtual]`

Set adjacency between the face connected to this edge and the face connected to `twin` by setting twin pointers

Reimplemented in [Go::ftEdge](#).

29.143.3.9 `virtual void Go::ftEdgeBase::disconnectThis ( ) [virtual]`

Remove this edge from the edge loop it belongs to.

Reimplemented in [Go::ftEdge](#).

29.143.3.10 `virtual void Go::ftEdgeBase::disconnectTwin ( ) [virtual]`

Disconnect this edge from its twin, i.e. remove adjacency information between the face connected to this edge and the face connected to the twin edge

Reimplemented in [Go::ftEdge](#).

29.143.3.11 `virtual int Go::ftEdgeBase::entryId ( ) [pure virtual]`

Id of edge. Default set to -1.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

29.143.3.12 `virtual ftFaceBase* Go::ftEdgeBase::face ( ) [pure virtual]`

The face corresponding to this edge.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

29.143.3.13 `virtual ftEdge* Go::ftEdgeBase::geomEdge ( ) [pure virtual]`

Return edge pointer.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

29.143.3.14 `shared_ptr<FaceConnectivity<ftEdgeBase>> Go::ftEdgeBase::getConnectivityInfo ( ) [inline]`

Fetch the continuity information regarding the joint between the face corresponding to this edge and the adjacent face along this edge

Definition at line 181 of file ftEdgeBase.h.

29.143.3.15 `bool Go::ftEdgeBase::hasConnectivityInfo ( ) [inline]`

Check if this edge has access to continuity information regarding the joint between the face corresponding to this edge and the adjacent face along this edge

Definition at line 174 of file ftEdgeBase.h.

29.143.3.16 `virtual bool Go::ftEdgeBase::isReversed ( ) [pure virtual]`

Get the value of the flag indicating that the orientation of the edge is reversed with respect to the parametrization of the underlying [ParamCurve](#).

Returns

*true* if orientation is reversed, *false* otherwise

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

29.143.3.17 `ftEdgeBase* Go::ftEdgeBase::next ( )`

Next edge in the edge loop.

29.143.3.18 `virtual Go::Point Go::ftEdgeBase::normal ( double t ) const [pure virtual]`

Evaluate normal of associated face.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

29.143.3.19 `virtual Go::Point Go::ftEdgeBase::normal ( double t, Go::Point & face_par_pt, double * face_seed ) const [pure virtual]`

Evaluate normal of associated face given a seed to the search for the corresponding face parameter

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

29.143.3.20 `bool Go::ftEdgeBase::onBoundary ( ) [inline]`

Check if this edge lies on the boundary of the associated face set, i.e. it has no neighbour

Definition at line 140 of file ftEdgeBase.h.

29.143.3.21 `virtual bool Go::ftEdgeBase::orientationOK ( ) const` [virtual]

Compare orientation of curve and edge.

Reimplemented in [Go::ftEdge](#).

29.143.3.22 `virtual Go::Point Go::ftEdgeBase::point ( double t ) const` [pure virtual]

Evaluate position.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

29.143.3.23 `ftEdgeBase* Go::ftEdgeBase::prev ( )`

Previous edge in the edge loop.

29.143.3.24 `void Go::ftEdgeBase::resetConnectivityInfo ( )` [inline]

Mark the connectivity information associated to this edge as outdated.

Definition at line 194 of file `ftEdgeBase.h`.

29.143.3.25 `void Go::ftEdgeBase::setConnectivityInfo ( shared_ptr< FaceConnectivity< ftEdgeBase > > info )`  
[inline]

Store the continuity information regarding the joint between the face corresponding to this edge and the adjacent face along this edge

Definition at line 188 of file `ftEdgeBase.h`.

29.143.3.26 `virtual void Go::ftEdgeBase::setEntryId ( int id )` [pure virtual]

Set id of edge.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

29.143.3.27 `virtual void Go::ftEdgeBase::setFace ( ftFaceBase * face )` [pure virtual]

Set face pointer.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

29.143.3.28 `virtual void Go::ftEdgeBase::setReversed ( bool is_reversed )` [pure virtual]

Set a flag to indicate that the orientation of the edge is reversed with respect to the parametrization of the underlying [ParamCurve](#).

## Parameters

|                    |                               |
|--------------------|-------------------------------|
| <i>is_reversed</i> | value of the orientation flag |
|--------------------|-------------------------------|

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

**29.143.3.29** `virtual ftEdgeBase* Go::ftEdgeBase::split ( double t ) [pure virtual]`

Split the edge at the given parameter t. This edge will then represent the first part of the original edge, the second part is returned to the caller.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

**29.143.3.30** `virtual Go::Point Go::ftEdgeBase::tangent ( double t ) const [pure virtual]`

Evaluate tangent.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

**29.143.3.31** `virtual double Go::ftEdgeBase::tMax ( ) const [pure virtual]`

End parameter value of edge.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

**29.143.3.32** `virtual double Go::ftEdgeBase::tMin ( ) const [pure virtual]`

Start parameter value of edge.

Implemented in [Go::ftEdge](#), and [Go::ftSSfEdge](#).

**29.143.3.33** `ftEdgeBase* Go::ftEdgeBase::twin ( )`

The corresponding edge on the neighbouring face. If no such neighbour exists, the function returns null.

## 29.143.4 Member Data Documentation

**29.143.4.1** `shared_ptr<FaceConnectivity<ftEdgeBase>> Go::ftEdgeBase::connectivity_info_ [protected]`

Definition at line 204 of file ftEdgeBase.h.

**29.143.4.2** `ftEdgeBase* Go::ftEdgeBase::next_ [protected]`

Definition at line 201 of file ftEdgeBase.h.

29.143.4.3 `ftEdgeBase*` `Go::ftEdgeBase::prev_` [protected]

Definition at line 202 of file `ftEdgeBase.h`.

29.143.4.4 `ftEdgeBase*` `Go::ftEdgeBase::twin_` [protected]

Definition at line 203 of file `ftEdgeBase.h`.

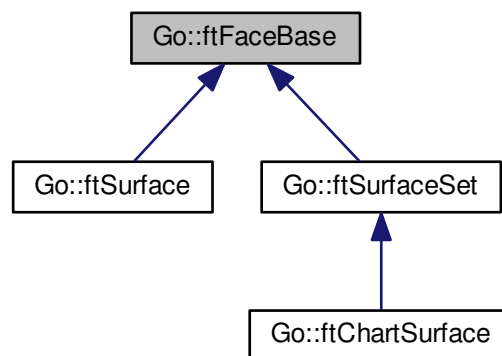

The documentation for this class was generated from the following file:

### 29.144.1 Detailed Description

`ftFaceBase` - An abstract interface to a topological face

Definition at line 60 of file `ftFaceBase.h`.

### 29.144.2 Constructor & Destructor Documentation

#### 29.144.2.1 Go::ftFaceBase::ftFaceBase ( )

Constructor.

#### 29.144.2.2 Go::ftFaceBase::ftFaceBase ( int id )

Constructor.

29.144.2.3 virtual `Go::ftFaceBase::~~ftFaceBase ( )` [virtual]

Destructor.

### 29.144.3 Member Function Documentation

29.144.3.1 virtual `ftSurface* Go::ftFaceBase::asFtSurface ( )` [virtual]

Reimplemented in [Go::ftSurface](#).

29.144.3.2 virtual `BoundingBox Go::ftFaceBase::boundingBox ( )` [pure virtual]

The bounding box corresponding to this face.

Implemented in [Go::ftSurface](#), and [Go::ftSurfaceSet](#).

29.144.3.3 virtual `void Go::ftFaceBase::clearInitialEdges ( )` [inline],[virtual]

Reset loop information.

Reimplemented in [Go::ftSurface](#).

Definition at line 74 of file `ftFaceBase.h`.

29.144.3.4 virtual `void Go::ftFaceBase::closestPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon ) const` [pure virtual]

Closest point between this face and a point.

Implemented in [Go::ftSurface](#), and [Go::ftSurfaceSet](#).

29.144.3.5 virtual `std::vector<shared_ptr<ftEdgeBase>> Go::ftFaceBase::createInitialEdges ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON, double kink = 0.00015, bool no_split = false )` [pure virtual]

Compute the edges associated to this face or fetch already existing edges

Implemented in [Go::ftSurface](#), [Go::ftChartSurface](#), and [Go::ftSurfaceSet](#).

29.144.3.6 virtual `ftMessage Go::ftFaceBase::createSurf ( double & max_error, double & mean_error )` [pure virtual]

Make sure that a geometric surface exists. Not applicable in normal configurations

Implemented in [Go::ftSurface](#), [Go::ftSurfaceSet](#), and [Go::ftChartSurface](#).

29.144.3.7 `virtual void Go::ftFaceBase::getError ( double & max_error, double & mean_error ) [pure virtual]`

Fetch the error due to approximations in createSurf. Not applicable in normal configurations

Implemented in [Go::ftSurface](#), [Go::ftSurfaceSet](#), and [Go::ftChartSurface](#).

29.144.3.8 `virtual int Go::ftFaceBase::getId ( ) [virtual]`

Return id, default id is -1.

Reimplemented in [Go::ftSurface](#), and [Go::ftSurfaceSet](#).

29.144.3.9 `virtual ftTangPriority Go::ftFaceBase::getPrioType ( ) const [pure virtual]`

Priority of current face. Not applicable in normal configurations.

Implemented in [Go::ftSurface](#), [Go::ftSurfaceSet](#), and [Go::ftChartSurface](#).

29.144.3.10 `virtual void Go::ftFaceBase::isolateFace ( ) [inline],[virtual]`

Remove all adjacency information related to this face.

Reimplemented in [Go::ftSurface](#).

Definition at line 116 of file ftFaceBase.h.

29.144.3.11 `virtual Point Go::ftFaceBase::normal ( double u, double v ) const [pure virtual]`

Evaluate surface normal.

Implemented in [Go::ftSurface](#), [Go::ftChartSurface](#), and [Go::ftSurfaceSet](#).

29.144.3.12 `virtual Point Go::ftFaceBase::point ( double u, double v ) const [pure virtual]`

Evaluate point on face.

Implemented in [Go::ftSurface](#), [Go::ftSurfaceSet](#), and [Go::ftChartSurface](#).

29.144.3.13 `virtual ftMessage Go::ftFaceBase::removeGap ( ftEdgeBase * e1, ftEdgeBase * e2, ftFaceBase * other ) [inline],[virtual]`

Close gap between adjacent faces.

Definition at line 123 of file ftFaceBase.h.

29.144.3.14 `virtual void Go::ftFaceBase::setId ( int id ) [virtual]`

Set id for this face.

Reimplemented in [Go::ftSurface](#), and [Go::ftSurfaceSet](#).

29.144.3.15 `virtual std::vector<shared_ptr<ftEdgeBase>> Go::ftFaceBase::startEdges ( ) [pure virtual]`

Return pointers to first part of all bd cvs.

Implemented in [Go::ftSurface](#), and [Go::ftSurfaceSet](#).

29.144.3.16 `virtual shared_ptr<ParamSurface> Go::ftFaceBase::surface ( ) [pure virtual]`

Fetch geometric surface.

Implemented in [Go::ftSurface](#), and [Go::ftSurfaceSet](#).

29.144.3.17 `virtual void Go::ftFaceBase::updateBoundaryLoops ( shared_ptr< ftEdgeBase > new_edge ) [virtual]`

Update the boundary loops corresponding to this face with a new edge, i.e. one edge is split and all related topology information must be updated accordingly

Reimplemented in [Go::ftSurface](#).

## 29.144.4 Member Data Documentation

29.144.4.1 `int Go::ftFaceBase::id_ [protected]`

Definition at line 137 of file `ftFaceBase.h`.

The documentation for this class was generated from the following file:

- `compositemodel/include/GoTools/compositemodel/ftFaceBase.h`

## 29.145 Go::ftGraphEdge Class Reference

```
#include <ftPlanarGraph.h>
```

## Public Member Functions

- [ftGraphEdge \( \)](#)  
*Constructor.*
- [ftGraphEdge \(ftSurfaceSetPoint \\*&lower, ftSurfaceSetPoint \\*&upper\)](#)
- [~ftGraphEdge \( \)](#)  
*Destructor.*
- [double startparam \( \) const](#)
- [double endparam \( \) const](#)
- [Vector2D startPoint \( \) const](#)
- [Vector2D endPoint \( \) const](#)
- [Vector2D point \(double v\\_par\)](#)
- [Vector2D point \(double v\\_par, shared\\_ptr< ftFaceBase > face\)](#)  
*Return parameter point in domain of face, given by its's v\_par on graph edge.*
- [const std::vector< shared\\_ptr< ftFaceBase > > & getFaces \( \) const](#)  
*Return the face(s) to which the edge belongs.*
- [Vector2D lower \( \) const](#)
- [Vector2D upper \( \) const](#)

### 29.145.1 Detailed Description

Edge is defined by two end points. The face(s) to which it belongs is also known. y-value of startpoint() is less than that of endpoint().

Definition at line 39 of file ftPlanarGraph.h.

### 29.145.2 Constructor & Destructor Documentation

#### 29.145.2.1 Go::ftGraphEdge::ftGraphEdge ( )

Constructor.

#### 29.145.2.2 Go::ftGraphEdge::ftGraphEdge ( ftSurfaceSetPoint \*& lower, ftSurfaceSetPoint \*& upper )

#### 29.145.2.3 Go::ftGraphEdge::~~ftGraphEdge ( )

Destructor.

### 29.145.3 Member Function Documentation

#### 29.145.3.1 double Go::ftGraphEdge::endparam ( ) const

#### 29.145.3.2 Vector2D Go::ftGraphEdge::endPoint ( ) const

#### 29.145.3.3 const std::vector<shared\_ptr<ftFaceBase> > & Go::ftGraphEdge::getFaces ( ) const

Return the face(s) to which the edge belongs.

29.145.3.4 **Vector2D** `Go::ftGraphEdge::lower ( ) const`

29.145.3.5 **Vector2D** `Go::ftGraphEdge::point ( double v_par )`

29.145.3.6 **Vector2D** `Go::ftGraphEdge::point ( double v_par, shared_ptr< ftFaceBase > face )`

Return parameter point in domain of face, given by its's v\_par on graph edge.

29.145.3.7 **double** `Go::ftGraphEdge::startparam ( ) const`

29.145.3.8 **Vector2D** `Go::ftGraphEdge::startPoint ( ) const`

29.145.3.9 **Vector2D** `Go::ftGraphEdge::upper ( ) const`

The documentation for this class was generated from the following file:

- [compositemodel/include/GoTools/compositemodel/ftPlanarGraph.h](#)

## 29.146 Go::ftGroupGeom Class Reference

A group of geometrical objects.

```
#include <ftGroupGeom.h>
```

### Public Member Functions

- [ftGroupGeom](#) ( )
- [~ftGroupGeom](#) ( )
- [shared\\_ptr< GeomObject > operator\[\]](#) (int idx) const  
*Fetch object number idx.*
- int [size](#) ( ) const  
*The number of objects in the group.*
- [ftTangPriority](#) [getType](#) ( ) const
- void [setType](#) (ftTangPriority type)
- void [addGeomObj](#) (shared\_ptr< [GeomObject](#) > obj)  
*Add a new geometry entity to the group.*

### Protected Attributes

- std::vector< shared\_ptr< [GeomObject](#) > > [geomobj\\_](#)
- [ftTangPriority](#) type\_

#### 29.146.1 Detailed Description

A group of geometrical objects.

Definition at line 53 of file [ftGroupGeom.h](#).

## 29.146.2 Constructor & Destructor Documentation

### 29.146.2.1 Go::ftGroupGeom::ftGroupGeom ( ) `[inline]`

Definition at line 57 of file ftGroupGeom.h.

### 29.146.2.2 Go::ftGroupGeom::~~ftGroupGeom ( ) `[inline]`

Definition at line 62 of file ftGroupGeom.h.

## 29.146.3 Member Function Documentation

### 29.146.3.1 void Go::ftGroupGeom::addGeomObj ( shared\_ptr< GeomObject > *obj* ) `[inline]`

Add a new geometry entity to the group.

Definition at line 86 of file ftGroupGeom.h.

### 29.146.3.2 ftTangPriority Go::ftGroupGeom::getType ( ) const `[inline]`

Whether the group of objects (surfaces) are a master, a slave or not specified. Related to tangent plane continuity between groups of surfaces

Definition at line 76 of file ftGroupGeom.h.

### 29.146.3.3 shared\_ptr<GeomObject> Go::ftGroupGeom::operator[] ( int *idx* ) const `[inline]`

Fetch object number *idx*.

Definition at line 66 of file ftGroupGeom.h.

### 29.146.3.4 void Go::ftGroupGeom::setType ( ftTangPriority *type* ) `[inline]`

Set whether the group of objects (surfaces) are a master, a slave or not specified. Related to tangent plane continuity between groups of surfaces

Definition at line 82 of file ftGroupGeom.h.

### 29.146.3.5 int Go::ftGroupGeom::size ( ) const `[inline]`

The number of objects in the group.

Definition at line 70 of file ftGroupGeom.h.

## 29.146.4 Member Data Documentation

29.146.4.1 `std::vector<shared_ptr<GeomObject>>` `Go::ftGroupGeom::geomobj_` [protected]

Definition at line 91 of file `ftGroupGeom.h`.

29.146.4.2 `ftTangPriority` `Go::ftGroupGeom::type_` [protected]

Definition at line 92 of file `ftGroupGeom.h`.

The documentation for this class was generated from the following file:

- `igeslib/include/GoTools/igeslib/ftGroupGeom.h`

## 29.147 Go::ftLine Class Reference

```
#include <ftLine.h>
```

Collaboration diagram for `Go::ftLine`:

### Public Member Functions

- `ftLine ()`  
*Default constructor.*
- `ftLine (const Point &dir, const Point &pnt)`
- `~ftLine ()`  
*Destructor.*
- `void getTwoPlanes (ftPlane &plane1, ftPlane &plane2) const`  
*Find two planes intersecting in this line.*
- `bool closeToScaledPoint (const Point &pt, const Point &scale, double dist2) const`
- `ftLine scaled (const Point &scale) const`  
*Return a new line corresponding to this line after a rescaling of the coordinates.*
- `bool intersectsSphereOfBox (const BoundingBox &box) const`
- `bool intersectsBox (const BoundingBox &box) const`  
*Determine if the line intersects a box.*
- `bool planesIntersectBox (const BoundingBox &box) const`
- `const Point &direction () const`  
*The direction of this line.*
- `const Point &point () const`  
*A point on this line.*

## Protected Attributes

- [Point dir\\_](#)
- [Point point\\_](#)

### 29.147.1 Detailed Description

[ftLine](#) - A line

Definition at line 59 of file ftLine.h.

### 29.147.2 Constructor & Destructor Documentation

#### 29.147.2.1 `Go::ftLine::ftLine ( )` [inline]

Default constructor.

Definition at line 70 of file ftLine.h.

#### 29.147.2.2 `Go::ftLine::ftLine ( const Point & dir, const Point & pnt )` [inline]

Constructor. First parameter is a vector normal to the plane, second parameter is a point in the plane.

Definition at line 76 of file ftLine.h.

#### 29.147.2.3 `Go::ftLine::~~ftLine ( )`

Destructor.

### 29.147.3 Member Function Documentation

#### 29.147.3.1 `bool Go::ftLine::closeToScaledPoint ( const Point & pt, const Point & scale, double dist2 ) const`

Determine if this line comes close enough to a given point after a rescaling of pt's coordinates

#### 29.147.3.2 `const Point& Go::ftLine::direction ( ) const` [inline]

The direction of this line.

Definition at line 108 of file ftLine.h.

#### 29.147.3.3 `void Go::ftLine::getTwoPlanes ( ftPlane & plane1, ftPlane & plane2 ) const`

Find two planes intersecting in this line.

29.147.3.4 **bool** Go::ftLine::intersectsBox ( **const** BoundingBox & *box* ) **const**

Determine if the line intersects a box.

29.147.3.5 **bool** Go::ftLine::intersectsSphereOfBox ( **const** BoundingBox & *box* ) **const**

Determine if the line intersects the smallest eliposide containing a box Is about 2 times faster than intersectsBox, but returns true about 50% more often than intersectsBox

29.147.3.6 **bool** Go::ftLine::planesIntersectBox ( **const** BoundingBox & *box* ) **const**

Determine if two surfaces of the line intersect a box Returns true about 45% more often than intersectsBox

29.147.3.7 **const Point&** Go::ftLine::point ( ) **const** [inline]

A point on this line.

Definition at line 110 of file ftLine.h.

29.147.3.8 **ftLine** Go::ftLine::scaled ( **const** Point & *scale* ) **const**

Return a new line corresponding to this line after a rescaling of the coordinates.

## 29.147.4 Member Data Documentation

29.147.4.1 **Point** Go::ftLine::dir\_ [protected]

Definition at line 65 of file ftLine.h.

29.147.4.2 **Point** Go::ftLine::point\_ [protected]

Definition at line 66 of file ftLine.h.

The documentation for this class was generated from the following file:

- [compositemodel/include/GoTools/compositemodel/ftLine.h](#)

## 29.148 Go::ftMessage Class Reference

```
#include <ftMessage.h>
```

## Public Member Functions

- [ftMessage](#) ()  
*Constructor.*
- [ftMessage](#) ([ftmessages](#) message)  
*Constructor.*
- [~ftMessage](#) ()  
*Destructor.*
- void [setError](#) ([ftmessages](#) error)  
*Set message.*
- void [addWarning](#) ([ftmessages](#) warning)  
*Add a warning.*
- bool [isOk](#) ()  
*Check for error and warning messages.*
- [ftmessages](#) [getMessage](#) ()  
*Return current message.*
- int [noOfWarnings](#) ()  
*Check number of warnings.*
- [ftmessages](#) [getWarning](#) (int i)  
*Return requested warning.*

### 29.148.1 Detailed Description

[ftMessage](#) - Error and warning messages. Used only in some contexts

Definition at line 92 of file [ftMessage.h](#).

### 29.148.2 Constructor & Destructor Documentation

#### 29.148.2.1 [Go::ftMessage::ftMessage](#) ( ) [[inline](#)]

Constructor.

Definition at line 97 of file [ftMessage.h](#).

#### 29.148.2.2 [Go::ftMessage::ftMessage](#) ( [ftmessages](#) message ) [[inline](#)]

Constructor.

Definition at line 102 of file [ftMessage.h](#).

#### 29.148.2.3 [Go::ftMessage::~ftMessage](#) ( ) [[inline](#)]

Destructor.

Definition at line 107 of file [ftMessage.h](#).

### 29.148.3 Member Function Documentation

29.148.3.1 `void Go::ftMessage::addWarning ( ftmessages warning )` [inline]

Add a warning.

Definition at line 114 of file `ftMessage.h`.

29.148.3.2 `ftmessages Go::ftMessage::getMessage ( )` [inline]

Return current message.

Definition at line 123 of file `ftMessage.h`.

29.148.3.3 `ftmessages Go::ftMessage::getWarning ( int i )` [inline]

Return requested warning.

Definition at line 131 of file `ftMessage.h`.

29.148.3.4 `bool Go::ftMessage::isOK ( )` [inline]

Check for error and warning messages.

Definition at line 119 of file `ftMessage.h`.

29.148.3.5 `int Go::ftMessage::noOfWarnings ( )` [inline]

Check number of warnings.

Definition at line 127 of file `ftMessage.h`.

29.148.3.6 `void Go::ftMessage::setError ( ftmessages error )` [inline]

Set message.

Definition at line 110 of file `ftMessage.h`.

The documentation for this class was generated from the following file:

- [compositemodel/include/GoTools/compositemodel/ftMessage.h](#)

### 29.149 Go::ftPlanarGraph Class Reference

```
#include <ftPlanarGraph.h>
```

## Public Member Functions

- [ftPlanarGraph](#) ()  
*Constructor.*
- [ftPlanarGraph](#) (std::vector< [ftSamplePoint](#) \* > &nodes)
- [~ftPlanarGraph](#) ()  
*Destructor.*
- void [setGraph](#) (std::vector< [ftSamplePoint](#) \* > &nodes)
- shared\_ptr< [ftFaceBase](#) > [locateInGraph](#) (double u, double v) **const**  
*Given input of parameter points, return the corresponding ftFaceBase.*
- void [getLocalParameters](#) (double &u, double &v, shared\_ptr< [ftFaceBase](#) > &face) **const**

### 29.149.1 Detailed Description

The chosen structure of graph is, in essence, taken from "Computational Geometry, 2.2.2.1, F. P. Preparata & M. I. Shamos, 1985", and is well suited for fast searching of points inside graph.

Definition at line 123 of file ftPlanarGraph.h.

### 29.149.2 Constructor & Destructor Documentation

#### 29.149.2.1 Go::ftPlanarGraph::ftPlanarGraph ( )

Constructor.

#### 29.149.2.2 Go::ftPlanarGraph::ftPlanarGraph ( std::vector< ftSamplePoint \* > & nodes )

Warning! points are really of type ftSurfaceSetPoint! We cast... We expect that every pair of points differ in their parameter values.

#### 29.149.2.3 Go::ftPlanarGraph::~~ftPlanarGraph ( )

Destructor.

### 29.149.3 Member Function Documentation

#### 29.149.3.1 void Go::ftPlanarGraph::getLocalParameters ( double & u, double & v, shared\_ptr< ftFaceBase > & face ) **const**

Return local parameter values in corresponding patch. We locate a bounding trapezoid inside a patch, and then make a qualified guess from corner values.

#### 29.149.3.2 shared\_ptr<ftFaceBase> Go::ftPlanarGraph::locateInGraph ( double u, double v ) **const**

Given input of parameter points, return the corresponding [ftFaceBase](#).

29.149.3.3 void Go::ftPlanarGraph::setGraph ( std::vector< ftSamplePoint \* > & nodes )

Warning! points are really of type ftSurfaceSetPoint! We cast... We expect that every pair of points differ in their parameter values. We only use those points which are on a subsurface-boundary.

The documentation for this class was generated from the following file:

- [compositemodel/include/GoTools/compositemodel/ftPlanarGraph.h](#)

## 29.150 Go::ftPlane Class Reference

#### 29.152.1 Detailed Description

[ftPointSet](#) - A set of sample points used as data in surface approximation

Definition at line 181 of file [ftPointSet.h](#).

#### 29.152.2 Constructor & Destructor Documentation

##### 29.152.2.1 Go::ftPointSet::ftPointSet ( )

Constructor.

##### 29.152.2.2 virtual Go::ftPointSet::~~ftPointSet ( ) [virtual]

Destructor.

### 29.152.3 Member Function Documentation

29.152.3.1 `PointIter Go::ftPointSet::addEntry ( shared_ptr< ftSamplePoint > point ) [inline]`

Add a new point to the point set.

Definition at line 209 of file ftPointSet.h.

29.152.3.2 `void Go::ftPointSet::append ( shared_ptr< ftPointSet > triang )`

Extend the point set with points from another set. Avoid points with no connectivity

29.152.3.3 `void Go::ftPointSet::checkAndUpdateTriangCorners ( )`

Avoid boundary points being connected to three other boundary points.

29.152.3.4 `void Go::ftPointSet::cleanNodeIdentity ( double tol )`

Remove identical boundary nodes.

29.152.3.5 `void Go::ftPointSet::computeDist ( shared_ptr< ParamSurface > surf )`

Compute the distances from the points in the point set to the given surface.

29.152.3.6 `void Go::ftPointSet::computeDistAndRepar ( shared_ptr< ParamSurface > surf )`

Compute the distances from the points in the point set to the given surface, and reparametrize.

29.152.3.7 `void Go::ftPointSet::computeParametricDist ( shared_ptr< ParamSurface > surf )`

Compute the distances from the points in the point set to the given surface, at the same parameter value.

29.152.3.8 `virtual Vector3D Go::ftPointSet::get3dNode ( int i ) const [virtual]`

Get content of point number i.

Implements [PrOrganizedPoints](#).

29.152.3.9 `double Go::ftPointSet::getMaxDist ( ) const`

Return the maximum distance in the pointset.

29.152.3.10 `double Go::ftPointSet::getMeanDist ( ) const`

Return the medium distance in the pointset.

29.152.3.11 `virtual void Go::ftPointSet::getNeighbours ( int i, std::vector< int > & neighbours ) const [virtual]`

Fetch all neighbours to point number i.

Implements [PrOrganizedPoints](#).

29.152.3.12 `virtual int Go::ftPointSet::getNumNodes ( ) const [virtual]`

Number of points in point set.

Implements [PrOrganizedPoints](#).

29.152.3.13 `void Go::ftPointSet::getOrientedTriangles ( std::vector< std::vector< int > > & triangles )`

Fetch all triangles in the connectivity graph and make sure that the triangle orientation is consistent, i.e. opposite directions of edges between the same two nodes

29.152.3.14 `void Go::ftPointSet::getPoints ( std::vector< Vector3D > & positions ) const`

Get the position of all points.

29.152.3.15 `void Go::ftPointSet::getTriangles ( std::vector< std::vector< int > > & triangles ) const`

Fetch all triangles in the connectivity graph.

29.152.3.16 `virtual double Go::ftPointSet::getU ( int i ) const [virtual]`

Fetch 1. parameter of point number i.

Implements [PrOrganizedPoints](#).

29.152.3.17 `virtual double Go::ftPointSet::getV ( int i ) const [virtual]`

Fetch 2. parameter of point number i.

Implements [PrOrganizedPoints](#).

29.152.3.18 `void Go::ftPointSet::identifyBdPnts ( std::vector< Point > & points, std::vector< int > & pnt_ix )`

Fetch index of specified points at the boundary (closest to given point)

29.152.3.19 `virtual bool Go::ftPointSet::isBoundary ( int i ) const [virtual]`

Check if point number *i* lies at the boundary of the point set.

Implements [PrOrganizedPoints](#).

29.152.3.20 `PointIter Go::ftPointSet::lastAdded ( ) [inline]`

Mark the last point added to this point set.

Definition at line 234 of file `ftPointSet.h`.

29.152.3.21 `void Go::ftPointSet::mergeBoundary ( shared_ptr< ftFaceBase > face1, int range1_idx1, int range1_idx2, shared_ptr< ftFaceBase > face2, int range2_idx1, int range2_idx2, double eps )`

Given two faces, rearrange points on the common boundary between these two faces

29.152.3.22 `ftSamplePoint* Go::ftPointSet::operator[] ( int idx ) [inline]`

Operator overload [].

Definition at line 196 of file `ftPointSet.h`.

29.152.3.23 `const ftSamplePoint* Go::ftPointSet::operator[] ( int idx ) const [inline]`

Operator overload [].

Definition at line 203 of file `ftPointSet.h`.

29.152.3.24 `void Go::ftPointSet::orderNeighbours ( )`

Reorganize the sequence of neighbours.

29.152.3.25 `void Go::ftPointSet::printPoints ( std::ostream & os ) const`

Debug.

29.152.3.26 `void Go::ftPointSet::removePoint ( PointIter point )`

Remove a point from the point set.

29.152.3.27 `double Go::ftPointSet::reparBdy ( shared_ptr< ParamSurface > surf, bool use_seed = true )`

Reparameterize points at the boundary of the point set.

29.152.3.28 `double Go::ftPointSet::reparInnerPoints ( shared_ptr< ParamSurface > surf, bool use_seed = true )`

Reparameterize points in the inner of the point set.

29.152.3.29 `virtual void Go::ftPointSet::set3dNode ( int i, const Vector3D & p ) [virtual]`

Change content on point number i.

29.152.3.30 `void Go::ftPointSet::setFirst ( PointIter point ) [inline]`

Mark the first point around the boundary of this point set.

Definition at line 222 of file ftPointSet.h.

29.152.3.31 `void Go::ftPointSet::setSecond ( PointIter point ) [inline]`

Mark the second point around the boundary of this point set.

Definition at line 228 of file ftPointSet.h.

29.152.3.32 `virtual void Go::ftPointSet::setU ( int i, double u ) [virtual]`

Set 1. parameter of point number i.

Implements [PrOrganizedPoints](#).

29.152.3.33 `virtual void Go::ftPointSet::setV ( int i, double v ) [virtual]`

Set 2. parameter of point number i.

Implements [PrOrganizedPoints](#).

29.152.3.34 `int Go::ftPointSet::size ( ) const [inline]`

Get the number of points.

Definition at line 192 of file ftPointSet.h.

29.152.3.35 `void Go::ftPointSet::write ( std::ostream & os ) const`

Write point set to stream.

29.152.3.36 `void Go::ftPointSet::write2D ( std::ostream & os ) const`

Write parameter points to stream.

## 29.152.4 Member Data Documentation

29.152.4.1 `PointIter Go::ftPointSet::first_ [protected]`

Definition at line 326 of file `ftPointSet.h`.

29.152.4.2 `std::vector<PointIter> Go::ftPointSet::index_to_iter_ [protected]`

Definition at line 324 of file `ftPointSet.h`.

29.152.4.3 `bool Go::ftPointSet::nb_ordered_ [mutable], [protected]`

Definition at line 325 of file `ftPointSet.h`.

29.152.4.4 `PointList Go::ftPointSet::points_ [protected]`

Definition at line 323 of file `ftPointSet.h`.

29.152.4.5 `PointIter Go::ftPointSet::second_ [protected]`

Definition at line 327 of file `ftPointSet.h`.

### 29.153.1 Detailed Description

[ftSamplePoint](#) - One point in a set of sample points

Definition at line 69 of file ftPointSet.h.

### 29.153.2 Constructor & Destructor Documentation

#### 29.153.2.1 Go::ftSamplePoint::ftSamplePoint ( **Vector3D** *xyz*, int *bn* )

Constructor.

#### 29.153.2.2 virtual Go::ftSamplePoint::~ftSamplePoint ( ) [inline],[virtual]

Destructor.

Definition at line 76 of file ftPointSet.h.

### 29.153.3 Member Function Documentation

#### 29.153.3.1 void Go::ftSamplePoint::addNeighbour ( **PointIter** *next* )

Add a new neighbouring point.

#### 29.153.3.2 virtual **ftSurfaceSetPoint\*** Go::ftSamplePoint::asSurfaceSetPoint ( ) [inline],[virtual]

Return pointer to sub class entity if the point is of that type.

Reimplemented in [Go::ftSurfaceSetPoint](#).

Definition at line 97 of file ftPointSet.h.

#### 29.153.3.3 virtual **bool** Go::ftSamplePoint::containsFace ( **ftFaceBase** \* *face* ) const [inline],[virtual]

Check if a face is associated this point.

Reimplemented in [Go::ftSurfaceSetPoint](#).

Definition at line 103 of file ftPointSet.h.

#### 29.153.3.4 void Go::ftSamplePoint::getAttachedTriangles ( **std::vector**< **std::vector**< int > > & *triangles* ) const

Fetch all triangles containing this point.

29.153.3.5 **double** Go::ftSamplePoint::getDist ( ) const [inline]

Return distance.

Definition at line 142 of file ftPointSet.h.

29.153.3.6 **PointIter** Go::ftSamplePoint::getFirstNeighbour ( ) [inline]

Get first neighbour.

Definition at line 150 of file ftPointSet.h.

29.153.3.7 **int** Go::ftSamplePoint::getIndex ( ) const [inline]

Return index.

Definition at line 145 of file ftPointSet.h.

29.153.3.8 **const** std::vector<PointIter>& Go::ftSamplePoint::getNeighbours ( ) const [inline]

Fetch all neighbouring points.

Definition at line 123 of file ftPointSet.h.

29.153.3.9 **int** Go::ftSamplePoint::getNmbNeighbour ( ) const [inline]

Get number of neighbours.

Definition at line 120 of file ftPointSet.h.

29.153.3.10 **Vector2D** Go::ftSamplePoint::getPar ( ) const [inline]

Return parameter value.

Definition at line 139 of file ftPointSet.h.

29.153.3.11 **Vector3D** Go::ftSamplePoint::getPoint ( ) const [inline]

Return 3D point value.

Definition at line 136 of file ftPointSet.h.

29.153.3.12 **bool** Go::ftSamplePoint::isConnected ( PointIter *pnt* ) [inline]

Check if the point *pnt* is a neighbour to this point.

Definition at line 127 of file ftPointSet.h.

29.153.3.13 **bool** Go::ftSamplePoint::isOnBoundary ( ) const [inline]

Am I on the boundary?

Definition at line 114 of file ftPointSet.h.

29.153.3.14 **bool** Go::ftSamplePoint::isOnSubSurfaceBoundary ( ) const [inline]

Am I on sub surface boundary?

Definition at line 117 of file ftPointSet.h.

29.153.3.15 **void** Go::ftSamplePoint::orderNeighbours ( ftSamplePoint \* *nextpoint*, **bool** *forward* )

Order the neighbours for one given point.

29.153.3.16 **double** Go::ftSamplePoint::pntDist ( ftSamplePoint \* *other* ) const

Distance between sample points.

29.153.3.17 **void** Go::ftSamplePoint::removeNeighbour ( PointIter *neighbour* )

If neighbour exists it is removed from neighbour vector.

29.153.3.18 **void** Go::ftSamplePoint::setBoundary ( int *bd\_info* ) [inline]

Set boundary information.

Definition at line 91 of file ftPointSet.h.

29.153.3.19 **void** Go::ftSamplePoint::setDist ( double *d* ) [inline]

Set dist.

Definition at line 85 of file ftPointSet.h.

29.153.3.20 **void** Go::ftSamplePoint::setIndex ( int *i* ) [inline]

Set index.

Definition at line 88 of file ftPointSet.h.

29.153.3.21 `void Go::ftSamplePoint::setPar ( Vector2D uv ) [inline]`

Set parameter value.

Definition at line 82 of file `ftPointSet.h`.

29.153.3.22 `void Go::ftSamplePoint::setPoint ( Vector3D xyz ) [inline]`

Set point.

Definition at line 79 of file `ftPointSet.h`.

29.153.3.23 `virtual void Go::ftSamplePoint::write2Dval ( std::ostream & os ) const [virtual]`

Debug.

Reimplemented in [Go::ftSurfaceSetPoint](#).

#### 29.153.4 Member Data Documentation

29.153.4.1 `int Go::ftSamplePoint::at_boundary_ [protected]`

Definition at line 168 of file `ftPointSet.h`.

29.153.4.2 `double Go::ftSamplePoint::dist_ [protected]`

Definition at line 166 of file `ftPointSet.h`.

29.153.4.3 `int Go::ftSamplePoint::index_ [protected]`

Definition at line 167 of file `ftPointSet.h`.

29.153.4.4 `std::vector<PointIter> Go::ftSamplePoint::next_ [protected]`

Definition at line 170 of file `ftPointSet.h`.

29.153.4.5 `Vector2D Go::ftSamplePoint::uv_ [protected]`

- `int seem_[2]`

### 29.155.1 Detailed Description

`ftSmoothSurf` - Surface smoothing and approximation. Interface to `SmoothSurf` in `gotools-core/creators`. An iterative process with parameter iteration and refinement of the initial surface with respect to approximation errors at each step.

Definition at line 61 of file `ftSmoothSurf.h`.

### 29.155.2 Constructor & Destructor Documentation

29.155.2.1 `Go::ftSmoothSurf::ftSmoothSurf ( shared_ptr< SplineSurface > surf, double approx_tol, double approx_orig_tol, std::vector< int > ccw_edge_derivs, int maxiter, bool lock_corner_points = false )`

Constructor

Parameters

|                           |                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>surf</i>               | initial surface                                                                                                                                   |
| <i>approx_tol</i>         | tolerance in point approximation                                                                                                                  |
| <i>approx_orig_tol</i>    | allowed deviance from the original surface                                                                                                        |
| <i>ccw_edge_derivs</i>    | number of derivatives to keep fixed along the boundaries, sequence: <code>umin</code> , <code>vmax</code> , <code>umax</code> , <code>vmin</code> |
| <i>maxiter</i>            | maximum allowed number of iterations in approximation                                                                                             |
| <i>lock_corner_points</i> | indicates if the surface corners are fixed                                                                                                        |

29.155.2.2 `Go::ftSmoothSurf::~~ftSmoothSurf ( )`

Destructor.

### 29.155.3 Member Function Documentation

29.155.3.1 `double Go::ftSmoothSurf::getApproxWeight ( ) [inline]`

Fetch weight on point approximation.

Definition at line 101 of file `ftSmoothSurf.h`.

29.155.3.2 `void Go::ftSmoothSurf::getError ( double & max_error, double & mean_error ) [inline]`

Fetch maximum and average error in approximation.

Definition at line 105 of file ftSmoothSurf.h.

29.155.3.3 `void Go::ftSmoothSurf::refineSurf ( ftPointSet & points, bool reparam = true )`

Express the surface to be modified on a refined knot vector.

29.155.3.4 `void Go::ftSmoothSurf::setApproxWeight ( double weight ) [inline]`

Weight on point approximation.

Definition at line 97 of file ftSmoothSurf.h.

29.155.3.5 `void Go::ftSmoothSurf::setSmoothU ( int k )`

Set expected continuity of seem in 1. parameter direction  $0 \leq k \leq 1$ , C0 and C1 continuity possible

29.155.3.6 `void Go::ftSmoothSurf::setSmoothV ( int k )`

Set expected continuity of seem in 2. parameter direction  $0 \leq k \leq 1$ , C0 and C1 continuity possible

29.155.3.7 `bool Go::ftSmoothSurf::update ( ftPointSet & points, double gapeps, bool reparam = true )`

Modify the surface. User may turn off reparametrization of points. If smoothing was a success, true is returned.

#### 29.155.4 Member Data Documentation

### 29.156.1 Detailed Description

[ftSSfEdge](#) - topological edge for Fantastic corresponding to [ftSuperSurface](#) Detailed description.

The [ftSSfEdge](#) is a half-edge implementation of a topological data structure. It implements the [ftEdgeBase](#) interface by using the [Go](#) geometry library.

#### Author

Atgeirr F Rasmussen [atgeirr@sintef.no](mailto:atgeirr@sintef.no)

**Bug** Not tested

#### See also

[ftEdgeBase](#)

Definition at line 41 of file [ftSSfEdge.h](#).

## 29.156.2 Constructor & Destructor Documentation

29.156.2.1 `Go::ftSSfEdge::ftSSfEdge ( ftFaceBase * face, ftEdge * edge, int entry_id = -1 )`

Constructor. Detailed description.

29.156.2.2 `Go::ftSSfEdge::~~ftSSfEdge ( )`

Empty destructor.

## 29.156.3 Member Function Documentation

29.156.3.1 `virtual BoundingBox Go::ftSSfEdge::boundingBox ( ) [virtual]`

Coordinate box surrounding this edge.

Implements [Go::ftEdgeBase](#).

29.156.3.2 `virtual void Go::ftSSfEdge::closestPoint ( const Point & pt, double & clo_t, Point & clo_pt, double & clo_dist, double const * seed = 0 ) const [virtual]`

Closest point on this edge to a given point.

Implements [Go::ftEdgeBase](#).

29.156.3.3 `virtual int Go::ftSSfEdge::entryId ( ) [inline],[virtual]`

Id of edge. Default set to -1.

Implements [Go::ftEdgeBase](#).

Definition at line 93 of file ftSSfEdge.h.

29.156.3.4 `virtual ftFaceBase* Go::ftSSfEdge::face ( ) [virtual]`

The face corresponding to this edge.

Implements [Go::ftEdgeBase](#).

29.156.3.5 `virtual ftEdge* Go::ftSSfEdge::geomEdge ( ) [virtual]`

Return edge pointer.

Implements [Go::ftEdgeBase](#).

29.156.3.6 `virtual bool Go::ftSSfEdge::isReversed ( ) [inline],[virtual]`

Get the value of the flag indicating that the orientation of the edge is reversed with respect to the parametrization of the underlying [ParamCurve](#).

#### Returns

*true* if orientation is reversed, *false* otherwise

Implements [Go::ftEdgeBase](#).

Definition at line 69 of file `ftSSfEdge.h`.

29.156.3.7 `virtual Point Go::ftSSfEdge::normal ( double t ) const [virtual]`

Evaluate normal of associated face.

Implements [Go::ftEdgeBase](#).

29.156.3.8 `virtual Point Go::ftSSfEdge::normal ( double t, Point & face_par_pt, double * face_seed ) const [virtual]`

Evaluate normal of associated face given a seed to the search for the corresponding face parameter

Implements [Go::ftEdgeBase](#).

29.156.3.9 `virtual Point Go::ftSSfEdge::point ( double t ) const [virtual]`

Evaluate position.

Implements [Go::ftEdgeBase](#).

29.156.3.10 `virtual void Go::ftSSfEdge::setEntryId ( int id ) [inline],[virtual]`

Set id of edge.

Implements [Go::ftEdgeBase](#).

Definition at line 94 of file `ftSSfEdge.h`.

29.156.3.11 `virtual void Go::ftSSfEdge::setFace ( ftFaceBase * face ) [inline],[virtual]`

Set face pointer.

Implements [Go::ftEdgeBase](#).

Definition at line 74 of file `ftSSfEdge.h`.

29.156.3.12 `virtual void Go::ftSSfEdge::setReversed ( bool is_reversed ) [inline],[virtual]`

Set a flag to indicate that the orientation of the edge is reversed with respect to the parametrization of the underlying [ParamCurve](#).

## Parameters

|                    |                               |
|--------------------|-------------------------------|
| <i>is_reversed</i> | value of the orientation flag |
|--------------------|-------------------------------|

Implements [Go::ftEdgeBase](#).

Definition at line 64 of file ftSSfEdge.h.

**29.156.3.13** virtual `ftSSfEdge*` `Go::ftSSfEdge::split ( double t )` [virtual]

Split the edge at the given parameter t. This edge will then represent the first part of the original edge, the second part is returned to the caller.

Implements [Go::ftEdgeBase](#).

**29.156.3.14** virtual `Point` `Go::ftSSfEdge::tangent ( double t ) const` [virtual]

Evaluate tangent.

Implements [Go::ftEdgeBase](#).

**29.156.3.15** virtual `double` `Go::ftSSfEdge::tMax ( ) const` [inline],[virtual]

End parameter value of edge.

Implements [Go::ftEdgeBase](#).

Definition at line 56 of file ftSSfEdge.h.

**29.156.3.16** virtual `double` `Go::ftSSfEdge::tMin ( ) const` [inline],[virtual]

Start parameter value of edge.

Implements [Go::ftEdgeBase](#).

Definition at line 52 of file ftSSfEdge.h.

### Additional Inherited Members

#### 29.157.1 Detailed Description

[ftSurface](#) - A topological face. The class also provides an interface for operations on the associated surface. Detailed description.

#### Author

Vibeke Skytt

#### See also

[ftFaceBase](#)

Definition at line 91 of file [ftSurface.h](#).

#### 29.157.2 Constructor & Destructor Documentation

##### 29.157.2.1 [Go::ftSurface::ftSurface \( shared\\_ptr< \[ParamSurface\]\(#\) > sf, int id \)](#)

Constructor. Typically, the [ParamSurface](#) in this constructor will be a [BoundedSurface](#). A loop will be built from this, but if we already have a loop and the edges in the loop has twins, then we must explicitly set this loop with [addBoundaryLoops\(\)](#). Note: In STEP, [ftSurface](#) corresponds to the entity 'advanced\_face'.

##### 29.157.2.2 [Go::ftSurface::ftSurface \( shared\\_ptr< \[ParamSurface\]\(#\) > sf, shared\\_ptr< \[Loop\]\(#\) > loop, int id = -1 \)](#)

Constructor. Input is the geometrical surface representing the underlying face, and the topological loop that bounds the face. Typically, the [ParamSurface](#) in this constructor will be a [SplineSurface](#) or an [ElementarySurface](#). Note: In STEP, [ftSurface](#) corresponds to the entity 'advanced\_face'.

29.157.2.3 `virtual Go::ftSurface::~~ftSurface ( ) [virtual]`

Empty destructor.

### 29.157.3 Member Function Documentation

29.157.3.1 `void Go::ftSurface::addBoundaryLoops ( std::vector< shared_ptr< Loop > > & bd_loops )`

Set information about boundary loops. Intended for use when topology information exist prior to building a [GoTools](#) face set (i.e. [SurfaceModel](#)). The function removes any existing loops prior to setting the input. Note that the function will throw if the loop information is inconsistent with the already existing information in `surf_` or the given loops are not consistent with the rules. If more than one loop is given, the first loop is the outer one. Subsequent loops must lie inside the outer loop. The loops may not intersect.

29.157.3.2 `void Go::ftSurface::addOuterBoundaryLoop ( shared_ptr< Loop > outer_loop )`

Set the outer boundary loop. Any existing loops are removed prior to setting the `outer_loop`.

29.157.3.3 `bool Go::ftSurface::allRadialEdges ( ) const`

All edges is connected a radial edge.

29.157.3.4 `double Go::ftSurface::area ( double tol ) const`

Compute face area.

29.157.3.5 `bool Go::ftSurface::areNeighbours ( ftSurface * other, shared_ptr< ftEdge > & edge1, shared_ptr< ftEdge > & edge2, int adj_idx = 0 ) const`

the edge along which this adjacency occurs

Check if two faces are adjacent, and return information about

29.157.3.6 `virtual ftSurface* Go::ftSurface::asFtSurface ( ) [virtual]`

Return as type [ftSurface](#).

Reimplemented from [Go::ftFaceBase](#).

29.157.3.7 `virtual BoundingBox Go::ftSurface::boundingBox ( ) [virtual]`

The bounding box corresponding to this face.

Implements [Go::ftFaceBase](#).

29.157.3.8 `bool Go::ftSurface::checkAndFixBoundaries ( )`

Check and fix orientation of boundary loops of trimmed surfaces

Returns

`true` if the orientation of a boundary loop was fixed, `false` otherwise

29.157.3.9 `bool Go::ftSurface::checkDegAdjacency ( ftSurface * other, shared_ptr< Vertex > vx, double tol, shared_ptr< ParamCurve > & bdcv1, shared_ptr< ParamCurve > & bdcv2 )`

Check if two degenerate surface boundaries meet in a vertex.

29.157.3.10 `bool Go::ftSurface::checkFaceTopology ( )`

Debug functionality.

29.157.3.11 `bool Go::ftSurface::checkLoopOrientation ( std::vector< shared_ptr< Loop > > & inconsistent_loops ) const`

Check consistency of boundary loops.

29.157.3.12 `virtual void Go::ftSurface::clearInitialEdges ( ) [virtual]`

Reset loop information.

Reimplemented from [Go::ftFaceBase](#).

29.157.3.13 `ftEdgeBase* Go::ftSurface::closestBoundaryPoint ( const Point & pt, const Point & in_vec, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double & clo_par ) const`

Closest point between a boundary on this face and a point.

29.157.3.14 `ftEdgeBase* Go::ftSurface::closestOuterBoundaryPoint ( const Point & pt, const Point & in_vec, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double & clo_par ) const`

Closest point between the outer boundary on this face and a point.

29.157.3.15 `virtual void Go::ftSurface::closestPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon ) const [virtual]`

Closest point between this face and a point.

Implements [Go::ftFaceBase](#).

29.157.3.16 `void Go::ftSurface::closestPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * domain_of_interest, double * seed ) const`

Closest point between a domain of this face and a point.

29.157.3.17 `bool Go::ftSurface::commonSplineSpace ( ftSurface * other, double tol )`

Check if two bodies are neighbours, are splines and have common a spline space at the interface

29.157.3.18 `bool Go::ftSurface::connectTwin ( ftSurface * newtwin, double tol, bool no_snap = true )`

Set adjacency between bodies Radial edge information is set

29.157.3.19 `void Go::ftSurface::connectTwin ( ftSurface * newtwin, std::vector< ftEdgeBase * > first1, std::vector< ftEdgeBase * > first2, std::vector< int > forward )`

Set adjacency between bodies Correspondence of surface loops is given as input

29.157.3.20 `virtual std::vector<shared_ptr<ftEdgeBase> > Go::ftSurface::createInitialEdges ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON, double kink = 0.00015, bool no_split = false ) [virtual]`

Compute the edges associated to this face or fetch already existing edges

Implements [Go::ftFaceBase](#).

29.157.3.21 `virtual ftMessage Go::ftSurface::createSurf ( double & max_error, double & mean_error ) [virtual]`

By inheritance, not relevant for this entity.

Implements [Go::ftFaceBase](#).

29.157.3.22 `void Go::ftSurface::disconnectTwin ( )`

Disconnect twin info. NB radial edge information is NOT removed.

29.157.3.23 `ftEdgeBase* Go::ftSurface::edgeClosestToPoint ( double u, double v )`

Return the edge on this face closest to a point.

29.157.3.24 `int Go::ftSurface::ElementBoundaryStatus ( int elem_ix, double eps ) [inline]`

Check if a polynomial element (for spline surfaces) intersects the (trimming) boundaries of this [ftSurface](#), is inside or outside

## Parameters

|                |                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------|
| <i>elem_ix</i> | Element index counted according to distinct knot values. Sequence of coordinates: x runs fastest, then y |
| <i>eps</i>     | Intersection tolerance                                                                                   |

## Returns

-1: Not a spline surface or element index out of range 0: Outside trimmed volume 1: On boundary (intersection with boundary found) 2: Internal to trimmed surfaces Note that a touch with the boundaries of the underlying surface is not considered a boundary intersection while touching a trimming curve is seen as an intersection

Definition at line 586 of file ftSurface.h.

29.157.3.25 `int Go::ftSurface::ElementOnBoundary ( int elem_ix, double eps ) [inline]`

Check if a polynomial element (for spline surfaces) intersects the (trimming) boundaries of this [ftSurface](#)

## Parameters

|                |                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------|
| <i>elem_ix</i> | Element index counted according to distinct knot values. Sequence of coordinates: x runs fastest, then y |
| <i>eps</i>     | Intersection tolerance                                                                                   |

## Returns

-1: Not a spline surface or element index out of range 0: Not on boundary or touching a boundary curve 1: On boundary (intersection with boundary found) Note that a touch with the boundaries of the underlying surfaces is not considered a boundary intersection while touching a trimming curve is seen as an intersection

Definition at line 569 of file ftSurface.h.

29.157.3.26 `std::vector<ftSurface*> Go::ftSurface::fetchCorrespondingFaces ( ) const`

Fetch all faces that belongs to all radial edges corresponding to this face

29.157.3.27 `bool Go::ftSurface::getAdjacencyInfo ( ftSurface * other, double tol, int & bd1, int & bd2, bool & same_orient )`

DEPRECATED METHOD. USE THE OTHER [getAdjacencyInfo\(\)](#) instead Fetch info on adjacency between neighbouring faces

## Parameters

|                    |                                                                               |
|--------------------|-------------------------------------------------------------------------------|
| <i>other</i>       | The other face                                                                |
| <i>tol</i>         | Adjacency tolerance                                                           |
| <i>bd1</i>         | Boundary index of first surface 0 = umin, 1 = umax, 2 = vmin, 3 = vmax        |
| <i>bd2</i>         | Boundary index of second surface 0 = umin, 1 = umax, 2 = vmin, 3 = vmax       |
| <i>same_orient</i> | Indicates whether the surfaces are equally oriented along the common boundary |

**Returns**

*true* if adjacency is found and both faces are non-trimmed or boundary trimmed

**29.157.3.28 AdjacencyInfo** `Go::ftSurface::getAdjacencyInfo ( ftSurface * other, double tol, int adj_idx = 0, bool test_corner = false )`

Fetch info on adjacency between neighbouring faces.

**29.157.3.29 AdjacencyInfo** `Go::ftSurface::getAdjacencyInfo ( ftEdge * edge, ftSurface * other, double tol )`

Fetch info on adjacency between neighbouring faces given information about the common edge

**29.157.3.30** `std::vector<Body*> Go::ftSurface::getAdjacentBodies ( ) const`

Get all (up to 2) adjacent bodies.

**29.157.3.31** `void Go::ftSurface::getAdjacentFaces ( std::vector< ftSurface * > & neighbours ) const`

Get neighbouring faces.

**29.157.3.32** `std::vector<ftEdge*> Go::ftSurface::getAllEdgePtrs ( ) const`

Fetch pointers to all edges in all loops.

**29.157.3.33** `std::vector<ftEdge*> Go::ftSurface::getAllEdgePtrs ( int loop_idx ) const`

Fetch pointers to all edges in specified loop.

**29.157.3.34** `std::vector<shared_ptr<ftEdge> > Go::ftSurface::getAllEdges ( ) const`

Fetch all edges in all loops.

**29.157.3.35** `std::vector<shared_ptr<ftEdge> > Go::ftSurface::getAllEdges ( int loop_idx ) const`

Fetch all edges in given loop.

**29.157.3.36** `void Go::ftSurface::getBadDistance ( std::vector< std::pair< ftSurface *, shared_ptr< Vertex > > > & badPairs, double tol )`

Collect all pairs of surface and vertex points where distance is greater than a tolerance.

29.157.3.37 `void Go::ftSurface::getBadDistance ( std::vector< std::pair< ftSurface *, ftEdge * > > & badPairs, double tol ) const`

Collect all pairs of surface and edge where some part of the edge has a distance to the surface greater than a tolerance

29.157.3.38 `void Go::ftSurface::getBadDistance ( std::vector< std::pair< ftEdge *, shared_ptr< Vertex > > > & badPairs, double tol ) const`

Collect all pairs of edge and vertex where the vertex has a distance to the edge greater than a tolerance

29.157.3.39 `Body* Go::ftSurface::getBody ( ) const [inline]`

Fetch associated body, if any.

Definition at line 398 of file ftSurface.h.

29.157.3.40 `bool Go::ftSurface::getBoundaryCoefEnumeration ( int bd, std::vector< int > & enumeration )`

For a spline surface, get the local enumeration of coefficients along a specified boundary return value: true if spline, false if not

29.157.3.41 `void Go::ftSurface::getBoundaryConditions ( int & bd_type, int & bd ) const [inline]`

Definition at line 375 of file ftSurface.h.

29.157.3.42 `shared_ptr<Loop> Go::ftSurface::getBoundaryLoop ( int idx ) [inline]`

Get the specified boundary loops.

Definition at line 185 of file ftSurface.h.

29.157.3.43 `shared_ptr<SplineCurve> Go::ftSurface::getBoundaryPiece ( Point & pt1, Point & pt2, double eps )`

Return a part of the boundary of the current surface, specified by two points belonging to this boundary curve

29.157.3.44 `shared_ptr<Vertex> Go::ftSurface::getClosestVertex ( const Point & pnt ) const`

Get the vertex closest to a given point.

29.157.3.45 `std::vector<shared_ptr<ftEdge> > Go::ftSurface::getCommonEdges ( ftSurface * other ) const`

Get all edges common to this face and another face represented by the half edges in this face

29.157.3.46 `std::vector<shared_ptr<Vertex>> Go::ftSurface::getCommonVertices ( ftSurface * other ) const`

Get all vertices common to this face and another face.

29.157.3.47 `std::vector<shared_ptr<Vertex>> Go::ftSurface::getCornerVertices ( double kink ) const`

Get corner vertices.

29.157.3.48 `std::vector<shared_ptr<Vertex>> Go::ftSurface::getCornerVertices ( double kink, int loop_idx ) const`

Get corner vertices restricted to a particular loop.

29.157.3.49 `bool Go::ftSurface::getCorrCoefEnumeration ( ftSurface * other, double tol, std::vector< std::pair< int, int > > & enumeration )`

Given two adjacent spline faces represented in the same spline space, return local enumeration of the coefficients. This surface is given first and the other surface second

29.157.3.50 `double Go::ftSurface::getCurrEps ( ) const [inline]`

Fetch tolerance used in check for degenerace.

Definition at line 385 of file ftSurface.h.

29.157.3.51 `virtual void Go::ftSurface::getError ( double & max_error, double & mean_error ) [virtual]`

By inheritance, not relevant for this entity.

Implements [Go::ftFaceBase](#).

29.157.3.52 `bool Go::ftSurface::getFreeBoundaryInfo ( double tol, std::vector< int > & free_boundaries )`

Return the boundary number of outer boundary edges that follow surface boundaries return value = true: All free boundaries are associated with surface boundaries = false:Some free boundaries are not associated with surface boundaries

29.157.3.53 `virtual int Go::ftSurface::getId ( ) [virtual]`

Fetch Id of this face, may not be uniquely set.

Reimplemented from [Go::ftFaceBase](#).

29.157.3.54 `void Go::ftSurface::getNarrowRegion ( double gap_tol, double tol, std::vector< std::pair< shared_ptr< PointOnEdge >, shared_ptr< PointOnEdge > > > & narrow_pt )`

Get pairs of close boundary loop points.

29.157.3.55 `std::vector<shared_ptr<Vertex> > Go::ftSurface::getNonCornerVertices ( double kink ) const`

Get non corner vertices.

29.157.3.56 `std::vector<shared_ptr<Vertex> > Go::ftSurface::getNonCornerVertices ( double kink, int loop_idx ) const`

Get non corner vertices restricted to a particular loop.

29.157.3.57 `void Go::ftSurface::getPosTangentSurfaceDiscont ( std::vector< ftEdge * > & badPos, std::vector< ftEdge * > & badTangent, double tol, double kink, double bend, int leastSurfIndex, shared_ptr< SurfaceModel > sm ) const`

Information about discontinuities, used in quality checking of a surface model

29.157.3.58 `virtual ftTangPriority Go::ftSurface::getPrioType ( ) const [virtual]`

Priority type, not relevant for this entity.

Implements [Go::ftFaceBase](#).

29.157.3.59 `std::vector<shared_ptr<EdgeVertex> > Go::ftSurface::getRadialEdges ( ) const`

Get all instances of radial edges.

29.157.3.60 `bool Go::ftSurface::getSurfaceDisconts ( double tol, std::vector< double > & disc_u, std::vector< double > & disc_v )`

Check for constant parameter line kinks, i.e. C1 discontinuities.

29.157.3.61 `bool Go::ftSurface::getSurfaceKinks ( double angtol, std::vector< double > & g1_disc_u, std::vector< double > & g1_disc_v )`

Check for constant parameter line kinks.

29.157.3.62 `shared_ptr<ParamSurface> Go::ftSurface::getUntrimmed ( double gap, double neighbour, double angtol, bool only_corner = false )`

Approximate a regular face with a non-trimmed spline surface If the initial surface is not regular, no output is created

29.157.3.63 **bool** Go::ftSurface::hasAcuteAngle ( **ftEdge** \* *along\_edge*, **double** *angtol* ) **const**

Used in quality checing of a surface model.

29.157.3.64 **bool** Go::ftSurface::hasBody ( ) **const** `[inline]`

Whether or not this face belongs to a solid.

Definition at line 404 of file ftSurface.h.

29.157.3.65 **bool** Go::ftSurface::hasBoundaryConditions ( ) **const** `[inline]`

Definition at line 370 of file ftSurface.h.

29.157.3.66 **bool** Go::ftSurface::hasRadialEdges ( ) **const**

Check for radial edges Existence

29.157.3.67 **bool** Go::ftSurface::hasRealRadialEdges ( ) **const**

29.157.3.68 **bool** Go::ftSurface::hasTwin ( ) `[inline]`

Definition at line 415 of file ftSurface.h.

29.157.3.69 **bool** Go::ftSurface::isClose ( **shared\_ptr**< **Vertex** > *v*, **double** *tol* ) **const**

Test if a [Vertex](#) is close to the surface within some tolerance.

29.157.3.70 **bool** Go::ftSurface::isCornerToCorner ( **ftSurface** \* *other*, **double** *tol*, **int** *adj\_idx* = 0 )

Check if two volumes are splines and meet in a corner-to-corner configuration

29.157.3.71 **virtual void** Go::ftSurface::isolateFace ( ) `[virtual]`

Remove all adjacency information related to this face.

Reimplemented from [Go::ftFaceBase](#).

29.157.3.72 **bool** Go::ftSurface::isSpline ( ) **const**

Check if the face is represented as a spline.

29.157.3.73 `void Go::ftSurface::makeCommonSplineSpace ( ftSurface * other )`

Ensure that two neighbouring spline surfaces have a common spline space at the interface Averaging of coefficients at the common boundary is also performed

29.157.3.74 `int Go::ftSurface::nmbAdjacencies ( ftSurface * other ) const`

Number of edges along which the two faces are adjacent.

29.157.3.75 `int Go::ftSurface::nmbBoundaryLoops ( ) [inline]`

Number of loops, the first is the outer boundary loop, further loops represents holes

Definition at line 179 of file ftSurface.h.

29.157.3.76 `int Go::ftSurface::nmbEdges ( ) const`

Number of edges in all loops.

29.157.3.77 `int Go::ftSurface::nmbNextNeighbours ( ftSurface * other ) const`

Number neighbouring faces common to the two given faces.

29.157.3.78 `int Go::ftSurface::nmbOuterBdCrvs ( double gap, double neighbour, double angtol ) const`

Count the number of curves in the outer boundary loop with regard to how many corners there is in this loop, but without regard to how the loop is actually divided into curves

29.157.3.79 `virtual Point Go::ftSurface::normal ( double u, double v ) const [virtual]`

Evaluate surface normal.

Implements [Go::ftFaceBase](#).

29.157.3.80 `bool Go::ftSurface::onlyOuterTrim ( ) const [inline]`

Check if this face contains any holes.

Definition at line 208 of file ftSurface.h.

29.157.3.81 `virtual Point Go::ftSurface::point ( double u, double v ) const [virtual]`

Evaluate point on face.

Implements [Go::ftFaceBase](#).

29.157.3.82 `bool Go::ftSurface::pointInFace ( double u, double v, double tol )` [inline]

[Point](#) in face testing.

Definition at line 538 of file `ftSurface.h`.

29.157.3.83 `int Go::ftSurface::pointInFace2 ( double u, double v, double tol )` [inline]

[Point](#) in face testing return value = 0 : Not in face = 1 : Internal in face = 2 : On boundary

Definition at line 547 of file `ftSurface.h`.

29.157.3.84 `bool Go::ftSurface::pointOnBd ( double u, double v, double tol )` [inline]

[Point](#) on surface boundary.

Definition at line 553 of file `ftSurface.h`.

29.157.3.85 `virtual ftMessage Go::ftSurface::removeGap ( ftEdgeBase * e1, ftEdgeBase * e2, ftFaceBase * other, double epsge )` [virtual]

Close the gap between adjacent surfaces if the configuration allows it.

29.157.3.86 `void Go::ftSurface::replaceSurf ( shared_ptr< ParamSurface > sf )` [inline],[protected]

Definition at line 595 of file `ftSurface.h`.

29.157.3.87 `void Go::ftSurface::setBody ( Body * body )` [inline]

Boundary model / volume model, set associated body.

Definition at line 392 of file `ftSurface.h`.

29.157.3.88 `void Go::ftSurface::setBoundaryConditions ( int bd_type, int bd )` [inline]

Set boundary conditions (related to isogeometric analysis)

Definition at line 364 of file `ftSurface.h`.

29.157.3.89 `virtual void Go::ftSurface::setId ( int id )` [virtual]

Set Id of this face.

Reimplemented from [Go::ftFaceBase](#).

29.157.3.90 `void Go::ftSurface::setPrioType ( ftTangPriority type ) [inline]`

Priority type, not relevant for this entity.

Definition at line 153 of file ftSurface.h.

29.157.3.91 `void Go::ftSurface::setTwin ( ftSurface * newtwin )`

Set adjacency between bodies Radial edge information is existed to exist

29.157.3.92 `ftMessage Go::ftSurface::smoothOutFace ( int edge_cont, double approx_orig_tol, double deg_tol, double & maxerr, double & meanerr, double approx_weight = 0.8 )`

Smooth the face, the associated surface is required to be of type [SplineSurface](#).

29.157.3.93 `std::vector<shared_ptr<ftSurface>> Go::ftSurface::splitAlongKinks ( double angtol )`

Split a surface along constant parameter line kinks. Currently only spline surface is implemented.

29.157.3.94 `void Go::ftSurface::splitAtInternalCorner ( ftSurface * other, std::vector< shared_ptr< ftSurface >> & new_face1, std::vector< shared_ptr< ftSurface >> & new_face2, double tol = DEFAULT_SPACE_EPSILON )`

Ensure that two spline volumes meet in a corner to corner configuration

29.157.3.95 `virtual std::vector<shared_ptr<ftEdgeBase>> Go::ftSurface::startEdges ( ) [virtual]`

Return pointers to first part of all bd cvs.

Implements [Go::ftFaceBase](#).

29.157.3.96 `virtual shared_ptr<ParamSurface> Go::ftSurface::surface ( ) [inline],[virtual]`

Turn orientation of the corresponding surface.

Get underlying surface

Implements [Go::ftFaceBase](#).

Definition at line 142 of file ftSurface.h.

29.157.3.97 `ftSurface* Go::ftSurface::twin ( ) [inline]`

Non-manifold, set adjacency information between two bodies.

Definition at line 410 of file ftSurface.h.

29.157.3.98 `virtual void Go::ftSurface::updateBoundaryLoops ( shared_ptr< ftEdgeBase > new_edge )` [virtual]

Update the information stored in the boundary loops.

Reimplemented from [Go::ftFaceBase](#).

29.157.3.99 `std::vector<shared_ptr<Vertex>> Go::ftSurface::vertices ( ) const`

Get all vertices, duplicates removed.

29.157.3.100 `void Go::ftSurface::write ( std::ostream & os )`

Write surface to stream.

The documentation for this class was generated from the following file:

### 29.158.1 Detailed Description

A set of surfaces is viewed as one surface. Member functions assume object is handled by a [tpTopologyTable](#).

Definition at line 53 of file `ftSurfaceSet.h`.

### 29.158.2 Constructor & Destructor Documentation

29.158.2.1 `Go::ftSurfaceSet::ftSurfaceSet ( const std::vector< shared_ptr< ParamSurface > > & surfaces, tpTolerances & topeps, double approxeps )`

Constructor.

29.158.2.2 `Go::ftSurfaceSet::~~ftSurfaceSet ( )`

Destructor.

### 29.158.3 Member Function Documentation

29.158.3.1 `virtual BoundingBox Go::ftSurfaceSet::boundingBox ( ) [virtual]`

The bounding box corresponding to this face.

Implements [Go::ftFaceBase](#).

29.158.3.2 `virtual void Go::ftSurfaceSet::closestPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon ) const [inline], [virtual]`

Closest point between this face and a point.

Implements [Go::ftFaceBase](#).

Definition at line 122 of file ftSurfaceSet.h.

29.158.3.3 `virtual std::vector<shared_ptr<ftEdgeBase> > Go::ftSurfaceSet::createInitialEdges ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON, double kink = 0.00015, bool no_split = false ) [pure virtual]`

Compute the edges associated to this face or fetch already existing edges

Implements [Go::ftFaceBase](#).

Implemented in [Go::ftChartSurface](#).

29.158.3.4 `virtual ftMessage Go::ftSurfaceSet::createSurf ( double & max_error, double & mean_error ) [pure virtual]`

Make sure that a geometric surface exists. Not applicable in normal configurations

Implements [Go::ftFaceBase](#).

Implemented in [Go::ftChartSurface](#).

29.158.3.5 `std::vector<double> Go::ftSurfaceSet::estimateSurfSides ( SplineSurface * surf ) [protected]`

29.158.3.6 `ftMessage Go::ftSurfaceSet::fetchSamplePoints ( const std::vector< ftEdgeBase * > & edgeloop, std::vector< int > & corner, std::vector< int > & cn, ftPointSet & points ) [protected]`

29.158.3.7 `double Go::ftSurfaceSet::getApproxweight ( ) [inline]`

Definition at line 112 of file ftSurfaceSet.h.

29.158.3.8 `ftMessage Go::ftSurfaceSet::getBoundaryConditions ( const std::vector< ftEdgeBase * > & edgeloop, std::vector< int > & corner, std::vector< shared_ptr< SplineCurve > > & bd_curves, std::vector< shared_ptr< SplineCurve > > & cross_curves, bool compute_cross_curves, std::vector< BoundaryPiece > & bdpiece, bool require_cord_length_param = false ) [protected]`

29.158.3.9 `shared_ptr<SplineCurve> Go::ftSurfaceSet::getBoundaryPiece ( Point & ptmin, Point & ptmax, double eps ) [protected]`

29.158.3.10 `virtual void Go::ftSurfaceSet::getError ( double & max_error, double & mean_error ) [pure virtual]`

Fetch the error due to approximations in createSurf. Not applicable in normal configurations

Implements [Go::ftFaceBase](#).

Implemented in [Go::ftChartSurface](#).

29.158.3.11 `virtual int Go::ftSurfaceSet::getId ( ) [virtual]`

Return id, default id is -1.

Reimplemented from [Go::ftFaceBase](#).

29.158.3.12 `void Go::ftSurfaceSet::getInitBndData ( std::vector< ftEdgeBase * > & edgc, ftPointSet & points, int cn[ ] ) [protected]`

29.158.3.14 `ftMessage Go::ftSurfaceSet::getInitInnerData2 ( ftPointSet & points ) [protected]`

29.158.3.15 `ftMessage Go::ftSurfaceSet::getNextEdgePieceInfo ( std::vector< ftEdgeBase * >::iterator & first_edge, std::vector< ftEdgeBase * >::iterator & last_edge, ftFaceBase * & adjsurf, SplineCurve * & cv, Point & ptmin, Point & ptmax, double & length ) [protected]`

29.158.3.16 `ftMessage Go::ftSurfaceSet::getOuterLoop ( std::vector< ftEdgeBase * > & outer_loop, std::vector< int > & corners, double bend_tol, double kink_tol ) [protected]`

29.158.3.17 `virtual ftTangPriority Go::ftSurfaceSet::getPrioType ( ) const [pure virtual]`

Priority type.

Implements [Go::ftFaceBase](#).

Implemented in [Go::ftChartSurface](#).

29.158.3.18 `void Go::ftSurfaceSet::getSurfaces ( vector< shared_ptr< ParamSurface > > & surfaces )`

Return the surfaces belonging to the surface set.

29.158.3.19 `shared_ptr< SplineCurve > Go::ftSurfaceSet::joinCrossCurves ( std::vector< shared_ptr< SplineCurve > > & cross_curves, double startpar, double endpar ) [protected]`

29.158.3.20 `ftMessage Go::ftSurfaceSet::merge ( double & max_error, double & mean_error, double bend_tol, double kink_tol ) [protected]`

29.158.3.21 `ftMessage Go::ftSurfaceSet::modifySurface ( int maxiter, int max_update_iter, std::vector< int > & edge_derivs, ftPointSet & points, double & max_error, double & mean_error )`

29.158.3.22 `virtual Point Go::ftSurfaceSet::normal ( double u, double v ) const [pure virtual]`

Evaluate surface normal.

Implements [Go::ftFaceBase](#).

Implemented in [Go::ftChartSurface](#).

29.158.3.23 `virtual Point Go::ftSurfaceSet::point ( double u, double v ) const` [pure virtual]

Evaluate point on face.

Implements [Go::ftFaceBase](#).

Implemented in [Go::ftChartSurface](#).

29.158.3.24 `ftMessage Go::ftSurfaceSet::reparametrizeSurf ( const std::vector< ftEdgeBase * > & first_edges, const std::vector< int > & corners, ftPointSet & points, double umin = 0, double umax = 0, double vmin = 0, double vmax = 0 )` [protected]

29.158.3.25 `virtual bool Go::ftSurfaceSet::sampleOnlyEdges ( ) const` [protected],[pure virtual]

Implemented in [Go::ftChartSurface](#).

29.158.3.26 `void Go::ftSurfaceSet::setAdditionalCornerPts ( std::vector< Point > & add_corner_pts )` [inline]

Definition at line 118 of file `ftSurfaceSet.h`.

29.158.3.27 `void Go::ftSurfaceSet::setApproxweight ( double approxweight )` [inline]

Definition at line 115 of file `ftSurfaceSet.h`.

29.158.3.28 `virtual void Go::ftSurfaceSet::setid ( int id )` [virtual]

Set id for this face.

Reimplemented from [Go::ftFaceBase](#).

29.158.3.29 `virtual std::vector<shared_ptr<ftEdgeBase>> Go::ftSurfaceSet::startEdges ( )` [virtual]

Return pointers to first part of all bd cvs.

Implements [Go::ftFaceBase](#).

29.158.3.30 `virtual shared_ptr<ParamSurface> Go::ftSurfaceSet::surface ( )` [inline],[virtual]

Fetch geometric surface.

Implements [Go::ftFaceBase](#).

Definition at line 87 of file `ftSurfaceSet.h`.

29.158.3.31 **ftMessage** Go::ftSurfaceSet::trimWithPlane ( const ftPlane & plane )

Faces or parts of faces in faces\_ are trimmed if they lie above plane. Remember to update top\_table\_ and first\_↔ edges\_!

29.158.3.32 **ftMessage** Go::ftSurfaceSet::updatePointTopology ( ftPointSet & points ) [protected]

## 29.158.4 Member Data Documentation

29.158.4.1 **std::vector<Point>** Go::ftSurfaceSet::additional\_corner\_pts\_ [protected]

Definition at line 150 of file ftSurfaceSet.h.

## Additional Inherited Members

### 29.159.1 Detailed Description

Subclass of [ftSamplePoint](#); intended for use when a point is member of multiple [ftFaceBase](#)'s.

Definition at line 54 of file [ftSurfaceSetPoint.h](#).

### 29.159.2 Constructor & Destructor Documentation

#### 29.159.2.1 [Go::ftSurfaceSetPoint::ftSurfaceSetPoint](#) ( [Vector3D](#) xyz, int bnd )

Constructor.

#### 29.159.2.2 [Go::ftSurfaceSetPoint::ftSurfaceSetPoint](#) ( [Vector3D](#) xyz, int bnd, [shared\\_ptr](#)< [ftFaceBase](#) > & face, [Vector2D](#) par\_pt )

Constructor.

29.159.2.3 `virtual Go::ftSurfaceSetPoint::~~ftSurfaceSetPoint ( ) [virtual]`

Destructor.

### 29.159.3 Member Function Documentation

29.159.3.1 `void Go::ftSurfaceSetPoint::addFace ( shared_ptr< ftFaceBase > & face )`

For a given point, add another face. Parameter values are computed.

29.159.3.2 `void Go::ftSurfaceSetPoint::addInfo ( ftSurfaceSetPoint * other )`

Add face, parameter and connectivity info from the point other to this point NB! It is assumed that the position information is consistent

29.159.3.3 `void Go::ftSurfaceSetPoint::addPair ( shared_ptr< ftFaceBase > & face, const Vector2D & par_pt )`

For a given point, add information about param values on another [ftFaceBase](#).

29.159.3.4 `virtual ftSurfaceSetPoint* Go::ftSurfaceSetPoint::asSurfaceSetPoint ( ) [inline],[virtual]`

Return pointer to this point as a surface set point.

Reimplemented from [Go::ftSamplePoint](#).

Definition at line 67 of file `ftSurfaceSetPoint.h`.

29.159.3.5 `virtual bool Go::ftSurfaceSetPoint::containsFace ( ftFaceBase * face ) const [virtual]`

Check if a face is associated this point.

Reimplemented from [Go::ftSamplePoint](#).

29.159.3.6 `shared_ptr<ftFaceBase> Go::ftSurfaceSetPoint::face ( int i )`

Return pointer to face number i (error if not enough faces).

29.159.3.7 `Vector2D Go::ftSurfaceSetPoint::getPar ( ftFaceBase * face )`

Fetch the parameter value in face face of this point.

29.159.3.8 `int Go::ftSurfaceSetPoint::nmbFaces ( )`

Return the number of faces in which point is member of.

29.159.3.9 `Vector2D Go::ftSurfaceSetPoint::parValue ( int i )`

Fetch the parameter vale in face number i of this point.

29.159.3.10 `void Go::ftSurfaceSetPoint::resetPosition ( Vector3D pos, int bnd )`

Change position of point and update parameter values accordingly.

29.159.3.11 `void Go::ftSurfaceSetPoint::resetPosition ( Vector3D pos )`

29.159.3.12 `virtual void Go::ftSurfaceSetPoint::write2Dval ( std::ostream & os ) const` [virtual]

Write parameter information to stream.

Reimplemented from [Go::ftSamplePoint](#).

The documentation for this class was generated from the following file:

## Additional Inherited Members

### 29.160.1 Detailed Description

A topological solid with a trivariate geometry description.

Definition at line 91 of file [ftVolume.h](#).

### 29.160.2 Constructor & Destructor Documentation

#### 29.160.2.1 Go::ftVolume::ftVolume ( shared\_ptr< [ParamVolume](#) > vol, int id = -1 )

Constructor given a trivariate volume description.

29.160.2.2 `Go::ftVolume::ftVolume ( shared_ptr< ParamVolume > vol, double gap_eps, double kink_eps, int id = -1 )`

Constructor given a trivariate volume description and tolerances for topology analysis of the boundary shell

29.160.2.3 `Go::ftVolume::ftVolume ( shared_ptr< ParamVolume > vol, double gap_eps, double neighbour, double kink_eps, double bend, int id = -1 )`

29.160.2.4 `Go::ftVolume::ftVolume ( shared_ptr< ParamVolume > vol, shared_ptr< SurfaceModel > shell, int id = -1 )`

Given a volume and boundary surfaces, create a possibly trimmed [ftVolume](#)

29.160.2.5 `Go::ftVolume::ftVolume ( shared_ptr< ParamVolume > vol, std::vector< shared_ptr< SurfaceModel > > shells, int id = -1 )`

Given a volume and a number of boundary shells, create a possibly trimmed [ftVolume](#)

29.160.2.6 `Go::ftVolume::ftVolume ( shared_ptr< SurfaceModel > shell, int id = -1 )`

Create a [ftVolume](#) when no geometry description is known yet.

29.160.2.7 `Go::ftVolume::~~ftVolume ( )`

Destructor.

### 29.160.3 Member Function Documentation

29.160.3.1 `virtual BoundingBox Go::ftVolume::boundingBox ( ) const` [virtual]

The bounding box corresponding to this solid.

Reimplemented from [Go::Body](#).

29.160.3.2 `bool Go::ftVolume::checkBodyTopology ( )`

Debug.

29.160.3.3 `bool Go::ftVolume::checkDegAdjacency ( ftVolume * other, shared_ptr< EdgeVertex > evx, double tol, shared_ptr< ParamSurface > & bdsf1, shared_ptr< ParamSurface > & bdsf2 )`

Look for adjacency between degenerate volumes in a degenerate boundary surface

29.160.3.4 `ftFaceBase* Go::ftVolume::closestBoundaryPoint ( Point & pt, double & clo_u, double & clo_v, double & clo_w, Point & clo_pt, double & clo_dist, double & clo_par_u, double & clo_par_v, double epsilon ) const`

Closest point between a boundary on this possibly trimmed volume and a point

29.160.3.5 `void Go::ftVolume::closestPoint ( Point & pt, double & clo_u, double & clo_v, double & clo_w, Point & clo_pt, double & clo_dist, double epsilon, double * seed = NULL ) const`

Closest point between this possibly trimmed volume and a point.

29.160.3.6 `bool Go::ftVolume::commonSplineSpace ( ftVolume * other, double tol )`

Check if two bodies are neighbours, are splines and have a common spline space at the interface

29.160.3.7 `int Go::ftVolume::ElementBoundaryStatus ( int elem_ix )`

Check if a polynomial element (for spline volumes) intersects the (trimming) boundaries of this [ftVolume](#), is inside or outside

#### Parameters

|                      |                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| <code>elem_ix</code> | Element index counted according to distinct knot values. Sequence of coordinates: x runs fastest, then y and at last z |
|----------------------|------------------------------------------------------------------------------------------------------------------------|

#### Returns

-1: Not a spline volume or element index out of range 0: Outside trimmed volume 1: On boundary (intersection with boundary found) 2: Internal to trimmed volume Note that a touch with the boundaries of the underlying volume is not considered a boundary intersection while touching a trimming surface is seen as an intersection

29.160.3.8 `int Go::ftVolume::ElementOnBoundary ( int elem_ix )`

Check if a polynomial element (for spline volumes) intersects the (trimming) boundaries of this [ftVolume](#)

#### Parameters

|                      |                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| <code>elem_ix</code> | Element index counted according to distinct knot values. Sequence of coordinates: x runs fastest, then y and at last z |
|----------------------|------------------------------------------------------------------------------------------------------------------------|

#### Returns

-1: Not a spline volume or element index out of range 0: Not on boundary or touching a boundary surface 1: On boundary (intersection with boundary found) Note that a touch with the boundaries of the underlying volume is not considered a boundary intersection while touching a trimming surface is seen as an intersection

29.160.3.9 **bool** Go::ftVolume::getAdjacencyInfo ( **ftVolume** \* *other*, **double** *tol*, **int** & *bd1*, **int** & *bd2*, **int** & *orientation*, **bool** & *same\_seq* )

DEPRECATED METHOD. USE THE OTHER [getAdjacencyInfo\(\)](#) instead Fetch info on adjacency between neighbouring bodies return value true if adjacency is found and both bodies are non-trimmed or boundary trimmed bd1: boundary index of first volume 0 = umin, 1 = umax, 2 = vmin, 3 = vmax, 4 = wmin, 5 = wmax bd2: boundary index of second volume 0 = umin, 1 = umax, 2 = vmin, 3 = vmax, 4 = wmin, 5 = wmax orientation: Indicates whether the surfaces are equally oriented along the common boundary 0 = same orientation 1 = first parameter of the common boundary surface is opposite 2 = second parameter of the common boundary surface is opposite 3 = both parameters of the common boundary surface is opposite same\_seq: Indicates if the two parameter directions of the common boundary surface are given in the same sequence

29.160.3.10 **VolumeAdjacencyInfo** Go::ftVolume::getAdjacencyInfo ( **ftVolume** \* *other*, **double** *tol*, **int** *adj\_idx* = 0, **bool** *test\_corner* = false )

Fetch info on adjacency between neighbouring bodies.

29.160.3.11 **void** Go::ftVolume::getAdjacentBodies ( **std::vector**< **ftVolume** \* > & *neighbours* )

Get neighbouring bodies.

29.160.3.12 **bool** Go::ftVolume::getBoundaryCoefEnumeration ( **int** *bd*, **std::vector**< **int** > & *enumeration* )

For a spline volume, get the local enumeration of coefficients along a specified boundary return value: true if spline, false if not

29.160.3.13 **std::vector**< **shared\_ptr**< **EdgeVertex** > > Go::ftVolume::getCommonEdges ( **ftVolume** \* *other* ) **const**

Fetch all radial edges common to this model and another one.

29.160.3.14 **VolumeAdjacencyInfo** Go::ftVolume::getCornerAdjacencyInfo ( **ftVolume** \* *other*, **EdgeVertex** \* *evx*, **double** *tol*, **int** *adj\_idx* = 0 )

29.160.3.15 **VolumeAdjacencyInfo** Go::ftVolume::getCornerAdjacencyInfo ( **ftVolume** \* *other*, **double** *tol*, **int** *adj\_idx* = 0 )

Fetch info on adjacence between bodies meeting an a common edge (no common face)

29.160.3.16 **bool** Go::ftVolume::getCorrCoefEnumeration ( **ftVolume** \* *other*, **double** *tol*, **std::vector**< **std::pair**< **int**, **int** > > & *enumeration* )

Given two adjacent spline volumes represented in the same spline space, return local enumeration of the coefficients. This surface is given first and the other volume second

29.160.3.17 **bool** Go::ftVolume::getFreeBoundaryInfo ( **double** *tol*, **std::vector**< **int** > & *free\_boundaries* )

Return the boundary number of outer boundary surfaces that follow volume boundaries return value = true: All free boundaries are associated with volume boundaries = false:Some free boundaries are not associated with volume boundaries

29.160.3.18 **int** Go::ftVolume::getId ( ) [*inline*]

Fetch Id, not necessarily uniquely set.

Definition at line 131 of file ftVolume.h.

29.160.3.19 **bool** Go::ftVolume::getVertexEnumeration ( **shared\_ptr**< **Vertex** > *vx*, **Point** & *param*, **int** & *corner*, **int** & *coef\_nmb* ) **const**

Given a vertex, find if this vertex is associated this body, compute the parameter value of the body associated with the vertex, and if this body is a spline volume, return the corner number and the number of the associated spline coefficient corner: 0=(umin,vmin,wmin), 1=(umax,vmin,wmin), 2=(umin,vmax,wmin), 3=(umax,vmax,wmin), 4=(umin,vmin,wmax), 5=(umax,vmin,wmax), 6=(umin,vmax,wmax), 7=(umax,vmax,wmax)

29.160.3.20 **bool** Go::ftVolume::getVertexPosition ( **shared\_ptr**< **Vertex** > *vx*, **Point** & *param* ) **const**

Given a vertex, find if this vertex is associated this body and compute the parameter value of the body associated with the vertex

29.160.3.21 **shared\_ptr**<**ParamVolume**> Go::ftVolume::getVolume ( ) [*inline*]

Fetch geometric description.

Definition at line 125 of file ftVolume.h.

29.160.3.22 **bool** Go::ftVolume::isBoundaryTrimmed ( ) **const**

Information about whether or not the volume is trimmed and how it is trimmed Check if the volume is boundary trimmed (not trimmed). The boundary surfaces themselves may be trimmed

29.160.3.23 **bool** Go::ftVolume::isCornerToCorner ( **shared\_ptr**< **ftVolume** > *other*, **double** *tol* )

Check if two volumes are splines and meet in a corner-to-corner configuration

29.160.3.24 **bool** Go::ftVolume::isIsoTrimmed ( ) **const**

Check if all boundary surfaces correspond to an iso-parameter in the volume

29.160.3.25 **bool** Go::ftVolume::isRegularized ( ) const

Check if this volume has 6 boundary surfaces that may act as the boundary surfaces of a non-trimmed spline volume

29.160.3.26 **bool** Go::ftVolume::isSpline ( ) const

Check if the volume is represented as a spline.

29.160.3.27 **bool** Go::ftVolume::makeCommonSplineSpace ( ftVolume \* other )

Ensure that two neighbouring spline volumes have a common spline space at the interface

29.160.3.28 **bool** Go::ftVolume::ParamInVolume ( double u, double v, double w )

Check if all boundary surfaces approximately correspond to an iso-parameter in the volume Check if a given parameter tripple is inside the possibly trimmed volume

29.160.3.29 **std::vector<shared\_ptr<EdgeVertex> >** Go::ftVolume::radialEdges ( ) const

Fetch all radial edges belonging to this model.

29.160.3.30 **bool** Go::ftVolume::regularizeBdShells ( std::vector< std::pair< Point, Point > > & corr\_vx\_pts, std::vector< SurfaceModel \* > & modified\_adjacent, int split\_mode = 1, bool pattern\_split = false )

Update the volume by regularizing all boundary shells, i.e. all faces in all boundary shells of all connected volumes should be 4-sided, and no T-joints are allowed

29.160.3.31 **std::vector<shared\_ptr<ftVolume> >** Go::ftVolume::replaceWithRegVolumes ( int degree, std::vector< SurfaceModel \* > & modified\_adjacent, bool performe\_step2 = true, int split\_mode = 1, bool pattern\_split = false )

Divide a trimmed volume into a set of regular volumes NB! The boundary shells of the corresponding volume model (or this volume) must be regular. Not all configurations are handled. If an unknown configuration occur, nothing is returned Should be called from [VolumeModel](#). Ruins the current [ftVolume](#).

29.160.3.32 **void** Go::ftVolume::splitAtInternalCorner ( ftVolume \* other, std::vector< shared\_ptr< ftVolume > > & new\_vol1, std::vector< shared\_ptr< ftVolume > > & new\_vol2, double tol = DEFAULT\_SPACE\_EPSILON )

Ensure that two spline volumes meet in a corner to corner configuration

29.160.3.33 `std::vector<shared_ptr<ftEdge> > Go::ftVolume::uniqueNonRadialEdges ( ) const`

Fetch edges where no radial edge exist, i.e. there is no adjacent volume along any boundary surface meeting in this edge. Only one occurrence in an edge, twin-edge pair is returned

29.160.3.34 `bool Go::ftVolume::untrimRegular ( int degree )`

Modify a regularized, possibly trimmed volume to become non-trimmed.

29.160.3.35 `void Go::ftVolume::updateBoundaryInfo ( )`

Update boundary shells to reflect changes in the geometric volume while maintaining topology information

### 29.162.1 Detailed Description

```
template<class Functor>
class Go::FunctionMinimizer< Functor >
```

This is the [FunctionMinimizer](#) class that can be used ex. with [minimise\\_conjugated\\_gradient](#). Together, they provide functionality for minimizing a function with an arbitrary number of parameters, using linear minimization along a set of directions which is chosen by the conjugated gradient algorithm, although the [FunctionMinimizer](#) can also be used independently for minimizing a function along any user-defined direction. The function to minimize must be presented in the form of a Functor, which has the following member functions:

```
/// double operator()(const double* arg) const; // to evaluate the function at the parameters
/// // pointed to by 'arg'.
/// void grad(const double* arg, double* grad) const; // to evaluate the function
/// // gradient at the parameters
/// // pointed to by 'arg'. The resulting
/// // vector will be written to 'grad'.
/// double minPar(int n) const; // return the lower bound of the n'th function parameter.
/// double maxPar(int n) const; // return the upper bound of the n'th function parameter.
///
```

Minimizing a function whose domain is  $R^n$  is a two-fold problem. One is of linear minimization along a specified direction. Another is to choose a set of directions to minimize along. The first problem is taken care of by the class [FunctionMinimizer](#), which wraps around the user-defined function and contains information about the current point of evaluation and minimizing along a given direction. The second problem can be taken care of by the supplied function '[minimise\\_conjugated\\_gradient](#)', or the user can use [FunctionMinimizer](#) in combination with his or her own direction-choosing algorithm.

The user first should wrap his or hers Functor into a [FunctionMinimizer](#), where the starting seed and tolerances should also be specified. The [FunctionMinimizer](#) can be used separately to minimize along directions that the user specify (using the '[minimize](#)' member function), or alternatively can be given to the supplied nonmember function '[minimise\\_conjugated\\_gradient](#)', which will try to find a local minimum starting from the supplied seed.

Example:

Let us assume that the user has a function taking four arguments. He defines the functor [MyFunction](#) containing the required member functions, and instanciates it:

```
/// MyFunction f(...constructor arguments...)
///
```

He now wraps it in a [FunctionMinimizer](#), giving the seed where he wants to start the search:

```
/// FunctionMinimizer<MyFunction> fmini(4, f, seed_p, 1.0e-8);
///
```

This function minimizer can now be used with the 'minimise\_conjugated\_gradient'-algorithm in order to search for a (local) minimum:

```
/// minimise_conjugated_gradient(fmini, 5);
///
```

The obtained 4-tuple of parameters corresponding to the found minimum can be obtained by:

```
/// const double* par_ptr = fmini.getPar();
///
```

Definition at line 49 of file GeneralFunctionMinimizer.h.

## 29.162.2 Constructor & Destructor Documentation

**29.162.2.1** `template<class Functor > Go::FunctionMinimizer< Functor >::FunctionMinimizer ( int num_param, const Functor & fun, const double *const seed, double tol = std::sqrt(std::numeric_limits<double>::epsilon()) ) [inline]`

Constructor. 'minimization\_tol' should in general be kept no lower than the square root of machine precision. 'seed' is a pointer to an array containing the start values for the search in the 'num\_param' parameters.

Definition at line 168 of file GeneralFunctionMinimizer\_implementation.h.

**29.162.2.2** `template<class Functor> Go::FunctionMinimizer< Functor >::~~FunctionMinimizer ( ) [inline]`

Definition at line 125 of file GeneralFunctionMinimizer.h.

## 29.162.3 Member Function Documentation

**29.162.3.1** `template<class Functor> bool Go::FunctionMinimizer< Functor >::atMax ( int param_ix ) const [inline]`

Definition at line 178 of file GeneralFunctionMinimizer.h.

**29.162.3.2** `template<class Functor> bool Go::FunctionMinimizer< Functor >::atMin ( int param_ix ) const [inline]`

Returns 'true' if the current parameter for the first/second curve is equal to the start/end-parameter for the curve.

Definition at line 177 of file GeneralFunctionMinimizer.h.

29.162.3.3 `template<class Functor > double Go::FunctionMinimizer< Functor >::fval ( ) const [inline]`

evaluating distance function at the current point of evaluation

Definition at line 730 of file GeneralFunctionMinimizer\_implementation.h.

29.162.3.4 `template<class Functor > double Go::FunctionMinimizer< Functor >::fval ( const Point & param ) const [inline]`

evaluating the distance function for an arbitrary parameter value (not the parameter pair).

Definition at line 742 of file GeneralFunctionMinimizer\_implementation.h.

29.162.3.5 `template<class Functor> double Go::FunctionMinimizer< Functor >::getPar ( int param_ix ) const [inline]`

Get the current value for parameter nb. 'param\_ix'.

Definition at line 181 of file GeneralFunctionMinimizer.h.

29.162.3.6 `template<class Functor> const double* Go::FunctionMinimizer< Functor >::getPar ( ) const [inline]`

Get a pointer to the array containing the current values of the parameters.

Definition at line 184 of file GeneralFunctionMinimizer.h.

29.162.3.7 `template<class Functor > void Go::FunctionMinimizer< Functor >::grad ( Point & result ) const [inline]`

evaluate the gradient (2 components) of the distance function at the currently set parameter pair of evaluation.

Definition at line 750 of file GeneralFunctionMinimizer\_implementation.h.

29.162.3.8 `template<class Functor > void Go::FunctionMinimizer< Functor >::grad ( const Point & param, Point & result ) const [inline]`

evaluate the gradient (2 components) of the distance function for an arbitrary parameter value (not the current parameter pair).

Definition at line 762 of file GeneralFunctionMinimizer\_implementation.h.

```
29.162.3.9 template<class Functor > double Go::FunctionMinimizer< Functor >::linminBrent (const Point & dir,
 const double * bracket, const double * fval_brak) [inline]
```

Move the current parameter point in order to minimize the function along a ray. The ray is given by the current parameter point and the parameter 'dir'. In contrast to [minimize\(\)](#), [linminBrent\(\)](#) requires that the minimum is bracketed. The method uses an algorithm inspired by Brent's method (with certain modifications). This method is rapid when the function is well-behaved. Otherwise it will use a slow but robust 'golden mean'-search. The current parameter point is moved to the minimum found along the given ray. Before calling this function, the minimum must be bracketed, and the brackets must be given to the function through the 'brackets' variable, and the corresponding function values through the 'fval\_brak' variable. The function value at the new minimum is returned.

Definition at line 324 of file GeneralFunctionMinimizer\_implementation.h.

```
29.162.3.10 template<class Functor > double Go::FunctionMinimizer< Functor >::minimize (const Point & dir,
 bool & hit_domain_edge, bool rerun = false) [inline]
```

Move the current parameter point in order to minimize the function along an unoriented line. The line is given by the current parameter point and the parameter 'dir'.

#### Parameters

|            |                                         |
|------------|-----------------------------------------|
| <i>dir</i> | a direction parallel to the search line |
|------------|-----------------------------------------|

#### Return values

|                        |                                                                       |
|------------------------|-----------------------------------------------------------------------|
| <i>hit_domain_edge</i> | indicates whether the found minimum is on the boundary of the domain. |
|------------------------|-----------------------------------------------------------------------|

Definition at line 209 of file GeneralFunctionMinimizer\_implementation.h.

```
29.162.3.11 template<class Functor > void Go::FunctionMinimizer< Functor >::moveUV (const Point & dir, double
 multiplier) [inline]
```

move the current parameter pair a certain distance ('multiplier') in a certain direction ('dir', which has 2 components)

Definition at line 770 of file GeneralFunctionMinimizer\_implementation.h.

```
29.162.3.12 template<class Functor> int Go::FunctionMinimizer< Functor >::numPars () const [inline]
```

Get the number of function parameters.

Definition at line 187 of file GeneralFunctionMinimizer.h.

### 29.165.1 Detailed Description

Super class for meshes. Used in transfer of mesh.

Definition at line 58 of file GeneralMesh.h.

### 29.165.2 Constructor & Destructor Documentation

29.165.2.1 `Go::GeneralMesh::GeneralMesh ( )`

29.165.2.2 `virtual Go::GeneralMesh::~~GeneralMesh ( ) [virtual]`

Destructor.

### 29.165.3 Member Function Documentation

29.165.3.1 `virtual GenericTriMesh* Go::GeneralMesh::asGenericTriMesh ( ) [virtual]`

Casting. Return as generic tri mesh if possible.

Reimplemented in [Go::GenericTriMesh](#).

29.165.3.2 `virtual LineStrip* Go::GeneralMesh::asLineStrip ( ) [virtual]`

Casting. Return as line strip if possible.

Reimplemented in [Go::LineStrip](#).

29.165.3.3 `virtual RegularMesh* Go::GeneralMesh::asRegularMesh ( ) [virtual]`

Casting. Return as regular mesh if possible.

Reimplemented in [Go::RegularMesh](#), and [Go::RegularVolMesh](#).

29.165.3.4 `virtual int Go::GeneralMesh::atBoundary ( int idx ) [pure virtual]`

Check if a given node lies at the boundary.

Implemented in [Go::RegularMesh](#), [Go::QuadMesh](#), [Go::RegularVolMesh](#), [Go::GenericTriMesh](#), and [Go::LineStrip](#).

29.165.3.5 `virtual int Go::GeneralMesh::numTriangles ( ) [inline],[virtual]`

The number of triangles represented by this mesh.

Reimplemented in [Go::RegularMesh](#), [Go::RegularVolMesh](#), [Go::GenericTriMesh](#), and [Go::QuadMesh](#).

Definition at line 80 of file `GeneralMesh.h`.

29.165.3.6 `virtual int Go::GeneralMesh::numVertices ( ) [pure virtual]`

Number of nodes in mesh.

Implemented in [Go::RegularMesh](#), [Go::RegularVolMesh](#), [Go::GenericTriMesh](#), [Go::QuadMesh](#), and [Go::LineStrip](#).

29.165.3.7 `virtual double* Go::GeneralMesh::paramArray ( ) [pure virtual]`

Fetch parameter values corresponding to the nodes.

Implemented in [Go::RegularMesh](#), [Go::QuadMesh](#), [Go::RegularVolMesh](#), [Go::GenericTriMesh](#), and [Go::LineStrip](#).

29.165.3.8 `void Go::GeneralMesh::translate ( const std::vector< double > & vert_translation )`

Translate all vertices by `vert_translation`, wrt the geometry, discarding any previous translation.

29.165.3.9 `virtual unsigned int* Go::GeneralMesh::triangleIndexArray ( ) [pure virtual]`

Indices of nodes belonging to each triangle.

Implemented in [Go::RegularMesh](#), [Go::RegularVolMesh](#), [Go::QuadMesh](#), [Go::GenericTriMesh](#), and [Go::LineStrip](#).

29.165.3.10 `virtual double* Go::GeneralMesh::vertexArray ( ) [pure virtual]`

Fetch all nodes.

Implemented in [Go::RegularMesh](#), [Go::RegularVolMesh](#), [Go::QuadMesh](#), [Go::GenericTriMesh](#), and [Go::LineStrip](#).

## 29.165.4 Member Data Documentation

29.165.4.1 `std::vector<double> Go::GeneralMesh::vert_translation_`

The 3D-translation wrt the geometry.

Definition at line 101 of file `GeneralMesh.h`.

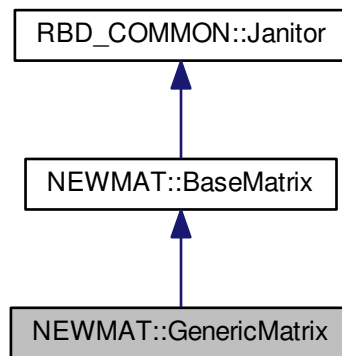

The documentation for this class was generated from the following file:

- `gotools-core/include/GoTools/tesselator/GeneralMesh.h`

## 29.166 NEWMAT::GenericMatrix Class Reference

## Additional Inherited Members

### 29.167.1 Detailed Description

Based on [RegularMesh](#), designed to store data for GL visualizing (regular triangles, not triangle strips).

Definition at line 58 of file `GenericTriMesh.h`.

### 29.167.2 Constructor & Destructor Documentation

**29.167.2.1** `Go::GenericTriMesh::GenericTriMesh ( int num_vert = 0, int num_tri = 0, bool use_normals = true, bool use_texcoords = false )`

Constructor. Give mesh size. Set whether or not normals and texture coordinates should be computed

**29.167.2.2** `Go::GenericTriMesh::~~GenericTriMesh ( )`

Destructor.

### 29.167.3 Member Function Documentation

**29.167.3.1** `virtual GenericTriMesh* Go::GenericTriMesh::asGenericTriMesh ( )` `[virtual]`

Casting. Return as generic tri mesh.

Reimplemented from [Go::GeneralMesh](#).

**29.167.3.2** `virtual int Go::GenericTriMesh::atBoundary ( int idx )` `[virtual]`

Check if a given node lies at the boundary.

Implements [Go::GeneralMesh](#).

**29.167.3.3** `int* Go::GenericTriMesh::boundaryArray ( )`

Indices to boundary nodes.

**29.167.3.4** `double* Go::GenericTriMesh::normalArray ( )`

Normal information.

**29.167.3.5** `virtual int Go::GenericTriMesh::numTriangles ( ) [inline],[virtual]`

The total number of triangles.

Reimplemented from [Go::GeneralMesh](#).

Definition at line 79 of file `GenericTriMesh.h`.

**29.167.3.6** `virtual int Go::GenericTriMesh::numVertices ( ) [inline],[virtual]`

Number of nodes in mesh.

Implements [Go::GeneralMesh](#).

Definition at line 82 of file `GenericTriMesh.h`.

**29.167.3.7** `virtual double* Go::GenericTriMesh::paramArray ( ) [virtual]`

Fetch parameter values corresponding to the nodes.

Implements [Go::GeneralMesh](#).

**29.167.3.8** `void Go::GenericTriMesh::resize ( int num_vert, int num_tri )`

Change mesh size.

**29.167.3.9** `double* Go::GenericTriMesh::texcoordArray ( )`

Texture coordinate information.

**29.167.3.10** `virtual unsigned int* Go::GenericTriMesh::triangleIndexArray ( ) [virtual]`

Indices of nodes belonging to each triangle.

Implements [Go::GeneralMesh](#).

**29.167.3.11** `bool Go::GenericTriMesh::useNormals ( ) [inline]`

Check if normals will be computed.

Definition at line 71 of file `GenericTriMesh.h`.

**29.167.3.12** `bool Go::GenericTriMesh::useTexCoords ( ) [inline]`

Check if texture coordinates will be computed.

Definition at line 75 of file `GenericTriMesh.h`.

29.167.3.13 virtual double\* Go::GenericTriMesh::vertexArray ( ) [virtual]

Fetch all nodes.

Implements [Go::GeneralMesh](#).

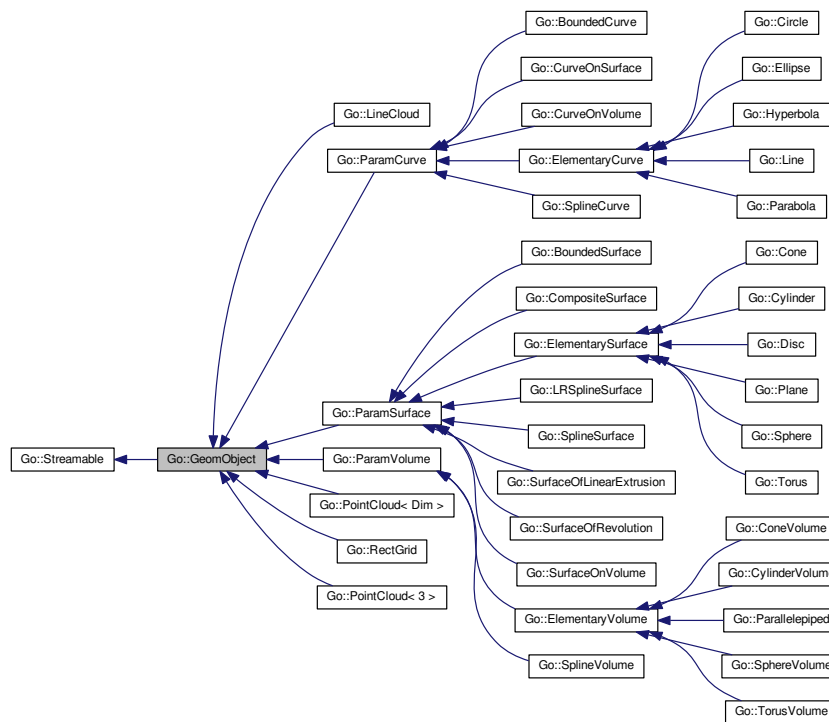

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/tesselator/GenericTriMesh.h](#)

## 29.168 Go::GeomObject Class Reference

*Return the class type identifier of a given class derived from [GeomObject](#).*

### 29.168.1 Detailed Description

Base class for geometrical objects (curves, surfaces, etc.) regrouping all the properties that they have in common.

Definition at line 59 of file `GeomObject.h`.

### 29.168.2 Constructor & Destructor Documentation

29.168.2.1 `virtual Go::GeomObject::~~GeomObject ( ) [virtual]`

### 29.168.3 Member Function Documentation

29.168.3.1 `virtual BoundingBox Go::GeomObject::boundingBox ( ) const [pure virtual]`

Return the object's bounding box.

Implemented in [Go::SplineVolume](#), [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::SplineCurve](#), [Go::BoundedSurface](#), [Go::CurveOnSurface](#), [Go::SurfaceOnVolume](#), [Go::Disc](#), [Go::Torus](#), [Go::SurfaceOfRevolution](#), [Go::CurveOnVolume](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Sphere](#), [Go::TorusVolume](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), [Go::SphereVolume](#), [Go::Parallelepiped](#), [Go::PointCloud< Dim >](#), [Go::PointCloud< 3 >](#), [Go::LineCloud](#), [Go::BoundedCurve](#), [Go::CompositeSurface](#), [Go::SurfaceOfLinearExtrusion](#), [Go::Line](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), [Go::Ellipse](#), and [Go::RectGrid](#).

29.168.3.2 `static ClassType Go::GeomObject::classType ( ) [static]`

Return the class type identifier of a given class derived from [GeomObject](#).

29.168.3.3 `virtual GeomObject* Go::GeomObject::clone ( ) const [pure virtual]`

Clone the [GeomObject](#) and return a pointer to the clone.

Implemented in [Go::SplineVolume](#), [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::ParamCurve](#), [Go::SplineCurve](#), [Go::CurveOnSurface](#), [Go::BoundedSurface](#), [Go::SurfaceOnVolume](#), [Go::CurveOnVolume](#), [Go::Disc](#), [Go::LineCloud](#), [Go::PointCloud< Dim >](#), [Go::PointCloud< 3 >](#), [Go::Torus](#), [Go::SurfaceOfRevolution](#), [Go::CompositeSurface](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Sphere](#), [Go::TorusVolume](#), [Go::BoundedCurve](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), [Go::SphereVolume](#), [Go::Parallelepiped](#), [Go::Line](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), [Go::SurfaceOfLinearExtrusion](#), [Go::RectGrid](#), [Go::Ellipse](#), [Go::ParamSurface](#), [Go::ElementarySurface](#), [Go::ParamVolume](#), [Go::ElementaryVolume](#), and [Go::ElementaryCurve](#).

29.168.3.4 `virtual int Go::GeomObject::dimension ( ) const [pure virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implemented in [Go::SplineVolume](#), [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::SplineCurve](#), [Go::BoundedSurface](#), [Go::CurveOnSurface](#), [Go::SurfaceOnVolume](#), [Go::CurveOnVolume](#), [Go::Disc](#), [Go::Torus](#), [Go::PointCloud< Dim >](#), [Go::PointCloud< 3 >](#), [Go::SurfaceOfRevolution](#), [Go::LineCloud](#), [Go::BoundedCurve](#), [Go::CompositeSurface](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Sphere](#), [Go::TorusVolume](#), [Go::Line](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), [Go::SphereVolume](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), [Go::Parallelepiped](#), [Go::Ellipse](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::RectGrid](#).

29.168.3.5 `virtual ClassType Go::GeomObject::instanceType ( ) const [pure virtual]`

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implemented in [Go::SplineVolume](#), [Go::SplineSurface](#), [Go::LRSplineSurface](#), [Go::SplineCurve](#), [Go::BoundedSurface](#), [Go::CurveOnSurface](#), [Go::SurfaceOnVolume](#), [Go::CurveOnVolume](#), [Go::Disc](#), [Go::PointCloud< Dim >](#), [Go::Torus](#), [Go::PointCloud< 3 >](#), [Go::LineCloud](#), [Go::SurfaceOfRevolution](#), [Go::CompositeSurface](#), [Go::BoundedCurve](#), [Go::Plane](#), [Go::Cone](#), [Go::Cylinder](#), [Go::Sphere](#), [Go::TorusVolume](#), [Go::Line](#), [Go::ConeVolume](#), [Go::CylinderVolume](#), [Go::SphereVolume](#), [Go::Circle](#), [Go::Hyperbola](#), [Go::Parabola](#), [Go::Parallelepiped](#), [Go::Ellipse](#), [Go::SurfaceOfLinearExtrusion](#), and [Go::RectGrid](#).

29.168.3.6 `void Go::GeomObject::writeStandardHeader ( std::ostream & os ) const`

Write header information of the [GeomObject](#) to stream. This typically precedes the act of writing the object itself to a stream, to signal to the receiver what object is streamed.

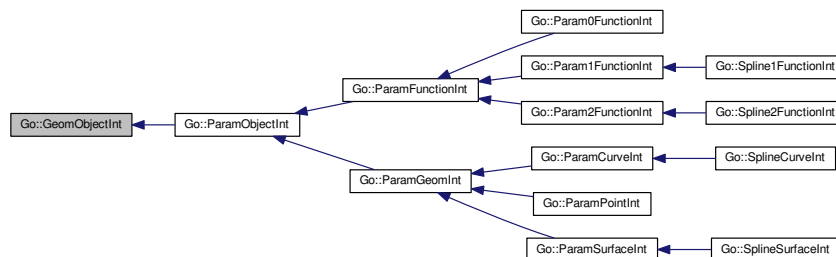

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/geometry/GeomObject.h](#)

## 29.169 Go::GeomObjectInt Class Reference

```
#include <GeomObjectInt.h>
```

Inheritance diagram for Go::GeomObjectInt:

### Public Member Functions

- virtual [~GeomObjectInt](#) ()  
*Destructor.*

### 29.169.1 Detailed Description

This class is an abstract base class providing an interface to the "intersection objects". An intersection object is a wrapper around a corresponding geometric object, containing additional functionality, and that is used in the intersection algorithms.

Definition at line 52 of file GeomObjectInt.h.

### 29.169.2 Constructor & Destructor Documentation

**29.169.2.1** virtual [Go::GeomObjectInt::~~GeomObjectInt](#) ( ) [inline], [virtual]

Destructor.

Definition at line 55 of file GeomObjectInt.h.

The documentation for this class was generated from the following file:

- intersections/include/GoTools/intersections/[GeomObjectInt.h](#)

## 29.170 Go::GeoTol Class Reference

Class handling various tolerances.

```
#include <GeoTol.h>
```

## Public Member Functions

- [GeoTol](#) ([double epsg](#), [double rel\\_par\\_res=1.0e-12](#), [double numerical\\_tol=1.0e-16](#))

*Write to output stream.*
- [void read](#) ([std::istream &is](#))  
*Read from input stream.*

### 29.170.1 Detailed Description

Class handling various tolerances.

Definition at line 62 of file GeoTol.h.

### 29.170.2 Constructor & Destructor Documentation

#### 29.170.2.1 [Go::GeoTol::GeoTol](#) ( [double epsg](#), [double rel\\_par\\_res = 1.0e-12](#), [double numerical\\_tol = 1.0e-16](#) )

Constructor.

#### 29.170.2.2 [Go::GeoTol::GeoTol](#) ( [GeoTol \\*epsg](#) )

Constructor.

#### 29.170.2.3 [Go::GeoTol::~~GeoTol](#) ( )

Destructor.

### 29.170.3 Member Function Documentation

29.170.3.1 `const double& Go::GeoTol::getAngleTol ( ) const` [inline]

Get angular tolerance.

Definition at line 98 of file GeoTol.h.

29.170.3.2 `const double& Go::GeoTol::getEpsBracket ( ) const` [inline]

Get "bracket" tolerance used to specify confidence intervals in the parameter domain

Definition at line 91 of file GeoTol.h.

29.170.3.3 `const double& Go::GeoTol::getEpsge ( ) const` [inline]

Get constant tolerance.

Definition at line 75 of file GeoTol.h.

29.170.3.4 `const double& Go::GeoTol::getMaxEpsge ( ) const` [inline]

Definition at line 86 of file GeoTol.h.

29.170.3.5 `const double& Go::GeoTol::getMinEpsge ( ) const` [inline]

Definition at line 78 of file GeoTol.h.

29.170.3.6 `const double& Go::GeoTol::getNumericalTol ( ) const` [inline]

Get numerical tolerance.

Definition at line 102 of file GeoTol.h.

29.170.3.7 `const double& Go::GeoTol::getRefAng ( ) const` [inline]

Definition at line 94 of file GeoTol.h.

29.170.3.8 `const double& Go::GeoTol::getRelParRes ( ) const` [inline]

Get relative parameter resolution.

Definition at line 83 of file GeoTol.h.

29.170.3.9 void Go::GeoTol::read ( std::istream & *is* )

Read from input stream.

29.170.3.10 void Go::GeoTol::write ( std::ostream & *os* ) const

Write to output stream.

The documentation for this class was generated from the following file:

- [intersections/include/GoTools/intersections/GeoTol.h](#)

*Set knot tolerance.*

### 29.175.1 Detailed Description

Class containing some service functions for the [GoTools](#) "system".

Definition at line 76 of file [GoTools.h](#).

### 29.175.2 Constructor & Destructor Documentation

29.175.2.1 [Go::GoTools::GoTools](#) ( )

29.175.2.2 virtual [Go::GoTools::~~GoTools](#) ( ) [[virtual](#)]

### 29.175.3 Member Function Documentation

29.175.3.1 static std::string [Go::GoTools::className](#) ( [ClassType](#) class\_type ) [[static](#)]

Conversion function that returns a std::string with the class name corresponding to [ClassType](#) class\_type.

29.175.3.2 static void [Go::GoTools::init](#) ( ) [[static](#)]

This functions sets up the factories for constructing [GeomObjects](#) at run-time (i.e. [Registrar](#) instantiations). If you need to construct [GeomObjects](#) at run-time, such as when reading from a file, then call this function early in the code.

29.175.3.3 `static double Go::GoTools::knotEpsilon ( ) [static]`

Get knot tolerance.

29.175.3.4 `static double Go::GoTools::parameterEpsilon ( ) [static]`

Get parameter tolerance.

29.175.3.5 `static void Go::GoTools::setKnotEpsilon ( double knot_epsilon ) [static]`

Set knot tolerance.

29.175.3.6 `static void Go::GoTools::setParameterEpsilon ( double parameter_epsilon ) [static]`

Set parameter tolerance.

29.175.3.7 `static void Go::GoTools::setSpaceEpsilon ( double space_epsilon ) [static]`

Set geometry tolerance.

29.175.3.8 `static double Go::GoTools::spaceEpsilon ( ) [static]`

Get geometry tolerance.

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/geometry/GoTools.h](#)

## 29.176 Go::GPos Struct Reference

```
#include <Mesh2D.h>
```

### Public Member Functions

- [GPos](#) (int i, int m)
- [GPos](#) ()

### Public Attributes

- int [ix](#)
- int [mult](#)

### 29.176.1 Detailed Description

Definition at line 56 of file Mesh2D.h.

### 29.176.2 Constructor & Destructor Documentation

#### 29.176.2.1 `Go::GPos::GPos ( int i, int m ) [inline]`

Definition at line 59 of file Mesh2D.h.

#### 29.176.2.2 `Go::GPos::GPos ( ) [inline]`

Definition at line 60 of file Mesh2D.h.

### 29.176.3 Member Data Documentation

#### 29.176.3.1 `int Go::GPos::ix`

Definition at line 62 of file Mesh2D.h.

#### 29.176.3.2 `int Go::GPos::mult`

Definition at line 63 of file Mesh2D.h.

The documentation for this struct was generated from the following file:

- [Irsplines2D/include/GoTools/Irsplines2D/Mesh2D.h](#)

## 29.177 `Go::GpuMatrix< T >` Class Template Reference

```
#include <GpuMatrix.hpp>
```

### Public Member Functions

- [GpuMatrix](#) (int rows, int cols)
- [GpuMatrix](#) (int rows, int cols, [T](#) \*data)
- [GpuMatrix](#) (int rows, int cols, [T](#) initializer)
- [~GpuMatrix](#) ()
- void [upload](#) ([T](#) \*data)
- void [download](#) ([T](#) \*data)
- int [getRows](#) ()
- int [getCols](#) ()

## Friends

- `template<typename U >`  
`std::ostream & operator<< (std::ostream &os, const GpuMatrix< U > &m)`

### 29.177.1 Detailed Description

```
template<typename T>
class Go::GpuMatrix< T >
```

Definition at line 49 of file GpuMatrix.hpp.

### 29.177.2 Constructor & Destructor Documentation

29.177.2.1 `template<typename T > Go::GpuMatrix< T >::GpuMatrix ( int rows, int cols )`

Constructs a matrix on the GPU

29.177.2.2 `template<typename T > Go::GpuMatrix< T >::GpuMatrix ( int rows, int cols, T * data )`

Constructs a matrix on the GPU using data as initial values

29.177.2.3 `template<typename T > Go::GpuMatrix< T >::GpuMatrix ( int rows, int cols, T initializer )`

Constructs a matrix on the GPU setting all values to initializer.

29.177.2.4 `template<typename T > Go::GpuMatrix< T >::~~GpuMatrix ( )`

Deletes data allocated on the gpu.

### 29.177.3 Member Function Documentation

29.177.3.1 `template<typename T > void Go::GpuMatrix< T >::download ( T * data )`

Downloads data from gpu memory to cpu memory. Using "pinned memory" will give best performance.

29.177.3.2 `template<typename T > int Go::GpuMatrix< T >::getCols ( )`

29.177.3.3 `template<typename T > int Go::GpuMatrix< T >::getRows ( )`

29.177.3.4 `template<typename T > void Go::GpuMatrix< T >::upload ( T * data )`

Uploads data from cpu memory to gpu memory. Using "pinned memory" will give best performance.

### 29.177.4 Friends And Related Function Documentation

29.177.4.1 `template<typename T > template<typename U > std::ostream& operator<< ( std::ostream & os, const GpuMatrix< U > & m ) [friend]`

Prints out the contents of the matrix m.

The documentation for this class was generated from the following file:

### 29.181.1 Detailed Description

[gvCamera](#) deals with perspective and modelview transformations, with GL viewports, and with drawing 3D axes.

Definition at line 52 of file gvCamera.h.

### 29.181.2 Constructor & Destructor Documentation

29.181.2.1 `gvCamera::gvCamera ( const Vector3D & fpoint, int x, int y, int w, int h )`

This constructor takes the initial focus point and the viewport as parameters. Default distance (from camera to focal point) is 10.0. Default axissize is zero.

29.181.2.2 `gvCamera::~gvCamera ( )`

### 29.181.3 Member Function Documentation

29.181.3.1 `void gvCamera::computeWinz ( )` `[protected]`

29.181.3.2 `Vector3D gvCamera::eyeCoordsToObjectCoords ( const Vector3D & eyept ) const`

Computes a ray in the model space corresponding to the screen point indicated.

29.181.3.3 `void gvCamera::getAxisSize ( double & size ) const` `[inline]`

Gets the current axissize.

Definition at line 99 of file gvCamera.h.

29.181.3.4 `void gvCamera::getDistance ( double & d ) const` `[inline]`

Gets the current distance.

Definition at line 91 of file gvCamera.h.

29.181.3.5 `void gvCamera::getFocalPoint ( Vector3D & fpoint ) const` `[inline]`

Gets the current focal point.

Definition at line 82 of file gvCamera.h.

29.181.3.6 `bool gvCamera::getPerspectiveMode ( ) const` `[inline]`

Gets the current perspective mode.

Definition at line 140 of file gvCamera.h.

29.181.3.7 `void gvCamera::getViewPort ( int & x, int & y, int & w, int & h ) const` `[inline]`

Gets the viewport.

Definition at line 132 of file gvCamera.h.

29.181.3.8 `Vector3D gvCamera::getWorldRay ( ) const`

29.181.3.9 `Vector3D gvCamera::getWorldSide ( ) const`

29.181.3.10 `Vector3D gvCamera::getWorldUp ( ) const`

29.181.3.11 `void gvCamera::initializeGL ( )`

This is called to initialize the camera. You need a valid OpenGL context to call this.

29.181.3.12 `void gvCamera::moveFocalPointRelative ( const Vector3D & eyeptr )`

Moves the focal point relative to screen coordinates.

29.181.3.13 `Vector3D gvCamera::objectCoordsToWindowCoords ( const Vector3D & pt ) const`

29.181.3.14 `void gvCamera::pick ( int x, int y, int w, int h ) const`

Sets up the projection, viewport and modelview, for picking.

29.181.3.15 `void gvCamera::resetRotation ( )`

Sets the internal modelview matrix to identity. The effect will be visible the next time `use()` is called.

29.181.3.16 `void gvCamera::rotate ( double axisx, double axisy, double angle )`

The axis of rotation is in screen coordinates, and will be translated to the correct coordinate system by the function. To give an example, if you detect a mouse drag in the direction (mx, my) you may want to rotate like this: `camera.↵ rotate(-my, mx, 0.1*sqrt(mx*mx + my*my));`

29.181.3.17 `void gvCamera::rotateTransversal ( double angle )`

Rotates the camera about the current (screen coordinate) z-axis.

29.181.3.18 `void gvCamera::setAxisSize ( double size )` `[inline]`

Sets the size (in modelspace units) of the axis. Setting the size to zero turns off the axis.

Definition at line 96 of file gvCamera.h.

29.181.3.19 `void gvCamera::setDistance ( double d ) [inline]`

Sets the distance. The distance is the modelspace distance from the camera to the focal point.

Definition at line 88 of file gvCamera.h.

29.181.3.20 `void gvCamera::setFocalPoint ( const Vector3D & fpoint ) [inline]`

Sets the focal point. The focal point is the point towards which the camera is looking. Also, the [rotate\(\)](#) call rotates the camera about this point.

Definition at line 79 of file gvCamera.h.

29.181.3.21 `void gvCamera::setPerspectiveMode ( bool perspective_mode ) [inline]`

Sets perspective mode. True means perspective, false means orthographic projection mode.

Definition at line 137 of file gvCamera.h.

29.181.3.22 `void gvCamera::setViewPort ( int x, int y, int w, int h ) [inline]`

Sets the viewport. The viewport should be set whenever the window size changes.

Definition at line 129 of file gvCamera.h.

29.181.3.23 `void gvCamera::use ( ) const`

Sets up the projection, viewport and modelview. Draws axis if axissize is nonzero.

29.181.3.24 `void gvCamera::useModelView ( ) const`

Sets up the modelview only.

## 29.181.4 Member Data Documentation

29.181.4.1 `double gvCamera::axissize_ [protected]`

Definition at line 152 of file gvCamera.h.

29.181.4.2 `double gvCamera::distance_ [protected]`

Definition at line 147 of file gvCamera.h.

29.181.4.3 `Vector3D gvCamera::focal_point_` [protected]

Definition at line 146 of file gvCamera.h.

29.181.4.4 `double gvCamera::mv_[16]` [protected]

mv\_ is the rotation matrix

Definition at line 150 of file gvCamera.h.

29.181.4.5 `bool gvCamera::perspective_mode_` [protected]

Definition at line 163 of file gvCamera.h.

29.181.4.6 `double gvCamera::viewfield_` [protected]

Definition at line 159 of file gvCamera.h.

29.181.4.7 `int gvCamera::viewheight_` [protected]

Definition at line 157 of file gvCamera.h.

29.181.4.8 `int gvCamera::viewwidth_` [protected]

Definition at line 156 of file gvCamera.h.

29.181.4.9 `int gvCamera::viewx_` [protected]

Definition at line 154 of file gvCamera.h.

29.181.4.10 `int gvCamera::viewy_` [protected]

Definition at line 155 of file gvCamera.h.

29.181.4.11 `double gvCamera::winz_` [protected]

Definition at line 161 of file gvCamera.h.

The documentation for this class was generated from the following file:

## 29.182 gvColor Struct Reference

Represents a color by four floats, like in OpenGL.

```
#include <gvColor.h>
```

### Public Member Functions

- [gvColor](#) ()  
*Default color is white.*
- `template<typename NumericType >`  
[gvColor](#) (NumericType r, NumericType g, NumericType b)
- `template<typename NumericType >`  
[gvColor](#) (NumericType r, NumericType g, NumericType b, NumericType alpha)
- [gvColor](#) (const [gvColor](#) &other)
- [gvColor](#) & `operator=` (const [gvColor](#) &other)

### Static Public Member Functions

- `template<typename NumericType >`  
static [gvColor](#) [hsva](#) (NumericType h, NumericType s, NumericType v, NumericType alpha)

### Public Attributes

- float [rgba](#) [4]

#### 29.182.1 Detailed Description

Represents a color by four floats, like in OpenGL.

Definition at line 49 of file [gvColor.h](#).

#### 29.182.2 Constructor & Destructor Documentation

##### 29.182.2.1 [gvColor::gvColor](#) ( ) [[inline](#)]

Default color is white.

Definition at line 53 of file [gvColor.h](#).

##### 29.182.2.2 `template<typename NumericType >` [gvColor::gvColor](#) ( NumericType r, NumericType g, NumericType b ) [[inline](#)]

Definition at line 58 of file [gvColor.h](#).

29.182.2.3 `template<typename NumericType > gvColor::gvColor ( NumericType r, NumericType g, NumericType b,  
NumericType alpha ) [inline]`

Definition at line 64 of file gvColor.h.

29.182.2.4 `gvColor::gvColor ( const gvColor & other ) [inline]`

Definition at line 103 of file gvColor.h.

### 29.182.3 Member Function Documentation

29.182.3.1 `template<typename NumericType > static gvColor gvColor::hsva ( NumericType h, NumericType s, NumericType  
v, NumericType alpha ) [inline],[static]`

Definition at line 72 of file gvColor.h.

29.182.3.2 `gvColor& gvColor::operator= ( const gvColor & other ) [inline]`

Definition at line 110 of file gvColor.h.

### 29.182.4 Member Data Documentation

29.182.4.1 `float gvColor::rgba[4]`

Definition at line 51 of file gvColor.h.

The documentation for this struct was generated from the following file:

- [viewlib/include/GoTools/viewlib/gvColor.h](#)

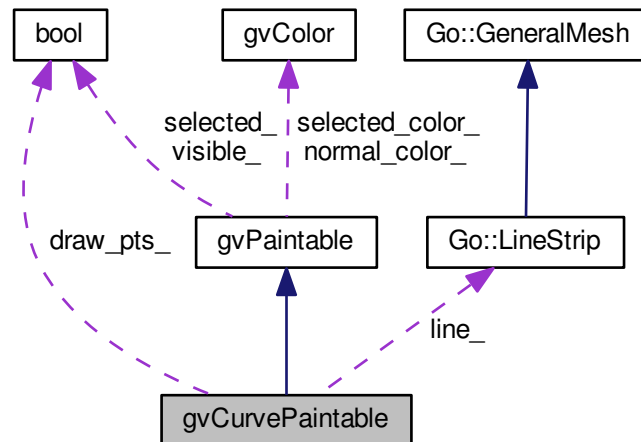

## 29.183 gvCurvePaintable Class Reference

```
#include <gvCurvePaintable.h>
```

Collaboration diagram for gvCurvePaintable:

## Public Member Functions

- [gvCurvePaintable](#) ([Go::LineStrip](#) &line, [const gvColor](#) &ncolor, [const gvColor](#) &scolor, int id)
- [gvCurvePaintable](#) ([Go::LineStrip](#) &line, [const gvColor](#) &ncolor, int id)
- virtual [~gvCurvePaintable](#) ()
- virtual void [paint](#) ([gvTexture](#) \*texture)
- void [setDrawPoints](#) ([bool](#) dp)
- [bool](#) [drawPoints](#) ()

## Protected Attributes

- [Go::LineStrip](#) & [line\\_](#)
- [bool](#) [draw\\_pts\\_](#)

### 29.183.1 Detailed Description

OpenGL calls for a parametric curve (represented by a LineStrip).

Definition at line 53 of file gvCurvePaintable.h.

### 29.183.2 Constructor & Destructor Documentation

29.183.2.1 [gvCurvePaintable::gvCurvePaintable](#) ([Go::LineStrip](#) & *line*, [const gvColor](#) & *ncolor*, [const gvColor](#) & *scolor*, int *id*) [[inline](#)]

Definition at line 56 of file gvCurvePaintable.h.

29.183.2.2 `gvCurvePaintable::gvCurvePaintable ( Go::LineStrip & line, const gvColor & ncolor, int id )` `[inline]`

Definition at line 63 of file `gvCurvePaintable.h`.

29.183.2.3 `virtual gvCurvePaintable::~~gvCurvePaintable ( )` `[virtual]`

### 29.183.3 Member Function Documentation

29.183.3.1 `bool gvCurvePaintable::drawPoints ( )` `[inline]`

Definition at line 77 of file `gvCurvePaintable.h`.

29.183.3.2 `virtual void gvCurvePaintable::paint ( gvTexture * texture )` `[virtual]`

The function that does the painting. Must be overridden by all subclasses. If your subclass does not use textures, just ignore the texture argument.

Implements [gvPaintable](#).

29.183.3.3 `void gvCurvePaintable::setDrawPoints ( bool dp )` `[inline]`

Definition at line 73 of file `gvCurvePaintable.h`.

### 29.183.4 Member Data Documentation

29.183.4.1 `bool gvCurvePaintable::draw_pts_` `[protected]`

Definition at line 85 of file `gvCurvePaintable.h`.

29.183.4.2 `Go::LineStrip& gvCurvePaintable::line_` `[protected]`

Definition at line 84 of file `gvCurvePaintable.h`.

The documentation for this class was generated from the following file:

- [viewlib/include/GoTools/viewlib/gvCurvePaintable.h](#)

## 29.184 gvData Class Reference

```
#include <gvData.h>
```

Collaboration diagram for gvData:

### 29.194.1 Detailed Description

[gvPaintable](#): Super class for OpenGL calls to geometric objects.

Definition at line 52 of file [gvPaintable.h](#).

## 29.194.2 Constructor & Destructor Documentation

29.194.2.1 `gvPaintable::gvPaintable ( const gvColor & ncolor, const gvColor & scolor, int id )` `[inline]`

The arguments of this constructor (which will be called only by subclasses) are the colors to use in normal and selected states.

Definition at line 58 of file `gvPaintable.h`.

29.194.2.2 `gvPaintable::gvPaintable ( const gvColor & ncolor, int id )` `[inline]`

If the selected-mode color is not specified, a lighter shade of the normal color will be used.

Definition at line 68 of file `gvPaintable.h`.

29.194.2.3 `virtual gvPaintable::~~gvPaintable ( )` `[virtual]`

## 29.194.3 Member Function Documentation

29.194.3.1 `gvColor gvPaintable::getNormalColor ( )` `[inline]`

Definition at line 125 of file `gvPaintable.h`.

29.194.3.2 `int gvPaintable::id ( ) const` `[inline]`

Definition at line 129 of file `gvPaintable.h`.

29.194.3.3 `virtual void gvPaintable::paint ( gvTexture * texture )` `[pure virtual]`

The function that does the painting. Must be overridden by all subclasses. If your subclass does not use textures, just ignore the texture argument.

Implemented in [gvParametricSurfacePaintable](#), [gvGenericTriPaintable< FloatType >](#), [gvPointCloudPaintable](#), [gvLineCloudPaintable](#), [gvCurvePaintable](#), [gvRectangularVolumePaintable](#), [gvQuadsPaintable](#), [gvRectangularSurfacePaintable](#), and [gvNoopPaintable](#).

29.194.3.4 `virtual void gvPaintable::paintGL ( QGLWidget * w, gvTexture * texture )` `[inline],[virtual]`

Reimplemented in [gvPointCloudPaintable](#).

Definition at line 88 of file `gvPaintable.h`.

29.194.3.5 `bool gvPaintable::selected ( ) const` `[inline]`

Definition at line 105 of file `gvPaintable.h`.

29.194.3.6 void gvPaintable::setColor ( const gvColor & ncolor, const gvColor & scolor ) [inline]

Definition at line 109 of file gvPaintable.h.

29.194.3.7 void gvPaintable::setColor ( const gvColor & ncolor ) [inline]

Definition at line 115 of file gvPaintable.h.

29.194.3.8 void gvPaintable::setId ( int id ) [inline]

Definition at line 133 of file gvPaintable.h.

29.194.3.9 void gvPaintable::setSelected ( bool state ) [inline]

Definition at line 101 of file gvPaintable.h.

29.194.3.10 void gvPaintable::setVisible ( bool state ) [inline]

Definition at line 93 of file gvPaintable.h.

29.194.3.11 bool gvPaintable::visible ( ) const [inline]

Definition at line 97 of file gvPaintable.h.

## 29.194.4 Member Data Documentation

29.194.4.1 int gvPaintable::id\_ [protected]

Definition at line 143 of file gvPaintable.h.

29.194.4.2 gvColor gvPaintable::normal\_color\_ [protected]

Definition at line 141 of file gvPaintable.h.

29.194.4.3 bool gvPaintable::selected\_ [protected]

Definition at line 140 of file gvPaintable.h.

29.194.4.4 gvColor gvPaintable::selected\_color\_ [protected]

Definition at line 142 of file gvPaintable.h.

29.194.4.5 `bool gvPaintable::visible_` [`protected`]

Definition at line 139 of file `gvPaintable.h`.

The documentation for this class was generated from the following file:

- [viewlib/include/GoTools/viewlib/gvPaintable.h](#)

## 29.195 gvPainter Class Reference

The `gvPainter` is responsible for painting the 3D scene.

```
#include <gvPainter.h>
```

### Public Member Functions

- `gvPainter` ()
- virtual `~gvPainter` ()
- virtual void `drawScene` (QGLWidget \*w=NULL)
- void `addPaintable` (shared\_ptr< `gvPaintable` > pa)
- void `removeAllPaintables` ()
- void `removePaintable` (int id)
- void `removeLastPaintable` ()
- `gvPaintable` & `getPaintable` (int index)
- void `setTexture` (int index, shared\_ptr< `gvTexture` > tex)
- shared\_ptr< `gvTexture` > `getTexture` (int index)
- shared\_ptr< const `gvTexture` > `setTexture` (int index)

### Protected Attributes

- std::vector< shared\_ptr< `gvPaintable` > > `paintables_`
- std::vector< shared\_ptr< `gvTexture` > > `textures_`

#### 29.195.1 Detailed Description

The `gvPainter` is responsible for painting the 3D scene.

Definition at line 53 of file `gvPainter.h`.

#### 29.195.2 Constructor & Destructor Documentation

29.195.2.1 `gvPainter::gvPainter` ( ) [`inline`]

Definition at line 56 of file `gvPainter.h`.

29.195.2.2 `virtual gvPainter::~gvPainter ( ) [virtual]`

### 29.195.3 Member Function Documentation

29.195.3.1 `void gvPainter::addPaintable ( shared_ptr< gvPaintable > pa ) [inline]`

Add a new paintable. [gvPaintable](#) is the abstract bas class of all paintables.

Definition at line 66 of file gvPainter.h.

29.195.3.2 `virtual void gvPainter::drawScene ( QGLWidget * w =NULL ) [virtual]`

Draws the 3D scene by calling the paint() virtual method of all its contained gvPaintables.

29.195.3.3 `gvPaintable& gvPainter::getPaintable ( int index ) [inline]`

Call this to access the individual paintables, in order to manipulate selection state, visibility state or color.

Definition at line 98 of file gvPainter.h.

29.195.3.4 `shared_ptr<gvTexture> gvPainter::getTexture ( int index ) [inline]`

Definition at line 109 of file gvPainter.h.

29.195.3.5 `void gvPainter::removeAllPaintables ( ) [inline]`

Removes all paintables, if you want to paint something you have to [addPaintable\(\)](#) again.

Definition at line 79 of file gvPainter.h.

29.195.3.6 `void gvPainter::removeLastPaintable ( ) [inline]`

Definition at line 91 of file gvPainter.h.

29.195.3.7 `void gvPainter::removePaintable ( int id ) [inline]`

Definition at line 85 of file gvPainter.h.

29.195.3.8 `void gvPainter::setTexture ( int index, shared_ptr< gvTexture > tex ) [inline]`

Definition at line 103 of file gvPainter.h.

29.195.3.9 `shared_ptr<const gvTexture> gvPainter::setTexture ( int index )` [inline]

Definition at line 115 of file gvPainter.h.

#### 29.195.4 Member Data Documentation

29.195.4.1 `std::vector< shared_ptr<gvPaintable> > gvPainter::paintables_` [protected]

Definition at line 122 of file gvPainter.h.

29.195.4.2 `std::vector< shared_ptr<gvTexture> > gvPainter::textures_` [protected]

Definition at line 123 of file gvPainter.h.

The documentation for this class was generated from the following file:

- [viewlib/include/GoTools/viewlib/gvPainter.h](#)

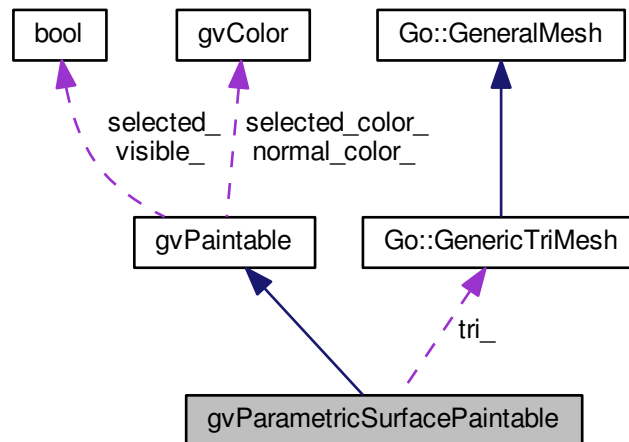

#### 29.196 gvParametricSurfacePaintable Class Reference

```
#include <gvParametricSurfacePaintable.h>
```

Inheritance diagram for gvParametricSurfacePaintable:

Collaboration diagram for gvParametricSurfacePaintable:

## Public Member Functions

- `gvParametricSurfacePaintable` (`genMesh` &tri, `const gvColor` &ncolor, `const gvColor` &scolor, int id)
- `gvParametricSurfacePaintable` (`genMesh` &tri, `const gvColor` &ncolor, int id)
- virtual `~gvParametricSurfacePaintable` ()
- virtual void `paint` (`gvTexture` \*texture)

## Protected Member Functions

- void `createSurface` ()
- void `drawSurface` ()

## Protected Attributes

- `genMesh` & tri\_

### 29.196.1 Detailed Description

`gvParametricSurfacePaintable`: OpenGL calls for a parametric surface.

Definition at line 63 of file `gvParametricSurfacePaintable.h`.

### 29.196.2 Constructor & Destructor Documentation

29.196.2.1 `gvParametricSurfacePaintable::gvParametricSurfacePaintable` (`genMesh` & tri, `const gvColor` & ncolor, `const gvColor` & scolor, int id ) `[inline]`

Definition at line 66 of file `gvParametricSurfacePaintable.h`.

29.196.2.2 `gvParametricSurfacePaintable::gvParametricSurfacePaintable ( genMesh & tri, const gvColor & ncolor, int id )`  
`[inline]`

Definition at line 73 of file `gvParametricSurfacePaintable.h`.

29.196.2.3 `virtual gvParametricSurfacePaintable::~~gvParametricSurfacePaintable ( )` `[virtual]`

### 29.196.3 Member Function Documentation

29.196.3.1 `void gvParametricSurfacePaintable::createSurface ( )` `[protected]`

29.196.3.2 `void gvParametricSurfacePaintable::drawSurface ( )` `[protected]`

29.196.3.3 `virtual void gvParametricSurfacePaintable::paint ( gvTexture * texture )` `[virtual]`

The function that does the painting. Must be overridden by all subclasses. If your subclass does not use textures, just ignore the texture argument.

Implements [gvPaintable](#).

### 29.196.4 Member Data Documentation

29.196.4.1 `genMesh& gvParametricSurfacePaintable::tri_` `[protected]`

Definition at line 94 of file `gvParametricSurfacePaintable.h`.

The documentation for this class was generated from the following file:

- [viewlib/include/GoTools/viewlib/gvParametricSurfacePaintable.h](#)

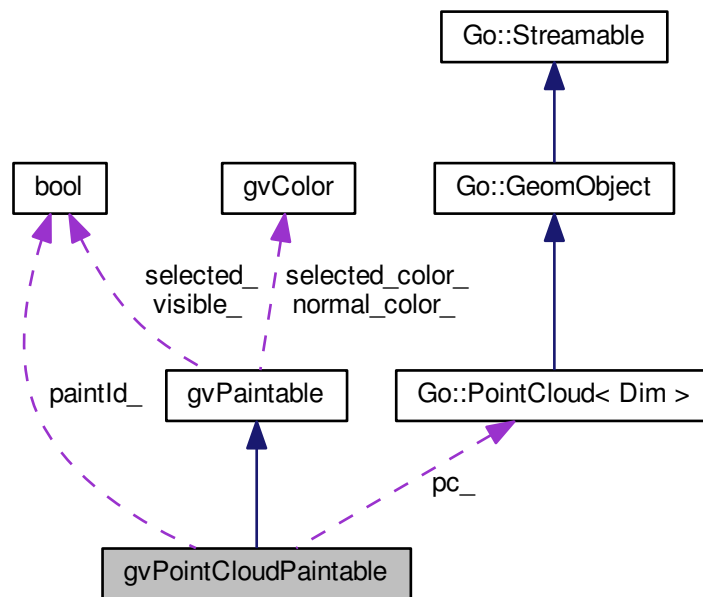

## 29.197 gvPointCloudPaintable Class Reference

### 29.205.1 Detailed Description

Documentation ... etc

Definition at line 68 of file gvView.h.

### 29.205.2 Constructor & Destructor Documentation

29.205.2.1 `gvView::gvView ( gvData & data, QWidget * parent = 0, const char * name = 0, const QGLWidget * shareWidget = 0, Qt::WFlags f = 0 )`

The [gvData&](#) argument is the [gvData](#) object this object should observe. The other arguments are standard arguments for the [QGLWidget](#) superclass.

29.205.2.2 `virtual gvView::~~gvView ( ) [virtual]`

29.205.2.3 `gvView::gvView ( const QGLFormat & format, gvData & data, QWidget * parent, const char * name, const QGLWidget * shareWidget, Qt::WFlags f ) [protected]`

### 29.205.3 Member Function Documentation

29.205.3.1 `bool gvView::axis ( ) [inline]`

Are we in paint-axis mode?

Definition at line 127 of file gvView.h.

29.205.3.2 `bool gvView::backCull ( ) [inline]`

Are we in bacface-culling mode?

Definition at line 129 of file gvView.h.

29.205.3.3 `bool gvView::blendingmode ( ) const [inline]`

Should the alpha value be used for blending?

Definition at line 137 of file gvView.h.

29.205.3.4 `void gvView::drawOverlay ( ) [protected]`

29.205.3.5 `void gvView::feedback ( int xrel, int yrel ) [signal]`

In feedback mode, indicates mouse position relative to start of drag.

29.205.3.6 `bool gvView::feedbackmode ( ) const [inline]`

Are we in feedback mode?

Definition at line 135 of file gvView.h.

29.205.3.7 `void gvView::focusOnBox ( )`

Put the center of the bounding box of the model in the middle of the screen, at a (hopefully) useful distance from the camera.

29.205.3.8 `void gvView::focusOnVisible ( )`

29.205.3.9 `virtual bool gvView::get3Dpoint ( int mousex, int mousey, Vector3D & objpt ) [protected],[virtual]`

29.205.3.10 `virtual void gvView::getObjAndParam ( int mousex, int mousey, shared_ptr< const Go::ParamSurface > & obj, double & tex_u, double & tex_v ) [virtual]`

Searching among visible and selected objects.

29.205.3.11 `void gvView::getWindowCoords ( const Vector3D & pt, int & mousex, int & mousey ) const`

29.205.3.12 `virtual void gvView::initializeGL ( ) [virtual]`

Initialize GL state (shademodel, lights, etc.)

29.205.3.13 `gvTexture* gvView::makeCoarseCheckImage ( )` [protected]

29.205.3.14 `gvTexture* gvView::makeFineCheckImage ( )` [protected]

29.205.3.15 `virtual QSize gvView::minimumSizeHint ( ) const` [inline],[virtual]

Definition at line 142 of file gvView.h.

29.205.3.16 `virtual void gvView::mouseMoveEvent ( QMouseEvent * e )` [protected],[virtual]

Overridden in order to make mouse moves translate, zoom and rotate the camera.

29.205.3.17 `virtual void gvView::mousePressEvent ( QMouseEvent * e )` [protected],[virtual]

Overridden in order to make mouse moves translate, zoom and rotate the camera.

29.205.3.18 `virtual void gvView::mouseReleaseEvent ( QMouseEvent * e )` [protected],[virtual]

Overridden in order to make mouse moves translate, zoom and rotate the camera.

29.205.3.19 `void gvView::objectPicked ( unsigned int name )` [signal]

An object has been picked.

29.205.3.20 `void gvView::objectsPicked ( unsigned int * names, int numnames )` [signal]

An object has been picked.

29.205.3.21 `virtual void gvView::observedChanged ( )` [virtual]

This function is called whenever the observed [gvData](#) object is changed.

Implements [gvObserver](#).

29.205.3.22 `virtual void gvView::paintGL ( )` [virtual]

This function does the actual drawing into the widget's area. After clearing the area, it will call `use()` on the camera, and ask the [gvPainter](#) owned by the observed [gvData](#) object to do a repaint.

29.205.3.23 `bool gvView::perspective ( )` [inline]

Are we in perspective projection mode?

Definition at line 133 of file gvView.h.

29.205.3.24 `void gvView::pick ( int mousex, int mousey )`

Pick the geometrical object at a mouse coordinate.

29.205.3.25 `void gvView::pickRegion ( int mousex, int mousey, int w, int h )`

Pick the geometrical objects in a region of the window.

29.205.3.26 `virtual void gvView::resizeGL ( int w, int h )` [virtual]

Called when the widget is resized. It will set the viewport of the camera and then do a repaint.

29.205.3.27 `virtual void gvView::saveSnapshot ( int w, int h, const QString & filename )` [virtual]

29.205.3.28 `bool gvView::selectionmode ( )` [inline]

Are we in selection mode?

Definition at line 125 of file gvView.h.

29.205.3.29 `void gvView::setAxis ( bool mode )` [slot]

Set paint-axis state.

29.205.3.30 `void gvView::setBackCull ( bool mode )` [slot]

Set backface-culling state.

29.205.3.31 `void gvView::setBlendingmode ( bool mode )` [slot]

Set blending state.

29.205.3.32 `void gvView::setCenter ( int x, int y )` [slot]

Centers view on point at x,y in back buffer.

29.205.3.33 `void gvView::setFeedbackmode ( bool mode )` [slot]

Set feedback state.

29.205.3.34 `void gvView::setGetClickmode ( bool mode ) [slot]`

Set get click mode.

29.205.3.35 `void gvView::setOriginFocalPoint ( bool origin )`

Let the camera focus on the origin. Vertices are then translated towards the origin.

29.205.3.36 `void gvView::setPerspective ( bool mode ) [slot]`

Set perspective projection state.

29.205.3.37 `void gvView::setSelectionMode ( bool mode ) [slot]`

Set selection mode.

29.205.3.38 `void gvView::setSpecular ( bool mode ) [slot]`

Set specular highlighting state.

29.205.3.39 `void gvView::setWireframe ( bool mode ) [slot]`

Set wireframe state.

29.205.3.40 `virtual QSize gvView::sizeHint ( ) const [virtual]`

@ Not sure if I need this

29.205.3.41 `bool gvView::specular ( ) [inline]`

Are we in specular highlight mode?

Definition at line 131 of file gvView.h.

29.205.3.42 `static void gvView::texCoordInt ( int num_objs, int ind, double & min_s, double & max_s, double & min_t, double & max_t ) [static],[protected]`

29.205.3.43 `bool gvView::wireframe ( ) [inline]`

Are we in wireframe mode?

Definition at line 123 of file gvView.h.

### 29.210.1 Detailed Description

This class is used to generate a [SplineCurve](#) from a [EvalCurve](#) using Hermite interpolation. The generated curve will approximate the [EvalCurve](#) within specified tolerances.

Definition at line 55 of file HermiteAppC.h.

### 29.210.2 Constructor & Destructor Documentation

29.210.2.1 `Go::HermiteAppC::HermiteAppC ( EvalCurve * crv, double tolerance1, double tolerance2 )`

Constructor where the tolerances and the curve to approximate are specified.

## Parameters

<i>crv</i>	the curve that we want to generate a Hermite approximation of. The curve is <i>not</i> copied, only pointed to by the <a href="#">HermiteAppC</a> .
<i>tolerance1</i>	the required geometrical accuracy of approximation
<i>tolerance2</i>	another tolerance, used for some kinds of EvalCurves

**29.210.2.2** `Go::HermiteAppC::HermiteAppC ( EvalCurve * crv, double initpars[], int n, double tolerance1, double tolerance2 )`

Constructor where the tolerances and the curve to approximate are specified, as well as the parameters for which we will sample the input curve before starting the approximating process.

## Parameters

<i>crv</i>	the curve that we want to generate a Hermite approximation of. The curve is <i>not</i> copied, only pointed to by the <a href="#">HermiteAppC</a> .
<i>initpars</i>	pointer to the array of parameter values for which we will sample the input curve.
<i>n</i>	number of parameter values in the array 'initpars'.
<i>tolerance1</i>	the required geometrical accuracy of approximation
<i>tolerance2</i>	another tolerance, used for some kinds of EvalCurves

**29.210.2.3** `Go::HermiteAppC::~~HermiteAppC ( ) [inline]`

Empty destructor.

Definition at line 80 of file HermiteAppC.h.

**29.210.3 Member Function Documentation**

**29.210.3.1** `shared_ptr<SplineCurve> Go::HermiteAppC::getCurve ( )`

Return the cubic spline curve Hermite interpolating the grid.

## Returns

the cubic spline curve that Hermite interpolates the sampled points of the [EvalCurve](#) specified in the constructor.

**29.210.3.2** `void Go::HermiteAppC::refineApproximation ( )`

Refine the internal sampling of the curve to approximate such that the Hermite interpolated curve of this sampling approximates parametrically the original curve within the specified tolerance.

The documentation for this class was generated from the following file:

- [gotools-core/include/GoTools/creators/HermiteAppC.h](#)

## 29.211 Go::HermiteApprEvalSurf Class Reference

### 29.211.1 Detailed Description

This class is used to generate a [SplineSurface](#) from a [EvalSurface](#) using Hermite interpolation. The generated surface will approximate the [EvalSurface](#) within specified tolerances.

Definition at line 57 of file [HermiteApprEvalSurf.h](#).

### 29.211.2 Constructor & Destructor Documentation

#### 29.211.2.1 Go::HermiteApprEvalSurf::HermiteApprEvalSurf ( [EvalSurface](#) \* sf, [double](#) tolerance1, [double](#) tolerance2 )

Constructor where the tolerances and the surface to approximate are specified.

#### Parameters

<i>sf</i>	the surface that we want to generate a Hermite approximation of. The surface is <i>not</i> copied, only pointed to by the <a href="#">HermiteApprEvalSurf</a> .
<i>tolerance1</i>	the required geometrical accuracy of approximation
<i>tolerance2</i>	another tolerance, used for some kinds of <a href="#">EvalSurfaces</a>

#### 29.211.2.2 Go::HermiteApprEvalSurf::HermiteApprEvalSurf ( [EvalSurface](#) \* sf, [double](#) initpars\_u[], [int](#) mm, [double](#) initpars\_v[], [int](#) nn, [double](#) tolerance1, [double](#) tolerance2 )

Constructor where the tolerances and the surface to approximate are specified, as well as the parameters for which we will sample the input surface before starting the approximating process.

## Parameters

<i>sf</i>	the surface that we want to generate a Hermite approximation of. The surface is <i>not</i> copied, only pointed to by the <a href="#">HermiteApprEvalSurf</a> .
<i>initpars</i>	pointer to the array of parameter values for which we will sample the input surface.
<i>n</i>	number of parameter values in the array 'initpars'.
<i>tolerance1</i>	the required geometrical accuracy of approximation
<i>tolerance2</i>	another tolerance, used for some kinds of EvalSurfaces

29.211.2.3 `Go::HermiteApprEvalSurf::~~HermiteApprEvalSurf ( ) [inline]`

Empty destructor.

Definition at line 86 of file `HermiteApprEvalSurf.h`.

### 29.211.3 Member Function Documentation

29.211.3.1 `const HermiteGrid2D& Go::HermiteApprEvalSurf::getGrid ( ) const`

29.211.3.2 `shared_ptr<SplineSurface> Go::HermiteApprEvalSurf::getSurface ( bool & method_failed )`

Return the cubic spline surface Hermite interpolating the grid.

#### Returns

the cubic spline surface that Hermite interpolates the sampled points of the [EvalSurface](#) specified in the constructor.

29.211.3.3 `void Go::HermiteApprEvalSurf::refineApproximation ( )`

Refine the internal sampling of the surface to approximate such that the Hermite interpolated surface of this sampling approximates parametrically the original surface within the specified tolerance.

29.211.3.4 `void Go::HermiteApprEvalSurf::removeGridLines ( const std::vector< double > & grid_lines_u, const std::vector< double > & grid_lines_v )`

29.211.3.5 `void Go::HermiteApprEvalSurf::setNoSplit ( const std::vector< shared_ptr< SplineCurve > > & no_split_cvs_2d, double no_split_dist_2d )`

The documentation for this class was generated from the following file:

- `compositemodel/include/GoTools/compositemodel/HermiteApprEvalSurf.h`

## 29.212 Go::HermiteAppS Class Reference

```
#include <HermiteAppS.h>
```

### Public Member Functions

- [HermiteAppS](#) ([EvalCurveSet](#) \**surface*, *double tolerance1*, *double tolerance2*, [std::vector](#)< int > *dims*)
- [HermiteAppS](#) ([EvalCurveSet](#) \**surface*, *double* *initpars*[], *int n*, *double tolerance1*, *double tolerance2*, [std::vector](#)< int > *dims*)
- [~HermiteAppS](#) ()  
*Empty destructor.*
- [void refineApproximation](#) ()
- [std::vector](#)< [shared\\_ptr](#)< [SplineCurve](#) > > [getCurves](#) ()

### 29.212.1 Detailed Description

This class is used to generate a set of [SplineCurves](#) from a [EvalCurveSet](#) (which itself represents a set of related curves) using Hermite interpolation. The generated curves will approximate those defined by the [EvalCurveSet](#) within specified tolerances. This class is really a generalization of [HermiteAppC](#).

Definition at line 56 of file [HermiteAppS.h](#).

### 29.212.2 Constructor & Destructor Documentation

**29.212.2.1** [Go::HermiteAppS::HermiteAppS](#) ( [EvalCurveSet](#) \* *surface*, *double tolerance1*, *double tolerance2*, [std::vector](#)< int > *dims* )

Constructor where the tolerances and the curves to approximate are specified.

#### Parameters

<i>surface</i>	the curve set that we want to approximate by Hermite interpolation of sampled values.
<i>tolerance1</i>	the required geometrical accuracy of approximation
<i>tolerance2</i>	another tolerance, used for some kinds of <a href="#">EvalCurveSets</a> .
<i>dims</i>	vector that specifies the spatial dimensions of the curves contained in the <a href="#">EvalCurveSet</a> . The size of the vector should be equal to the total number of curves in 'surf', ie. the return value of its <a href="#">EvalCurveSet::nmbCvs()</a> function.

**29.212.2.2** [Go::HermiteAppS::HermiteAppS](#) ( [EvalCurveSet](#) \* *surface*, *double* *initpars*[], *int n*, *double tolerance1*, *double tolerance2*, [std::vector](#)< int > *dims* )

Constructor where the tolerances and the curve set to approximate are specified, as well as the parameters where they should be sampled prior to the Hermite interpolation.

#### Parameters

<i>surface</i>	the curve set that we want to approximate by Hermite interpolation of sampled values.
----------------	---------------------------------------------------------------------------------------

## Parameters

<i>initpars</i>	pointer to the array of parameter values for which we will sample the input curves.
<i>n</i>	number of parameter values in the array 'initpars[]'.
<i>tolerance1</i>	the required geometrical accuracy of approximation
<i>tolerance2</i>	another tolerance, used for some kinds of EvalCurveSets.
<i>dims</i>	vector that specifies the spatial dimensions of the curves contained in the <a href="#">EvalCurveSet</a> . The size of the vector should be equal to the total number of curves in 'surf', ie. the return value of its <a href="#">EvalCurveSet::nmbCvs()</a> function.

### 29.212.2.3 Go::HermiteAppS::~HermiteAppS ( ) [inline]

Empty destructor.

Definition at line 92 of file HermiteAppS.h.

### 29.212.3 Member Function Documentation

#### 29.212.3.1 std::vector<shared\_ptr<SplineCurve>> Go::HermiteAppS::getCurves ( )

Return the cubic spline curves interpolating the grid (ie. approximating the original curve set).

#### Returns

a vector containing shared pointers to the newly created spline curves that Hermite interpolate the sampled points of the [EvalCurveSet](#) (curve set) specified in the constructor.

#### 29.212.3.2 void Go::HermiteAppS::refineApproximation ( )

Refine the internal sampling of the curves such that the Hermite interpolated curves parametrically approximates the original curve within a specified tolerance.

The documentation for this class was generated from the following file:

- [gtools-core/include/GoTools/creators/HermiteAppS.h](#)

### 29.213 Go::HermiteGrid1D Class Reference

```
#include <HermiteGrid1D.h>
```

## Public Member Functions

*Return the spatial dimension.*
- [int size](#) ()  
*Return the number of samples in the grid.*

### 29.213.1 Detailed Description

The type "GoHemiteGrid1D" holds a one dimensional grid containing sampled points and derivatives from a curve. It can be used to generate bezier curve segments obtained by Hermite interpolation of intervals between the sampled parameter values.

Definition at line 56 of file HermiteGrid1D.h.

### 29.213.2 Constructor & Destructor Documentation

#### 29.213.2.1 Go::HermiteGrid1D::HermiteGrid1D ( [const EvalCurve](#) & crv, [double](#) start, [double](#) end )

Construct a [HermiteGrid1D](#) from a curve and a given interval. The grid will only contain the sampled values (position, derivative) for the first and last value of the interval.

##### Parameters

<i>crv</i>	curve to sample
<i>start</i>	start of interval
<i>end</i>	end of interval

#### 29.213.2.2 Go::HermiteGrid1D::HermiteGrid1D ( [const EvalCurve](#) & crv, [double](#) param[], [int](#) n )

Construct a [HermiteGrid1D](#) from a curve and a set of parameter values.

##### Parameters

<i>crv</i>	curve to sample
<i>param</i>	array of strictly increasing parameters contained in the parameter domain of 'crv'.
<i>n</i>	number of elements in 'param[]'.

### 29.213.2.3 Go::HermiteGrid1D::~~HermiteGrid1D ( )

Default destructor.

## 29.213.3 Member Function Documentation

### 29.213.3.1 int Go::HermiteGrid1D::addKnot ( const EvalCurve & *crv*, double *knot* )

Add another sample (parameter, position, tangent) to the grid. Returns the index of the new knot (parameter value) in the sorted knot vector after insertion.

#### Parameters

<i>crv</i>	curve to evaluate
<i>knot</i>	the new sample value (parameter value, knot)

### 29.213.3.2 int Go::HermiteGrid1D::dim ( ) [inline]

Return the spatial dimension.

Definition at line 104 of file HermiteGrid1D.h.

### 29.213.3.3 std::vector<Point> Go::HermiteGrid1D::getData ( ) [inline]

Return the sample values (positions and first derivatives)

Definition at line 101 of file HermiteGrid1D.h.

### 29.213.3.4 std::vector<double> Go::HermiteGrid1D::getKnots ( ) [inline]

Return the grid parameters.

Definition at line 98 of file HermiteGrid1D.h.

### 29.213.3.5 void Go::HermiteGrid1D::getSegment ( int *left*, int *right*, double & *spar*, double & *epar*, Point *bezcoef*[4] )

Calculate Bezier coefficients of the cubic curve interpolating the point and tangent values at grid nodes with indices "left" and "right".

#### Parameters

<i>left</i>	indicating grid node for start of curve segment
<i>right</i>	indicating grid node for end of curve segment
<i>spar</i>	start parameter of segment
<i>epar</i>	end parameter of segment
<i>bezcoef</i>	array of cubic Bezier coefficients

29.213.3.6 `int Go::HermiteGrid1D::size ( ) [inline]`

Return the number of samples in the grid.

Definition at line 107 of file HermiteGrid1D.h.

### 29.214.1 Detailed Description

The type "GoHemiteGrid1DMulti" holds a one dimensional grid containing sampled points and derivatives from a set of curves, as represented by a [EvalCurveSet](#). It can be used to generate bezier curve segments obtained by Hermite interpolation of intervals between the sampled parameter values.

Definition at line 56 of file HermiteGrid1DMulti.h.

### 29.214.2 Constructor & Destructor Documentation

29.214.2.1 `Go::HermiteGrid1DMulti::HermiteGrid1DMulti ( EvalCurveSet & surf, double start, double end, std::vector< int > dims )`

Construct a [HermiteGrid1DMulti](#) from a set of related curves (represented by a [EvalCurveSet](#)) and a given interval.

## Parameters

<i>surf</i>	the curve collection to sample from
<i>start</i>	start of parameter interval
<i>end</i>	end of parameter interval
<i>dims</i>	vector that specifies the dimensions of the curves contained in the <a href="#">EvalCurveSet</a> . The size of the vector should be equal to the total number of curves in 'surf', ie. the return value of its <a href="#">EvalCurveSet::nmbCvs()</a> function.

29.214.2.2 `Go::HermiteGrid1DMulti::HermiteGrid1DMulti ( EvalCurveSet & surf, double param[], int n, std::vector< int > dims )`

Construct a [HermiteGrid1DMulti](#) from a set of related curves (represented by a [EvalCurveSet](#)) and a set of parameter values.

## Parameters

<i>surf</i>	the curve collection to sample from
<i>param</i>	array of strictly increasing parameters contained in the parameter domain of 'surf'.
<i>n</i>	number of elements in 'param[]'
<i>dims</i>	vector that specifies the dimensions of the curves contained in the <a href="#">EvalCurveSet</a> . The size of the vector should be equal to the total number of curves in 'surf', ie. the return value of its <a href="#">EvalCurveSet::nmbCvs()</a> function.

29.214.2.3 `Go::HermiteGrid1DMulti::~~HermiteGrid1DMulti ( )`

Default destructor.

## 29.214.3 Member Function Documentation

29.214.3.1 `int Go::HermiteGrid1DMulti::addKnot ( EvalCurveSet & surf, double knot )`

Add another sample (parameter, positions, tangents) to the grid. Returns the index of the new knot (parameter value) in the sorted knot vector after insertion.

## Parameters

<i>surf</i>	the curve collection to sample from
<i>knot</i>	the new sample value (parameter value, knot)

29.214.3.2 `int Go::HermiteGrid1DMulti::dims ( int ki ) [inline]`

Return the spatial dimension of each of the curves.

Definition at line 114 of file [HermiteGrid1DMulti.h](#).

29.214.3.3 `std::vector<std::vector<Point>>` `Go::HermiteGrid1DMulti::getData ( )` `[inline]`

Return the sample values (positions and first derivatives)

Definition at line 111 of file `HermiteGrid1DMulti.h`.

29.214.3.4 `std::vector<double>` `Go::HermiteGrid1DMulti::getKnots ( )` `[inline]`

Return the grid parameters.

Definition at line 107 of file `HermiteGrid1DMulti.h`.

29.214.3.5 `void Go::HermiteGrid1DMulti::getSegment ( int left, int right, double & spar, double & epar, std::vector<std::vector< Point >> & bezcoef )`

Calculate Bezier coefficients of the cubic curves interpolating the points and tangents at the grid nodes with indices 'left' and 'right'.

#### Parameters

<i>left</i>	indicating grid node for start of curve segment
<i>right</i>	indicating grid node for end of curve segment
<i>spar</i>	start parameter of segment
<i>epar</i>	end parameter of segment
<i>bezcoef</i>	a vector containing arrays of cubic Bezier coefficients. There are as many vector entries as there are curves, and each entry contains the Bezier coefficients for that curve.

29.214.3.6 `int Go::HermiteGrid1DMulti::size ( )` `[inline]`

Return the number of samples in the grid.

Definition at line 117 of file `HermiteGrid1DMulti.h`.

The documentation for this class was generated from the following file:

- `gtools-core/include/GoTools/creators/HermiteGrid1DMulti.h`

### 29.215.1 Detailed Description

The type "GoHermiteGrid1D" holds a one dimensional grid containing sampled points and derivatives from a curve. It can be used to generate bezier curve segments obtained by Hermite interpolation of intervals between the sampled parameter values.

Definition at line 57 of file HermiteGrid2D.h.

### 29.215.2 Constructor & Destructor Documentation

29.215.2.1 [Go::HermiteGrid2D::HermiteGrid2D](#) ( [const EvalSurface](#) &sf, [double](#) u1, [double](#) u2, [double](#) v1, [double](#) v2 )

Construct a [HermiteGrid1D](#) from a curve and a given interval. The grid will only contain the sampled values (position, derivative) for the first and last value of the interval.

#### Parameters

<i>crv</i>	curve to sample
<i>start</i>	start of interval
<i>end</i>	end of interval

29.215.2.2 [Go::HermiteGrid2D::HermiteGrid2D](#) ( [const EvalSurface](#) &sf, [double](#) param\_u[], [double](#) param\_v[], [int](#) mm, [int](#) nn )

Construct a [HermiteGrid1D](#) from a curve and a set of parameter values.

## Parameters

<i>crv</i>	curve to sample
<i>param</i>	array of strictly increasing parameters contained in the parameter domain of 'crv'.
<i>n</i>	number of elements in 'param[]'.

## 29.215.2.3 Go::HermiteGrid2D::~~HermiteGrid2D ( )

Default destructor.

## 29.215.3 Member Function Documentation

## 29.215.3.1 int Go::HermiteGrid2D::addKnot ( const EvalSurface &amp; sf, double knot, bool dir\_is\_u )

Add another sample (parameter, position, tangent) to the grid. Returns the index of the new knot (parameter value) in the sorted knot vector after insertion.

## Parameters

<i>crv</i>	curve to evaluate
<i>knot</i>	the new sample value (parameter value, knot)

## 29.215.3.2 int Go::HermiteGrid2D::dim ( ) const [inline]

Return the spatial dimension.

Definition at line 110 of file HermiteGrid2D.h.

## 29.215.3.3 std::vector&lt;Point&gt; Go::HermiteGrid2D::getData ( ) const [inline]

Return the sample values (positions and first derivatives)

Definition at line 107 of file HermiteGrid2D.h.

## 29.215.3.4 std::vector&lt;double&gt; Go::HermiteGrid2D::getKnots ( bool dir\_is\_u ) const [inline]

Return the grid parameters.

Definition at line 104 of file HermiteGrid2D.h.

## 29.215.3.5 int Go::HermiteGrid2D::getNoSplitStatus ( int ind\_u, int ind\_v )

## 29.215.3.6 void Go::HermiteGrid2D::getSegment ( int left1, int right1, int left2, int right2, double &amp; spar1, double &amp; epar1, double &amp; spar2, double &amp; epar2, Point bezcoef[4] )

Calculate Bezier coefficients of the cubic curve interpolating the point and tangent values at grid nodes with indices "left" and "right".

## Parameters

<i>left</i>	indicating grid node for start of curve segment
<i>right</i>	indicating grid node for end of curve segment
<i>spar</i>	start parameter of segment
<i>epar</i>	end parameter of segment
<i>bezcoef</i>	array of cubic Bezier coefficients

29.215.3.7 void Go::HermiteGrid2D::removeGridLines ( const std::vector< int > & *grid\_lines\_u*, const std::vector< int > & *grid\_lines\_v* )

29.215.3.8 void Go::HermiteGrid2D::setNoSplitStatus ( int *ind\_u*, int *ind\_v*, int *no\_split\_status* )

29.215.3.9 int Go::HermiteGrid2D::size1 ( ) const [inline]

Return the number of samples in the grid.

Definition at line 113 of file HermiteGrid2D.h.

29.215.3.10 int Go::HermiteGrid2D::size2 ( ) const [inline]

Definition at line 115 of file HermiteGrid2D.h.

### 29.216.1 Detailed Description

An [Interpolator](#) that generates a hermite spline curve through given points and tangents.

Definition at line 55 of file `HermitInterpolator.h`.

### 29.216.2 Constructor & Destructor Documentation

#### 29.216.2.1 `Go::HermitInterpolator::HermitInterpolator ( )` [`inline`]

Constructor takes no arguments.

Definition at line 59 of file `HermitInterpolator.h`.

#### 29.216.2.2 `virtual Go::HermitInterpolator::~~HermitInterpolator ( )` [`virtual`]

Virtual destructor enables safe inheritance.

### 29.216.3 Member Function Documentation

#### 29.216.3.1 virtual const BsplineBasis& Go::HermitelInterpolator::basis ( ) [virtual]

after the function [interpolate\(\)](#) has been successfully run, this function can be called to get the [BsplineBasis](#) of the generated curve.

##### Returns

a constant reference to the [BsplineBasis](#) of the curve previously generated by [interpolate\(\)](#).

Implements [Go::Interpolator](#).

#### 29.216.3.2 virtual void Go::HermitelInterpolator::interpolate ( int num\_points, int dimension, const double \* param\_start, const double \* data\_start, std::vector< double > & coefs ) [virtual]

Hermite interpolation of a sequence of points with associated tangents and parameter values

##### Parameters

<i>num_points</i>	number of points to interpolate
<i>dimension</i>	dimension of points to interpolate (2D, 3D, etc..)
<i>param_start</i>	pointer to the start of the array where the parameter values of the points are stored. This should be a strictly increasing sequence of 'num_points' values.
<i>data_start</i>	pointer to the start of the array where the points and tangents to be interpolated are stored. Each point and tangent consist of 'dimension' coordinates, and each tangent is stored immediately after its corresponding point.

##### Return values

<i>coefs</i>	The control points of the computed hermite interpolation curve will be returned in this vector. (Use the <a href="#">basis()</a> function to get the associated b-spline basis).
--------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Implements [Go::Interpolator](#).

#### 29.216.3.3 void Go::HermitelInterpolator::interpolate ( const std::vector< Point > & data, const std::vector< double > & param, std::vector< double > & coefs )

Hermite interpolation of a sequence of points with associated tangents and parameter values.

##### Parameters

<i>data</i>	This vector contains the set of points and tangents to be interpolated. The size of the vector is twice the total number of points. Each entry on the form [2i] represents a point, and the entry [2i+1] represents the associated tangent.
<i>param</i>	This vector represent the parameterization of the points, and should have one entry per point. (Making it half the size of the 'data' vector). The parameter sequence must be strictly increasing.

## Return values

<i>coefs</i>	The control points of the computed hermite interpolation curve will be returned in this vector. (Use the <a href="#">basis()</a> function to get the associated b-spline basis.
--------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### 29.217.1 Detailed Description

Class that represents a hyperbola. It is a subclass of [ElementaryCurve](#) and thus has a parametrization.

A hyperbola has a natural parametrization in terms of its values:  $f(t) = C + (R_1 * \cosh(t))*x + (R_2 * \sinh(t)) * y$ . This parametrization is unbounded:  $-\infty < t < \infty$ .

Definition at line 59 of file [Hyperbola.h](#).

## 29.217.2 Constructor & Destructor Documentation

### 29.217.2.1 `Go::Hyperbola::Hyperbola ( )` `[inline]`

Default constructor. Constructs an uninitialized [Hyperbola](#) which can only be assigned to or read into.

Definition at line 64 of file `Hyperbola.h`.

### 29.217.2.2 `Go::Hyperbola::Hyperbola ( Point location, Point direction, Point normal, double r1, double r2, bool isReversed = false )`

Constructor. Input is location, direction (x-axis), normal and the two semi-axes. The default hyperbola is unbounded in its parametrization. To bound it, use [setParamBounds\(\)](#).

### 29.217.2.3 `virtual Go::Hyperbola::~~Hyperbola ( )` `[virtual]`

virtual destructor - ensures safe inheritance

## 29.217.3 Member Function Documentation

### 29.217.3.1 `virtual void Go::Hyperbola::appendCurve ( ParamCurve * cv, bool reparam = true )` `[virtual]`

append a curve to this curve, with eventual reparametrization NB: This virtual member function currently only works for `SplineCurves` and `CurveOnSurfaces`. Moreover, 'this' curve and the 'cv' curve must be of the same type.

#### Parameters

<i>cv</i>	the curve to append to 'this' curve.
<i>reparam</i>	specify whether or not there should be reparametrization

Implements [Go::ParamCurve](#).

### 29.217.3.2 `virtual void Go::Hyperbola::appendCurve ( ParamCurve * cv, int continuity, double & dist, bool reparam = true )` `[virtual]`

append a curve to this curve, with eventual reparametrization

#### Parameters

<i>cv</i>	the curve to append to 'this' curve.
<i>continuity</i>	the required continuity at the transition. Can be $G^{(-1)}$ and upwards.
<i>dist</i>	a measure of the local distortion around the transition in order to achieve the specified continuity.
<i>reparam</i>	specify whether or not there should be reparametrization

Implements [Go::ParamCurve](#).

29.217.3.3 virtual **BoundingBox** Go::Hyperbola::boundingBox ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.217.3.4 static **ClassType** Go::Hyperbola::classType ( ) [static]

29.217.3.5 virtual **Hyperbola\*** Go::Hyperbola::clone ( ) const [virtual]

The clone-function is herited from [GeomObject](#), but overridden here to get a covariant return type (for those compilers that allow this).

Implements [Go::ElementaryCurve](#).

29.217.3.6 virtual void Go::Hyperbola::closestPoint ( const **Point** & *pt*, double *tmin*, double *tmax*, double & *clo\_t*, **Point** & *clo\_pt*, double & *clo\_dist*, double const \* *seed* = 0 ) const [virtual]

Compute the closest point from an interval of this curve to a specified point.

Parameters

<i>pt</i>	point we want to find the closest point to
<i>tmin</i>	start parameter of search interval
<i>tmax</i>	end parameter of search interval
<i>clo_t</i>	upon function return, 'clo_t' will contain the parameter value of the closest point found.
<i>clo_pt</i>	upon function return, 'clo_pt' will contain the position of the closest point found.
<i>clo_dist</i>	upon function return, 'clo_dist' will contain the distance between 'pt' and the closest point found.
<i>seed</i>	pointer to initial guess value, provided by the user (can be 0, for which the algorithm will determine a (hopefully) reasonable choice).

Implements [Go::ParamCurve](#).

29.217.3.7 virtual **SplineCurve\*** Go::Hyperbola::createSplineCurve ( ) const [virtual]

Fetch spline representation of curve.

Implements [Go::ElementaryCurve](#).

29.217.3.8 virtual int Go::Hyperbola::dimension ( ) const [virtual]

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.217.3.9 virtual **DirectionCone** Go::Hyperbola::directionCone ( ) const [virtual]

Creates a [DirectionCone](#) which covers all tangent directions of this curve.

#### Returns

the smallest [DirectionCone](#) containing all tangent directions of this curve.

Implements [Go::ParamCurve](#).

29.217.3.10 virtual **double** Go::Hyperbola::endparam ( ) const [virtual]

Query the end parameter of the curve

#### Returns

the curve's end parameter

Implements [Go::ParamCurve](#).

29.217.3.11 virtual **SplineCurve\*** Go::Hyperbola::geometryCurve ( ) [virtual]

If the definition of this [ParamCurve](#) contains a [SplineCurve](#) describing its spatial shape, then this function will return a pointer to this [SplineCurve](#). Otherwise it will return a null pointer. The returned curve is NEWed, so the user is responsible for deleting it. This function may have side-effects.

#### Returns

a pointer to a [SplineCurve](#) representation of the [ParamCurve](#), if it exists. Null pointer otherwise.

Implements [Go::ParamCurve](#).

29.217.3.12 virtual **ClassType** Go::Hyperbola::instanceType ( ) const [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.217.3.13 **bool** Go::Hyperbola::isBounded ( ) const

Query if parametrization is bounded. Both upper and lower parameter bounds must be finite for this to be true.

#### Returns

*true* if bounded, *false* otherwise

29.217.3.14 virtual **bool** Go::Hyperbola::isDegenerate ( **double** *degenerate\_epsilon* ) [virtual]

Query whether the curve is degenerate (collapsed into a single point).

## Parameters

<i>degenerate_epsilon</i>	the tolerance used in determine whether the curve is degenerate. A curve is considered degenerate if its total length is shorter than this value.
---------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

`true` if the curve is degenerate, `false` otherwise.

Implements [Go::ParamCurve](#).

29.217.3.15 `virtual bool Go::Hyperbola::isInPlane ( const Point & norm, double eps, Point & pos ) const` [virtual]

Check if the hyperbola lies in a plane with a given normal.

Reimplemented from [Go::ParamCurve](#).

29.217.3.16 `virtual double Go::Hyperbola::length ( double tol )` [virtual]

Compute the total length of this curve up to some tolerance

## Parameters

<i>tol</i>	the relative tolerance when approximating the length, i.e. stop iteration when error becomes smaller than <code>tol/(curve length)</code>
------------	-------------------------------------------------------------------------------------------------------------------------------------------

## Returns

the length calculated

Implements [Go::ParamCurve](#).

29.217.3.17 `virtual void Go::Hyperbola::point ( Point & pt, double tpar ) const` [virtual]

Evaluate the curve's position at a given parameter

## Parameters

<i>pt</i>	the evaluated position will be written to this <a href="#">Point</a>
<i>tpar</i>	the parameter for which we wish to evaluate the curve

Implements [Go::ParamCurve](#).

29.217.3.18 `virtual void Go::Hyperbola::point ( std::vector< Point > & pts, double tpar, int derivs, bool from_right = true ) const [virtual]`

Evaluate the curve's position and a certain number of derivatives at a given parameter.

#### Parameters

<i>pts</i>	the evaluated position and derivatives (tangent, curvature vector, etc.) will be written to this vector. The first entry will be the position, the second entry will be the first derivative, etc. The size of this vector must be set to 'derivs'+ 1 prior to calling this function.
<i>tpar</i>	the parameter for which we want to evaluate the curve
<i>derivs</i>	the number of derivatives we want to have calculated
<i>from_right</i>	specify whether we should calculate derivatives 'from the right' or 'from the left' (default is from the right). This matters only when the curve presents discontinuities in its derivatives.

Implements [Go::ParamCurve](#).

29.217.3.19 `virtual void Go::Hyperbola::read ( std::istream & is ) [virtual]`

Read object from stream

#### Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.217.3.20 `virtual void Go::Hyperbola::setParamBounds ( double startpar, double endpar ) [virtual]`

Set bounds for the parametrization of the [Hyperbola](#).

#### Parameters

<i>startpar</i>	start parameter
<i>endpar</i>	end parameter

Implements [Go::ElementaryCurve](#).

29.217.3.21 `virtual void Go::Hyperbola::setParameterInterval ( double t1, double t2 ) [virtual]`

Limit the curve by limiting the parameter interval.

Implements [Go::ParamCurve](#).

29.217.3.22 void Go::Hyperbola::setSpanningVectors ( ) [protected]

29.217.3.23 virtual double Go::Hyperbola::startparam ( ) const [virtual]

Query the start parameter of the curve

#### Returns

the curve's start parameter

Implements [Go::ParamCurve](#).

29.217.3.24 virtual Hyperbola\* Go::Hyperbola::subCurve ( double *from\_par*, double *to\_par*, double *fuzzy* = DEFAULT\_PARAMETER\_EPSILON ) const [virtual]

Returns a curve which is a part of this curve. The result is NEWed, so the user is responsible for deleting it. NB: It is not guaranteed that the [ParamCurve](#) that is returned is of the same type as the curve itself. Thus, the returned curve might be a [SplineCurve](#).

#### Parameters

<i>from_par</i>	start value of parameter interval that will define the subcurve
<i>to_par</i>	end value of parameter interval that will define the subcurve
<i>fuzzy</i>	since subCurve works on those curves who are spline-based, this tolerance defines how close the start and end parameter must be to an existing knot in order to be considered <i>on</i> the knot.

#### Returns

a pointer to a new subcurve which represents the part of the curve between 'from\_par' and 'to\_par'. It will be spline-based and have a k-regular knotvector. The user is responsible for deleting this subcurve when it is no longer needed.

Implements [Go::ElementaryCurve](#).

29.217.3.25 virtual void Go::Hyperbola::swapParameters2D ( ) [virtual]

If the curve is 2 dimensional, x and y coordinates will be swapped. Used when curve is a parameter curve.

Implements [Go::ElementaryCurve](#).

29.217.3.26 virtual void Go::Hyperbola::translateCurve ( const Point & *dir* ) [virtual]

Implements [Go::ElementaryCurve](#).

29.217.3.27 virtual void Go::Hyperbola::write ( std::ostream & *os* ) const [virtual]

Write object to stream

## Parameters

<i>os</i>	stream to which object is written
-----------	-----------------------------------

Implements [Go::Streamable](#).

### 29.220.1 Detailed Description

The converter between the IGES fileformat, the file format used in [GoTools](#), a file format used for SISEL. The disp file format is outdated.

Definition at line 215 of file IGESconverter.h.

### 29.220.2 Constructor & Destructor Documentation

#### 29.220.2.1 Go::IGESconverter::IGESconverter ( )

Default constructor.

29.220.2.2 `Go::IGESconverter::IGESconverter ( std::istream & is, FileFormat from_type, std::ostream & os, FileFormat to_type )`

This constructor calls the appropriate read and write members.

29.220.2.3 `Go::IGESconverter::~~IGESconverter ( )`

Destructure.

### 29.220.3 Member Function Documentation

29.220.3.1 `void Go::IGESconverter::addGeom ( shared_ptr< Go::GeomObject > sp )`

Add one more geometry object to this converter.

29.220.3.2 `const std::vector<double>& Go::IGESconverter::getColour ( int i ) [inline]`

Get the colour of entity number i.

Definition at line 252 of file IGESconverter.h.

29.220.3.3 `const std::vector<shared_ptr<Go::GeomObject> >& Go::IGESconverter::getGoGeom ( ) [inline]`

Get all geometry objects stored in this converter.

Definition at line 248 of file IGESconverter.h.

29.220.3.4 `const std::vector<ftGroupGeom>& Go::IGESconverter::getGroup ( ) [inline]`

Get group information given in the IGES file (specified by form number)

Definition at line 256 of file IGESconverter.h.

29.220.3.5 `IGESheader& Go::IGESconverter::header ( ) [inline]`

Gives dangerous but necessary direct access to header info.

Definition at line 268 of file IGESconverter.h.

29.220.3.6 `double Go::IGESconverter::minResolution ( ) const [inline]`

Fetch the geometry tolerance given in an IGES file.

Definition at line 260 of file IGESconverter.h.

29.220.3.7 `int Go::IGESconverter::num_geom ( ) [inline]`

Number of geometric entities.

Definition at line 264 of file IGESconverter.h.

29.220.3.8 `int Go::IGESconverter::num_group ( ) [inline]`

Number of groups of entities.

Definition at line 266 of file IGESconverter.h.

29.220.3.9 `void Go::IGESconverter::readdisp ( std::istream & is )`

29.220.3.10 `void Go::IGESconverter::readgo ( std::istream & is )`

Read a g2-file.

29.220.3.11 `void Go::IGESconverter::readIGES ( std::istream & is )`

Read an IGES file.

29.220.3.12 `void Go::IGESconverter::readsislcrvs ( std::istream & is )`

Read a number of sisl curves.

29.220.3.13 `void Go::IGESconverter::readsislrfs ( std::istream & is )`

Read a number of sisl surfaces.

29.220.3.14 `void Go::IGESconverter::writedisp ( std::ostream & os )`

29.220.3.15 `void Go::IGESconverter::writego ( std::ostream & os )`

Write the content of this converter to a g2-file.

29.220.3.16 `void Go::IGESconverter::writeIGES ( std::ostream & os )`

Write the content of this converter to an IGES-file.

The documentation for this class was generated from the following file:

- void [setTolerance](#) (double tol)
- void [perform](#) ()
- void [getResultData](#) ([BernsteinTriangularPoly](#) &implicit, [BaryCoordSystem2D](#) &bc, double &sigma\_min)

### 29.223.1 Detailed Description

Class that implements an implicitization algorithm for spline curves.

Input: A curve of type [SplineCurve](#), and the degree that is chosen for the implicit representation.

Output: A barycentric coordinate system, and the Bernstein polynomial that represents the implicit curve.

The algorithm first defines a barycentric coordinate system in terms of a triangle that is slightly larger than the bounding box of the spline curve. It then computes the Bernstein polynomial representing the implicit curve. If the chosen degree is too low to produce the exact result, an approximate implicit curve is produced. If the degree is too high, the resulting polynomial will be reducible and contain the exact implicitization as a factor. If the input curve consists of multiple segments, the output polynomial will be a product of the separate implicit curves, or an approximation of it.

Definition at line 73 of file [ImplicitizeCurveAlgo.h](#).

### 29.223.2 Constructor & Destructor Documentation

**29.223.2.2** [Go::ImplicitizeCurveAlgo::ImplicitizeCurveAlgo](#) ( int *deg* ) `[inline], [explicit]`

Constructor

Parameters

<i>deg</i>	degree of the implicit representation
------------	---------------------------------------

Definition at line 79 of file ImplicitizeCurveAlgo.h.

29.223.2.3 Go::ImplicitizeCurveAlgo::ImplicitizeCurveAlgo ( const SplineCurve & curve, int deg ) [inline]

Constructor

Parameters

<i>curve</i>	spline curve to be implicitized
<i>deg</i>	degree of the implicit representation

Definition at line 83 of file ImplicitizeCurveAlgo.h.

### 29.223.3 Member Function Documentation

29.223.3.1 void Go::ImplicitizeCurveAlgo::getResultData ( BernsteinTriangularPoly & implicit, BaryCoordSystem2D & bc, double & sigma\_min ) [inline]

Get the result of the implicitization

Return values

<i>implicit</i>	a <a href="#">BernsteinTriangularPoly</a> representing the implicit curve
<i>bc</i>	the barycentric coordinate system in which the <a href="#">BernsteinTriangularPoly</a> is defined

Definition at line 110 of file ImplicitizeCurveAlgo.h.

29.223.3.2 void Go::ImplicitizeCurveAlgo::perform ( )

Perform the implicitization. This function runs the implicitization algorithm.

29.223.3.3 void Go::ImplicitizeCurveAlgo::setDegree ( int deg ) [inline]

Choose the degree of the implicit representation

Parameters

<i>deg</i>	degree
------------	--------

Definition at line 93 of file ImplicitizeCurveAlgo.h.

29.223.3.4 void Go::ImplicitizeCurveAlgo::setTolerance ( double tol ) [inline]

Set the tolerance

## Parameters

<i>tol</i>	tolerance; default value is 3.0e-15
------------	-------------------------------------

Definition at line 98 of file ImplicitizeCurveAlgo.h.

29.223.3.5 void Go::ImplicitizeCurveAlgo::useSplineCurve ( const SplineCurve & curve ) [inline]

Load the spline curve to be implicitized

## Parameters

<i>curve</i>	curve on <a href="#">SplineCurve</a> form
--------------	-------------------------------------------

Definition at line 88 of file ImplicitizeCurveAlgo.h.

### 29.224.1 Detailed Description

Class that implements an algorithm for finding an implicit ruled surface defined by a curve and a vector.

Input: A curve of type [SplineCurve](#), a vector of type [Point](#), and the degree that is chosen for the implicit surface.

Output: A barycentric coordinate system, and the Bernstein polynomial that represents the implicit surface.

The algorithm first defines a barycentric coordinate system in terms of a tetrahedron that is slightly larger than the bounding box of the spline curve. It then computes the Bernstein polynomial representing the implicit ruled surface defined by the spline curve and vector. If the chosen degree is too low to produce the exact result, an approximate implicit surface is produced. If the degree is too high, the resulting polynomial will be reducible and contain the exact implicitization as a factor. If the input curve consists of multiple segments, the output polynomial will be a product of the separate implicit surfaces, or an approximation of it.

Definition at line 75 of file ImplicitizeCurveAndVectorAlgo.h.

Destructor.

### 29.230.3 Member Function Documentation

29.230.3.1 `virtual bool Go::IntCrvEvaluator::approximationOK ( double par, const std::vector< Point > & approxpos, double tol1, double tol2 ) [virtual]`

Whether the approximation is within tolerances in input parameter.

Parameters

<i>par</i>	parameter in which to evaluate.
<i>approxpos</i>	whether the input points are within tolerance from the evaluated points (as given by <a href="#">eval()</a> ).
<i>tol1</i>	tolerance used to decide approximation accuracy.
<i>tol2</i>	tolerance used to decide approximation accuracy.

Returns

whether the approximation is within tolerances in input parameter.

Implements [Go::EvalCurveSet](#).

29.230.3.2 `virtual int Go::IntCrvEvaluator::dim ( ) [virtual]`

The geometric dimension of the spline curves.

Returns

geometric dimension of the total space.

Implements [Go::EvalCurveSet](#).

29.230.3.3 `virtual double Go::IntCrvEvaluator::end ( ) [virtual]`

End parameter of domain.

Returns

end parameter of the spline space.

Implements [Go::EvalCurveSet](#).

29.230.3.4 `virtual std::vector<Point> Go::IntCrvEvaluator::eval ( double t ) [virtual]`

Evaluate the curves.

Parameters

<i>t</i>	parameter in which to evaluate.
----------	---------------------------------

Returns

the evaluated points for the curve set.

Implements [Go::EvalCurveSet](#).

29.230.3.5 `virtual void Go::IntCrvEvaluator::eval ( double t, int n, std::vector< std::vector< Point > > & der ) [virtual]`

Evaluate the curve derivatives.

Parameters

<i>t</i>	parameter in which to evaluate.
<i>n</i>	number of derivatives to compute.
<i>der</i>	the evaluated points up to the n'th derivative for the curve set.

Implements [Go::EvalCurveSet](#).

29.230.3.6 `double Go::IntCrvEvaluator::getMaxErr ( ) [inline]`

Get maximum approximation error.

Definition at line 109 of file IntCrvEvaluator.h.

29.230.3.7 `virtual int Go::IntCrvEvaluator::nmbCvs ( ) [virtual]`

The number of curves in the curve set.

**Returns**

the number of curves in the curve set.

Implements [Go::EvalCurveSet](#).

**29.230.3.8** `virtual void Go::IntCrvEvaluator::resetErr( ) [inline],[virtual]`

Reset intermediate error. New iterationa.

Reimplemented from [Go::EvalCurveSet](#).

Definition at line 103 of file IntCrvEvaluator.h.

**29.230.3.9** `virtual double Go::IntCrvEvaluator::start( ) [virtual]`

Start parameter of domain.

**Returns**

start parameter of the spline space.

Implements [Go::EvalCurveSet](#).

<i>tan</i>	the calculated tangent of the curve at parameter <i>pval</i> .
------------	----------------------------------------------------------------

Implements [Go::IntersectionCurve](#).

29.232.3.2 `virtual shared_ptr<ParamCurve> Go::InterpolatedIntersectionCurve::getCurve ( ) const [virtual]`

Get out a (shared) pointer to a parametric curve that approximates this [IntersectionCurve](#).

Implements [Go::IntersectionCurve](#).

```
29.232.3.3 virtual bool Go::InterpolatedIntersectionCurve::getGuidePointTangent (shared_ptr< IntersectionPoint > pt,
Point & tan, int type) const [virtual]
```

Get the tangent of a guidepoint that we know lies on the curve (just using the `getTangent()` function of the guidepoint can be deceiving, as it is not necessarily unique).

#### Parameters

<i>pt</i>	shared pointer to the guidepoint. It is supposed to be part of the definition of the curve.
<i>type</i>	specifies what kind of tangent the user wants. '1' means the parameter plane tangent for the first object. '2' means the parameter plane tangent for the second object. Other values of 'type' means the tangent in 3D space.

#### Return values

<i>tan</i>	the requested tangent
------------	-----------------------

#### Returns

'true' if a tangent was found (i.e. *pt* was indeed a guidepoint of the [IntersectionCurve](#)). In the opposite case, 'false' is returned.

Reimplemented from [Go::IntersectionCurve](#).

```
29.232.3.4 virtual shared_ptr<ParamCurve> Go::InterpolatedIntersectionCurve::getParamCurve (int obj_nmb) const
[virtual]
```

Get out a (shared) pointer to the curve in the parametric plane of the first or second object. Should only be called when the concerned object is 2-parametric.

#### Parameters

<i>obj_nmb</i>	should be either 1 or 2, depending on whether you want to get the parametric curve in object 1 or object 2.
----------------	-------------------------------------------------------------------------------------------------------------

#### Returns

a shared pointer to a curve that approximates the intersection curve in the parametric domain of the specified object.

Implements [Go::IntersectionCurve](#).

```
29.232.3.5 virtual void Go::InterpolatedIntersectionCurve::getParamSpan (double & start, double & end) const
[inline],[virtual]
```

Get the start and end value for the parametric span of the [IntersectionCurve](#).

## Return values

<i>start</i>	upon function return this variable will contain the start value of the parametric span.
<i>end</i>	upon function return this variable will contain the end value of the parametric span.

Implements [Go::IntersectionCurve](#).

Definition at line 411 of file IntersectionCurve.h.

**29.232.3.6** `virtual bool Go::InterpolatedIntersectionCurve::isDegenerated ( ) const [inline],[virtual]`

Determine if the [IntersectionCurve](#) is in fact a degenerated curve (a single point in space).

## Returns

'true' if the [IntersectionCurve](#) is degenerated. 'false' otherwise.

Implements [Go::IntersectionCurve](#).

Definition at line 408 of file IntersectionCurve.h.

**29.232.3.7** `virtual bool Go::InterpolatedIntersectionCurve::isIsocurve ( ) const [inline],[virtual]`

Determine if the [IntersectionCurve](#) is in fact representing an isoparametric intersection.

## Returns

'true' if the [IntersectionCurve](#) is part of an isocurve for one of the objects, 'false' otherwise.

Implements [Go::IntersectionCurve](#).

Definition at line 405 of file IntersectionCurve.h.

**29.232.3.8** `void Go::InterpolatedIntersectionCurve::read ( std::istream & is ) const`

**29.232.3.9** `virtual void Go::InterpolatedIntersectionCurve::refine ( const double & pos_tol, const double & angle_tol ) [virtual]`

Refine the curve (which means to increase the number of [IntersectionPoint](#) s defining it), so that the curve matches a specific positional and angle tolerance.

## Parameters

<i>pos_tol</i>	the positional tolerance that the curve should match after refinement.
<i>angle_tol</i>	the angular tolerance that the tangent of the curve should match after refinement.

Implements [Go::IntersectionCurve](#).

29.232.3.10 `void Go::InterpolatedIntersectionCurve::write ( std::ostream & os ) const`

## 29.232.4 Friends And Related Function Documentation

29.232.4.1 `template<class iterator > shared_ptr<IntersectionCurve> constructIntersectionCurve ( const iterator begin, const iterator end ) [friend]`

Definition at line 601 of file IntersectionCurve.h.

The documentation for this class was generated from the following file:

- [intersections/include/GoTools/intersections/IntersectionCurve.h](#)

## 29.233 Go::Interpolator Class Reference

Base class for spline interpolators or approximators.

```
#include <Interpolator.h>
```

Inheritance diagram for Go::Interpolator:

### Public Member Functions

- virtual `~Interpolator ()`  
*virtual desctructor assures safe inheritance*
- virtual void `interpolate (int num_points, int dimension, const double *param_start, const double *data_start, std::vector< double > &coefs)=0`
- virtual `const BsplineBasis & basis ()=0`

### 29.233.1 Detailed Description

Base class for spline interpolators or approximators.

Definition at line 52 of file Interpolator.h.

## 29.233.2 Constructor & Destructor Documentation

29.233.2.1 virtual `Go::Interpolator::~~Interpolator ( )` [virtual]

virtual desctructor assures safe inheritance

## 29.233.3 Member Function Documentation

29.233.3.1 virtual `const BsplineBasis& Go::Interpolator::basis ( )` [pure virtual]

after the function `interpolate()` has been successfully run, this function can be called to get the `BsplineBasis` of the generated curve.

### Returns

a constant reference to the `BsplineBasis` of the curve previously generated by `interpolate()`.

Implemented in `Go::SplineInterpolator`, `Go::SplineApproximator`, and `Go::HermitInterpolator`.

29.233.3.2 virtual `void Go::Interpolator::interpolate ( int num_points, int dimension, const double * param_start, const double * data_start, std::vector< double > & coefs )` [pure virtual]

Interpolate or approximate a set of point data by a spline

### Parameters

<i>num_points</i>	the number of data points to approximate
<i>dimension</i>	the dimension of each data point
<i>param_start</i>	pointer to the array where the points' parameters are consecutively stored
<i>data_start</i>	pointer to the array where the points are consecutively stored
<i>coefs</i>	upon function completion, this vector will contain the control points of the interpolating (or approximating spline). (In order to get access to the associated <code>BsplineBasis</code> , use the function <code>basis()</code> ).

Implemented in `Go::SplineInterpolator`, `Go::HermitInterpolator`, and `Go::SplineApproximator`.

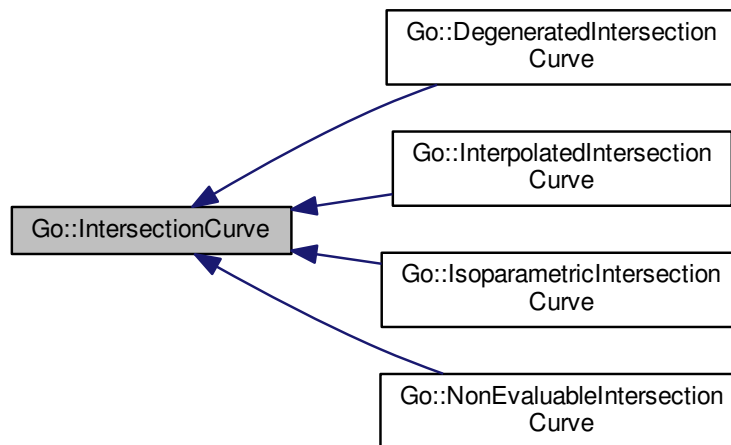

The documentation for this class was generated from the following file:

- `gtools-core/include/GoTools/geometry/Interpolator.h`

### 29.234.1 Detailed Description

Object describing the curve that results from an intersection of two geometrical objects.

Definition at line 96 of file IntersectionCurve.h.

### 29.234.2 Constructor & Destructor Documentation

29.234.2.1 `virtual Go::IntersectionCurve::~IntersectionCurve ( ) [inline],[virtual]`

Virtual destructor.

Definition at line 100 of file IntersectionCurve.h.

29.234.2.2 `template<class iterator > Go::IntersectionCurve::IntersectionCurve ( iterator begin, iterator end ) [inline],[protected]`

Definition at line 200 of file IntersectionCurve.h.

### 29.234.3 Member Function Documentation

29.234.3.1 `virtual void Go::IntersectionCurve::evaluateAt ( double pval, Point & pos, Point & tan ) [pure virtual]`

Evaluate the [IntersectionCurve](#) at parameter value *pval*. Its position at this parameter value will be returned in *pos* and its tangent direction will be returned in *tan*.

#### Parameters

<i>pval</i>	the parameter value for which to evaluate the <a href="#">IntersectionCurve</a> . It should be within the parametric span (which can be obtained from <code>GetParamSpan()</code> ).
-------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Return values

<i>pos</i>	the calculated position of the point on the curve at parameter <i>pval</i> .
------------	------------------------------------------------------------------------------

#### Parameters

<i>tan</i>	the calculated tangent of the curve at parameter <i>pval</i> .
------------	----------------------------------------------------------------

Implemented in [Go::InterpolatedIntersectionCurve](#), [Go::IsoparametricIntersectionCurve](#), [Go::NonEvaluableIntersectionCurve](#), and [Go::DegeneratedIntersectionCurve](#).

29.234.3.2 `virtual shared_ptr<ParamCurve> Go::IntersectionCurve::getCurve ( ) const [pure virtual]`

Get out a (shared) pointer to a parametric curve that approximates this [IntersectionCurve](#).

Implemented in [Go::InterpolatedIntersectionCurve](#), [Go::IsoparametricIntersectionCurve](#), [Go::NonEvaluableIntersectionCurve](#), and [Go::DegeneratedIntersectionCurve](#).

29.234.3.3 `shared_ptr<IntersectionPoint> Go::IntersectionCurve::getGuidePoint ( int index ) const`

Get one of the specific guidepoints ([IntersectionPoint](#)) that define the curve.

#### Parameters

<i>index</i>	the index of the requested <a href="#">IntersectionPoint</a> (from 0 and up to the number of defining <a href="#">IntersectionPoint</a> s - 1). To find out how many <a href="#">IntersectionPoint</a> s participate in the definition of the curve, use the <a href="#">numGuidePoints()</a> function.
--------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

a shared pointer to the requested [IntersectionPoint](#).

29.234.3.4 `virtual bool Go::IntersectionCurve::getGuidePointTangent ( shared_ptr< IntersectionPoint > pt, Point & tan, int type = 0 ) const [virtual]`

Get the tangent of a guidepoint that we know lies on the curve (just using the `getTangent()` function of the guidepoint can be deceiving, as it is not necessarily unique).

#### Parameters

<i>pt</i>	shared pointer to the guidepoint. It is supposed to be part of the definition of the curve.
<i>type</i>	specifies what kind of tangent the user wants. '1' means the parameter plane tangent for the first object. '2' means the parameter plane tangent for the second object. Other values of 'type' means the tangent in 3D space.

#### Return values

<i>tan</i>	the requested tangent
------------	-----------------------

#### Returns

'true' if a tangent was found (i.e. *pt* was indeed a guidepoint of the [IntersectionCurve](#)). In the opposite case, 'false' is returned.

Reimplemented in [Go::InterpolatedIntersectionCurve](#).

29.234.3.5 `virtual shared_ptr<ParamCurve> Go::IntersectionCurve::getParamCurve ( int obj_nmb ) const [pure virtual]`

Get out a (shared) pointer to the curve in the parametric plane of the first or second object. Should only be called when the concerned object is 2-parametric.

## Parameters

<i>obj_nmb</i>	should be either 1 or 2, depending on whether you want to get the parametric curve in object 1 or object 2.
----------------	-------------------------------------------------------------------------------------------------------------

## Returns

a shared pointer to a curve that approximates the intersection curve in the parametric domain of the specified object.

Implemented in [Go::InterpolatedIntersectionCurve](#), [Go::IsoparametricIntersectionCurve](#), [Go::NonEvaluableIntersectionCurve](#), and [Go::DegeneratedIntersectionCurve](#).

```
29.234.3.6 virtual void Go::IntersectionCurve::getParamSpan (double & start, double & end) const [pure virtual]
```

Get the start and end value for the parametric span of the [IntersectionCurve](#).

## Return values

<i>start</i>	upon function return this variable will contain the start value of the parametric span.
<i>end</i>	upon function return this variable will contain the end value of the parametric span.

Implemented in [Go::InterpolatedIntersectionCurve](#), [Go::IsoparametricIntersectionCurve](#), [Go::NonEvaluableIntersectionCurve](#), and [Go::DegeneratedIntersectionCurve](#).

```
29.234.3.7 virtual bool Go::IntersectionCurve::isDegenerated () const [pure virtual]
```

Determine if the [IntersectionCurve](#) is in fact a degenerated curve (a single point in space).

## Returns

'true' if the [IntersectionCurve](#) is degenerated. 'false' otherwise.

Implemented in [Go::InterpolatedIntersectionCurve](#), [Go::IsoparametricIntersectionCurve](#), [Go::NonEvaluableIntersectionCurve](#), and [Go::DegeneratedIntersectionCurve](#).

```
29.234.3.8 virtual bool Go::IntersectionCurve::isIsocurve () const [pure virtual]
```

Determine if the [IntersectionCurve](#) is in fact representing an isoparametric intersection.

## Returns

'true' if the [IntersectionCurve](#) is part of an isocurve for one of the objects, 'false' otherwise.

Implemented in [Go::InterpolatedIntersectionCurve](#), [Go::IsoparametricIntersectionCurve](#), [Go::NonEvaluableIntersectionCurve](#), and [Go::DegeneratedIntersectionCurve](#).

29.234.3.9 `int Go::IntersectionCurve::numGuidePoints ( ) const [inline]`

Get number of guide points defining the curve.

#### Returns

the number of guide points currently defining the curve (may increase if the [refine\(\)](#) function is run).

Definition at line 190 of file `IntersectionCurve.h`.

29.234.3.10 `virtual void Go::IntersectionCurve::refine ( const double & pos_tol, const double & angle_tol ) [pure virtual]`

Refine the curve (which means to increase the number of [IntersectionPoint](#) s defining it), so that the curve matches a specific positional and angle tolerance.

#### Parameters

<i>pos_tol</i>	the positional tolerance that the curve should match after refinement.
<i>angle_tol</i>	the angular tolerance that the tangent of the curve should match after refinement.

Implemented in [Go::InterpolatedIntersectionCurve](#), [Go::IsoparametricIntersectionCurve](#), [Go::NonEvaluableIntersectionCurve](#), and [Go::DegeneratedIntersectionCurve](#).

29.234.3.11 `void Go::IntersectionCurve::writePointsToStream ( std::ostream & os ) const`

Write the [IntersectionPoints](#) defining this [IntersectionCurve](#) to stream

#### Parameters

<i>os</i>	output stream
-----------	---------------

## 29.234.4 Friends And Related Function Documentation

### 29.235.1 Detailed Description

This class represents a link between two intersection points. It is owned by both of the points in question, and can therefore refer to them only by means of ordinary pointers (no shared\_ptr stuff here...)

Definition at line 59 of file IntersectionLink.h.

### 29.235.2 Constructor & Destructor Documentation

**29.235.2.1** [Go::IntersectionLink::IntersectionLink](#) ([IntersectionPoint](#) \* p1, [IntersectionPoint](#) \* p2 ) [\[inline\]](#)

Constructor.

Definition at line 62 of file IntersectionLink.h.

### 29.235.3 Member Function Documentation

**29.235.3.1** void [Go::IntersectionLink::copyMetaInformation](#) ([const IntersectionLink](#) & rhs ) [\[inline\]](#)

Set all meta-information (all private info except IntersectionPoint-pointers) equal to the one in 'rhs'

Definition at line 104 of file IntersectionLink.h.

**29.235.3.2** `int Go::IntersectionLink::crosses ( const shared_ptr< IntersectionLink > & link ) const [inline]`

Test for crossing between 'this' and 'link'.

Definition at line 164 of file IntersectionLink.h.

**29.235.3.3** `bool Go::IntersectionLink::delimitsPAC ( ) const [inline]`

Find out whether this link is participating in defining a partial coincidence area

Definition at line 114 of file IntersectionLink.h.

**29.235.3.4** `void Go::IntersectionLink::dumpToStream ( std::ostream & os ) [inline]`

Definition at line 320 of file IntersectionLink.h.

**29.235.3.5** `void Go::IntersectionLink::getIntersectionPoints ( IntersectionPoint *& p1, IntersectionPoint *& p2 ) [inline]`

This function will set the 'p1' and 'p2' to point to the IntersectionPoints participating in this link.

Definition at line 73 of file IntersectionLink.h.

**29.235.3.6** `void Go::IntersectionLink::getIntersectionPoints ( const IntersectionPoint *& p1, const IntersectionPoint *& p2 ) const [inline]`

This function will set the 'p1' and 'p2' to point to the IntersectionPoints participating in this link.

Definition at line 82 of file IntersectionLink.h.

**29.235.3.7** `IntersectionPoint* Go::IntersectionLink::getOtherPoint ( const IntersectionPoint * p1 ) [inline]`

When one of the two points in the link is input, this function returns the other point.

Definition at line 91 of file IntersectionLink.h.

**29.235.3.8** `bool Go::IntersectionLink::isAttachedTo ( const IntersectionPoint * ip ) [inline]`

Returns true if the link is attached to the input point.

Definition at line 97 of file IntersectionLink.h.

**29.235.3.9** `bool Go::IntersectionLink::isIsoparametric ( ) const [inline]`

Definition at line 147 of file IntersectionLink.h.

**29.235.3.10** `bool Go::IntersectionLink::isIsoparametricIn ( int dir ) const [inline]`

Definition at line 141 of file IntersectionLink.h.

**29.235.3.11** `const LinkType& Go::IntersectionLink::linkType ( ) const [inline]`

Returns the link type of the link

## Return values

<i>a</i>	LinkType enum
----------	---------------

Definition at line 253 of file IntersectionLink.h.

**29.235.3.12 LinkType& Go::IntersectionLink::linkType ( )** [inline]

Returns the link type of the link

## Return values

<i>a</i>	LinkType enum
----------	---------------

Definition at line 258 of file IntersectionLink.h.

**29.235.3.13 int Go::IntersectionLink::numParams ( ) const** [inline]

Definition at line 158 of file IntersectionLink.h.

**29.235.3.14 void Go::IntersectionLink::setIsoparametricIn ( int *dir*, bool *iso* )** [inline]

Definition at line 124 of file IntersectionLink.h.

**29.235.3.15 void Go::IntersectionLink::setPAC ( bool *value* )** [inline]

Definition at line 119 of file IntersectionLink.h.

**29.235.3.16 void Go::IntersectionLink::writeInfo ( ) const** [inline]

Writes info about the link to standard output.

Definition at line 262 of file IntersectionLink.h.

The documentation for this class was generated from the following file:

- intersections/include/GoTools/intersections/[IntersectionLink.h](#)

## Static Public Attributes

- static `const double tangent_tol`

### 29.236.1 Detailed Description

Object describing a point located on the intersection of two geometrical objects.

Definition at line 65 of file IntersectionPoint.h.

### 29.236.2 Constructor & Destructor Documentation

- 29.236.2.1 `Go::IntersectionPoint::IntersectionPoint ( const ParamObjectInt * obj1, const ParamObjectInt * obj2, const shared_ptr< GeoTol > epsge, const double * obj1_params, const double * obj2_params )`

Constructor. This constructor specifies an [IntersectionPoint](#) from all its defining components.

## Parameters

<i>obj1</i>	the first of the two intersecting objects on which the <a href="#">IntersectionPoint</a> lies.
<i>obj2</i>	the second of the two intersecting objects on which the <a href="#">IntersectionPoint</a> lies.
<i>epsge</i>	an object defining various tolerances
<i>obj_1_params</i>	parameters of the intersection point for the first object
<i>obj_2_params</i>	parameters of the intersection point for the second object

29.236.2.2 `Go::IntersectionPoint::IntersectionPoint ( const ParamObjectInt * obj1, const ParamObjectInt * obj2, const shared_ptr< IntersectionPoint > ip, int missing_param )`

Constructor. This constructor is for creating an [IntersectionPoint](#) that is a replica of an existing one, but where one of the objects has one parameter less (i.e. is 'picked' from one of the objects of the existing [IntersectionPoint](#) by fixing one of its parameters).

## Parameters

<i>obj1</i>	the first of the two intersecting objects on which the <a href="#">IntersectionPoint</a> lies. It is either the same as the first object defining the point <i>ip</i> , or picked from it (one parameter less).
<i>obj2</i>	the second of the two intersecting objects on which the <a href="#">IntersectionPoint</a> lies. It is either the same as the second object defining the point <i>ip</i> , or picked from it (one parameter less).
<i>ip</i>	The already-existing <a href="#">IntersectionPoint</a> that 'this' <a href="#">IntersectionPoint</a> will represent.
<i>missing_param</i>	indicates which parameter of the point <i>ip</i> is 'missing' for 'this' <a href="#">IntersectionPoint</a> . (Parameters are numbered from 0 and up to the total number of parameters in 'obj1' and 'obj2').

29.236.2.3 `Go::IntersectionPoint::~~IntersectionPoint ( )`

Destructor.

29.236.2.4 `Go::IntersectionPoint::IntersectionPoint ( ) [inline]`

Default constructor.

Definition at line 112 of file `IntersectionPoint.h`.

## 29.236.3 Member Function Documentation

29.236.3.1 `bool Go::IntersectionPoint::checkIntersectionPoint ( IntPtInfo & int_pt_info ) const`

Check if the intersection point is OK, and get some info about the point.

## Parameters

<i>int_pt_info</i>	struct of type <a href="#">IntPtInfo</a> with info about the point. Indicates if the point is ok, the number of neighbours, the singularity type, and the location of the point is the parameter domains of the objects
--------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Returns**

'true' if the intersection points is OK, 'false' otherwise

**29.236.3.2** `int Go::IntersectionPoint::commonIsoLinks ( int *const iso_par_dirs ) const`

Returns the number of parameter directions for which all [IntersectionLink](#) s of this [IntersectionPoint](#) are isoparametric. The indices of these parameter directions are written to the array pointed to by 'iso\_par\_dirs' (allocated by the user).

**Parameters**

<code>iso_par_dirs</code>	pointer to the array where the indices will be written.
---------------------------	---------------------------------------------------------

**Returns**

the number of parameter directions for which all [IntersectionLink](#) s of this [IntersectionPoint](#) are isoparametric.

**29.236.3.3** `shared_ptr<IntersectionLink> Go::IntersectionPoint::connectTo ( IntersectionPoint *const point, LinkType type, shared_ptr< IntersectionLink > model_link = shared_ptr< IntersectionLink > (), int added_parameter_dir = -1 )`

This function topologically "connects" this point with another [IntersectionPoint](#). It generates a new [IntersectionLink](#) combining these points. This [IntersectionLink](#) can inherit the meta-information from `model_link`. This is typically useful when an [IntersectionPoint](#) is "inserted" between two already-connected points, and the two new links should contain the same information as the older, split-up link. Another example where information from `model_link` needs to be copied is when parents of two connected points needs to be connected. In that case, it is important that we know which parameter direction has been introduced when moving to the parent, so that we can "shift" the meta-information pertaining to individual parameters accordingly. If no new parameter information has been introduced, `added_parameter_dir` should be left at its default value of -1.

**Parameters**

<code>point</code>	the <a href="#">IntersectionPoint</a> we want to connect to <code>this</code> point
<code>type</code>	the type of the link in terms of a <code>LinkType</code>
<code>model_link</code>	if this parameter is specified, the information associated with <code>model_link</code> will be copied by the newly created <a href="#">IntersectionLink</a> .
<code>added_parameter_dir</code>	relevant parameter when <code>model_link</code> contains one parameter direction less than the new <a href="#">IntersectionLink</a> does. In this case, <code>added_parameter_dir</code> will specify the index of the parameter that is lacking.

**Returns**

shared pointer to the generated link

29.236.3.4 `shared_ptr<IntersectionLink> Go::IntersectionPoint::connectTo ( shared_ptr< IntersectionPoint > point, LinkType type, shared_ptr< IntersectionLink > model_link = shared_ptr<IntersectionLink> (), int added_parameter_dir = -1 ) [inline]`

This function topologically "connects" this point with another [IntersectionPoint](#). It generates a new [IntersectionLink](#) combining these points. This [IntersectionLink](#) can inherit the meta-information from *model\_link*. This is typically useful when an [IntersectionPoint](#) is "inserted" between two already-connected points, and the two new links should contain the same information as the older, split-up link. Another example where information from *model\_link* needs to be copied is when parents of two connected points needs to be connected. In that case, it is important that we know which parameter direction has been introduced when moving to the parent, so that we can "shift" the meta-information pertaining to individual parameters accordingly. If no new parameter information has been introduced, *added\_parameter\_dir* should be left at its default value of -1.

#### Parameters

<i>point</i>	the <a href="#">IntersectionPoint</a> we want to connect to <code>this</code> point
<i>type</i>	the type of the link in terms of a <code>LinkType</code>
<i>model_link</i>	if this parameter is specified, the information associated with <i>model_link</i> will be copied by the newly created <a href="#">IntersectionLink</a> .
<i>added_parameter_dir</i>	relevant parameter when <i>model_link</i> contains one parameter direction less than the new <a href="#">IntersectionLink</a> does. In this case, <i>added_parameter_dir</i> will specify the index of the parameter that is lacking.

#### Returns

shared pointer to the generated link

Definition at line 457 of file `IntersectionPoint.h`.

29.236.3.5 `bool Go::IntersectionPoint::containsG2Discontinuity ( ) const [inline]`

Check if there is a G2-discontinuity for one of the parameters at this [IntersectionPoint](#).

#### Returns

'true' if at least one G2-discontinuity was found, 'false' otherwise.

Definition at line 702 of file `IntersectionPoint.h`.

29.236.3.6 `bool Go::IntersectionPoint::differentiatesFromLeft ( int pdir ) const [inline]`

Returns whether the internal state for parameter 'pdir' is set so that it differentiates from left.

#### Parameters

<i>pdir</i>	the concerned parameter direction
-------------	-----------------------------------

**Returns**

'true' if differentiation is set to be carried out 'from the left' for this parameter, 'false' otherwise.

Definition at line 669 of file IntersectionPoint.h.

**29.236.3.7 void Go::IntersectionPoint::disconnectFrom ( IntersectionPoint \* *point* )**

Topologically disconnect 'this' [IntersectionPoint](#) from another [IntersectionPoint](#) (which means removing whatever [IntersectionLink](#) there might be between them).

**Parameters**

<i>point</i>	the <a href="#">IntersectionPoint</a> we want to disconnect from 'this' <a href="#">IntersectionPoint</a> .
--------------	-------------------------------------------------------------------------------------------------------------

**29.236.3.8 double Go::IntersectionPoint::endParam ( int *parDir* )**

Get the end value of the parameter interval for the specified parameter.

**Parameters**

<i>parDir</i>	the parameter for which we seek the end value.
---------------	------------------------------------------------

**Returns**

the end value of the parameter interval for the parameter 'parDir'.

**29.236.3.9 void Go::IntersectionPoint::fixTangentOrientation ( bool *flip* )**

If the tangent is not oriented (because of singular intersection), it can be set manually with this command. If the argument is "true", the tangent's orientation will be flipped. In the opposite case, it will be kept as it is. Subsequent calls to the [tangentIsOriented\(\)](#) function will now report that the tangent is oriented. Not to be called for an ORDINARY\_POINT (which should have been handled already). See [SingularityType](#) for a definition of what ORDINARY\_POINT means.

**Parameters**

<i>flip</i>	if 'true', then the tangent's orientation will be flipped, otherwise it will be kept as it is. In any case, the <a href="#">IntersectionPoint</a> will now consider the orientation of its tangent to be 'fixed'.
-------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**29.236.3.10 void Go::IntersectionPoint::flipObjects ( )**

Flip the two intersecting objects (useful sometimes for self-intersections, should be avoided otherwise).

**29.236.3.11** `IntPtClassification` `Go::IntersectionPoint::getClassification ( const ParamSurface * surf1, const ParamSurface * surf2, int branch_num = 0 ) const`

Classifies an [IntersectionPoint](#) according to the direction of the corresponding intersection curve with respect to the parameter domain of two surfaces. *branch\_num* indicates which tangential branch to use (usually there's just one (*branch\_num* should be 0), but for branchpoints there are two (*branch\_num* can be 0 or 1)).

#### Parameters

<i>surf1</i>	the first surface
<i>surf2</i>	the second surface
<i>branch_num</i>	indicates which tangential branch to use

#### Returns

the classification of this [IntersectionPoint](#) according to the domain of the given surfaces. See also [IntPtClassification](#).

**29.236.3.12** `IntPtClassification` `Go::IntersectionPoint::getClassification ( const ParamSurface * par_func, double C, int branch_num = 0 ) const`

Classifies an [IntersectionPoint](#) according to the direction of the corresponding intersection curve with respect to the parameter domain of a *function*. *branch\_num* indicates which tangential branch to use (usually there's just one (*branch\_num* should be 0), but for branchpoints there are two (*branch\_num* can be 0 or 1)).

#### Parameters

<i>par_func</i>	the function, expressed as a 1D <a href="#">ParamSurface</a>
<i>C</i>	the iso-value that defines the intersection on this function.
<i>branch_num</i>	indicates which tangential branch to use

#### Returns

the classification of this [IntersectionPoint](#) according to the domain of the given function. See also [IntPtClassification](#).

**29.236.3.13** `double` `Go::IntersectionPoint::getDist ( ) const` `[inline]`

Distance between the position of the [IntersectionPoint](#) as described in the first object and as described in the second object.

#### Returns

the distance between the two points describing the [IntersectionPoint](#) in each of the objects.

Definition at line 203 of file `IntersectionPoint.h`.

29.236.3.14 `double Go::IntersectionPoint::getInfluenceArea ( int dir, bool forward, bool first_outside, double aeps = 0.0 ) const`

Returns the parameter value corresponding to the influence area of the intersection point in a specified direction and orientation. Since the bounds of the influence area are bracketed, we do not have the exact value of its limits. If 'first\_outside' is 'true', we will return the first parameter value detected outside the influence area. Otherwise, we will return the last parameter detected inside the influence area.

#### Parameters

<i>dir</i>	the parameter direction for which we seek the influence area.
<i>forward</i>	'true' if we want to locate the upper end of the point's influence area, 'false' if we want to locate the lower end.
<i>first_outside</i>	'true' if we want the returned value to be the first parameter value <i>outside</i> the influence area that was found by the function. 'false' if we seek the last detected value <i>inside</i> the influence area.

#### Returns

a value that (according to the function arguments) either represents the last found parameter value *inside* or first found parameter value *outside* the influence area of this [IntersectionPoint](#) along the specified parameter direction.

29.236.3.15 `shared_ptr<IntersectionLink> Go::IntersectionPoint::getIntersectionLink ( const IntersectionPoint * point )`

Return the intersection link connecting `this` point with *point*. If no such link exists, a null pointer will be returned.

#### Parameters

<i>point</i>	the point for which we seek the <a href="#">IntersectionLink</a> to this point.
--------------	---------------------------------------------------------------------------------

#### Returns

the [IntersectionLink](#) in question.

29.236.3.16 `void Go::IntersectionPoint::getNeighbourLinks ( std::vector< shared_ptr< IntersectionLink > > & links ) const`

Get a vector containing all the [IntersectionLinks](#) that defines connections from `this` [IntersectionPoint](#).

#### Return values

<i>links</i>	upon function return, this will be the vector sought for.
--------------	-----------------------------------------------------------

29.236.3.17 `void Go::IntersectionPoint::getNeighbours ( std::vector< IntersectionPoint * > & pnts ) const`

Get a vector containing pointers of all [IntersectionPoints](#) topologically connected with this [IntersectionPoint](#). [IntersectionPoints](#) are topologically connected if they share an [IntersectionLink](#).

Return values

<i>pnts</i>	upon function return, this will be the vector sought for.
-------------	-----------------------------------------------------------

29.236.3.18 `const ParamObjectInt* Go::IntersectionPoint::getObj1 ( ) const` `[inline]`

Get pointer to first object.

Definition at line 287 of file [IntersectionPoint.h](#).

29.236.3.19 `const ParamObjectInt* Go::IntersectionPoint::getObj2 ( ) const` `[inline]`

Get pointer to second object.

Definition at line 291 of file [IntersectionPoint.h](#).

29.236.3.20 `const std::vector<double>& Go::IntersectionPoint::getPar ( ) const` `[inline]`

Get a vector containing the [IntersectionPoint](#)'s parameter values.

Definition at line 208 of file [IntersectionPoint.h](#).

29.236.3.21 `double Go::IntersectionPoint::getPar ( int idx ) const` `[inline]`

Get a specified parameter value of the [IntersectionPoint](#)

Parameters

<i>idx</i>	the number of their parameter for which we seek the value
------------	-----------------------------------------------------------

Returns

the specified parameter value

Definition at line 215 of file [IntersectionPoint.h](#).

29.236.3.22 `const double* Go::IntersectionPoint::getPar1 ( ) const`

Get a pointer to the parameter values in the first object

Returns

a pointer to the array where the parameter values for the first object are (consecutively) stored.

29.236.3.23 Point Go::IntersectionPoint::getPar1Dir ( bool *second\_branch* = false ) const

Get the parameter direction along intersection in first object at this [IntersectionPoint](#). If this point is a branch point (several intersection curves meet at this point), then the user has to specify the branch that she wants the tangent to.

## Parameters

<i>second_branch</i>	usually set to 'false' (default). If the <a href="#">IntersectionPoint</a> lies at a branchpoint, then the user can set this parameter to 'true' in order to get the parameter direction for the <i>second</i> of the two branches that supposedly meet in this point. However, setting this parameter to 'true' <i>will</i> cause an error if the <a href="#">IntersectionPoint</a> is <i>not</i> a branch point.
----------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

the parameter direction along the intersection in the first object at this point.

## 29.236.3.24 Point Go::IntersectionPoint::getPar1Point ( ) const

Get a [Point](#) representing the [IntersectionPoint](#) in the parameter domain of the first object

## 29.236.3.25 const double\* Go::IntersectionPoint::getPar2 ( ) const

Get a pointer to the parameter values in the second object

## Returns

a pointer to the array where the parameter values for the second object are (consecutively) stored.

29.236.3.26 Point Go::IntersectionPoint::getPar2Dir ( bool *second\_branch* = false ) const

Get the parameter direction along intersection in second object at this [IntersectionPoint](#). If this point is a branch point (several intersection curves meet at this point), then the user has to specify the branch that she wants the tangent to.

## Parameters

<i>second_branch</i>	usually set to 'false' (default). If the <a href="#">IntersectionPoint</a> lies at a branchpoint, then the user can set this parameter to 'true' in order to get the parameter direction for the <i>second</i> of the two branches that supposedly meet in this point. However, setting this parameter to 'true' <i>will</i> cause an error if the <a href="#">IntersectionPoint</a> is <i>not</i> a branch point.
----------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

the parameter direction along the intersection in the second object at this point.

**29.236.3.27 Point Go::IntersectionPoint::getPar2Point ( ) const**

Get a [Point](#) representing the [IntersectionPoint](#) in the parameter domain of the second object

**29.236.3.28 Point Go::IntersectionPoint::getPoint ( ) const**

Get average of the [IntersectionPoint](#)'s position in space as evaluated in the two underlying objects.

**Returns**

the position of the [IntersectionPoint](#) in space

**29.236.3.29 Point Go::IntersectionPoint::getPoint1 ( ) const** `[inline]`

Get the [IntersectionPoint](#)'s position in space as evaluated in the first underlying object.

**Returns**

the position of the [IntersectionPoint](#) in space

Definition at line 153 of file `IntersectionPoint.h`.

**29.236.3.30 Point Go::IntersectionPoint::getPoint2 ( ) const** `[inline]`

Get the [IntersectionPoint](#)'s position in space as evaluated in the second underlying object.

**Returns**

the position of the [IntersectionPoint](#) in space

Definition at line 159 of file `IntersectionPoint.h`.

**29.236.3.31 SingularityType Go::IntersectionPoint::getSingularityType ( ) const**

Get the `SingularityType` of this [IntersectionPoint](#).

**29.236.3.32 Point Go::IntersectionPoint::getTangent ( bool *second\_branch* = false ) const**

Get the tangent of the intersection at the point. If the point is a branch point (several intersection curves meet at this point), then the user has to specify the branch that she wants the tangent to.

## Parameters

<i>second_branch</i>	usually set to 'false' (default). If the <a href="#">IntersectionPoint</a> lies at a branchpoint, then the user can set this parameter to 'true' in order to get the tangent of the <i>second</i> of the two branches that supposedly meet in this point. However, setting this parameter to 'true' <i>will</i> cause an error if the <a href="#">IntersectionPoint</a> is <i>not</i> a branch point.
----------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

the tangent of intersection curve at this point.

**29.236.3.33** `shared_ptr<GeoTol> Go::IntersectionPoint::getTolerance ( ) [inline]`

Get the object containing the *tolerances* used by this [IntersectionPoint](#)

Definition at line 516 of file IntersectionPoint.h.

**29.236.3.34** `shared_ptr<const GeoTol> Go::IntersectionPoint::getTolerance ( ) const [inline]`

Get the object containing the *tolerances* used by this [IntersectionPoint](#)

Definition at line 521 of file IntersectionPoint.h.

**29.236.3.35** `int Go::IntersectionPoint::hasIsoLinks ( int *const iso_par_dirs ) const`

Returns the number of parameter directions for which this point is connected with links that are isoparametric. The indices of the isoparametric parameter directions are written to an array pointed to by 'iso\_par\_dirs' (allocated by the user).

## Parameters

<i>iso_par_dirs</i>	pointer to the array where the indices will be written.
---------------------	---------------------------------------------------------

## Returns

the number of parameter directions for which this point is connected with links that are isoparametric.

**29.236.3.36** `bool Go::IntersectionPoint::hasParentPoint ( ) [inline]`

Definition at line 540 of file IntersectionPoint.h.

**29.236.3.37** `bool Go::IntersectionPoint::hasUniqueTangentDirection ( ) const`

Check if there is a unique tangent direction for the intersection at the position of this [IntersectionPoint](#). This is the case for ORDINARY\_POINTS and TANGENTIAL\_POINTS, and false in all other cases (see [SingularityType](#)). See also [tangentsOriented\(\)](#).

**Returns**

'true' if the [IntersectionPoint](#) has a unique tangent direction (not necessarily uniquely oriented). 'false' otherwise.

**29.236.3.38** `int Go::IntersectionPoint::inInfluenceArea ( int pardir, double par, bool first_outside ) const`

Returns 0 if the given parameter value *par* was not in the point's influence area for the point's parameter *pardir*. Returns 1 if it is inside the point's influence area, but not exactly on the point. Returns 2 if it is exactly on the point. Since the bounds of the influence area are bracketed, we do not have the exact value of its limits. If *first\_outside* is 'true', we will check against the first parameter value detected outside the influence area. Otherwise, we will check against the last parameter detected inside the influence area.

**Parameters**

<i>pardir</i>	the concerned parameter directon
<i>par</i>	the concerned parameter value
<i>first_outside</i>	specify whether we want to check against the first detected value <i>outside</i> the influence area ('true'), or the last detected value <i>inside</i> it ('false').

**Returns**

0, 1 or 2, according to the above description.

**29.236.3.39** `bool Go::IntersectionPoint::inInfluenceAreaBracket ( int pardir, double parval ) [inline]`

This function is not properly defined at the moment.

**Parameters**

<i>pardir</i>	the concerned parameter directon
<i>parval</i>	the concerned parameter value

Definition at line 609 of file `IntersectionPoint.h`.

**29.236.3.40** `void Go::IntersectionPoint::isBoundaryPoint ( bool & first, bool & second ) const`

The first and second argument are set to 'true' or 'false' according to whether the point is lying on the boundary of respectively the first and second object.

**Return values**

<i>first</i>	'true' if this <a href="#">IntersectionPoint</a> is located on the boundary of the first object, 'false' otherwise.
<i>second</i>	'true' if this <a href="#">IntersectionPoint</a> is located on the boundary of the second object, 'false' otherwise.

29.236.3.41 `bool Go::IntersectionPoint::isConnectedTo ( shared_ptr< IntersectionPoint > p ) const [inline]`

Check if this point is topologically connected with another [IntersectionPoint](#) (i.e. that there is an [IntersectionLink](#) between them).

#### Parameters

<i>p</i>	a shared pointer to the point we are checking against.
----------	--------------------------------------------------------

#### Returns

'true' if there is an [IntersectionLink](#) between 'this' point and *p*. 'false' otherwise.

Definition at line 385 of file IntersectionPoint.h.

29.236.3.42 `bool Go::IntersectionPoint::isConnectedTo ( const IntersectionPoint * point ) const`

Check if this point is topologically connected with another [IntersectionPoint](#) (i.e. that there is an [IntersectionLink](#) between them).

#### Parameters

<i>point</i>	a pointer to the point we are checking against.
--------------	-------------------------------------------------

#### Returns

'true' if there is an [IntersectionLink](#) between 'this' point and *point*. 'false' otherwise.

29.236.3.43 `bool Go::IntersectionPoint::isDegenerate ( ) const`

Check if the point lies on a degenerate edge (or other degenerate part) of the surface.

#### Returns

'true' if degenerate, 'false' otherwise.

29.236.3.44 `bool Go::IntersectionPoint::isInDomain ( double * frompar, double * topar ) const`

Check if the point is in the domain specified by a parameter box.

#### Parameters

<i>frompar</i>	the array of parameters defining the lower corner of the box in question.
<i>topar</i>	the array of parameters defining the upper corner of the box in question.

## Return values

--	--

29.236.3.45 **bool** Go::IntersectionPoint::isNearSingular ( ) const

Return 'true' if the point was found to be near-singular, that is, the tangent calculated in this point is very small.

29.236.3.46 **bool** Go::IntersectionPoint::isSamePoint ( const IntersectionPoint \* *point* ) const

Check if the given intersection point represents the same point as 'this' point within the tolerance.

## Parameters

<i>point</i>	pointer to the intersection point we wish to test on
--------------	------------------------------------------------------

## Return values

'true'	if the points are the same, 'false' otherwise
--------	-----------------------------------------------

29.236.3.47 **int** Go::IntersectionPoint::numBranches ( ) const

Returns how many 'tangential branches' emanates from this point (usually 1, but 2 for branch points, and 0 for isolated- or higher-order points). See [SingularityType](#) for a classification of [IntersectionPoint](#) s.

29.236.3.48 **int** Go::IntersectionPoint::numNeighbours ( ) const `[inline]`

Query the number of IntersectionPoints ('neighbours') that are connected to `this` [IntersectionPoint](#) via an [IntersectionLink](#).

Definition at line 638 of file IntersectionPoint.h.

29.236.3.49 **int** Go::IntersectionPoint::numParams1 ( ) const

Get number of parameter values in object number 1.

29.236.3.50 **int** Go::IntersectionPoint::numParams2 ( ) const

Get number of parameter values in object number 2.

29.236.3.51 **double** Go::IntersectionPoint::parameterTolerance ( int *pardir* )

Return the tolerance for the parameter in the direction 'pardir'. This is equal to `GeoTol::rel_par_res_` multiplied by the span of the parameter.

## Parameters

<i>parDir</i>	the parameter for which we want to find the parameter tolerance
---------------	-----------------------------------------------------------------

## Returns

the tolerance for the specified parameter.

29.236.3.52 `shared_ptr<IntersectionPoint> Go::IntersectionPoint::parentPoint ( ) [inline]`

Get a shared pointer to the parent point of this [IntersectionPoint](#). If it has no parent, the shared pointer will be a null-pointer.

Definition at line 527 of file `IntersectionPoint.h`.

29.236.3.53 `bool Go::IntersectionPoint::pointIsSingular ( ) const [inline]`

Return 'true' if the point was found to be singular, ie. not on a normal, transversal intersection (see [SingularityType](#)).

Definition at line 311 of file `IntersectionPoint.h`.

29.236.3.54 `void Go::IntersectionPoint::projectToParamPlanes ( const Point & dir, Point & par_1_dir, Point & par_2_dir ) const`

This function currently only works (and makes sense) for 3D geometrical objects (not functions). Given a vector 'dir', it projects this vector onto the two objects at the [IntersectionPoint](#), and calculates this direction in the two parameter spaces. These normalized directions are returned in 'par\_1\_dir' and 'par\_2\_dir'.

## Parameters

<i>dir</i>	the direction vector that the user wants to project on the objects
------------	--------------------------------------------------------------------

## Return values

<i>par_1_dir</i>	the direction of the projected vector in the parameter space of the first object.
<i>par_2_dir</i>	the direction of the projected vector in the parameter space of the second object.

29.236.3.55 `void Go::IntersectionPoint::read ( std::istream & is )`

Read [IntersectionPoint](#) from stream (NB: no topological or parent information)

## Parameters

<i>is</i>	input stream
-----------	--------------

29.236.3.56 `void Go::IntersectionPoint::replaceParameter ( double * param )`

Replace the parameters defining this [IntersectionPoint](#) and recalculate internal information (the underlying geometric objects are kept).

#### Parameters

<i>param</i>	pointer to an array of <code>double</code> s, defining the new values for the point's parameters. The array should of course have length equal to the total number of parameters defining this <a href="#">IntersectionPoint</a> .
--------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

29.236.3.57 `template<class bool_iterator > void Go::IntersectionPoint::setDifferentiateFromLeft ( bool_iterator it ) const [inline]`

*it* should point to a p-array of `bool`, where *p* is the total number of parameters for this [IntersectionPoint](#). The value at *it*[*i*] determines whether second-order differentiation for the parameter *i* should be carried out from the left, rather than from the right (default). This sets an internal state variable that will not be changed until the next call of [setDifferentiateFromLeft\(\)](#). (The reason a template was used here is to be able to use iterators to vectors of `bool`, which are special in that they cannot be accessed in the usual pointer way).

#### Parameters

<i>it</i>	an iterator (pointer, etc.) to the aforementioned array of <code>bool</code> .
-----------	--------------------------------------------------------------------------------

Definition at line 653 of file `IntersectionPoint.h`.

29.236.3.58 `void Go::IntersectionPoint::setParentPoint ( shared_ptr< IntersectionPoint > p ) [inline]`

Set a given [IntersectionPoint](#) to be the parent point of this [IntersectionPoint](#).

#### Parameters

<i>p</i>	the point that shall be the parent point of this <a href="#">IntersectionPoint</a> .
----------	--------------------------------------------------------------------------------------

Definition at line 534 of file `IntersectionPoint.h`.

29.236.3.59 `void Go::IntersectionPoint::shareInfluenceAreaWith ( shared_ptr< IntersectionPoint > other_pt, int pdir )`

This function is mostly for optimizing reasons. This point is supposed to lie inside the influence area of *other\_pt*, and by this function, this influence interval is split up and shared between this point and the other point. By deducing this interval directly from *other\_pt*, we avoid having to march it out again. The concerned parameter direction is *pdir*.

#### Parameters

<i>other_pt</i>	refers to the <a href="#">IntersectionPoint</a> that we assume share influence area with <code>this</code> <a href="#">IntersectionPoint</a> .
<i>pdir</i>	the concerned parameter directon

29.236.3.60 `double Go::IntersectionPoint::startParam ( int pardir )`

Get the start value of the parameter interval for the specified parameter.

## Parameters

<i>pardir</i>	the parameter for which we seek the start value.
---------------	--------------------------------------------------

## Returns

the start value of the parameter interval for the parameter '*pardir*'.

29.236.3.61 `bool Go::IntersectionPoint::tangentsOriented ( ) const`

Returns true if this [IntersectionPoint](#) is sure about the orientation of its tangent. It is sure about the orientation if the intersection is transversal, or if the intersection is singular and the orientation has been set manually through the [fixTangentOrientation\(\)](#) command. See also [hasUniqueTangentDirection\(\)](#).

## Returns

'true' if the *tangent orientation* is clear (a prerequisite is of course that the *tangent direction* is clear). 'false' otherwise.

29.236.3.62 `void Go::IntersectionPoint::tangentPointingInwards ( bool & first, bool & second, bool & first_along_boundary, bool & second_along_boundary ) const`

The first and second argument are set to 'true' or 'false' according to whether the tangent direction in this point is clearly oriented toward the inside of the domain for respectively the first and second surface. It can only be pointing outwards if the point is lying on the boundary. If the point is on the boundary and its tangent is close to parallel with the boundary, '*first\_along\_boundary*' and/or '*second\_along\_boundary*' will be set to true, otherwise they are false. Of course, points whose tangents are directed along the boundary will return 'first' and/or 'second' false.

## Return values

<i>first</i>	'true' if the tangent direction of the intersection at this point is clearly oriented toward the inside of the domain of the first object. 'false' if not.
<i>second</i>	'true' if the tangent direction of the intersection at this point is clearly oriented toward the inside of the domain of the second object. 'false' if not.
<i>first_along_boundary</i>	'true' if the point is on the boundary of the first object, and with a tangent that is close to parallel with the boundary. 'false' otherwise.
<i>second_along_boundary</i>	'true' if the point is on the boundary of the second object, and with at tangent that is close to parallel with the boundary. 'false' otherwise.

29.236.3.63 `void Go::IntersectionPoint::write ( std::ostream & os ) const`

Write [IntersectionPoint](#) to stream (NB: topological and parent information will be lost)

## Parameters

<i>os</i>	output stream
-----------	---------------

29.236.3.64 void `Go::IntersectionPoint::writeInfo ( )` const

Write available info about an [IntersectionPoint](#) to standard output. Makes use of the struct [IntPtInfo](#).

29.236.3.65 void `Go::IntersectionPoint::writeParams ( std::ostream & os )` const

Write the parameters of the intersection point to stream

## Parameters

<i>os</i>	output stream
-----------	---------------

## 29.236.4 Member Data Documentation

29.236.4.1 const double `Go::IntersectionPoint::tangent_tol` [*static*]

Global tolerance for tangent length (considered singular if length is less than this value).

Definition at line 744 of file `IntersectionPoint.h`.

The documentation for this class was generated from the following file:

- [intersections/include/GoTools/intersections/IntersectionPoint.h](#)

- class [SfSfIntersector](#)

### 29.237.1 Detailed Description

Class providing access to the intersection points and surfaces related to a particular subproblem.

Definition at line 64 of file [IntersectionPool.h](#).

### 29.237.2 Constructor & Destructor Documentation

**29.237.2.1** `Go::IntersectionPool::IntersectionPool ( shared_ptr< ParamObjectInt > obj1, shared_ptr< ParamObjectInt > obj2, shared_ptr< IntersectionPool > parent = shared_ptr< IntersectionPool > (), int missing_dir = -1, double missing_value = 0 )`

Constructor

Parameters

<i>obj1</i>	the first object of the (possible) intersection
<i>obj2</i>	the second object of the (possible) intersection
<i>parent</i>	pointer to parent pool (null pointer if no parent)
<i>missing_dir</i>	index of the missing parameter (negative if no missing parameter)
<i>missing_value</i>	value of the missing parameter

29.237.2.2 `virtual Go::IntersectionPool::~~IntersectionPool ( ) [inline],[virtual]`

Destructor.

Definition at line 83 of file IntersectionPool.h.

### 29.237.3 Member Function Documentation

29.237.3.1 `template<class ip_iterator > void Go::IntersectionPool::addCurve ( ip_iterator start, ip_iterator end ) [inline]`

Add one [IntersectionCurve](#) to the pool, by specifying a range of [IntersectionPoints](#) that make up the curve.

Parameters

<i>start</i>	iterator to the start of the range of <a href="#">IntersectionPoints</a> .
<i>end</i>	iterator to the end of the range of <a href="#">IntersectionPoints</a> .

Definition at line 940 of file IntersectionPool.h.

29.237.3.2 `template<class ip_iterator > void Go::IntersectionPool::addCurves ( int nmb_int_cvs, ip_iterator * start_iterators, ip_iterator * end_iterators ) [inline]`

Add a number of [IntersectionCurves](#) to the pool by specifying iterators to the [IntersectionPoint](#) making up the curves.

Parameters

<i>nmb_int_cvs</i>	number of curves to add
<i>start_iterators</i>	pointer to a range of iterators to <a href="#">IntersectionPoint</a> . The range should have length equal to the number of curves to add. Each iterator represents the start of a range of <a href="#">IntersectionPoints</a> that defines an <a href="#">IntersectionCurve</a> to add to the pool. (The corresponding end of the range is specified by the corresponding iterator in <i>end_iterators</i> ).
<i>end_iterators</i>	pointer to a range of iterators to <a href="#">IntersectionPoint</a> . The range should have length equal to the number of curves to add. Each iterator represents the one-past-end of a range of <a href="#">IntersectionPoint</a> s that defines an <a href="#">IntersectionCurve</a> to add to the pool. (The corresponding start of the range is specified by the corresponding iterator in <i>start_iterators</i> )

Definition at line 927 of file IntersectionPool.h.

29.237.3.3 `shared_ptr<IntersectionPoint> Go::IntersectionPool::addIntersectionPoint ( shared_ptr< ParamObjectInt > obj_int1, shared_ptr< ParamObjectInt > obj_int2, shared_ptr< GeoTol > epsge, double * par1, double * par2 )`

Construct a new [IntersectionPoint](#) and add it to this pool, as well as the pool's parents (and older ancestors). NB: The objects given as input should be equal to - or sub-objects of the objects that are already pointed to by this pool.

## Parameters

<i>obj_↔</i> <i>int1_</i>	The first of the intersecting objects of the new <a href="#">IntersectionPoint</a>
<i>obj_↔</i> <i>int2_</i>	The second of the intersecting objects of the new <a href="#">IntersectionPoint</a>
<i>epsge</i>	the tolerances used for the new IntesectionPoint
<i>par1</i>	pointer to the <a href="#">IntersectionPoint</a> 's parameters in the first object
<i>par2</i>	pointer to the <a href="#">IntersectionPoint</a> 's parameters in the second object

29.237.3.4 `void Go::IntersectionPool::addParamPoints ( int nmb_int_pts, double * pointpar1, double * pointpar2, shared_ptr< GeoTol > epsge )`

Add a number of [IntersectionPoint](#) s to the pool by specifying their parameter values.

## Parameters

<i>nmb_int_pts</i>	the number of <a href="#">IntersectionPoint</a> s that shall be added to the pool.
<i>pointpar1</i>	pointer to an array containing the consecutive parameter values in the first object for the <a href="#">IntersectionPoint</a> s to add.
<i>pointpar2</i>	pointer to an array containing the consecutive parameter values in the second object for the <a href="#">IntersectionPoint</a> s to add.
<i>epsge</i>	shared pointer to the object specifying the tolerances to use for the added <a href="#">IntersectionPoint</a> s.

29.237.3.5 `bool Go::IntersectionPool::atDifferentBoundary ( shared_ptr< IntersectionPoint > pt1, shared_ptr< IntersectionPoint > pt2 )`

Check if two [IntersectionPoints](#) can be found on two different boundaries of the parametric domain of this [IntersectionPools](#) objects (*obj1\_* and *obj2\_*)

## Parameters

<i>pt1</i>	the first <a href="#">IntersectionPoint</a>
<i>pt2</i>	the second <a href="#">IntersectionPoint</a>

## Returns

'true' if *pt1* and *pt2* could be found to lie on two distinct borders (i.e. *pt1* lay on one border and *pt2* lay on another).

29.237.3.6 `bool Go::IntersectionPool::atSameBoundary ( shared_ptr< IntersectionPoint > pt1, shared_ptr< IntersectionPoint > pt2 )`

Check if two [IntersectionPoints](#) lie on the same boundary of the parametric domain of this [IntersectionPools](#) objects (*obj1\_* and *obj2\_*).

## Parameters

<i>pt1</i>	the first <a href="#">IntersectionPoint</a>
<i>pt2</i>	the second <a href="#">IntersectionPoint</a>

## Returns

'true' if *pt1* and *pt2* both were found to lie on the same (parametric) boundary. 'false' otherwise.

**29.237.3.7** `bool Go::IntersectionPool::checkIfBothPointsLieOnOneEndpointAndNotOfTheSameCurve ( )`

**29.237.3.8** `bool Go::IntersectionPool::checkIntersectionChain ( IntersectionPoint * pt, IntersectionPoint * first, IntersectionPoint * prev = 0 )`

Check consistence of chain of intersection links with respect to number of neighbours

**29.237.3.9** `bool Go::IntersectionPool::checkIntersectionLinks ( ) const`

Check if the intersection links are OK. If they are not, give further diagnostics.

**29.237.3.10** `bool Go::IntersectionPool::checkIntersectionPoints ( std::vector< IntPtInfo > & int_pt_info ) const`

Check if the intersection points are OK. If they are not, give further diagnostics.

## Parameters

<i>int_pt_info</i>	vector with information about the intersection points. This information has the type of struct <a href="#">IntPtInfo</a> , which indicates if the point is ok, the number of neighbours, the singularity type, and the location of the point is the parameter domains of the objects
--------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

'true' if all intersection points are OK, 'false' if at least one point is not OK

**29.237.3.11** `bool Go::IntersectionPool::checkSortingDir ( Point & vec, int sorting_obj )`

Check the consistency between the direction of the intersection curve indicated by *vec* and the direction computed in the existing intersection points. Turn the direction of *vec* if necessary.

## Parameters

<i>vec</i>	the direction of the intersection curve. This may be turned if necessary.
<i>sorting_obj</i>	the object - 0 or 1 - used for sorting

## Return values

'true'	if ???, 'false' if ???
--------	------------------------

29.237.3.12 `void Go::IntersectionPool::cleanUpPool ( int first_idx = 0, double epsge = 1.0e-15 )`

Remove redundant [IntersectionPoints](#) from the pool, starting from the point indexed *first\_idx* and upwards. An [IntersectionPoint](#) is considered redundant if:

- it has exactly two neighbours *AND*
- it lies on an isoparametric intersection curve *AND*
- both of its (two) neighbours are in the pool

## Parameters

<i>first_idx</i>	index of the first point
------------------	--------------------------

29.237.3.13 `bool Go::IntersectionPool::closestInDomain ( double param[], shared_ptr< IntersectionPoint > & pnt ) const`

Locate the [IntersectionPoint](#) in this [IntersectionPool](#) whose parameter values are closest (in the Euclidean norm on the parameter space) to a given set of parameters.

## Parameters

<i>param[]</i>	pointer to an array containing the parameter values that we want to find the closest <a href="#">IntersectionPoint</a> to.
----------------	----------------------------------------------------------------------------------------------------------------------------

## Return values

<i>pnt</i>	upon function return, if a closest <a href="#">IntersectionPoint</a> was found, <i>pnt</i> will be set to that <a href="#">IntersectionPoint</a> .
------------	----------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

'true' if a closest [IntersectionPoint](#) was found, 'false' otherwise.

29.237.3.14 `bool Go::IntersectionPool::closestInDomain ( const double param[], shared_ptr< IntersectionPoint > & pnt ) const`

Locate the [IntersectionPoint](#) in this [IntersectionPool](#) whose parameter values are closest (in the Euclidean norm on the parameter space) to a given set of parameters.

## Parameters

<i>param[]</i>	pointer to an array containing the parameter values that we want to find the closest <a href="#">IntersectionPoint</a> to.
----------------	----------------------------------------------------------------------------------------------------------------------------

## Return values

<i>pnt</i>	upon function return, if a closest <a href="#">IntersectionPoint</a> was found, <i>pnt</i> will be set to that <a href="#">IntersectionPoint</a> .
------------	----------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

'true' if a closest [IntersectionPoint](#) was found, 'false' otherwise.

29.237.3.15 `double Go::IntersectionPool::endParam ( int dir ) const`

Get the end of the parameter interval for the specified parameter direction

## Parameters

<i>dir</i>	the specified parameter direction
------------	-----------------------------------

## Returns

the end of the parameter interval for the specified parameter direction.

29.237.3.16 `bool Go::IntersectionPool::existIntersectionPoint ( int dir, double par )`

Checks the existence of any intersection points with the given parameter in the given direction.

## Parameters

<i>dir</i>	specifies the concerned parameter direction.
<i>par</i>	specifies the value of this parameter.

## Returns

'true' if the pool contains an [IntersectionPoint](#) whose parameter *dir* is approximately equal to *par*.

29.237.3.17 `bool Go::IntersectionPool::fetchLoops ( std::vector< std::vector< shared_ptr< IntersectionPoint > > > & loop_ints )`

Get all the intersection loops contained in this [IntersectionPool](#). This function assumes that the topologies of the loops in this pool are not too 'warped'. Notably, it might fail if two loops share some edges, since in that case there will be ambiguous choices for what constitutes the loops. (This is a fact from graph theory, and if we want to work around it, we might have to consider additional information of a non-topological nature, like looking at the geometric/parametric position of the points).

## Return values

<i>loop_ints</i>	upon function return, this vector will contain all the loops that were found in this <a href="#">IntersectionPool</a> (each loop is represented as a vector of <a href="#">IntersectionPoints</a> ).
------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Returns**

'true' if at least one loop was found. 'false' otherwise.

29.237.3.18 `void Go::IntersectionPool::getAllIntersections ( std::vector< shared_ptr< IntersectionPoint > > & result )`  
`[inline]`

Definition at line 194 of file IntersectionPool.h.

29.237.3.19 `void Go::IntersectionPool::getAllLinks ( std::set< shared_ptr< IntersectionLink > > & links )`

29.237.3.20 `void Go::IntersectionPool::getBoundaryIntersections ( std::vector< shared_ptr< IntersectionPoint > > & bd_ints )`

Get a vector containing shared pointers to all IntersectionPoints in the pool that is located on the boundary of one of the pool's objects.

**Return values**

<i>bd_ints</i>	vector of shared pointers to boundary intersection points
----------------	-----------------------------------------------------------

29.237.3.21 `void Go::IntersectionPool::getBranchPoints ( std::vector< shared_ptr< IntersectionPoint > > & pts )`

Get a vector containing all those IntersectionPoints in the pool that are branchpoints.

**Return values**

<i>pts</i>	vector of shared pointers to IntersectionPointss
------------	--------------------------------------------------

29.237.3.22 `void Go::IntersectionPool::getIntersectionCurves ( std::vector< shared_ptr< IntersectionCurve > > & int_curves ) const` `[inline]`

Fill the argument vector with shared pointers to all the IntersectionCurves in 'this' [IntersectionPool](#).

**Parameters**

<i>int_curves</i>	vector of shared pointers to all of the pool's IntersectionCurves.
-------------------	--------------------------------------------------------------------

Definition at line 891 of file IntersectionPool.h.

29.237.3.23 `const std::vector< shared_ptr< IntersectionCurve > > & Go::IntersectionPool::getIntersectionCurves ( )`  
`const` `[inline]`

Get a reference to the vector containing (shared pointers to) 'this' IntersectionPools IntersectionCurves.

## Return values

<i>reference</i>	to vector of shared pointers to IntersectionCurves
------------------	----------------------------------------------------

Definition at line 918 of file IntersectionPool.h.

```
29.237.3.24 void Go::IntersectionPool::getIntersectionPoints (std::vector< shared_ptr< IntersectionPoint > > & int_pts)
 const [inline]
```

Fill the vector given as argument with shared pointers to all the IntersectionPoints in 'this' [IntersectionPool](#).

## Return values

<i>int_pts</i>	vector of shared pointers to all of the pool's IntersectionPoints.
----------------	--------------------------------------------------------------------

Definition at line 881 of file IntersectionPool.h.

```
29.237.3.25 std::vector< shared_ptr< IntersectionPoint > > & Go::IntersectionPool::getIntersectionPoints ()
 [inline]
```

Get a reference to the vector containing (shared pointers to) 'this' [IntersectionPool](#)'s IntersectionPoints.

## Return values

<i>reference</i>	to vector of shared pointers to IntersectionPoints
------------------	----------------------------------------------------

Definition at line 900 of file IntersectionPool.h.

```
29.237.3.26 const std::vector< shared_ptr< IntersectionPoint > > & Go::IntersectionPool::getIntersectionPoints ()
 const [inline]
```

Get a reference to the vector containing (shared pointers to) 'this' IntersectionPools [IntersectionPoint](#) s.

## Return values

<i>reference</i>	to vector of shared pointers to IntersectionPoints
------------------	----------------------------------------------------

Definition at line 909 of file IntersectionPool.h.

```
29.237.3.27 void Go::IntersectionPool::getIntersectionPoints (int dir, double par, std::vector< shared_ptr<
 IntersectionPoint > > & result) const
```

Fetch the IntersectionPoints with a specified parameter value in a specified direction

## Parameters

<i>dir</i>	the specified parameter direction
<i>par</i>	the specified parameter value

## Return values

<i>result</i>	the vector containing those of the pool's <code>IntersectionPoints</code> that (approximately) had the specified parameter value in the specified parameter direction.
---------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------

29.237.3.28 `void Go::IntersectionPool::getMidParameter ( double * mid )`

Compute the middle parameter value of all intersection points of this intersection pool

## Return values

<i>mid</i>	points to an array of <code>doubles</code> where the result will be written. The number of elements in the array is equal to the total number of parameter directions for this pool.
------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

29.237.3.29 `void Go::IntersectionPool::getOrigPoints ( std::vector< shared_ptr< IntersectionPoint > > & int_pts ) const`

Get the "original" intersection points of this intersection pool. If this pool has no parents with the same number of parameters as itself, then return the `IntersectionPoints` of this pool. Otherwise, return the `IntersectionPoints` of the parent pool.

## Return values

<i>int_pts</i>	the returned <code>IntersectionPoints</code> .
----------------	------------------------------------------------

29.237.3.30 `void Go::IntersectionPool::getResult ( std::vector< shared_ptr< IntersectionPoint > > & int_points, std::vector< shared_ptr< IntersectionCurve > > & int_curves )`

Get all isolated `IntersectionPoints` in the pool (those with no neighbours), as well as all `IntersectionCurves`.

## Return values

<i>int_points</i>	upon function return, this vector will contain shared pointers to all the <code>IntersectionPoints</code> in this pool that had no neighbours.
<i>int_curves</i>	upon function return, this vector will contain shared pointers to all the <code>IntersectionCurves</code> contained in this pool.

29.237.3.31 `void Go::IntersectionPool::getSortedBdInts ( const Point & vec, std::vector< shared_ptr< IntersectionPoint > > & result, int obj_nmb = -1 )`

Get a vector containing shared pointers to the pool's IntersectionPoints, sorted along a given spatial or parametrical direction. NOTE: The name of this function contains 'Bd' for 'boundary' for historical reasons. In fact, we get *all* intersections.

#### Parameters

<i>vec</i>	the direction along which to sort the <a href="#">IntersectionPoint</a> . If the number of vector elements is 3, it is interpreted as a 'spatial' vector; otherwise it is interpreted as a vector in the combined parametric domain of the two objects.
------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Return values

<i>result</i>	vector of shared pointers to IntersectionPoints
---------------	-------------------------------------------------

29.237.3.32 `std::vector<double> Go::IntersectionPool::getSortedInnerInts ( int padir )`

Get a vector containing the parametric values along a specific parameter direction for all the pool's IntersectionPoints that do not lie 'on' or 'close to' the boundary along this parameter. The returned values will be sorted according to increasing value.

#### Parameters

<i>padir</i>	the concerned parameter direction
--------------	-----------------------------------

#### Returns

the vector containing the requested parameter values.

29.237.3.33 `void Go::IntersectionPool::getSortedIntersections ( std::vector< shared_ptr< IntersectionPoint > > & int_pts )`

Get a vector containing shared pointers to all the IntersectionPoints in the pool. The entries in the vector will be sorted according to parameter values.

#### Return values

<i>int_pts</i>	vector containing the pool's IntersectionPoints in a sorted manner.
----------------	---------------------------------------------------------------------

29.237.3.34 `void Go::IntersectionPool::getSortedInts ( std::vector< shared_ptr< IntersectionPoint > > & result )`  
`[inline]`

Definition at line 189 of file IntersectionPool.h.

29.237.3.35 **bool** Go::IntersectionPool::hasIntersectionPoints ( ) const [inline]

Check if this [IntersectionPool](#) contains any [IntersectionPoints](#) at all.

#### Returns

'true' if 'this' pool contains at least one [IntersectionPoint](#).

Definition at line 290 of file IntersectionPool.h.

29.237.3.36 **bool** Go::IntersectionPool::hasIntersectionPoints ( int *dir*, double *par* ) const

Check if the [IntersectionPool](#) contains at least one [IntersectionPoint](#) with the specified parameter value in the specified direction.

#### Parameters

<i>dir</i>	the specified parameter direction
<i>par</i>	the specified parameter value

#### Returns

'true' if at least one [IntersectionPoint](#) with the specified parameter value in the specified parameter direction was found in the pool. 'false' otherwise.

29.237.3.37 **bool** Go::IntersectionPool::hasPointsInInner ( int *pardir* )

Check if this [IntersectionPool](#) contains [IntersectionPoints](#) that are not "boundary points" with respect to the parameter *pardir*.

#### Parameters

<i>pardir</i>	the parameter direction we want to check for
---------------	----------------------------------------------

#### Returns

'true' if there was found at least one [IntersectionPoint](#) whose *pardir* parameter did not lie on the extremal values of its interval. 'false' otherwise.

29.237.3.38 **void** Go::IntersectionPool::includeCoveredNeighbourPoints ( )

Check all the neighbours of the [IntersectionPoints](#) in this pool, and add those of them that are not already in the pool, but whose parameters are covered by the pool's parameter domain.

29.237.3.39 void Go::IntersectionPool::includeReducedInts ( shared\_ptr< IntersectionPool > lower\_order\_pool )

Include the IntersectionPoints in the lower\_order\_pool into 'this' pool, generating new representations of the points which includes the missing parameter. It is assumed that the IntersectionPoints in lower\_order\_pool have no [IntersectionLink](#) with points outside the pool.

## Parameters

<i>lower_order_pool</i>	a pointer to the lower-order pool from which we want to include its IntersectionPoints.
-------------------------	-----------------------------------------------------------------------------------------

29.237.3.40 `int Go::IntersectionPool::inInfluenceArea ( int pardir, double par, bool first_outside = true )`

Check if a given parameter value in a given parameter direction lies in the influence area of any IntersectionPoints in the pool.

## Parameters

<i>pardir</i>	the concerned parameter direction
<i>par</i>	the parameter value to check against
<i>first_outside</i>	if this is set to 'true' then the outer brackets of the influence intervals will be used (which in practice means that if the function returns 'false', then <i>par</i> is <i>guaranteed</i> to be outside the influence area of all points). If this argument is set to 'false', then the inner brackets of the influence interval will be used (which in practice means that if the function returns 'true', then <i>par</i> is <i>guaranteed</i> to be inside the influence area of at least one point).

## Returns

- 0 if no [IntersectionPoint](#) with an influence area covering the specified value was found.
- 1 if we found an [IntersectionPoint](#) whose influence area covered the specified value, but where the specified value did not hit *exactly* on the [IntersectionPoint](#)'s own parameter.
- 2 if we found an [IntersectionPoint](#) whose parameter value in the specified direction coincide with the specified value.

29.237.3.41 `int Go::IntersectionPool::inInfluenceArea ( int pardir, double par, std::vector< shared_ptr< IntersectionPoint > > & int_pts, bool first_outside = true )`

Check if a given parameter value in a given parameter direction lies in the influence area of any IntersectionPoints in the specified vector.

## Parameters

<i>pardir</i>	the concerned parameter direction
<i>par</i>	the parameter value to check against
<i>int_pts</i>	the vector of IntersectionPoints to check against.
<i>first_outside</i>	if this is set to 'true' then the outer brackets of the influence intervals will be used (which in practice means that if the function returns 'false', then <i>par</i> is <i>guaranteed</i> to be outside the influence area of all points). If this argument is set to 'false', then the inner brackets of the influence interval will be used (which in practice means that if the function returns 'true', then <i>par</i> is <i>guaranteed</i> to be inside the influence area of at least one point).

## Returns

- 0 if no [IntersectionPoint](#) with an influence area covering the specified value was found.

- 1 if we found an [IntersectionPoint](#) whose influence area covered the specified value, but where the specified value did not hit *exactly* on the [IntersectionPoint](#)'s own parameter.
- 2 if we found an [IntersectionPoint](#) whose parameter value in the specified direction coincide with the specified value.

29.237.3.42 `void Go::IntersectionPool::insertInInfluenceInterval ( shared_ptr< IntersectionPoint > pt_in_pool, double * parvals, int pardir )`

Create a new [IntersectionPoint](#) and add it to the the [IntersectionPool](#). The new [IntersectionPoint](#) (A) will lie inside the influence interval of another of the pool's points; the one (B) indicated by *pt\_in\_pool* (supposedly in the pool already). The parameter direction in which (A) lies inside the influence interval of (B) is indicated by *pardir*. The parameter values of the new point is pointed to by *parvals* (an array which also contains the parameter value in *pardir*. There will be inserted an [IntersectionLink](#) between (A) and (B), which will be isoparametric in the other parameter direction if *pardir* is on a two-parametric object (surface or function).

#### Parameters

<i>pt_in_pool</i>	the <a href="#">IntersectionPoint</a> (supposedly already in the pool) whose influence area the new <a href="#">IntersectionPoint</a> is going to lie.
<i>parvals</i>	pointer to an array specifying the parameter values for the new <a href="#">IntersectionPoint</a> to create.
<i>pardir</i>	the parameter direction that will be iso-parametric in the newly established <a href="#">IntersectionLink</a> (see above).

29.237.3.43 `void Go::IntersectionPool::intersectAlongCommonBoundary ( double frac, std::vector< BoundaryIntersectionData > & isects )`

Check if two surfaces intersect along a common boundary (i.e. a linked intersection list exist along one boundary in both objects).

Intersections whose parametric extent is smaller than a specified fraction (*frac*) of the surface's parameter intervals are ignored. The data on the found boundary intersections are returned as entries into a vector of [BoundaryIntersectionData](#).

#### Parameters

<i>frac</i>	the fraction of a parameter's total span that must be covered in order to consider this intersection "long enough" to be considered. (A value between 0 and 1, typically small).
-------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Return values

<i>isects</i>	vector with objects containing information on the found boundary intersections.
---------------	---------------------------------------------------------------------------------

29.237.3.44 `bool Go::IntersectionPool::isBoundaryIntersection ( shared_ptr< IntersectionPoint > pt1, shared_ptr< IntersectionPoint > pt2 )`

Check if the two specified [IntersectionPoints](#) represent a boundary intersection in this pool. In order to be interpreted as such, they must both lie on the same (parametric) boundary, and be connected with an iso-parametric [IntersectionLink](#)

## Parameters

<i>pt1</i>	the first <a href="#">IntersectionPoint</a>
<i>pt2</i>	the second <a href="#">IntersectionPoint</a>

## Returns

'true' if *pt1* and *pt2* satisfy the criteria specified above, 'false' otherwise.

29.237.3.45 **bool** `Go::IntersectionPool::isBoundaryPoint ( shared_ptr< IntersectionPoint > pt1 )` `[inline]`

Check if a point lies at a boundary in the current domain(s)

Definition at line 546 of file `IntersectionPool.h`.

29.237.3.46 **bool** `Go::IntersectionPool::isBoundaryPoint ( IntersectionPoint * pt1 )`

29.237.3.47 **bool** `Go::IntersectionPool::isConnectedInside ( shared_ptr< IntersectionPoint > pt1, shared_ptr< IntersectionPoint > pt2 )`

Checks if there is a path of connected [IntersectionPoints](#) going between the two [IntersectionPoints](#) specified. The specified points are assumed to be in this [IntersectionPool](#), and all [IntersectionPoints](#) of the path must also be in the pool.

## Parameters

<i>pt1</i>	the first <a href="#">IntersectionPoint</a> . Must already be in the pool. Otherwise, an error will occur.
<i>pt2</i>	the second <a href="#">IntersectionPoint</a> . Must already be in the pool. Otherwise, an error will occur.

## Returns

'true' if a path was found connecting *pt1* with *pt2* using only [IntersectionPoints](#) in the pool. 'false' otherwise.

29.237.3.48 **bool** `Go::IntersectionPool::isInDomain ( IntersectionPoint * pnt ) const`

Check if a given [IntersectionPoint](#) is in this [IntersectionPool](#).

## Parameters

<i>pnt</i>	pointer to the <a href="#">IntersectionPoint</a> that we want to check.
------------	-------------------------------------------------------------------------

## Returns

'true' if this [IntersectionPoint](#) was found in this [IntersectionPool](#), 'false' otherwise.

**29.237.3.49** `bool Go::IntersectionPool::isPAC ( std::vector< shared_ptr< IntersectionPoint > > & int_loop )`

Check if a given loop delimits a partial coincidence area (PAC). To determine this the meta-information in the [IntersectionLink](#) s is examined.

#### Parameters

<code>int_loop</code>	the loop to check
-----------------------	-------------------

#### Returns

'true' if the loop delimits a PAC, 'false' otherwise.

**29.237.3.50** `int Go::IntersectionPool::lackingParameter ( ) const [inline]`

Get the index of the missing parameter (-1 if none missing)

#### Returns

the index of the missing parameter

Definition at line 949 of file IntersectionPool.h.

**29.237.3.51** `double Go::IntersectionPool::lackingParameterValue ( ) const [inline]`

Get value of missing parameter (if it exists)

#### Returns

value of the missing parameter

Definition at line 957 of file IntersectionPool.h.

**29.237.3.52** `void Go::IntersectionPool::makeIntersectionCurves ( )`

Prepare output by making IntersectionCurves. Points that have one or three or more IntersectionLinks are considered endpoints to curves, points with two IntersectionLinks lie in the inner of a curve.

**29.237.3.53** `void Go::IntersectionPool::mirrorIntersectionPoints ( size_t first )`

**29.237.3.54** `int Go::IntersectionPool::numIntersectionPoints ( ) const [inline]`

Query the number of IntersectionPoints contained in this [IntersectionPool](#).

#### Returns

the number of IntersectionPoints in this pool.

Definition at line 296 of file IntersectionPool.h.

29.237.3.55 `int Go::IntersectionPool::numParams ( ) const [inline]`

Get the combined number of parameter directions in the two objects.

#### Returns

the number of parameters in the first object plus the number of parameters in the second object.

Definition at line 633 of file IntersectionPool.h.

29.237.3.56 `int Go::IntersectionPool::numSingularIntersectionPoints ( )`

Get the number of IntersectionPoints in this pool who are not classified as ORDINARY\_POINTs (see [SingularityType](#) for more info), i.e. points that lie on non-transversal intersections.

#### Returns

number of singular IntersectionPoints.

29.237.3.57 `void Go::IntersectionPool::removeBoundaryIntersections ( bool single_pt = true )`

Removes IntersectionLinks positioned along the boundary of both objects, The concerned IntersectionPoints are also removed, except when they also links to points which are NOT on the boundary.

29.237.3.58 `void Go::IntersectionPool::removeDefectLinks ( )`

Remove defect intersection links. Whether or not a link is defect depends on the return value of [verifyIntersection↔Link\(\)](#).

29.237.3.59 `void Go::IntersectionPool::removeDoublePoints ( )`

Remove double points by merging into one single point. Double points are points that are the same within the tolerance. The new points that results from this will inherit all the links from the old points.

29.237.3.60 `void Go::IntersectionPool::removeFalseCorners ( )`

29.237.3.61 `void Go::IntersectionPool::removeIntPoint ( shared_ptr< IntersectionPoint > int_point )`

Remove an [IntersectionPoint](#) from the pool. Should only be called if the number of neighbours are less than or equal to two.

#### Parameters

<i>int_point</i>	the <a href="#">IntersectionPoint</a> to remove from the pool and its ancestors (as long as the ancestors have the same number of parameter directions). IntersectionLinks will be broken up and the removed <a href="#">IntersectionPoint</a> 's neighbours will be reconnected.
<i>int_point</i>	shared pointer to the <a href="#">IntersectionPoint</a> to remove.

29.237.3.62 void Go::IntersectionPool::removeIntPoint2 ( shared\_ptr< IntersectionPoint > int\_point )

Remove an [IntersectionPoint](#) from the pool.

#### Parameters

<i>int_point</i>	the <a href="#">IntersectionPoint</a> to remove from the pool and its ancestors (as long as the ancestors have the same number of parameter directions). IntersectionLinks will be broken up.
<i>int_point</i>	shared pointer to the <a href="#">IntersectionPoint</a> to remove.

29.237.3.63 void Go::IntersectionPool::removeIntPoints ( double \* frompar, double \* topar, bool only\_inner = false )

Remove all intersection points from the pool whose parameters lie in the box defined by *frompar* and *topar*. IntersectionLinks will be broken up.

#### Parameters

<i>frompar</i>	the array of parameters defining the lower corner of the box in question.
<i>topar</i>	the array of parameters defining the upper corner of the box in question.

29.237.3.64 void Go::IntersectionPool::removeLooseEnds ( )

29.237.3.65 void Go::IntersectionPool::selfIntersectParamReorganise ( shared\_ptr< IntersectionPool > sub\_pool )

Reorganize self-intersection parameters. A 'twin point' is a concept when working with self-intersection objects. It represent an [IntersectionPoint](#) that already exist in the parent pool, but whose ordering of parameters had to be switched in order to conform with its objects (which are really two parts of the same, global surface). If a pool contains twin points, we must assure that the curves where these points are included have a consistent ordering of the parameters. This function takes care of making this ordering consistent. Moreover, since the twin points are really just another representation of an already-existing point, they will go out of scope and disappear when the sub-pool in which they lie is destroyed. Therefore, we must make sure that points linked to by the twin points will now be linked to by the original points that the twin-points are representing.

**NB:** This is a very special function that is only used with the following preconditions:

- this pool should represent a self-intersection, ie. its first and second object should be the same.
- the 'sub\_pool' (given as argument) should be a child of 'this' pool.
- 'this' pool and the one pointed to by *sub\_pool* should have the same number of parameters.

#### Parameters

<i>sub_pool</i>	shared pointer to the sub-pool, as described above.
-----------------	-----------------------------------------------------

29.237.3.66 `void Go::IntersectionPool::setCoincidence ( std::vector< shared_ptr< IntersectionPoint > > & int_loop )`

Set the specified loop to be a partial coincidence area (PAC). This is written into the loop's `IntersectionLinks` as meta-information.

#### Parameters

<code>int_loop</code>	the loop in question
-----------------------	----------------------

29.237.3.67 `void Go::IntersectionPool::splitIntersectionLinks ( int fixed_dir, double fixed_val )`

Among all `IntersectionLinks` between `IntersectionPoints` in this pool, split those who cross a specified parameter direction at a specified parameter value. Split means to insert a new `IntersectionPoint` at this place.

#### Parameters

<code>fixed_dir</code>	the specified parameter direction
<code>fixed_val</code>	the specified parameter value

29.237.3.68 `double Go::IntersectionPool::startParam ( int dir ) const`

Get the start of the parameter interval for the specified parameter direction

#### Parameters

<code>dir</code>	the specified parameter direction
------------------	-----------------------------------

#### Returns

the start of the parameter interval for the `dir` parameter direction.

29.237.3.69 `void Go::IntersectionPool::synchronizePool ( )`

Synchronize pool with its parent. We check that the pool is "valid" by making sure that the intersection points on the current level is also present at previous levels. If there are intersection points that are redundant in this sense, we remove them. This function is useful when several sibling subintersector are around, and running compute on one of them has removed intersection points that are also present in some of the others.

29.237.3.70 `bool Go::IntersectionPool::validate ( ) const`

Checks if the pool is "valid", that is, if the intersection points on the present subdivision level exist also on previous levels.

#### Returns

`true` if the pool is valid, `false` otherwise

29.237.3.71 `bool Go::IntersectionPool::verifyIntersectionLink ( const shared_ptr< IntersectionLink > & link, int recursion_limit = 10 ) const`

Verify that the given intersection link is in the pool and represents a connected piece of the intersection curve.

#### Parameters

<i>link</i>	shared pointer to the intersection link we wish to verify
-------------	-----------------------------------------------------------

#### Return values

'true'	if the link represents a connected piece of the intersection curve, 'false' otherwise
--------	---------------------------------------------------------------------------------------

29.237.3.72 `void Go::IntersectionPool::weedOutClutterPoints ( )`

29.237.3.73 `void Go::IntersectionPool::writeDebug ( int singular = 0 )`

Write various debug information

#### Parameters

<i>singular</i>	use 1 for singular case, 0 is default
-----------------	---------------------------------------

29.237.3.74 `void Go::IntersectionPool::writeIntersectionLinks ( ) const`

Writes out a list of links between intersection points in the pool. Writes to cout.

29.237.3.75 `void Go::IntersectionPool::writeIntersectionPoints ( ) const`

Writes out a list of the current intersection points in the pool. Writes to cout.

## 29.237.4 Friends And Related Function Documentation

29.237.4.1 `friend class SfSfIntersector` [*friend*]

Definition at line 792 of file IntersectionPool.h.

### 29.238.1 Detailed Description

This class is an abstract class providing an interface to the intersection functionality in [GoTools](#).

Definition at line 67 of file `Intersector.h`.

### 29.238.2 Constructor & Destructor Documentation

#### 29.238.2.1 `Go::Intersector::Intersector ( )` `[inline]`

Default constructor.

Definition at line 71 of file `Intersector.h`.

#### 29.238.2.2 `Go::Intersector::Intersector ( double epsg, Intersector * prev = 0 )`

Constructor.

##### Parameters

<i>epsg</i>	the geometric tolerance for the intersector.
<i>prev</i>	the previous intersector.

#### 29.238.2.3 `Go::Intersector::Intersector ( shared_ptr< GeoTol > epsg, Intersector * prev = 0 )`

Constructor.

##### Parameters

<i>epsg</i>	the geometric tolerance for the intersector.
<i>prev</i>	the previous intersector.

#### 29.238.2.4 `virtual Go::Intersector::~~Intersector ( )` `[inline]`, `[virtual]`

Destructor.

Definition at line 84 of file `Intersector.h`.

### 29.238.3 Member Function Documentation

29.238.3.1 `virtual void Go::Intersector::addComplexDomain ( RectDomain dom ) [inline],[virtual]`

Reimplemented in [Go::SfSelfIntersector](#).

Definition at line 202 of file `Intersector.h`.

29.238.3.2 `virtual int Go::Intersector::checkCoincidence ( ) [protected],[pure virtual]`

Implemented in [Go::Intersector2Obj](#), [Go::SfSelfIntersector](#), [Go::IntersectorAlgPar](#), [Go::SfCvIntersector](#), [Go::SfSfIntersector](#), [Go::IntersectorFuncConst](#), [Go::CvPtIntersector](#), [Go::CvCvIntersector](#), [Go::PtPtIntersector](#), [Go::Par1FuncIntersector](#), [Go::Par2FuncIntersector](#), [Go::Par0FuncIntersector](#), and [Go::SfPtIntersector](#).

29.238.3.3 `virtual int Go::Intersector::complexIntercept ( ) [inline],[protected],[virtual]`

Reimplemented in [Go::Intersector2Obj](#).

Definition at line 263 of file `Intersector.h`.

29.238.3.4 `virtual bool Go::Intersector::complexityReduced ( ) [protected],[pure virtual]`

Implemented in [Go::Intersector2Obj](#), [Go::SfSelfIntersector](#), [Go::IntersectorAlgPar](#), [Go::SfSfIntersector](#), and [Go::IntersectorFuncConst](#).

29.238.3.5 `virtual int Go::Intersector::complexSimpleCase ( ) [inline],[protected],[virtual]`

Reimplemented in [Go::Intersector2Obj](#).

Definition at line 268 of file `Intersector.h`.

29.238.3.6 `virtual void Go::Intersector::compute ( bool compute_at_boundary = true ) [virtual]`

Compute the current intersections (topology).

Parameters

<code><i>compute_at_boundary</i></code>	if true we will include computation of boundary intersections.
-----------------------------------------	----------------------------------------------------------------

Reimplemented in [Go::SfSelfIntersector](#), and [Go::IntersectorAlgPar](#).

29.238.3.7 `virtual bool Go::Intersector::degTriangleSimple ( ) [inline],[protected],[virtual]`

Reimplemented in [Go::SfSfIntersector](#).

Definition at line 241 of file `Intersector.h`.

29.238.3.8 `virtual void Go::Intersector::doPostIterate ( ) [inline],[protected],[virtual]`

Reimplemented in [Go::Intersector2Obj](#).

Definition at line 273 of file Intersector.h.

29.238.3.9 `virtual int Go::Intersector::doSubdivide ( ) [protected],[pure virtual]`

Implemented in [Go::Intersector2Obj](#), [Go::SfSelfIntersector](#), [Go::SfSfIntersector](#), [Go::IntersectorAlgPar](#), [Go::SfCvIntersector](#), [Go::IntersectorFuncConst](#), [Go::CvPtIntersector](#), [Go::CvCvIntersector](#), [Go::Par2FuncIntersector](#), [Go::PtPtIntersector](#), [Go::Par1FuncIntersector](#), [Go::Par0FuncIntersector](#), and [Go::SfPtIntersector](#).

29.238.3.10 `virtual int Go::Intersector::getBoundaryIntersections ( ) [protected],[pure virtual]`

Implemented in [Go::Intersector2Obj](#), [Go::SfSelfIntersector](#), [Go::IntersectorAlgPar](#), and [Go::IntersectorFuncConst](#).

29.238.3.11 `virtual BoundaryGeomInt* Go::Intersector::getBoundaryObject ( int idx, int bd_idx ) const [inline],[virtual]`

Get the specified boundary object belonging to the specified [ParamGeomInt](#).

#### Parameters

<i>idx</i>	refers to obj1 or obj2. Indexing starts at 0.
<i>bd_idx</i>	index of the boundary object in the <a href="#">ParamGeomInt</a> .

#### Returns

The boundary object.

Reimplemented in [Go::Intersector2Obj](#).

Definition at line 179 of file Intersector.h.

29.238.3.12 `shared_ptr<ComplexityInfo> Go::Intersector::getComplexityInfo ( ) [inline]`

Get info on the complexity of the problem.

#### Returns

Info on the complexity of the problem.

Definition at line 158 of file Intersector.h.

29.238.3.13 `shared_ptr<IntersectionPool> Go::Intersector::getIntPool ( ) [inline]`

Get the [IntersectionPool](#) for the intersector.

#### Returns

The [IntersectionPool](#).

Definition at line 104 of file `Intersector.h`.

29.238.3.14 `virtual void Go::Intersector::getResult ( std::vector< shared_ptr< IntersectionPoint > > &int_points, std::vector< shared_ptr< IntersectionCurve > > &int_curves ) [virtual]`

Get intersection points and curves. Sends request to [IntersectionPool](#). The intersection points are isolated.

#### Parameters

<i>int_points</i>	vector of intersection points
<i>int_curves</i>	vector of intersection curves

Reimplemented in [Go::IntersectorAlgPar](#).

29.238.3.15 `shared_ptr<SingularityInfo> Go::Intersector::getSingularityInfo ( ) [inline]`

Get info regarding singularities.

#### Returns

The singularify info for the intersector.

Definition at line 125 of file `Intersector.h`.

29.238.3.16 `shared_ptr<GeoTol> Go::Intersector::getTolerance ( ) [inline]`

Get the tolerance object used by this [Intersector](#)

#### Returns

The tolerance object for the intersector.

Definition at line 115 of file `Intersector.h`.

29.238.3.17 `virtual void Go::Intersector::handleComplexity ( ) [protected],[pure virtual]`

Implemented in [Go::Intersector2Obj](#), [Go::SfSelfIntersector](#), [Go::IntersectorAlgPar](#), [Go::SfSfIntersector](#), and [Go::↔IntersectorFuncConst](#).

**29.238.3.18** `bool Go::Intersector::hasComplexityInfo ( ) [inline]`

Verify whether there has been created info regarding the complexity of the problem.

#### Returns

True if complexity info has been created.

Definition at line 153 of file Intersector.h.

**29.238.3.19** `bool Go::Intersector::hasSingularityInfo ( ) [inline]`

Verify whether singularities has been set.

#### Returns

True if info on singularities has been set.

Definition at line 120 of file Intersector.h.

**29.238.3.20** `virtual bool Go::Intersector::isLinear ( ) [protected],[pure virtual]`

Implemented in [Go::Intersector2Obj](#), [Go::SfSelfIntersector](#), [Go::IntersectorAlgPar](#), and [Go::IntersectorFuncConst](#).

**29.238.3.21** `virtual int Go::Intersector::isSelfintCase ( ) [inline],[virtual]`

Check if this intersection algorithm is performed in a self-intersection context.

Reimplemented in [Go::Intersector2Obj](#).

Definition at line 199 of file Intersector.h.

**29.238.3.22** `virtual bool Go::Intersector::isSelfIntersection ( ) [inline],[virtual]`

Verify whether the surface is self-intersecting.

#### Returns

True if the surface is self-intersecting.

Reimplemented in [Go::SfSelfIntersector](#).

Definition at line 194 of file Intersector.h.

**29.238.3.23** `virtual int Go::Intersector::linearCase ( ) [protected],[pure virtual]`

Implemented in [Go::Intersector2Obj](#), [Go::SfSelfIntersector](#), [Go::SfSfIntersector](#), [Go::IntersectorAlgPar](#), [Go::SfCv↔Intersector](#), [Go::IntersectorFuncConst](#), [Go::CvPtIntersector](#), [Go::CvCvIntersector](#), [Go::PtPtIntersector](#), and [Go::↔SfPtIntersector](#).

**29.238.3.24** `virtual void Go::Intersector::microCase ( ) [protected],[pure virtual]`

Implemented in [Go::Intersector2Obj](#), [Go::SfSelfIntersector](#), [Go::IntersectorAlgPar](#), [Go::SfCvIntersector](#), [Go::SfSf↔Intersector](#), [Go::IntersectorFuncConst](#), [Go::CvPtIntersector](#), [Go::CvCvIntersector](#), [Go::PtPtIntersector](#), [Go::Par1↔FuncIntersector](#), [Go::Par2FuncIntersector](#), [Go::Par0FuncIntersector](#), and [Go::SfPtIntersector](#).

**29.238.3.25** `virtual int Go::Intersector::nmbBdObj ( int idx ) const [inline],[virtual]`

Count the number of boundary objects belonging to the specified [ParamGeomInt](#).

## Parameters

<i>idx</i>	refers to obj1 or obj2. Indexing starts at 0.
------------	-----------------------------------------------

## Returns

The number of boundary objects.

Reimplemented in [Go::Intersector2Obj](#).

Definition at line 170 of file Intersector.h.

**29.238.3.26** `int Go::Intersector::nmbRecurions ( ) [inline]`

The current recursion level.

## Returns

The current recursion level.

Definition at line 184 of file Intersector.h.

**29.238.3.27** `virtual int Go::Intersector::numParams ( ) const [pure virtual]`

Get the number of parameter directions for the intersection.

## Returns

The number of parameter directions for the intersection.

Implemented in [Go::SfSelfIntersector](#), [Go::CvPtIntersector](#), [Go::SfCvIntersector](#), [Go::IntersectorAlgPar](#), [Go::Cv↔CvIntersector](#), [Go::PtPtIntersector](#), [Go::SfSfIntersector](#), [Go::Par1FuncIntersector](#), [Go::Par2FuncIntersector](#), [Go::↔Par0FuncIntersector](#), and [Go::SfPtIntersector](#).

**29.238.3.28** `virtual int Go::Intersector::performInterception ( ) [protected],[pure virtual]`

Implemented in [Go::SfSelfIntersector](#), [Go::Intersector2Obj](#), [Go::IntersectorAlgPar](#), and [Go::IntersectorFuncConst](#).

**29.238.3.29** `virtual void Go::Intersector::print_objs ( ) [protected],[pure virtual]`

**29.238.3.32** `void Go::Intersector::setHighPriSing ( double * par )`

Instruct the intersector about known singular points.

## Parameters

<i>par</i>	the parameter value of the singularity. Size of array should be <a href="#">numParams()</a> .
------------	-----------------------------------------------------------------------------------------------

29.238.3.33 `void Go::Intersector::setSingularityInfo ( shared_ptr< SingularityInfo > previous, int missing_dir )`  
`[inline]`

Set info regarding singularities.

## Parameters

<i>previous</i>	the singularity info.
<i>missing_dir</i>	if the dimension of the intersection problem has been reduced from previous, the index tells us which parameter direction that was removed. Indexing starts at 0.

Definition at line 134 of file Intersector.h.

29.238.3.34 `virtual int Go::Intersector::simpleCase ( )` `[protected],[pure virtual]`

Implemented in [Go::Intersector2Obj](#), [Go::SfSelfIntersector](#), [Go::SfCvIntersector](#), [Go::IntersectorAlgPar](#), and [Go::IntersectorFuncConst](#).

29.238.3.35 `virtual int Go::Intersector::updateIntersections ( )` `[protected],[pure virtual]`

### 29.239.1 Detailed Description

This class is an abstract class providing an interface to the intersection functionality in [GoTools](#).

Definition at line 54 of file `Intersector2Obj.h`.

### 29.239.2 Constructor & Destructor Documentation

#### 29.239.2.1 Go::Intersector2Obj::Intersector2Obj( ) [inline]

Default constructor.

Definition at line 58 of file `Intersector2Obj.h`.

#### 29.239.2.2 Go::Intersector2Obj::Intersector2Obj( `shared_ptr< ParamGeomInt > obj1`, `shared_ptr< ParamGeomInt > obj2`, `shared_ptr< GeoTol > epsge`, `Intersector * prev = 0`, `int eliminated_parameter = -1`, `double eliminated_value = 0` )

Constructor. The last two variables are relevant only if the parent has one more parameter than the [Intersector](#) to be constructed.

## Parameters

<i>obj1</i>	object of type <a href="#">ParamSurfaceInt</a> , <a href="#">ParamCurveInt</a> or <a href="#">ParamPointInt</a> .
<i>obj2</i>	object of type <a href="#">ParamSurfaceInt</a> , <a href="#">ParamCurveInt</a> or <a href="#">ParamPointInt</a> .
<i>epsge</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).
<i>eliminated_parameter</i>	the index of the parameter that was removed from the parent <i>prev</i> .
<i>eliminated_value</i>	the value of the parameter that was removed from the parent <i>prev</i> .

29.239.2.3 `Go::Intersector2Obj::Intersector2Obj ( shared_ptr< ParamGeomInt > obj1, shared_ptr< ParamGeomInt > obj2, double epsge, Intersector * prev = 0, int eliminated_parameter = -1, double eliminated_value = 0 )`

Constructor. The last two variables are relevant only if the parent has one more parameter than the [Intersector](#) to be constructed.

## Parameters

<i>obj1</i>	object of type <a href="#">ParamSurfaceInt</a> , <a href="#">ParamCurveInt</a> or <a href="#">ParamPointInt</a> .
<i>obj2</i>	object of type <a href="#">ParamSurfaceInt</a> , <a href="#">ParamCurveInt</a> or <a href="#">ParamPointInt</a> .
<i>epsge</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).
<i>eliminated_parameter</i>	the index of the parameter that was removed from the parent <i>prev</i> .
<i>eliminated_value</i>	the value of the parameter that was removed from the parent <i>prev</i> .

29.239.2.4 `virtual Go::Intersector2Obj::~~Intersector2Obj ( ) [virtual]`

Destructor.

## 29.239.3 Member Function Documentation

29.239.3.1 `bool Go::Intersector2Obj::atBoundary ( const double * par1, std::vector< bool > & boundaries )`  
[protected]

29.239.3.2 `bool Go::Intersector2Obj::atSameBoundary ( const double * par1, const double * par2 )` [protected]

29.239.3.3 `virtual int Go::Intersector2Obj::checkCoincidence ( )` [protected],[pure virtual]

Implements [Go::Intersector](#).

Implemented in [Go::SfCvIntersector](#), [Go::SfSfIntersector](#), [Go::CvPtIntersector](#), [Go::CvCvIntersector](#), [Go::PtPtIntersector](#), and [Go::SfPtIntersector](#).

29.239.3.4 `virtual int Go::Intersector2Obj::complexIntercept ( )` [protected],[virtual]

Reimplemented from [Go::Intersector](#).

29.239.3.5 `virtual bool Go::Intersector2Obj::complexityReduced ( ) [inline],[protected],[virtual]`

Implements [Go::Intersector](#).

Reimplemented in [Go::SfSfIntersector](#).

Definition at line 188 of file `Intersector2Obj.h`.

29.239.3.6 `virtual int Go::Intersector2Obj::complexSimpleCase ( ) [protected],[virtual]`

Reimplemented from [Go::Intersector](#).

29.239.3.7 `virtual void Go::Intersector2Obj::doPostIterate ( ) [inline],[protected],[virtual]`

Reimplemented from [Go::Intersector](#).

Definition at line 216 of file `Intersector2Obj.h`.

29.239.3.8 `virtual int Go::Intersector2Obj::doSubdivide ( ) [protected],[pure virtual]`

Implements [Go::Intersector](#).

Implemented in [Go::SfSfIntersector](#), [Go::SfCvIntersector](#), [Go::CvPtIntersector](#), [Go::CvCvIntersector](#), [Go::PtPtIntersector](#), and [Go::SfPtIntersector](#).

29.239.3.9 `virtual bool Go::Intersector2Obj::foundIntersectionNearBoundary ( ) [inline],[protected],[virtual]`

Reimplemented in [Go::SfCvIntersector](#), [Go::CvCvIntersector](#), and [Go::SfSfIntersector](#).

Definition at line 159 of file `Intersector2Obj.h`.

29.239.3.10 `virtual int Go::Intersector2Obj::getBoundaryIntersections ( ) [protected],[virtual]`

Implements [Go::Intersector](#).

29.239.3.11 `virtual BoundaryGeomInt* Go::Intersector2Obj::getBoundaryObject ( int idx, int bd_idx ) const [inline],[virtual]`

Get the specified boundary object belonging to the specified [ParamGeomInt](#).

#### Parameters

<i>idx</i>	refers to <i>obj1</i> or <i>obj2</i> (i.e. 0 or 1).
<i>bd_idx</i>	index of the boundary object in the <a href="#">ParamGeomInt</a> .

**Returns**

The boundary object.

Reimplemented from [Go::Intersector](#).

Definition at line 121 of file Intersector2Obj.h.

29.239.3.12 `void Go::Intersector2Obj::getSeedIteration ( double seed[] )` [protected]

29.239.3.13 `virtual void Go::Intersector2Obj::handleComplexity ( )` [inline],[protected],[virtual]

Implements [Go::Intersector](#).

Reimplemented in [Go::SfSfIntersector](#).

Definition at line 194 of file Intersector2Obj.h.

29.239.3.14 `virtual int Go::Intersector2Obj::interceptionBySeparationSurface ( )` [inline],[protected],[virtual]

Reimplemented in [Go::SfSfIntersector](#).

Definition at line 174 of file Intersector2Obj.h.

29.239.3.15 `virtual bool Go::Intersector2Obj::isLinear ( )` [protected],[virtual]

Implements [Go::Intersector](#).

29.239.3.16 `virtual int Go::Intersector2Obj::isSelfintCase ( )` [inline],[virtual]

Check if this intersection is performed in self-intersection context.

**Returns**

`true` if this is a self-intersection, `false` otherwise

Reimplemented from [Go::Intersector](#).

Definition at line 134 of file Intersector2Obj.h.

29.239.3.17 `virtual int Go::Intersector2Obj::linearCase ( )` [protected],[pure virtual]

Implements [Go::Intersector](#).

Implemented in [Go::SfSfIntersector](#), [Go::SfCvIntersector](#), [Go::CvPtIntersector](#), [Go::CvCvIntersector](#), [Go::PtPtIntersector](#), and [Go::SfPtIntersector](#).

29.239.3.18 `virtual shared_ptr<Intersector> Go::Intersector2Obj::lowerOrderIntersector ( shared_ptr< ParamGeomInt > obj1, shared_ptr< ParamGeomInt > obj2, Intersector * prev = 0, int eliminated_parameter = -1, double eliminated_value = 0 )` [protected],[pure virtual]

Implemented in [Go::SfCvIntersector](#), [Go::CvPtIntersector](#), [Go::CvCvIntersector](#), [Go::PtPtIntersector](#), [Go::SfSfIntersector](#), and [Go::SfPtIntersector](#).

29.239.3.19 `virtual void Go::Intersector2Obj::microCase ( )` [protected],[pure virtual]

Implements [Go::Intersector](#).

Implemented in [Go::SfCvIntersector](#), [Go::SfSfIntersector](#), [Go::CvPtIntersector](#), [Go::CvCvIntersector](#), [Go::PtPtIntersector](#), and [Go::SfPtIntersector](#).

29.239.3.20 `virtual int Go::Intersector2Obj::nmbBdObj ( int idx ) const` [inline],[virtual]

Count the number of boundary objects belonging to the specified [ParamGeomInt](#).

#### Parameters

<i>idx</i>	refers to <i>obj1</i> or <i>obj2</i> (i.e. 0 or 1).
------------	-----------------------------------------------------

#### Returns

The number of boundary objects.

Reimplemented from [Go::Intersector](#).

Definition at line 112 of file [Intersector2Obj.h](#).

29.239.3.21 `virtual int Go::Intersector2Obj::performInterception ( )` [protected],[virtual]

Implements [Go::Intersector](#).

29.239.3.22 `virtual int Go::Intersector2Obj::performInterceptionByImplicitization ( )` [inline],[protected],[virtual]

Reimplemented in [Go::SfSfIntersector](#).

Definition at line 167 of file [Intersector2Obj.h](#).

### 29.240.1 Detailed Description

This class is an interface class used to compute the intersection between an algebraic object and a parametric object. The algebraic object is "plugged" into the parametric object, resulting in a scalar function. We then use the [IntersectorFuncConst](#) class to find the intersection.

Definition at line 65 of file `IntersectorAlgPar.h`.

### 29.240.2 Constructor & Destructor Documentation

**29.240.2.1** `Go::IntersectorAlgPar::IntersectorAlgPar ( shared_ptr< AlgObjectInt > alg_obj, shared_ptr< ParamObjectInt > param_obj, shared_ptr< GeoTol > epsge, Intersector * prev = 0, int eliminated_parameter = -1, double eliminated_value = 0 )`

Constructor. The last two variables are relevant only if the parent has one more parameter than the [Intersector](#) to be constructed.

#### Parameters

<i>alg_obj</i>	the algebraic object.
<i>param_obj</i>	the parametric object.
<i>epsge</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).
<i>eliminated_parameter</i>	the index of the parameter that was removed from the parent <i>prev</i> .
<i>eliminated_value</i>	the value of the parameter that was removed from the parent <i>prev</i> .

**29.240.2.2** `virtual Go::IntersectorAlgPar::~~IntersectorAlgPar ( ) [inline],[virtual]`

Destructor.

Definition at line 88 of file `IntersectorAlgPar.h`.

### 29.240.3 Member Function Documentation

**29.240.3.1** `virtual int Go::IntersectorAlgPar::checkCoincidence ( ) [protected],[virtual]`

Implements [Go::Intersector](#).

**29.240.3.2** `virtual bool Go::IntersectorAlgPar::complexityReduced ( ) [protected],[virtual]`

Implements [Go::Intersector](#).

**29.240.3.3** `virtual void Go::IntersectorAlgPar::compute ( bool compute_at_boundary = true ) [virtual]`

Compute the current intersections (topology)

## Parameters

<i>compute_at_boundary</i>	flag to indicate that we compute at the boundary
----------------------------	--------------------------------------------------

Reimplemented from [Go::Intersector](#).

29.240.3.4 `virtual int Go::IntersectorAlgPar::doSubdivide ( ) [protected],[virtual]`

Implements [Go::Intersector](#).

29.240.3.5 `virtual int Go::IntersectorAlgPar::getBoundaryIntersections ( ) [protected],[virtual]`

Implements [Go::Intersector](#).

29.240.3.6 `virtual void Go::IntersectorAlgPar::getResult ( std::vector< shared_ptr< IntersectionPoint > > & int_points, std::vector< shared_ptr< IntersectionCurve > > & int_curves ) [virtual]`

Return intersection points and curves.

## Parameters

<i>int_points</i>	vector of shared pointers to IntersectionPoints
<i>int_curves</i>	vector of shared pointers to IntersectionCurves

Reimplemented from [Go::Intersector](#).

29.240.3.7 `virtual void Go::IntersectorAlgPar::handleComplexity ( ) [protected],[virtual]`

Implements [Go::Intersector](#).

29.240.3.8 `virtual bool Go::IntersectorAlgPar::isLinear ( ) [protected],[virtual]`

Implements [Go::Intersector](#).

29.240.3.9 `virtual int Go::IntersectorAlgPar::linearCase ( ) [protected],[virtual]`

Implements [Go::Intersector](#).

29.240.3.10 `virtual void Go::IntersectorAlgPar::microCase ( ) [protected],[virtual]`

Implements [Go::Intersector](#).

29.240.3.11 `virtual int Go::IntersectorAlgPar::numParams ( ) const [virtual]`

Return the number of parameter directions for the object.

Returns

thenumber of parameter directions

Implements [Go::Intersector](#).

29.240.3.12 `virtual int Go::IntersectorAlgPar::performInterception ( ) [protected],[virtual]`

Implements [Go::Intersector](#).

29.240.3.13 `virtual void Go::IntersectorAlgPar::print_objs ( ) [protected],[virtual]`

## Friends

- class [IntersectorAlgPar](#)

### 29.241.1 Detailed Description

This class is an interface class for finding the intersection between a parametric function (with range R) and a constant.

Definition at line 56 of file [IntersectorFuncConst.h](#).

### 29.241.2 Constructor & Destructor Documentation

**29.241.2.1** [Go::IntersectorFuncConst::IntersectorFuncConst](#) ( shared\_ptr< [ParamFunctionInt](#) > *func*, shared\_ptr< [ParamFunctionInt](#) > *C*, shared\_ptr< [GeoTol](#) > *epsge*, [Intersector](#) \* *prev* = 0, int *eliminated\_parameter* = -1, double *eliminated\_value* = 0 )

Constructor. The last two variables are relevant only if the parent has one more parameter than the [Intersector](#) to be constructed.

#### Parameters

<i>func</i>	of type <a href="#">ParamFunctionInt</a> .
<i>C</i>	of type <a href="#">Param0FunctionInt</a> .
<i>epsge</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).
<i>eliminated_parameter</i>	the index of the parameter that was removed from the parent <i>prev</i> .
<i>eliminated_value</i>	the value of the parameter that was removed from the parent <i>prev</i> .

29.241.2.2 virtual `Go::IntersectorFuncConst::~~IntersectorFuncConst ( )` [virtual]

Destructor.

## Additional Inherited Members

### 29.243.1 Detailed Description

Storage of results from intersection operations related to a [CompositeCurve](#)

Definition at line 58 of file `IntResultsCompCv.h`.

### 29.243.2 Constructor & Destructor Documentation

#### 29.243.2.1 Go::IntResultsCompCv::IntResultsCompCv ( [CompositeCurve](#) \* *compcv*, const [ftLine](#) & *line* )

Constructor.

#### 29.243.2.2 Go::IntResultsCompCv::IntResultsCompCv ( [CompositeCurve](#) \* *compcv*, const [ftPlane](#) & *plane* )

Constructor.

29.243.2.3 `Go::IntResultsCompCv::~~IntResultsCompCv ( )`

Destructor.

### 29.243.3 Member Function Documentation

29.243.3.1 `void Go::IntResultsCompCv::addIntCv ( shared_ptr< ParamCurve > cv, double * startpar, double * endpar )`

Add an intersection curve.

29.243.3.2 `void Go::IntResultsCompCv::addIntPt ( shared_ptr< ParamCurve > cv, double * parval )`

Add an intersection point.

29.243.3.3 `void Go::IntResultsCompCv::getIntersectionCurves ( std::vector< std::pair< PointOnCurve, PointOnCurve > & int_crvs ) const`

Fetch all intersection curves.

29.243.3.4 `void Go::IntResultsCompCv::getIntersectionPoints ( std::vector< PointOnCurve > & int_points ) const`

Fetch all intersection points.

29.243.3.5 `virtual bool Go::IntResultsCompCv::hasIntCurves ( ) const [inline],[virtual]`

Check if any intersection curves are found.

Implements [Go::IntResultsModel](#).

Definition at line 80 of file `IntResultsCompCv.h`.

29.243.3.6 `virtual bool Go::IntResultsCompCv::hasIntersections ( ) const [inline],[virtual]`

Check if any intersections are found.

Implements [Go::IntResultsModel](#).

Definition at line 111 of file `IntResultsCompCv.h`.

29.243.3.7 `virtual bool Go::IntResultsCompCv::hasIntPoints ( ) const [inline],[virtual]`

Check if any intersection point are found.

Implements [Go::IntResultsModel](#).

Definition at line 92 of file `IntResultsCompCv.h`.

29.243.3.8 `virtual int Go::IntResultsCompCv::nmbCurveSegments ( ) const [inline],[virtual]`

Return the number of intersection curve segments.

Implements [Go::IntResultsModel](#).

Definition at line 86 of file `IntResultsCompCv.h`.

29.243.3.9 `virtual int Go::IntResultsCompCv::nmbIntPoints ( ) const [inline],[virtual]`

Return the number of intersection points.

Implements [Go::IntResultsModel](#).

Definition at line 98 of file `IntResultsCompCv.h`.

29.243.3.10 `virtual void Go::IntResultsCompCv::tessellate ( std::vector< shared_ptr< LineStrip > > & meshes, PointCloud3D & points ) const [virtual]`

Tessellation Tessellate with respect to a default value

Implements [Go::IntResultsModel](#).

29.243.3.11 `virtual void Go::IntResultsCompCv::tessellate ( int resolution, std::vector< shared_ptr< LineStrip > > & meshes, PointCloud3D & points ) const [virtual]`

Tessellate with respect to a given resolution, the same for each intersection curve

Implements [Go::IntResultsModel](#).

29.243.3.12 `virtual void Go::IntResultsCompCv::tessellate ( double density, std::vector< shared_ptr< LineStrip > > & meshes, PointCloud3D & points ) const [virtual]`

Tessellate with respect to a given density.

Implements [Go::IntResultsModel](#).

The documentation for this class was generated from the following file:

- `compositemodel/include/GoTools/compositemodel/IntResultsCompCv.h`

### 29.255.1 Detailed Description

[IntersectionCurve](#) defined by an isoparametric curve that can be picked from the underlying object

Definition at line 326 of file `IntersectionCurve.h`.

### 29.255.2 Constructor & Destructor Documentation

29.255.2.1 `virtual Go::IsoparametricIntersectionCurve::~IsoparametricIntersectionCurve ( )` `[inline]`, `[virtual]`

Definition at line 330 of file `IntersectionCurve.h`.

29.255.2.2 `template<class iterator > Go::IsoparametricIntersectionCurve::IsoparametricIntersectionCurve ( const iterator begin, const iterator end, int isopar )` `[inline]`, `[protected]`

Definition at line 368 of file `IntersectionCurve.h`.

### 29.255.3 Member Function Documentation

29.255.3.1 `virtual void Go::IsoparametricIntersectionCurve::evaluateAt ( double pval, Point & pos, Point & tan )`  
`[inline]`, `[virtual]`

Evaluate the [IntersectionCurve](#) at parameter value *pval*. Its position at this parameter value will be returned in *pos* and its tangent direction will be returned in *tan*.

#### Parameters

<i>pval</i>	the parameter value for which to evaluate the <a href="#">IntersectionCurve</a> . It should be within the parametric span (which can be obtained from <code>GetParamSpan()</code> ).
-------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Return values

<i>pos</i>	the calculated position of the point on the curve at parameter <i>pval</i> .
------------	------------------------------------------------------------------------------

#### Parameters

<i>tan</i>	the calculated tangent of the curve at parameter <i>pval</i> .
------------	----------------------------------------------------------------

Implements [Go::IntersectionCurve](#).

Definition at line 353 of file `IntersectionCurve.h`.

29.255.3.2 `virtual shared_ptr<ParamCurve> Go::IsoparametricIntersectionCurve::getCurve ( ) const [virtual]`

Get out a (shared) pointer to a parametric curve that approximates this [IntersectionCurve](#).

Implements [Go::IntersectionCurve](#).

29.255.3.3 `virtual shared_ptr<ParamCurve> Go::IsoparametricIntersectionCurve::getParamCurve ( int obj_nmb ) const [virtual]`

Get out a (shared) pointer to the curve in the parametric plane of the first or second object. Should only be called when the concerned object is 2-parametric.

#### Parameters

<i>obj_nmb</i>	should be either 1 or 2, depending on whether you want to get the parametric curve in object 1 or object 2.
----------------	-------------------------------------------------------------------------------------------------------------

#### Returns

a shared pointer to a curve that approximates the intersection curve in the parametric domain of the specified object.

Implements [Go::IntersectionCurve](#).

29.255.3.4 `virtual void Go::IsoparametricIntersectionCurve::getParamSpan ( double & start, double & end ) const [inline],[virtual]`

Get the start and end value for the parametric span of the [IntersectionCurve](#).

#### Return values

<i>start</i>	upon function return this variable will contain the start value of the parametric span.
<i>end</i>	upon function return this variable will contain the end value of the parametric span.

Implements [Go::IntersectionCurve](#).

Definition at line 347 of file `IntersectionCurve.h`.

29.255.3.5 `virtual bool Go::IsoparametricIntersectionCurve::isDegenerated ( ) const [inline],[virtual]`

Determine if the [IntersectionCurve](#) is in fact a degenerated curve (a single point in space).

#### Returns

'true' if the [IntersectionCurve](#) is degenerated. 'false' otherwise.

Implements [Go::IntersectionCurve](#).

Definition at line 339 of file `IntersectionCurve.h`.

29.255.3.6 `virtual bool Go::IsoparametricIntersectionCurve::isIsocurve ( ) const [inline], [virtual]`

Determine if the [IntersectionCurve](#) is in fact representing an isoparametric intersection.

#### Returns

'true' if the [IntersectionCurve](#) is part of an isocurve for one of the objects, 'false' otherwise.

Implements [Go::IntersectionCurve](#).

Definition at line 336 of file `IntersectionCurve.h`.

29.255.3.7 `void Go::IsoparametricIntersectionCurve::precalculate_iso_curves ( int isopar ) [protected]`

29.255.3.8 `virtual void Go::IsoparametricIntersectionCurve::refine ( const double & pos_tol, const double & angle_tol ) [inline], [virtual]`

Refine the curve (which means to increase the number of [IntersectionPoint](#) s defining it), so that the curve matches a specific positional and angle tolerance.

#### Parameters

<i>pos_tol</i>	the positional tolerance that the curve should match after refinement.
<i>angle_tol</i>	the angular tolerance that the tangent of the curve should match after refinement.

Implements [Go::IntersectionCurve](#).

Definition at line 342 of file `IntersectionCurve.h`.

29.255.3.9 `template<class iterator > std::vector< int > Go::IsoparametricIntersectionCurve::resolve_isoparametric_directions ( const iterator begin, const iterator end ) [static], [protected]`

Definition at line 658 of file `IntersectionCurve.h`.

## 29.255.4 Friends And Related Function Documentation

- `virtual double end () const`
- `virtual int dim () const`  
*Dimension of the lifted curve (i.e. 3).*
- `virtual bool approximationOK (double par, Point approxpos, double tol1, double tol2) const`

### 29.259.1 Detailed Description

This class represents a "lift curve", generated from taking a surface and a 2D curve and then evaluate the surface at the parameter values obtained by evaluating the 2D curve.

Definition at line 59 of file LiftCurve.h.

### 29.259.2 Constructor & Destructor Documentation

29.259.2.1 `Go::LiftCurve::LiftCurve ( shared_ptr< Go::ParamCurve > & parameter_crv, shared_ptr< Go::ParamSurface > & surf, double epsgeo )`

Constructor, taking a 2D parameter curve and a surface.

#### Parameters

<i>parameter_crv</i>	the 2D parameter curve that will be 'lifted'
<i>surf</i>	the surface on which the resulting, 'lifted' curve will lie
<i>epsgeo</i>	geometrical tolerance used when running the 'approximationOK' function.

29.259.2.2 `virtual Go::LiftCurve::~~LiftCurve ( ) [virtual]`

virtual destructor enables safe inheritance

### 29.259.3 Member Function Documentation

29.259.3.1 `virtual bool Go::LiftCurve::approximationOK ( double par, Point approxpos, double tol1, double tol2 ) const [virtual]`

Inherited from [EvalCurve::approximationOK\(\)](#).

#### Parameters

<i>par</i>	the parameter at which to check the curve
<i>approxpos</i>	the position we want to check whether or not the curve approximates for parameter 'par'.
<i>tol1</i>	unused
<i>tol2</i>	unused

#### Returns

'true' if the curve approximates the point at the parameter (within the tolerance given in the constructor, 'epsgeo'). 'false' otherwise.

Implements [Go::EvalCurve](#).

29.259.3.2 virtual int Go::LiftCurve::dim ( ) const [virtual]

Dimension of the lifted curve (i.e. 3).

Implements [Go::EvalCurve](#).

29.259.3.3 virtual double Go::LiftCurve::end ( ) const [virtual]

Get the end parameter of the curve.

Returns

the end parameter of the curve.

Implements [Go::EvalCurve](#).

29.259.3.4 virtual Point Go::LiftCurve::eval ( double t ) const [virtual]

Evaluate a point on the curve for a given parameter

Parameters

<i>t</i>	the parameter for which to evaluate the curve.
----------	------------------------------------------------

Returns

the evaluated point

Implements [Go::EvalCurve](#).

29.259.3.5 virtual void Go::LiftCurve::eval ( double t, int n, Point der[] ) const [virtual]

Evaluate a point and a certain number of derivatives on the curve for a given parameter.

Parameters

<i>t</i>	the parameter for which to evaluate the curve.
<i>n</i>	the number of derivatives (0 or more)

Return values

<i>der</i>	pointer to an array of Points where the result will be written. The position will be stored first, then the first derivative (tangent), then the second, etc.. <b>NB:</b> For most (all) derived classes of ' <a href="#">EvalCurve</a> ', the implementation actually only supports the computation of one derivative, i.e. if $n > 1$ , only one derivative will be computed anyway.
------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Implements [Go::EvalCurve](#).

29.259.3.6 `virtual double Go::LiftCurve::start ( ) const [virtual]`

Get the start parameter of the curve.

#### Returns

the start parameter of the curve.

Implements [Go::EvalCurve](#).

The documentation for this class was generated from the following file:

- `gotools-core/include/GoTools/creators/LiftCurve.h`

## 29.260 Go::Line Class Reference

#### 29.260.1 Detailed Description

Class that represents a line. It is a subclass of [ElementaryCurve](#) and thus has a parametrization.

A [Line](#) has a natural parametrization in terms of its location  $\mathbf{C}$  and direction vector  $\mathbf{V}$ :  $p(t) = \mathbf{C} + t\mathbf{V}$ .

Definition at line 56 of file [Line.h](#).

## 29.260.2 Constructor & Destructor Documentation

### 29.260.2.1 Go::Line::Line ( ) [inline]

Default constructor. Constructs an uninitialized [Line](#) which can only be assigned to or read into.

Definition at line 61 of file Line.h.

### 29.260.2.2 Go::Line::Line ( Point point, Point direction, bool isReversed = false )

Constructor. Input is point and direction. The default [Line](#) is unbounded in its parametrization. To bound it, use [setParamBounds\(\)](#).

### 29.260.2.3 Go::Line::Line ( Point point, Point direction, double length, bool isReversed = false )

Constructor. Bounded line.

### 29.260.2.4 Go::Line::Line ( Point point1, Point point2, double par1, double par2, bool isReversed = false )

Constructor. Bounded line with parameterization.

### 29.260.2.5 virtual Go::Line::~~Line ( ) [virtual]

virtual destructor - ensures safe inheritance

## 29.260.3 Member Function Documentation

### 29.260.3.1 virtual void Go::Line::appendCurve ( ParamCurve \* cv, bool reparam = true ) [virtual]

append a curve to this curve, with eventual reparametrization NB: This virtual member function currently only works for [SplineCurves](#) and [CurveOnSurfaces](#). Moreover, 'this' curve and the 'cv' curve must be of the same type.

#### Parameters

<i>cv</i>	the curve to append to 'this' curve.
<i>reparam</i>	specify whether or not there should be reparametrization

Implements [Go::ParamCurve](#).

### 29.260.3.2 virtual void Go::Line::appendCurve ( ParamCurve \* cv, int continuity, double & dist, bool reparam = true ) [virtual]

append a curve to this curve, with eventual reparametrization

## Parameters

<i>cv</i>	the curve to append to 'this' curve.
<i>continuity</i>	the required continuity at the transition. Can be $G^{-1}$ and upwards.
<i>dist</i>	a measure of the local distortion around the transition in order to achieve the specified continuity.
<i>reparam</i>	specify whether or not there should be reparametrization

Implements [Go::ParamCurve](#).

29.260.3.3 virtual **BoundingBox** Go::Line::boundingBox ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.260.3.4 static **ClassType** Go::Line::classType ( ) [static]

29.260.3.5 virtual **Line\*** Go::Line::clone ( ) const [virtual]

The clone-function is inherited from [GeomObject](#), but overridden here to get a covariant return type (for those compilers that allow this).

Implements [Go::ElementaryCurve](#).

29.260.3.6 virtual void Go::Line::closestPoint ( const Point & *pt*, double *tmin*, double *tmax*, double & *clo\_t*, Point & *clo\_pt*, double & *clo\_dist*, double const \* *seed* = 0 ) const [virtual]

Compute the closest point from an interval of this curve to a specified point.

## Parameters

<i>pt</i>	point we want to find the closest point to
<i>tmin</i>	start parameter of search interval
<i>tmax</i>	end parameter of search interval
<i>clo_t</i>	upon function return, 'clo_t' will contain the parameter value of the closest point found.
<i>clo_pt</i>	upon function return, 'clo_pt' will contain the position of the closest point found.
<i>clo_dist</i>	upon function return, 'clo_dist' will contain the distance between 'pt' and the closest point found.
<i>seed</i>	pointer to initial guess value, provided by the user (can be 0, for which the algorithm will determine a (hopefully) reasonable choice).

Implements [Go::ParamCurve](#).

29.260.3.7 virtual **SplineCurve\*** Go::Line::createSplineCurve ( ) const [virtual]

Fetch spline representation of curve.

Implements [Go::ElementaryCurve](#).

29.260.3.8 `virtual int Go::Line::dimension ( ) const [virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.260.3.9 `virtual DirectionCone Go::Line::directionCone ( ) const [virtual]`

Creates a [DirectionCone](#) which covers all tangent directions of this curve.

Returns

the smallest [DirectionCone](#) containing all tangent directions of this curve.

Implements [Go::ParamCurve](#).

29.260.3.10 `virtual double Go::Line::endparam ( ) const [virtual]`

Query the end parameter of the curve

Returns

the curve's end parameter

Implements [Go::ParamCurve](#).

29.260.3.11 `virtual SplineCurve* Go::Line::geometryCurve ( ) [virtual]`

If the definition of this [ParamCurve](#) contains a [SplineCurve](#) describing its spatial shape, then this function will return a pointer to this [SplineCurve](#). Otherwise it will return a null pointer. The returned curve is NEWed, so the user is responsible for deleting it. This function may have side-effects.

Returns

a pointer to a [SplineCurve](#) representation of the [ParamCurve](#), if it exists. Null pointer otherwise.

Implements [Go::ParamCurve](#).

29.260.3.12 `Point Go::Line::getDirection ( ) [inline]`

Direction vector.

Definition at line 151 of file Line.h.

29.260.3.13 **Point** `Go::Line::getPoint ( )` `[inline]`

[Point](#) on line.

Definition at line 147 of file Line.h.

29.260.3.14 **virtual ClassType** `Go::Line::instanceType ( ) const` `[virtual]`

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.260.3.15 **bool** `Go::Line::isBounded ( ) const`

Query if parametrization is bounded. Both upper and lower parameter bounds must be finite for this to be true.

Returns

*true* if bounded, *false* otherwise

29.260.3.16 **virtual bool** `Go::Line::isDegenerate ( double degenerate_epsilon )` `[virtual]`

Query whether the curve is degenerate (collapsed into a single point).

Parameters

<i>degenerate_epsilon</i>	the tolerance used in determine whether the curve is degenerate. A curve is considered degenerate if its total length is shorter than this value.
---------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------

Returns

*true* if the curve is degenerate, *false* otherwise.

Implements [Go::ParamCurve](#).

29.260.3.17 **virtual bool** `Go::Line::isInPlane ( const Point & loc, const Point & axis, double eps, Point & normal ) const` `[virtual]`

Check if the line lies in a plane passing through a given axis.

Reimplemented from [Go::ParamCurve](#).

29.260.3.18 **virtual bool** `Go::Line::isInPlane ( const Point & norm, double eps, Point & pos ) const` `[virtual]`

Check if the line lies in a plane with a given normal.

Reimplemented from [Go::ParamCurve](#).

29.260.3.19 `virtual bool Go::Line::isLinear ( Point & dir, double tol ) [virtual]`

Confirm that the curve is linear.

Reimplemented from [Go::ParamCurve](#).

29.260.3.20 `virtual double Go::Line::length ( double tol ) [virtual]`

Compute the total length of this curve up to some tolerance

#### Parameters

<i>tol</i>	the relative tolerance when approximating the length, i.e. stop iteration when error becomes smaller than $tol/(curve\ length)$
------------	---------------------------------------------------------------------------------------------------------------------------------

#### Returns

the length calculated

Implements [Go::ParamCurve](#).

29.260.3.21 `virtual void Go::Line::point ( Point & pt, double tpar ) const [virtual]`

Evaluate the curve's position at a given parameter

#### Parameters

<i>pt</i>	the evaluated position will be written to this <a href="#">Point</a>
<i>tpar</i>	the parameter for which we wish to evaluate the curve

Implements [Go::ParamCurve](#).

29.260.3.22 `virtual void Go::Line::point ( std::vector< Point > & pts, double tpar, int derivs, bool from_right = true ) const [virtual]`

Evaluate the curve's position and a certain number of derivatives at a given parameter.

#### Parameters

<i>pts</i>	the evaluated position and derivatives (tangent, curvature vector, etc.) will be written to this vector. The first entry will be the position, the second entry will be the first derivative, etc. The size of this vector must be set to 'derivs'+ 1 prior to calling this function.
<i>tpar</i>	the parameter for which we want to evaluate the curve
<i>derivs</i>	the number of derivatives we want to have calculated
<i>from_right</i>	specify whether we should calculate derivatives 'from the right' or 'from the left' (default is from the right). This matters only when the curve presents discontinuities in its derivatives.

Implements [Go::ParamCurve](#).

29.260.3.23 `virtual void Go::Line::read ( std::istream & is ) [virtual]`

Read object from stream

#### Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.260.3.24 `virtual void Go::Line::setParamBounds ( double startpar, double endpar ) [virtual]`

Set bounds for the parametrization of the [Line](#).

#### Parameters

<i>startpar</i>	start parameter
<i>endpar</i>	end parameter

Implements [Go::ElementaryCurve](#).

29.260.3.25 `virtual void Go::Line::setParameterInterval ( double t1, double t2 ) [virtual]`

Limit the curve by limiting the parameter interval.

Implements [Go::ParamCurve](#).

29.260.3.26 `virtual double Go::Line::startparam ( ) const [virtual]`

Query the start parameter of the curve

#### Returns

the curve's start parameter

Implements [Go::ParamCurve](#).

29.260.3.27 `virtual Line* Go::Line::subCurve ( double from_par, double to_par, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [virtual]`

Returns a curve which is a part of this curve. The result is NEWed, so the user is responsible for deleting it. NB: It is not guaranteed that the [ParamCurve](#) that is returned is of the same type as the curve itself. Thus, the returned curve might be a [SplineCurve](#).

## Parameters

<i>from_par</i>	start value of parameter interval that will define the subcurve
<i>to_par</i>	end value of parameter interval that will define the subcurve
<i>fuzzy</i>	since subCurve works on those curves who are spline-based, this tolerance defines how close the start and end parameter must be to an existing knot in order to be considered <i>on</i> the knot.

## Returns

a pointer to a new subcurve which represents the part of the curve between 'from\_par' and 'to\_par'. It will be spline-based and have a k-regular knotvector. The user is responsible for deleting this subcurve when it is no longer needed.

Implements [Go::ElementaryCurve](#).

**29.260.3.28** virtual void Go::Line::swapParameters2D ( ) [virtual]

If the curve is 2 dimensional, x and y coordinates will be swapped. Used when curve is a parameter curve.

Implements [Go::ElementaryCurve](#).

**29.260.3.29** virtual void Go::Line::translateCurve ( const Point & dir ) [virtual]

Implements [Go::ElementaryCurve](#).

**29.260.3.30** virtual void Go::Line::write ( std::ostream & os ) const [virtual]

Write object to stream

## Parameters

<i>os</i>	stream to which object is written
-----------	-----------------------------------

Implements [Go::Streamable](#).

**29.260.4 Member Data Documentation**

**29.260.4.1** Point Go::Line::dir\_ [protected]

Definition at line 185 of file Line.h.

- [double](#) c ()

## Additional Inherited Members

### 29.261.1 Detailed Description

Class representing an algebraic line in 2-dimensional space.

Definition at line 53 of file Line2DInt.h.

### 29.261.2 Constructor & Destructor Documentation

#### 29.261.2.1 Go::Line2DInt::Line2DInt ( [Point](#) point, [Point](#) dir )

Constructor.

Parameters

<i>point</i>	reference point which lies on the line.
<i>dir</i>	direction of the line.

### 29.261.2.2 `Go::Line2DInt::Line2DInt ( double a, double b, double c )`

Constructor. The line is given by the expression  $ax + by + c = 0$ .

#### Parameters

<i>a</i>	the x multiplier.
<i>b</i>	the y multiplier.
<i>c</i>	the constant

### 29.261.2.3 `virtual Go::Line2DInt::~~Line2DInt ( ) [inline],[virtual]`

Destructor.

Definition at line 68 of file Line2DInt.h.

## 29.261.3 Member Function Documentation

### 29.261.3.1 `double Go::Line2DInt::a ( )`

Get the x multiplier.

#### Returns

The x multiplier.

### 29.261.3.2 `double Go::Line2DInt::b ( )`

Get the y multiplier.

#### Returns

The y multiplier.

### 29.261.3.3 `double Go::Line2DInt::c ( )`

Get the constant.

#### Returns

The constant.

### 29.263.1 Detailed Description

[GeomObject](#) representing a collection of line segments in space.

Definition at line 57 of file [LineCloud.h](#).

### 29.263.2 Constructor & Destructor Documentation

#### 29.263.2.1 `Go::LineCloud::LineCloud ( )` [\[inline\]](#)

Makes an uninitialized [LineCloud](#) that can later be assigned or [read\(\)](#) into.

Definition at line 62 of file [LineCloud.h](#).

#### 29.263.2.2 `template<typename ForwardIterator > Go::LineCloud::LineCloud ( ForwardIterator start, int numlines )` [\[inline\]](#)

`start` is supposed to point to the start of the array to be copied, its valuetype should be convertible to double. Generate a [LineCloud](#) based on values stored in memory. The lines should be stored as a sequence of point pairs indicating the start and end position of each line in the line cloud. Each point is stored as (x\_coord, y\_coord, z\_coord). The coordinates should be convertible to 'double'. Ex: p0\_start\_x, p0\_start\_y, p0\_start\_z, p0\_end\_x, p0\_end\_y, p0\_end\_z, p1\_start\_x, p1\_start\_y, p1\_start\_z,....

#### Parameters

<code>start</code>	pointer to the start of the memory area from which point information is to be copied
<code>numlines</code>	number of lines in the <a href="#">LineCloud</a>

Definition at line 77 of file [LineCloud.h](#).

29.263.2.3 virtual `Go::LineCloud::~~LineCloud ( )` [virtual]

Virtual destructor, enables safe inheritance.

### 29.263.3 Member Function Documentation

29.263.3.1 virtual `BoundingBox Go::LineCloud::boundingBox ( ) const` [virtual]

Get the [BoundingBox](#) of the [LineCloud](#)

#### Returns

the [BoundingBox](#) enclosing the [LineCloud](#)

Implements [Go::GeomObject](#).

29.263.3.2 static `ClassType Go::LineCloud::classType ( )` [inline],[static]

Get the `ClassType` identifier of [LineCloud](#).

#### Returns

the `ClassType` identifier of [LineCloud](#)

Definition at line 112 of file `LineCloud.h`.

29.263.3.3 virtual `LineCloud* Go::LineCloud::clone ( ) const` [inline],[virtual]

Clone this object

#### Returns

a pointer to a cloned [LineCloud](#).

Implements [Go::GeomObject](#).

Definition at line 126 of file `LineCloud.h`.

29.263.3.4 virtual `int Go::LineCloud::dimension ( ) const` [inline],[virtual]

Query the dimension of the space in which the [LineCloud](#) is embedded (currently, only dimension=3 is allowed...)

#### Returns

the dimension of the space (always 3 for now)

Implements [Go::GeomObject](#).

Definition at line 101 of file `LineCloud.h`.

```
29.263.3.5 virtual ClassType Go::LineCloud::instanceType () const [inline],[virtual]
```

Get the ClassType of this [GeomObject](#) (which is of course the ClassType identified [LineCloud](#)).

#### Returns

the ClassType identifier of [LineCloud](#)

Implements [Go::GeomObject](#).

Definition at line 107 of file LineCloud.h.

```
29.263.3.6 int Go::LineCloud::numLines () const [inline]
```

Query the number of lines in the [LineCloud](#)

#### Returns

the [LineCloud](#)'s number of lines.

Definition at line 140 of file LineCloud.h.

```
29.263.3.7 Vector3D& Go::LineCloud::point (int i) [inline]
```

Get a start or end point from a line in the [LineCloud](#) (non-const version)

#### Parameters

<i>i</i>	the index of the start/end point. If 'i' is pair, then the returned point is a start point, else it is an end point.
----------	----------------------------------------------------------------------------------------------------------------------

#### Returns

a reference to the requested start/end point

Definition at line 146 of file LineCloud.h.

```
29.263.3.8 const Vector3D& Go::LineCloud::point (int i) const [inline]
```

Get a start or end point from a line in the [LineCloud](#) (const version)

#### Parameters

<i>i</i>	the index of the start/end point. If 'i' is even, then the returned point is a start point, else it is an end point.
----------	----------------------------------------------------------------------------------------------------------------------

**Returns**

a const-reference to the requested start/end point

Definition at line 152 of file LineCloud.h.

**29.263.3.9 double\* Go::LineCloud::rawData ( ) [inline]**

Get a pointer to the start of the internal memory area where line information is stored.

**Returns**

a pointer to the beginning of the array where line information is stored.

Definition at line 157 of file LineCloud.h.

**29.263.3.10 virtual void Go::LineCloud::read ( std::istream & is ) [virtual]**

Read a [LineCloud](#) from an input stream

**Parameters**

<i>is</i>	the stream from which we will read the <a href="#">LineCloud</a>
-----------	------------------------------------------------------------------

Implements [Go::Streamable](#).

**29.263.3.11 void Go::LineCloud::setCloud ( const double \* points, int numlines )**

Fill a line cloud with information read from memory. The layout of the read information should be as for the [LineCloud](#) constructor: [LineCloud](#)(ForwardIterator start, int numlines)

**Parameters**

<i>points</i>	pointer to the memory area where the coordinates of the elements in the <a href="#">LineCloud</a> can be found. (This information will be copied).
<i>numlines</i>	number of lines in the <a href="#">LineCloud</a> .

**29.263.3.12 virtual void Go::LineCloud::write ( std::ostream & os ) const [virtual]**

Write the [LineCloud](#) to stream

**Parameters**

<i>os</i>	the stream that we will write the <a href="#">LineCloud</a> to
-----------	----------------------------------------------------------------

Implements [Go::Streamable](#).

The documentation for this class was generated from the following file:

### 29.271.1 Detailed Description

Primarily a loop connected to a face in a boundary represented solid or face set. May also be used to represent a general closed sequence of edges.

Definition at line 70 of file Loop.h.

## 29.271.2 Constructor & Destructor Documentation

29.271.2.1 `Go::Loop::Loop ( ftFaceBase * face, CurveLoop & curve_loop, double kink, bool split_in_kinks = true, bool no_split = false )`

Constructor.

29.271.2.2 `Go::Loop::Loop ( ftFaceBase * face, std::vector< shared_ptr< ftEdgeBase > > & edges, double space_epsilon )`

This constructor takes an ordered sequence of edges as input Note that the function may throw

29.271.2.3 `Go::Loop::Loop ( std::vector< shared_ptr< ftEdgeBase > > & edges, double space_epsilon )`

Constructor that takes an ordered sequence of edges as input. There is no reference to a face object.

29.271.2.4 `Go::Loop::~~Loop ( )`

Destructor.

## 29.271.3 Member Function Documentation

29.271.3.1 `bool Go::Loop::allRadialEdges ( ) const`

All edges is connected a radial edge.

29.271.3.2 `bool Go::Loop::checkConsistency ( ) const`

Check if the edges of the loop are consistent with the corresponding curves with regard to orientation

29.271.3.3 `void Go::Loop::closestPoint ( const Point & pt, int & clo_ind, double & clo_par, Point & clo_pt, double & clo_dist ) const`

Find the closest point on the curve loop to a point specified by the user.

### Parameters

<code>pt</code>	The point given by the user. We want to determine the closest point to this on the <a href="#">CurveLoop</a> .
<code>clo_ind</code>	Upon return: the index of the curve segment on which the closest point was found.
<code>clo_par</code>	Upon return: the parameter of the detected closest point on the curve containing it.
<code>clo_pt</code>	Upon return: the geometric position of the detected closest point
<code>clo_dist</code>	Upon return: the distance to the detected closest point.

29.271.3.4 **bool** Go::Loop::correspondingEdges ( *shared\_ptr*< Loop > *other*, *double tol*, *ftEdgeBase* \* & *first1*, *ftEdgeBase* \* & *first2*, *bool* & *same\_dir*, *bool no\_snap = true* )

Non-manifold functionality Check for loop correspondance, split edges if required and return the start edges for corresponding loops

29.271.3.5 **void** Go::Loop::getAcuteEdges ( *std::vector*< *std::pair*< *ftEdge* \*, *ftEdge* \* > > & *acute\_edges*, *double angtol* ) *const*

Check for acute edges in boundary loop.

29.271.3.6 **void** Go::Loop::getBadDistance ( *std::vector*< *std::pair*< *ftSurface* \*, *ftEdge* \* > > & *badPairs*, *RectDomain* \* *domain*, *double tol* ) *const*

Collect all pairs of surface and edges where some part of the edge has a distance to the surface greater than a tolerance.

29.271.3.7 **void** Go::Loop::getBadDistance ( *std::vector*< *std::pair*< *ftEdge* \*, *shared\_ptr*< Vertex > > > & *badPairs*, *double tol* ) *const*

29.271.3.8 *shared\_ptr*<*ftEdgeBase*> Go::Loop::getEdge ( *size\_t idx* ) [*inline*]

Fetch an edge from the loop specified by the index in the sequence of edges

Definition at line 107 of file Loop.h.

29.271.3.9 *std::vector*<*shared\_ptr*<*ftEdgeBase*> > & Go::Loop::getEdges ( ) [*inline*]

Get all edges oriented head to tail.

Definition at line 100 of file Loop.h.

29.271.3.10 **const** *ftFaceBase*\* Go::Loop::getFace ( ) [*inline*]

The face associated to this loop.

Definition at line 136 of file Loop.h.

29.271.3.11 **void** Go::Loop::getLoopIntersections ( *shared\_ptr*< Loop > *loop2*, *double tol*, *std::vector*< *std::pair*< *shared\_ptr*< PointOnEdge >, *shared\_ptr*< PointOnEdge > > > & *int\_pt* ) *const*

Compute intersections between boundary loops.

```
29.271.3.12 void Go::Loop::getLoopSelfIntersections (double tol, std::vector< std::pair< shared_ptr< PointOnEdge >,
shared_ptr< PointOnEdge > > > & int_pt) const
```

Compute self intersections of boundary loop.

```
29.271.3.13 void Go::Loop::getPosTangentSurfaceDiscont (std::vector< ftEdge * > & badPos, std::vector< ftEdge * > &
badTangent, double tol, double kink, double bend, int leastSurfIndex, shared_ptr< SurfaceModel > sm)
const
```

Fetch information on continuity.

```
29.271.3.14 std::vector<shared_ptr<Vertex> > Go::Loop::getSeqVertices () const
```

Fetch all vertices between edges in the loop in sequence.

```
29.271.3.15 double Go::Loop::getTol () [inline]
```

Get tolerance.

Definition at line 123 of file Loop.h.

```
29.271.3.16 std::vector<shared_ptr<Vertex> > Go::Loop::getVertices () const
```

Fetch all vertices between edges in the loop.

```
29.271.3.17 void Go::Loop::groupSmoothEdges (double tol, double angtol, std::vector< std::vector< shared_ptr<
ftEdgeBase > > > & edge_groups)
```

Group edges that are smoothly joined together. The sequence of edges corresponds to the sequence in the [Loop](#), i.e. head to tail connected

```
29.271.3.18 bool Go::Loop::hasRadialEdges () const
```

Check for radial edges Existence

```
29.271.3.19 bool Go::Loop::isClose (ftEdge * edge, RectDomain * domain, double tol) const
```

Test if an edge is close to the surface within some tolerance.

```
29.271.3.20 bool Go::Loop::isFaceConsistent ()
```

Check consistency with regard to face.

29.271.3.21 `bool Go::Loop::isInLoop ( ftEdgeBase * edge ) [inline]`

Check if a given edge is in this loop.

Definition at line 212 of file Loop.h.

29.271.3.22 `void Go::Loop::setFace ( ftFaceBase * face )`

Set face pointer.

29.271.3.23 `size_t Go::Loop::size ( ) [inline]`

Number of edges in loop.

Definition at line 94 of file Loop.h.

29.271.3.24 `void Go::Loop::split ( int ind, double par )`

Split loop in a given parameter of an edge given by index.

29.271.3.25 `void Go::Loop::updateLoop ( shared_ptr< ftEdgeBase > new_edge )`

Make sure that the edges belonging to this loop is complete.

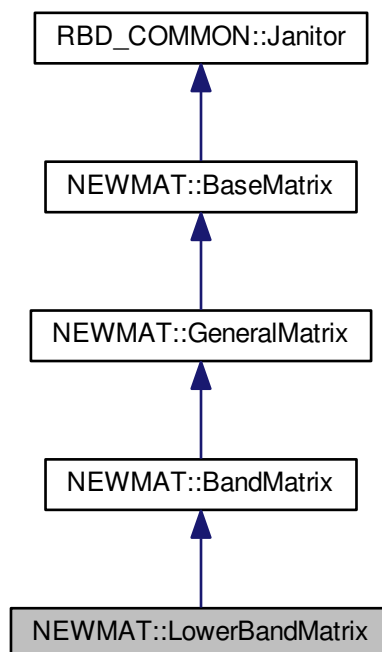

The documentation for this class was generated from the following file:

- `compositemodel/include/GoTools/compositemodel/Loop.h`

### 29.273.3 Member Function Documentation

29.273.3.1 **MatrixBandWidth** **LowerTriangularMatrix::BandWidth** ( ) **const** [virtual]

Reimplemented from [NEWMAT::BaseMatrix](#).

Definition at line 409 of file newmat4.cpp.

29.273.3.2 **Real&** **NEWMAT::LowerTriangularMatrix::element** ( **int**, **int** )

29.273.3.3 **Real** **NEWMAT::LowerTriangularMatrix::element** ( **int**, **int** ) **const**

29.273.3.4 **void** **NEWMAT::LowerTriangularMatrix::GetCol** ( **MatrixRowCol &** ) [virtual]

Implements [NEWMAT::GeneralMatrix](#).

29.273.3.5 **void** **NEWMAT::LowerTriangularMatrix::GetCol** ( **MatrixCoIX &** ) [virtual]

Implements [NEWMAT::GeneralMatrix](#).

29.273.3.6 **void** **LowerTriangularMatrix::GetRow** ( **MatrixRowCol & mrc** ) [virtual]

Implements [NEWMAT::GeneralMatrix](#).

Definition at line 334 of file newmat3.cpp.

29.273.3.7 **LogAndSign** **LowerTriangularMatrix::LogDeterminant** ( ) **const** [virtual]

Reimplemented from [NEWMAT::GeneralMatrix](#).

Definition at line 655 of file newmat8.cpp.

29.273.3.8 **GeneralMatrix\*** NEWMAT::LowerTriangularMatrix::MakeSolver ( ) [inline],[virtual]

Reimplemented from [NEWMAT::GeneralMatrix](#).

Definition at line 730 of file newmat.h.

29.273.3.9 void LowerTriangularMatrix::NextRow ( **MatrixRowCol** & *mrc* ) [virtual]

Reimplemented from [NEWMAT::GeneralMatrix](#).

Definition at line 392 of file newmat3.cpp.

29.273.3.10 **Real&** NEWMAT::LowerTriangularMatrix::operator() ( *int* , *int* )

29.273.3.11 **Real** NEWMAT::LowerTriangularMatrix::operator() ( *int* , *int* ) const

29.273.3.12 void NEWMAT::LowerTriangularMatrix::operator= ( **const BaseMatrix** & )

29.273.3.13 void NEWMAT::LowerTriangularMatrix::operator= ( **Real** *f* ) [inline]

Definition at line 718 of file newmat.h.

29.273.3.14 void NEWMAT::LowerTriangularMatrix::operator= ( **const LowerTriangularMatrix** & *m* ) [inline]

Definition at line 719 of file newmat.h.

29.273.3.15 void NEWMAT::LowerTriangularMatrix::ReSize ( *int* )

29.273.3.16 void LowerTriangularMatrix::ReSize ( **const GeneralMatrix** & *A* ) [virtual]

Reimplemented from [NEWMAT::GeneralMatrix](#).

Definition at line 315 of file newmat4.cpp.

29.273.3.17 void NEWMAT::LowerTriangularMatrix::RestoreCol ( **MatrixRowCol** & ) [virtual]

Reimplemented from [NEWMAT::GeneralMatrix](#).

29.273.3.18 void NEWMAT::LowerTriangularMatrix::RestoreCol ( **MatrixColX** & *c* ) [inline],[virtual]

Reimplemented from [NEWMAT::GeneralMatrix](#).

Definition at line 738 of file newmat.h.

29.273.3.19 `void LowerTriangularMatrix::Solver ( MatrixCoIX & mcout, const MatrixCoIX & mcin ) [virtual]`

Reimplemented from [NEWMAT::GeneralMatrix](#).

Definition at line 70 of file newmat7.cpp.

29.273.3.20 `Real LowerTriangularMatrix::Trace ( ) const [virtual]`

Reimplemented from [NEWMAT::BaseMatrix](#).

Definition at line 563 of file newmat8.cpp.

29.273.3.21 `MatrixType LowerTriangularMatrix::Type ( ) const [virtual]`

Implements [NEWMAT::GeneralMatrix](#).

Definition at line 388 of file newmat4.cpp.

### 29.274.1 Detailed Description

Definition at line 66 of file LRBSpline2D.h.

### 29.274.2 Constructor & Destructor Documentation

#### 29.274.2.1 Go::LRBSpline2D::LRBSpline2D ( ) [inline]

Constructor to create an empty (invalid) LRBSpline2D.

Definition at line 76 of file LRBSpline2D.h.

29.274.2.2 `template<typename Iterator > Go::LRBSpline2D::LRBSpline2D ( const Point & c_g, double weight, int deg_u, int deg_v, Iterator kvec_u_start, Iterator kvec_v_start, double gamma, const Mesh2D * mesh, bool rational = false ) [inline]`

Definition at line 80 of file LRBSpline2D.h.

29.274.2.3 `Go::LRBSpline2D::LRBSpline2D ( const LRBSpline2D & rhs )`

Copy constructor.

29.274.2.4 `Go::LRBSpline2D::~~LRBSpline2D ( ) [inline]`

Definition at line 110 of file LRBSpline2D.h.

### 29.274.3 Member Function Documentation

29.274.3.1 `bool Go::LRBSpline2D::addSupport ( Element2D * el )`

29.274.3.2 `Point Go::LRBSpline2D::Coef ( ) [inline]`

Definition at line 203 of file LRBSpline2D.h.

29.274.3.3 `const Point Go::LRBSpline2D::Coef ( ) const [inline]`

Definition at line 204 of file LRBSpline2D.h.

29.274.3.4 `int Go::LRBSpline2D::coefFixed ( ) const [inline]`

Definition at line 255 of file LRBSpline2D.h.

29.274.3.5 `Point& Go::LRBSpline2D::coefTimesGamma ( ) [inline]`

Definition at line 200 of file LRBSpline2D.h.

29.274.3.6 `const Point& Go::LRBSpline2D::coefTimesGamma ( ) const [inline]`

Definition at line 201 of file LRBSpline2D.h.

29.274.3.7 `bool Go::LRBSpline2D::coversCorner ( int u_ix, int v_ix ) const [inline]`

Definition at line 273 of file LRBSpline2D.h.

29.274.3.8 `const int Go::LRBSpline2D::degree ( Direction2D d ) const [inline]`

Definition at line 229 of file LRBSpline2D.h.

29.274.3.9 `const int Go::LRBSpline2D::dimension ( ) const [inline]`

Definition at line 219 of file LRBSpline2D.h.

29.274.3.10 `int Go::LRBSpline2D::endmult_u ( bool atstart ) const`

29.274.3.11 `int Go::LRBSpline2D::endmult_v ( bool atstart ) const`

29.274.3.12 `Point Go::LRBSpline2D::eval ( double u, double v, int u_deriv = 0, int v_deriv = 0, bool u_at_end = false, bool v_at_end = false ) const [inline]`

Definition at line 151 of file LRBSpline2D.h.

29.274.3.13 `double Go::LRBSpline2D::evalBasisFunc ( double u, double v ) const`

29.274.3.14 `double Go::LRBSpline2D::evalBasisFunction ( double u, double v, int u_deriv = 0, int v_deriv = 0, bool u_at_end = false, bool v_at_end = false ) const`

Similar to 'eval' below, but returns the value of the [LRBSpline2D](#)'s underlying *basis* function, rather than the function value itself. (In other words, the basis function's value is not multiplied by the spline coefficient, nor gamma, before it is returned.)

29.274.3.15 `void Go::LRBSpline2D::evalBasisGridDer ( int nmb_der, const std::vector< double > & par1, const std::vector< double > & par2, std::vector< double > & derivs ) const`

Compute a number of derivatives of the LRBSpline in a grid of parameter values specified in the two parameter directions. The sequence of the output is: du for all points, then dv, duu, duv, dvv, ... The position of the basis function is NOT stored. Rationals are NOT handled

29.274.3.16 `void Go::LRBSpline2D::evalBasisLineDer ( int nmb_der, Direction2D d, const std::vector< double > & parval, std::vector< double > & derivs ) const`

29.274.3.17 `void Go::LRBSpline2D::evalpos ( double u, double v, double pos[] ) [inline]`

Evaluate position only, array of correct size is expected as input. No size checking

Definition at line 173 of file LRBSpline2D.h.

29.274.3.18 `double& Go::LRBSpline2D::gamma ( ) [inline]`

Definition at line 208 of file LRBSpline2D.h.

29.274.3.19 `const double& Go::LRBSpline2D::gamma ( ) const [inline]`

Definition at line 209 of file LRBSpline2D.h.

29.274.3.20 `std::vector<Element2D*> Go::LRBSpline2D::getExtendedSupport ( )`

29.274.3.21 `Point Go::LRBSpline2D::getGrevilleParameter ( ) const`

29.274.3.22 `double Go::LRBSpline2D::getGrevilleParameter ( Direction2D d ) const`

29.274.3.23 `const Mesh2D* Go::LRBSpline2D::getMesh ( ) [inline]`

Definition at line 308 of file LRBSpline2D.h.

29.274.3.24 `std::vector<Element2D*> Go::LRBSpline2D::getMinimalExtendedSupport ( )`

29.274.3.25 `bool Go::LRBSpline2D::hasSupportedElement ( Element2D * el )`

29.274.3.26 `const std::vector<int>& Go::LRBSpline2D::kvec ( Direction2D d ) const [inline]`

Definition at line 225 of file LRBSpline2D.h.

29.274.3.27 `std::vector<int>& Go::LRBSpline2D::kvec ( Direction2D d ) [inline]`

Definition at line 226 of file LRBSpline2D.h.

29.274.3.28 `int Go::LRBSpline2D::nmbSupportedElements ( ) [inline]`

Definition at line 301 of file LRBSpline2D.h.

29.274.3.29 `bool Go::LRBSpline2D::operator< ( const LRBSpline2D & rhs ) const`

29.274.3.30 `bool Go::LRBSpline2D::operator==( const LRBSpline2D & rhs ) const`

29.274.3.31 `bool Go::LRBSpline2D::overlaps ( Element2D * el ) const`

29.274.3.32 `bool Go::LRBSpline2D::overlaps ( double domain[ ] ) const`

29.274.3.33 `const bool Go::LRBSpline2D::rational ( ) const [inline]`

Definition at line 215 of file LRBSpline2D.h.

29.274.3.34 `virtual void Go::LRBSpline2D::read ( std::istream & is )` [virtual]

Read the [LRBSpline2D](#) from a stream.

Implements [Go::Streamable](#).

29.274.3.35 `void Go::LRBSpline2D::removeSupport ( Element2D * el )`

29.274.3.36 `void Go::LRBSpline2D::reverseParameterDirection ( bool dir_is_u )`

29.274.3.37 `void Go::LRBSpline2D::setCoefAndGamma ( Point & coef, double gamma )` [inline]

Definition at line 325 of file LRBSpline2D.h.

29.274.3.38 `void Go::LRBSpline2D::setFixCoef ( int coef_fixed )` [inline]

Definition at line 260 of file LRBSpline2D.h.

29.274.3.39 `void Go::LRBSpline2D::setMesh ( const Mesh2D * mesh )` [inline]

Definition at line 303 of file LRBSpline2D.h.

29.274.3.40 `void Go::LRBSpline2D::setSupport ( std::vector< Element2D * > elements )` [inline]

Definition at line 295 of file LRBSpline2D.h.

29.274.3.41 `void Go::LRBSpline2D::subtractKnotIdx ( int u_del, int v_del )`

29.274.3.42 `const int Go::LRBSpline2D::suppMax ( Direction2D d ) const` [inline]

Definition at line 235 of file LRBSpline2D.h.

29.274.3.43 `const int Go::LRBSpline2D::suppMin ( Direction2D d ) const` [inline]

Get the index to the knot that defines the start (end) of the [LRBSpline2D](#)'s support.

Definition at line 234 of file LRBSpline2D.h.

29.274.3.44 `std::vector<Element2D*>::iterator Go::LRBSpline2D::supportedElementBegin ( )`

29.274.3.45 `std::vector<Element2D*>::iterator Go::LRBSpline2D::supportedElementEnd ( )`

29.274.3.46 `const std::vector<Element2D*>& Go::LRBSpline2D::supportedElements ( )` [inline]

Definition at line 291 of file LRBSpline2D.h.

29.274.3.47 `void Go::LRBSpline2D::swap ( LRBSpline2D & rhs ) [inline]`

Swap the contents of two LRBSpline2Ds.

Definition at line 98 of file LRBSpline2D.h.

29.274.3.48 `void Go::LRBSpline2D::swapParameterDirection ( )`

29.274.3.49 `double Go::LRBSpline2D::umax ( ) const [inline]`

Definition at line 242 of file LRBSpline2D.h.

29.274.3.50 `double Go::LRBSpline2D::umin ( ) const [inline]`

Information about the domain covered by this B-spline.

Definition at line 238 of file LRBSpline2D.h.

29.274.3.51 `std::vector<double> Go::LRBSpline2D::unitSquareBernsteinBasis ( double start_u, double stop_u, double start_v, double stop_v ) const`

For a given rectangle inside one of the elements cut out by the knot lines, this B-spline is a bi-degree polynomial. After transforming the rectangle to the unit square, this polynomial times the coefficient times gamma can be expressed by the Bernstein basis. This function returns the coefficients for this expression.

#### Parameters

<code>start_u</code>	the minimum u-value of the given rectangle
<code>stop_u</code>	the maximum u-value of the given rectangle
<code>start_v</code>	the minimum v-value of the given rectangle
<code>stop_v</code>	the maximum v-value of the given rectangle

#### Returns

a vector of the coefficients of the control points  $p_{ij}$  in order  $p_{00}[0]$ ,  $p_{00}[1]$ , ...,  $p_{10}[0]$ , ...,  $p_{01}[0]$ , ...

29.274.3.52 `double Go::LRBSpline2D::vmax ( ) const [inline]`

Definition at line 250 of file LRBSpline2D.h.

29.274.3.53 `double Go::LRBSpline2D::vmin ( ) const [inline]`

Definition at line 246 of file LRBSpline2D.h.

29.274.3.54 `double& Go::LRBSpline2D::weight ( ) [inline]`

Definition at line 212 of file LRBSpline2D.h.

29.274.3.55 `const double& Go::LRBSpline2D::weight ( ) const [inline]`

Definition at line 213 of file LRBSpline2D.h.

29.274.3.56 `virtual void Go::LRBSpline2D::write ( std::ostream & os ) const [virtual]`

Write the [LRBSpline2D](#) to a stream.

Implements [Go::Streamable](#).

## 29.276.4 Member Function Documentation

```
29.276.4.1 void Go::LRSplineSurface::addSurface (const LRSplineSurface & other_sf, double fac = 1.0)
```

```
29.276.4.2 virtual std::vector<CurveLoop> Go::LRSplineSurface::allBoundaryLoops (double degenerate_epsilon =
 DEFAULT_SPACE_EPSILON) const [virtual]
```

Returns the anticlockwise outer boundary loop of the surface, together with clockwise loops of any interior boundaries, such that the surface always is 'to the left of' the loops.

### Parameters

<i>degenerate_epsilon</i>	edges whose length is smaller than this value are ignored.
---------------------------	------------------------------------------------------------

### Returns

a vector containing CurveLoops. The first of these describe the outer boundary of the surface (clockwise), whereas the others describe boundaries of interior holes (clockwise).

Implements [Go::ParamSurface](#).

```
29.276.4.3 virtual double Go::LRSplineSurface::area (double tol) const [virtual]
```

Compute the total area of this surface up to some tolerance

## Parameters

<i>tol</i>	the relative tolerance when approximating the area, i.e. stop iteration when error becomes smaller than $tol/(surface\ area)$
------------	-------------------------------------------------------------------------------------------------------------------------------

## Returns

the area calculated

Implements [Go::ParamSurface](#).

**29.276.4.4** virtual **SplineSurface\*** **Go::LRSplineSurface::asSplineSurface** ( ) `[virtual]`

Return the spline surface represented by this surface, if any The user may get the spline surface lying in the (refined) regular grid by calling the function [expandToFullTensorProduct\(\)](#).

Reimplemented from [Go::ParamSurface](#).

**29.276.4.5** **BSplineMap::const\_iterator** **Go::LRSplineSurface::basisFunctionsBegin** ( ) `const [inline]`

Definition at line 546 of file LRSplineSurface.h.

**29.276.4.6** **BSplineMap::iterator** **Go::LRSplineSurface::basisFunctionsBeginNonconst** ( ) `[inline]`

Definition at line 550 of file LRSplineSurface.h.

**29.276.4.7** **BSplineMap::const\_iterator** **Go::LRSplineSurface::basisFunctionsEnd** ( ) `const [inline]`

Definition at line 547 of file LRSplineSurface.h.

**29.276.4.8** **BSplineMap::iterator** **Go::LRSplineSurface::basisFunctionsEndNonconst** ( ) `[inline]`

Definition at line 551 of file LRSplineSurface.h.

**29.276.4.9** **std::vector<LRBSpline2D\*>** **Go::LRSplineSurface::basisFunctionsWithSupportAt** ( **double u**, **double v** ) `const`

**29.276.4.10** virtual **BoundingBox** **Go::LRSplineSurface::boundingBox** ( ) `const [virtual]`

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.276.4.11 `BSplineMap::iterator Go::LRSplineSurface::bsplineFromDomain ( double start_u, double start_v, double end_u, double end_v, int startmult_u, int startmult_v, int endmult_u, int endmult_v )`

29.276.4.12 `static ClassType Go::LRSplineSurface::classType ( ) [inline],[static]`

Definition at line 216 of file LRSplineSurface.h.

29.276.4.13 `virtual LRSplineSurface* Go::LRSplineSurface::clone ( ) const [inline],[virtual]`

make a clone of this surface and return a pointer to it (user is responsible for clearing up memory afterwards).

#### Returns

pointer to cloned object

Implements [Go::ParamSurface](#).

Definition at line 219 of file LRSplineSurface.h.

29.276.4.14 `virtual void Go::LRSplineSurface::closestBoundaryPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, const RectDomain * rd = NULL, double * seed = 0 ) const [virtual]`

Iterates to the closest point to pt on the boundary of the surface.

#### See also

[closestPoint\(\)](#)

Implements [Go::ParamSurface](#).

29.276.4.15 `virtual Point Go::LRSplineSurface::closestInDomain ( double u, double v ) const [virtual]`

Fetch the parameter value in the parameter domain of the surface closest to the parameter pair (u,v)

Implements [Go::ParamSurface](#).

29.276.4.16 `void Go::LRSplineSurface::closestPoint ( const Point & pt, double & clo_u, double & clo_v, Point & clo_pt, double & clo_dist, double epsilon, int maxiter, Element2D * elem = NULL, const RectDomain * rd = NULL, double * seed = NULL ) const`

Closest point iteration taking benefit from information about an element in which to start searching

29.276.4.17 virtual **CompositeBox** Go::LRSplineSurface::compositeBox ( ) const [virtual]

Creates a composite box enclosing the surface. The composite box consists of an inner and an edge box. The inner box is supposed to be made from the interior of the surface, while the edge box is made from the boundary curves. The default implementation simply makes both boxes identical to the regular bounding box.

Returns

the [CompositeBox](#) of the surface, as specified above

Reimplemented from [Go::ParamSurface](#).

29.276.4.18 void Go::LRSplineSurface::computeBasis ( double *param\_u*, double *param\_v*, BasisPtsSf & *result*, int *iEI* = -1 ) const

29.276.4.19 void Go::LRSplineSurface::computeBasis ( double *param\_u*, double *param\_v*, BasisDerivsSf & *result*, int *iEI* = -1 ) const

29.276.4.20 void Go::LRSplineSurface::computeBasis ( double *param\_u*, double *param\_v*, BasisDerivsSf2 & *result*, int *iEI* = -1 ) const

29.276.4.21 void Go::LRSplineSurface::computeBasis ( double *param\_u*, double *param\_v*, std::vector< std::vector< double >> & *result*, int *derivs* = 0, int *iEI* = -1 ) const

29.276.4.22 **SplineCurve\*** Go::LRSplineSurface::constParamCurve ( double *parameter*, bool *pardir\_is\_u* ) const

29.276.4.23 void Go::LRSplineSurface::constParamCurve ( double *parameter*, bool *pardir\_is\_u*, **SplineCurve** \*& *cv*, **SplineCurve** \*& *crosscv* ) const

Generate and return two **SplineCurves**, representing a constant parameter curve on the surface as well as its cross-tangent curve.

Parameters

<i>parameter</i>	value of the fixed parameter
<i>pardir_is_u</i>	'true' if the first parameter is the running parameter, 'false' otherwise.
<i>cv</i>	upon function completion, 'cv' will point to a newly constructed <a href="#">SplineCurve</a> representing the specified constant parameter curve. It is the user's responsibility to delete it when it is no longer needed.
<i>crosscv</i>	upon function completion, 'crosscv' will point to a newly constructed <a href="#">SplineCurve</a> representing the cross-tangent curve of the specified constant parameter curve. It is the user's responsibility to delete it when it is no longer needed.

29.276.4.24 virtual std::vector< shared\_ptr<**ParamCurve**>> Go::LRSplineSurface::constParamCurves ( double *parameter*, bool *pardir\_is\_u* ) const [virtual]

Get the curve(s) obtained by intersecting the surface with one of its constant parameter curves. For surfaces without holes, this will be the parameter curve itself; for surfaces with interior holes this may be a collection of several, disjoint

curves.

#### Parameters

<i>parameter</i>	parameter value for the constant parameter (either u or v)
<i>pardir_is_u</i>	specify whether the <i>moving</i> parameter (as opposed to the <i>constant</i> parameter) is the first ('true') or the second ('false') one.

#### Returns

a vector containing shared pointers to the obtained, newly constructed constant-parameter curves.

Implements [Go::ParamSurface](#).

29.276.4.25 `void Go::LRSplineSurface::constructElementMesh ( std::vector< Element2D * > & elements ) const`

29.276.4.26 `virtual RectDomain Go::LRSplineSurface::containingDomain ( ) const` `[virtual]`

Get a rectangular parameter domain that is guaranteed to contain the surface's [parameterDomain\(\)](#). It may be the same. There is no guarantee that this is the smallest domain containing the actual domain.

#### Returns

a [RectDomain](#) that is guaranteed to include the surface's total parameter domain.

Implements [Go::ParamSurface](#).

29.276.4.27 `Element2D* Go::LRSplineSurface::coveringElement ( double u, double v ) const`

29.276.4.28 `int Go::LRSplineSurface::degree ( Direction2D d ) const` `[inline]`

Definition at line 84 of file `LRSplineSurface_impl.h`.

29.276.4.29 `virtual int Go::LRSplineSurface::dimension ( ) const` `[inline],[virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

Definition at line 233 of file `LRSplineSurface.h`.

29.276.4.30 `SplineCurve* Go::LRSplineSurface::edgeCurve ( int edge_num ) const`

29.276.4.31 `ElementMap::const_iterator Go::LRSplineSurface::elementsBegin ( ) const` `[inline]`

Definition at line 638 of file `LRSplineSurface.h`.

29.276.4.32 `ElementMap::const_iterator Go::LRSplineSurface::elementsEnd ( ) const [inline]`

Definition at line 639 of file `LRSplineSurface.h`.

29.276.4.33 `virtual double Go::LRSplineSurface::endparam_u ( ) const [virtual]`

Get the end value for the u-parameter

Returns

the end value for the u-parameter

29.276.4.34 `virtual double Go::LRSplineSurface::endparam_v ( ) const [virtual]`

Get the end value for the v-parameter

Returns

the end value for the v-parameter

29.276.4.35 `virtual void Go::LRSplineSurface::evalGrid ( int num_u, int num_v, double umin, double umax, double vmin, double vmax, std::vector< double > & points, double nodata_val = -9999 ) const [virtual]`

Evaluate points in a grid The nodata value is applicable for bounded surfaces and will not be used in this context

Reimplemented from [Go::ParamSurface](#).

29.276.4.36 `void Go::LRSplineSurface::expandToFullTensorProduct ( )`

29.276.4.37 `LRSplineSurface::BSKey Go::LRSplineSurface::generate_key ( const LRBSpline2D & b, const Mesh2D & m ) [inline],[static]`

Definition at line 152 of file `LRSplineSurface_impl.h`.

29.276.4.38 `LRSplineSurface::BSKey Go::LRSplineSurface::generate_key ( const LRBSpline2D & b ) [inline],[static]`

Definition at line 176 of file `LRSplineSurface_impl.h`.

29.276.4.39 `LRSplineSurface::ElemKey Go::LRSplineSurface::generate_key ( const double & umin, const double & vmin ) [inline],[static]`

Definition at line 218 of file `LRSplineSurface_impl.h`.

29.276.4.40 `std::vector<LRBSpline2D*> Go::LRSplineSurface::getBoundaryBsplines ( Direction2D d, bool atstart )`

29.276.4.41 `void Go::LRSplineSurface::getBoundaryIdx ( Point & pt1, Point & pt2, double epsilon, int & bindex, double & par1, double & par2, double knot_tol = 1e-05 ) const`

Given two points on the surface boundary, find the number of the corresponding boundary and the curve parameter of the closest points on this surface boundary.

Ordering of boundaries:

```

/// 1
/// - - - - -
/// | |
/// 2 | | 3
/// v | |
/// ^ - - - - -
/// |-> u 0
///

```

#### Parameters

<i>pt1</i>	point in geometry space
<i>pt2</i>	point in geometry space
<i>epsilon</i>	geometric tolerance
<i>bindex</i>	if the two points are on a common boundary, the index of the boundary, otherwise -1.
<i>par1</i>	if bindex is 0 or 1, the u parameter of pt1, otherwise the v parameter.
<i>par2</i>	if bindex is 0 or 1, the u parameter of pt2, otherwise the v parameter.
<i>knot_tol</i>	tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.

29.276.4.42 `virtual void Go::LRSplineSurface::getBoundaryInfo ( Point & pt1, Point & pt2, double epsilon, SplineCurve *& cv, SplineCurve *& crosscv, double knot_tol = 1e-05 ) const [virtual]`

Get the boundary curve segment between two points on the boundary, as well as the cross-tangent curve. If the given points are not positioned on the same boundary (within a certain tolerance), no curves will be created.

#### Parameters

<i>pt1</i>	the first point on the boundary, given by the user
<i>pt2</i>	the second point on the boundary, given by the user
<i>epsilon</i>	the tolerance used when determining whether the given points are lying on a boundary, and if they do, whether they both lie on the <i>same</i> boundary.
<i>cv</i>	upon return, this will point to a newly created curve representing the boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. No curve is created if the given points are not found to lie on the same boundary.
<i>crosscv</i>	upon return, this will point to a newly created curve representing the cross-boundary curve between 'pt1' and 'pt2'. The user assumes ownership of this object and is responsible for its deletion. The direction is outwards from the surface. No curve is created if the given points are not found to lie on the same boundary.
<i>knot_tol</i>	tolerance used when working with the knot-vector, to specify how close a parameter value must be to a knot in order to be considered 'on' the knot.

Implements [Go::ParamSurface](#).

29.276.4.43 `void Go::LRSplineSurface::getBoundaryInfo ( double par1, double par2, int bindex, SplineCurve *& cv, SplineCurve *& crosscv, double knot_tol ) const`

29.276.4.44 `virtual void Go::LRSplineSurface::getCornerPoints ( std::vector< std::pair< Point, Point > > & corners ) const` [virtual]

Return surface corners, geometric and parametric points in that sequence

Implements [Go::ParamSurface](#).

29.276.4.45 `virtual void Go::LRSplineSurface::getDegenerateCorners ( std::vector< Point > & deg_corners, double tol ) const` [virtual]

Check for parallel and anti parallel partial derivatives in surface corners.

Implements [Go::ParamSurface](#).

29.276.4.46 `LineCloud Go::LRSplineSurface::getElementBds ( int num_pts = 5 ) const`

29.276.4.47 `int Go::LRSplineSurface::getElementContaining ( double u, double v ) const`

29.276.4.48 `double Go::LRSplineSurface::getKnotTol ( )` [inline]

Tolerance for equality of knots.

Definition at line 565 of file LRSplineSurface.h.

29.276.4.49 `virtual bool Go::LRSplineSurface::inDomain ( double u, double v, double eps = 1.0e-4 ) const` [virtual]

Check if a parameter pair lies inside the domain of this surface.

Implements [Go::ParamSurface](#).

29.276.4.50 `virtual int Go::LRSplineSurface::inDomain2 ( double u, double v, double eps = 1.0e-4 ) const` [virtual]

Check if a parameter pair lies inside the domain of this surface return value = 0: outside = 1: internal = 2: at the boundary

Implements [Go::ParamSurface](#).

29.276.4.51 `virtual ClassType Go::LRSplineSurface::instanceType ( ) const` [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.276.4.52 `bool Go::LRSplineSurface::isDegenerate ( bool & b, bool & r, bool & t, bool & l, double tolerance ) const` [virtual]

The order of the edge indicators (bottom, right, top, left) matches the edge\_number of [edgeCurve\(\)](#). Query whether any of the four boundary curves are degenerate (zero length) within a certain tolerance. In the below, we refer to 'u' as the first parameter and 'v' as the second.

## Parameters

<i>b</i>	'true' upon return of function if the boundary ( $v = v_{\min}$ ) is degenerate
<i>r</i>	'true' upon return of function if the boundary ( $v = v_{\max}$ ) is degenerate
<i>t</i>	'true' upon return of function if the boundary ( $u = u_{\min}$ ) is degenerate
<i>l</i>	'true' upon return of function if the boundary ( $u = u_{\max}$ ) is degenerate
<i>tolerance</i>	boundaries are considered degenerate if their length is shorter than this value, given by the user

## Returns

'true' if at least one boundary curve was found to be degenerate, 'false' otherwise.

Reimplemented from [Go::ParamSurface](#).

29.276.4.53 **bool** `Go::LRSplineSurface::isFullTensorProduct ( ) const`

29.276.4.54 **const Mesh2D&** `Go::LRSplineSurface::mesh ( ) const` `[inline]`

Definition at line 505 of file LRSplineSurface.h.

29.276.4.55 **virtual LRSplineSurface\*** `Go::LRSplineSurface::mirrorSurface ( const Point & pos, const Point & norm ) const` `[virtual]`

Mirror a surface around a specified plane.

Reimplemented from [Go::ParamSurface](#).

29.276.4.56 **virtual double** `Go::LRSplineSurface::nextSegmentVal ( int dir, double par, bool forward, double tol ) const` `[virtual]`

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

## Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0 or 1)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value

## Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamSurface](#).

29.276.4.57 `virtual void Go::LRSplineSurface::normal ( Point & n, double upar, double vpar ) const` [virtual]

Evaluates the surface normal for a given parameter pair

Parameters

<i>n</i>	the computed normal will be written to this variable
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

29.276.4.58 `void Go::LRSplineSurface::normal ( Point & n, double upar, double vpar, Element2D * elem ) const`

29.276.4.59 `virtual DirectionCone Go::LRSplineSurface::normalCone ( ) const` [virtual]

Function that calls `normalCone(NormalConeMethod)` with `method = SederbergMeyers`. Needed because `normalCone()` is virtual! (Inherited from [ParamSurface](#)).

Returns

a [DirectionCone](#) (not necessarily the smallest) containing all normals to this surface.

Implements [Go::ParamSurface](#).

29.276.4.60 `int Go::LRSplineSurface::numBasisFunctions ( ) const` [inline]

Definition at line 508 of file `LRSplineSurface.h`.

29.276.4.61 `int Go::LRSplineSurface::numElements ( ) const` [inline]

Definition at line 510 of file `LRSplineSurface.h`.

29.276.4.62 `virtual bool Go::LRSplineSurface::onBoundary ( double u, double v, double eps = 1.0e-4 ) const` [virtual]

Check if a parameter pair lies at the boundary of this surface.

Implements [Go::ParamSurface](#).

29.276.4.63 `Point Go::LRSplineSurface::operator() ( double u, double v, int u_deriv = 0, int v_deriv = 0 ) const`

29.276.4.64 `Point Go::LRSplineSurface::operator() ( double u, double v, int u_deriv, int v_deriv, Element2D * elem ) const`

29.276.4.65 `const LRSplineSurface& Go::LRSplineSurface::operator= ( const LRSplineSurface & other )`

29.276.4.66 `virtual CurveLoop Go::LRSplineSurface::outerBoundaryLoop ( double degenerate_epsilon = DEFAULT_SPACE_EPSILON ) const` [virtual]

Returns the anticlockwise, outer boundary loop of the surface.

## Parameters

<i>degenerate_epsilon</i>	edges whose length is smaller than this value are ignored.
---------------------------	------------------------------------------------------------

## Returns

a [CurveLoop](#) describing the anticlockwise, outer boundary loop of the surface. A negative *degenerate\_epsilon* indicates that all curves, also the degenerate ones are wanted

Implements [Go::ParamSurface](#).

29.276.4.67 `virtual const RectDomain& Go::LRSplineSurface::parameterDomain ( ) const` [virtual]

Return the parameter domain of the surface. This may be a simple rectangular domain ([RectDomain](#)) or any other subclass of [Domain](#) (such as [GoCurveBoundedDomain](#), found in the `sisl_dependent` module).

## Returns

a [Domain](#) object describing the parametric domain of the surface

Implements [Go::ParamSurface](#).

29.276.4.68 `double Go::LRSplineSurface::paramMax ( Direction2D d ) const` [inline]

Definition at line 122 of file `LRSplineSurface_impl.h`.

29.276.4.69 `double Go::LRSplineSurface::paramMin ( Direction2D d ) const` [inline]

Definition at line 92 of file `LRSplineSurface_impl.h`.

29.276.4.70 `virtual void Go::LRSplineSurface::point ( Point & pt, double upar, double vpar ) const` [virtual]

Evaluates the surface's position for a given parameter pair.

## Parameters

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter

Implements [Go::ParamSurface](#).

29.276.4.71 `void Go::LRSplineSurface::point ( Point & pt, double upar, double vpar, Element2D * elem ) const`

29.276.4.72 `virtual void Go::LRSplineSurface::point ( std::vector< Point > & pts, double upar, double vpar, int derivs, bool u_from_right = true, bool v_from_right = true, double resolution = 1.0e-12 ) const` [virtual]

Evaluates the surface's position and a certain number of derivatives for a given parameter pair.

#### Parameters

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function, and should be equal to $(derivs+1) * (derivs+2) / 2$ . Upon completion of the function, its first entry is the surface's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the surface tangents along the first and second parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dv2), and similar for even higher derivatives.
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implements [Go::ParamSurface](#).

29.276.4.73 `void Go::LRSplineSurface::point ( std::vector< Point > & pts, double upar, double vpar, int derivs, Element2D * elem, bool u_from_right = true, bool v_from_right = true, double resolution = 1.0e-12 ) const`

29.276.4.74 `bool Go::LRSplineSurface::rational ( ) const`

29.276.4.75 `virtual void Go::LRSplineSurface::read ( std::istream & is )` [virtual]

read object from stream

#### Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.276.4.76 `void Go::LRSplineSurface::refine ( Direction2D d, double fixed_val, double start, double end, int mult = 1, bool absolute = false )`

29.276.4.77 `void Go::LRSplineSurface::refine ( const Refinement2D & ref, bool absolute = false )`

29.276.4.78 `void Go::LRSplineSurface::refine ( const std::vector< Refinement2D > & refs, bool absolute = false )`

29.276.4.79 void Go::LRSplineSurface::refineBasisFunction ( int *index* )

29.276.4.80 void Go::LRSplineSurface::refineBasisFunction ( const std::vector< int > & *indices* )

29.276.4.81 void Go::LRSplineSurface::refineElement ( int *index* )

29.276.4.82 void Go::LRSplineSurface::refineElement ( const std::vector< int > & *indices* )

29.276.4.83 virtual void Go::LRSplineSurface::reverseParameterDirection ( bool *direction\_is\_u* ) [virtual]

Reverses the direction of the basis in input direction.

#### Parameters

<i>direction_is_u</i>	if 'true', the first parameter direction will be reversed, otherwise, the second parameter direction will be reversed
-----------------------	-----------------------------------------------------------------------------------------------------------------------

Implements [Go::ParamSurface](#).

29.276.4.84 void Go::LRSplineSurface::setCoef ( const Point & *value*, const LRBSpline2D \* *target* )

29.276.4.85 void Go::LRSplineSurface::setCoef ( const Point & *value*, int *umin\_ix*, int *vmin\_ix*, int *umax\_ix*, int *vmax\_ix*, int *u\_mult* = 1, int *v\_mult* = 1 )

29.276.4.86 void Go::LRSplineSurface::setCoefTimesGamma ( const Point & *value*, const LRBSpline2D \* *target* )

29.276.4.87 void Go::LRSplineSurface::setCurrentElement ( Element2D \* *curr\_el* ) [inline]

Definition at line 642 of file LRSplineSurface.h.

29.276.4.88 virtual void Go::LRSplineSurface::setParameterDomain ( double *u1*, double *u2*, double *v1*, double *v2* ) [virtual]

set the parameter domain to a given rectangle

#### Parameters

<i>u1</i>	new min. value of first parameter span
<i>u2</i>	new max. value of first parameter span
<i>v1</i>	new min. value of second parameter span
<i>v2</i>	new max. value of second parameter span

Reimplemented from [Go::ParamSurface](#).

29.276.4.89 `virtual double Go::LRSplineSurface::startparam_u ( ) const [virtual]`

Get the start value for the u-parameter

Returns

the start value for the u-parameter

29.276.4.90 `virtual double Go::LRSplineSurface::startparam_v ( ) const [virtual]`

Get the start value for the v-parameter

Returns

the start value for the v-parameter

29.276.4.91 `LRSplineSurface* Go::LRSplineSurface::subSurface ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy ) const`

29.276.4.92 `virtual std::vector<shared_ptr<ParamSurface>> Go::LRSplineSurface::subSurfaces ( double from_upar, double from_vpar, double to_upar, double to_vpar, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [virtual]`

Get the surface(s) obtained by cropping the parameter domain of this surface between given values for the first and second parameter. In general, for surfaces with no interior holes, the result will be *one* surface; however, for surfaces with interior holes, the result might be *several disjoint* surfaces.

Parameters

<i>from_upar</i>	lower value for the first parameter in the subdomain
<i>from_vpar</i>	lower value for the second parameter in the subdomain
<i>to_upar</i>	upper value for the first parameter in the subdomain
<i>to_vpar</i>	upper value for the second parameter in the subdomain
<i>fuzzy</i>	tolerance used when determining intersection with interior boundaries

Returns

a vector contained shared pointers to the obtained, newly constructed sub-surfaces.

Implements [Go::ParamSurface](#).

29.276.4.93 `void Go::LRSplineSurface::swap ( LRSplineSurface & rhs )`

29.276.4.94 `virtual void Go::LRSplineSurface::swapParameterDirection ( ) [virtual]`

Swaps the two parameter directions.

Implements [Go::ParamSurface](#).

29.276.4.95 `virtual DirectionCone Go::LRSplineSurface::tangentCone ( bool pardir_is_u ) const` `[virtual]`

Creates a [DirectionCone](#) covering all tangents to this surface along a given parameter direction.

#### Parameters

<code><i>pardir_is_u</i></code>	if 'true', then the <a href="#">DirectionCone</a> will be defined on basis of the surface's tangents along the first parameter direction. Otherwise the second parameter direction will be used.
---------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

a [DirectionCone](#) (not necessarily the smallest) containing all tangents to this surface along the specified parameter direction.

Implements [Go::ParamSurface](#).

29.276.4.96 `void Go::LRSplineSurface::to3D ( )`

29.276.4.97 `void Go::LRSplineSurface::translate ( const Point & vec )`

29.276.4.98 `virtual void Go::LRSplineSurface::turnOrientation ( )` `[virtual]`

Turns the direction of the normal of the surface.

Implements [Go::ParamSurface](#).

29.276.4.99 `virtual void Go::LRSplineSurface::write ( std::ostream & os ) const` `[virtual]`

write object to stream

#### Parameters

<code><i>os</i></code>	stream to which object is written
------------------------	-----------------------------------

Implements [Go::Streamable](#).

### 29.277.1 Detailed Description

This class can generate a LR B-spline surface that approximates a set of points for a given accuracy.

Definition at line 57 of file LRSurfApprox.h.

### 29.277.2 Constructor & Destructor Documentation

**29.277.2.1** `Go::LRSurfApprox::LRSurfApprox ( std::vector< double > & points, int dim, double epsge, bool init_mba = false, double mba_level = 0.0, bool closest_dist = true, bool repar = false )`

Constructor given a parameterized point set

## Parameters

<i>points</i>	Parameterized point set given as (u1,v1,x1,y1,z1, u2, v2, ...) The length of the array is (2+dim)x(the number of points)
<i>dim</i>	The dimension of the geometry space
<i>epsge</i>	Requested approximation accuracy
<i>closest_dist</i>	Check accuracy in closest point or in corresponding parameter value
<i>repar</i>	Perform reparameterization during iterations

29.277.2.2 `Go::LRSurfApprox::LRSurfApprox ( shared_ptr< SplineSurface > & srf, std::vector< double > & points, double epsge, bool closest_dist = true, bool repar = false )`

Constructor given a parameterized point set and an initial spline surface

## Parameters

<i>srf</i>	Given spline surface
<i>points</i>	Parameterized point set given as (u1,v1,x1,y1,z1, u2, v2, ...) The length of the array is (2+dim)x(the number of points) Note that the sequence of the points can be changed and this class references the initial points (no copy)
<i>dim</i>	The dimension of the geometry space
<i>epsge</i>	Requested approximation accuracy
<i>closest_dist</i>	Check accuracy in closest point or in corresponding parameter value
<i>repar</i>	Perform reparameterization during iterations

29.277.2.3 `Go::LRSurfApprox::LRSurfApprox ( shared_ptr< LRBSplineSurface > & srf, std::vector< double > & points, double epsge, bool closest_dist = true, bool repar = false, bool check_init_accuracy = false )`

Constructor given a parameterized point set and an initial LR B-spline surface

## Parameters

<i>srf</i>	Given LR B-spline surface
<i>points</i>	Parameterized point set given as (u1,v1,x1,y1,z1, u2, v2, ...) The length of the array is (2+dim)x(the number of points) Note that the sequence of the points can be changed and this class references the initial points (no copy)
<i>dim</i>	The dimension of the geometry space
<i>epsge</i>	Requested approximation accuracy
<i>closest_dist</i>	Check accuracy in closest point or in corresponding parameter value
<i>repar</i>	Perform reparameterization during iterations

29.277.2.4 `Go::LRSurfApprox::LRSurfApprox ( int ncoef_u, int order_u, int ncoef_v, int order_v, std::vector< double > & points, int dim, double epsge, bool init_mba = false, double mba_level = 0.0, bool closest_dist = true, bool repar = false )`

Constructor given a parameterized point set and the size of an initial spline space

## Parameters

<i>ncoef_u</i>	Number of coefficients in the 1. parameter direction
<i>order_u</i>	Order in the 1. parameter direction
<i>ncoef_v</i>	Number of coefficients in the 2. parameter direction
<i>order_v</i>	Order in the 2. parameter direction
<i>points</i>	Parameterized point set given as (u1,v1,x1,y1,z1, u2, v2, ...) The length of the array is (2+dim)x(the number of points) Note that the sequence of the points can be changed and this class references the initial points (no copy)
<i>dim</i>	The dimension of the geometry space
<i>epsge</i>	Requested approximation accuracy
<i>closest_dist</i>	Check accuracy in closest point or in corresponding parameter value
<i>repar</i>	Perform reparameterization during iterations

**29.277.2.5** Go::LRSurfApprox::LRSurfApprox ( int *order\_u*, std::vector< double > & *knots\_u*, int *order\_v*, std::vector< double > & *knots\_v*, std::vector< double > & *points*, int *dim*, double *epsge*, bool *init\_mba* = false, double *mba\_level* = 0.0, bool *closest\_dist* = true, bool *repar* = false )

Constructor given a parameterized point set and an initial spline space

## Parameters

<i>order_u</i>	Order in the 1. parameter direction
<i>knots_u</i>	Knot vector in the 1. parameter direction
<i>order_v</i>	Order in the 2. parameter direction
<i>knots_v</i>	Knot vector in the 2. parameter direction
<i>points</i>	Parameterized point set given as (u1,v1,x1,y1,z1, u2, v2, ...) The length of the array is (2+dim)x(the number of points) Note that the sequence of the points can be changed and this class references the initial points (no copy)
<i>dim</i>	The dimension of the geometry space
<i>epsge</i>	Requested approximation accuracy
<i>closest_dist</i>	Check accuracy in closest point or in corresponding parameter value
<i>repar</i>	Perform reparameterization during iterations

**29.277.2.6** Go::LRSurfApprox::LRSurfApprox ( int *ncoef\_u*, int *order\_u*, int *ncoef\_v*, int *order\_v*, std::vector< double > & *points*, int *dim*, double *domain*[4], double *epsge*, bool *init\_mba* = false, double *mba\_level* = 0.0, bool *closest\_dist* = true, bool *repar* = false )

Constructor given a parameterized point set and the size of an initial spline space

## Parameters

<i>ncoef_u</i>	Number of coefficients in the 1. parameter direction
<i>order_u</i>	Order in the 1. parameter direction
<i>ncoef_v</i>	Number of coefficients in the 2. parameter direction
<i>order_v</i>	Order in the 2. parameter direction
<i>points</i>	Parameterized point set given as (u1,v1,x1,y1,z1, u2, v2, ...) The length of the array is (2+dim)x(the number of points) Note that the sequence of the points can be changed and this class references the initial points (no copy)

## Parameters

<i>dim</i>	The dimension of the geometry space
<i>domain</i>	A possibly extended parameter domain (umin, umax, vmin, vmax)
<i>epsge</i>	Requested approximation accuracy
<i>closest_dist</i>	Check accuracy in closest point or in corresponding parameter value
<i>repar</i>	Perform reparameterization during iterations

## 29.277.2.7 Go::LRSurfApprox::~~LRSurfApprox ( )

Destructor.

## 29.277.3 Member Function Documentation

29.277.3.1 void Go::LRSurfApprox::addLowerConstraint ( double *minval* ) [inline]

Add lower constraint. Only functional (1D surface)

Definition at line 251 of file LRSurfApprox.h.

29.277.3.2 void Go::LRSurfApprox::addUpperConstraint ( double *maxval* ) [inline]

Add upper constraint. Only functional (1D surface)

Definition at line 258 of file LRSurfApprox.h.

29.277.3.3 void Go::LRSurfApprox::edgeFix ( int *edge\_fix*[ ] ) [inline]

Decide whether specific edges of the surface's boundary should be kept fixed (i.e. unchanged by approximation process), as well as a certain number of cross-derivatives across these curves.

## Parameters

<i>edge_fix</i>	pointer to an array of four integers specifying to which extent each surface edge should be kept fixed during the approximation process. A value of 0 means that it will not be kept fixed, 1 means that its position will be kept fixed, derivatives at the boundary are currently NOT kept fixed. The integers are associated with the surface edges starting with the edge 'v=vmin' and moving counterclockwise.
-----------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Definition at line 216 of file LRSurfApprox.h.

29.277.3.4 shared\_ptr<LRSplineSurface> Go::LRSurfApprox::getApproxSurf ( double & *maxdist*, double & *avdist\_all*, double & *avdist*, int & *nmb\_out\_eps*, int *max\_iter* = 4 )

When everything else is set, this function can be used to run the approximation process and fetch the approximated surface.

## Return values

<i>maxdist</i>	report the maximum distance between the approximated surface and the data points
<i>avdist</i>	report the average distance between the approximated surface and the datapoints

## Parameters

<i>nmb_out_eps</i>	report the number of data points that were found to lie outside the geometric tolerance (as specified by the 'aepsge' argument to the <a href="#">ApproxSurf</a> constructor.
<i>max_iter</i>	maximum number of iterations

## Returns

a shared pointer to the generated [SplineCurve](#), approximating the points as specified.

**29.277.3.5** void Go::LRSurfApprox::setFixBoundary ( bool *fix\_boundary* ) [inline]

Decide whether or not the total boundary of the surface should be kept fixed (i.e. unchanged by approximation process). Default is true. Cross derivatives will not be kept fixed. (If you want to keep cross derivatives fixed, use the [edgeFix\(\)](#) member function instead).

## Parameters

<i>fix_boundary</i>	if 'true' the boundary of the surface will not be modified, if 'false' it will be open to modification.
---------------------	---------------------------------------------------------------------------------------------------------

Definition at line 193 of file LRSurfApprox.h.

**29.277.3.6** void Go::LRSurfApprox::setFixCorner ( bool *fix\_corner* ) [inline]

Definition at line 200 of file LRSurfApprox.h.

**29.277.3.7** void Go::LRSurfApprox::setGridInfo ( double *grid\_start*[], double *cell\_size*[] ) [inline]

Definition at line 228 of file LRSurfApprox.h.

**29.277.3.8** void Go::LRSurfApprox::setInitMBA ( bool *initMBA*, double *start\_coef* = 0.0 ) [inline]

Set if an initial MBA surface should be used in LS approximation Default is false

Definition at line 286 of file LRSurfApprox.h.

**29.277.3.9** void Go::LRSurfApprox::setLocalConstraint ( double *constraint\_factor* ) [inline]

Set local constraint on coefficient. Only functional (1D surface)

Definition at line 265 of file LRSurfApprox.h.

29.277.3.10 void Go::LRSurfApprox::setMakeGhostPoints ( bool *make\_ghost\_points* ) [inline]

Decide if ghost points should be constructed.

Definition at line 238 of file LRSurfApprox.h.

29.277.3.11 void Go::LRSurfApprox::setMinimumElementSize ( double *usize\_min*, double *vsize\_min* ) [inline]

Set minimum element size.

Definition at line 272 of file LRSurfApprox.h.

29.277.3.12 void Go::LRSurfApprox::setSmoothBoundary ( bool *smoothbd* ) [inline]

Definition at line 182 of file LRSurfApprox.h.

29.277.3.13 void Go::LRSurfApprox::setSmoothingWeight ( double *smooth* ) [inline]

Sets the smoothing weight to something other than the default (1e-9). The value should lie in the unit interval, typically close to 0.

#### Parameters

<i>smooth</i>	the new smoothing weight.
---------------	---------------------------

Definition at line 176 of file LRSurfApprox.h.

29.277.3.14 void Go::LRSurfApprox::setSwitchToMBA ( int *iter* ) [inline]

Iteration count on which to switch to MBA (if LS)

Definition at line 279 of file LRSurfApprox.h.

29.277.3.15 void Go::LRSurfApprox::setTurn3D ( int *iter* ) [inline]

Definition at line 223 of file LRSurfApprox.h.

29.277.3.16 void Go::LRSurfApprox::setUseMBA ( bool *useMBA* ) [inline]

Decide if the MBA algorithm should be used to approximate points (default == false)

Definition at line 245 of file LRSurfApprox.h.

29.277.3.17 void Go::LRSurfApprox::setVerbose ( bool *verbose* ) [inline]

Whether or not intermediate information should be written to standard output (default is not)

Definition at line 294 of file LRSurfApprox.h.

- void [setLeastSquares](#) (std::vector< [double](#) > &points, const [double](#) weight)
- int [equationSolve](#) (shared\_ptr< [LRSplineSurface](#) > &surf)

### 29.278.1 Detailed Description

Definition at line 72 of file LRSurfSmoothLS.h.

### 29.278.2 Constructor & Destructor Documentation

29.278.2.1 Go::LRSurfSmoothLS::LRSurfSmoothLS ( shared\_ptr< [LRSplineSurface](#) > *surf*, std::vector< int > &*coef\_known* )

Constructor Note that the surface is modified

## Parameters

<i>coef_known</i>	indicates if the coefficient associated to the LR B-splines is known already
-------------------	------------------------------------------------------------------------------

29.278.2.2 `Go::LRSurfSmoothLS::LRSurfSmoothLS ( )`

Empty constructor.

29.278.2.3 `Go::LRSurfSmoothLS::~~LRSurfSmoothLS ( )`

Destructor.

### 29.278.3 Member Function Documentation

29.278.3.1 `void Go::LRSurfSmoothLS::addDataPoints ( std::vector< double > & points, bool is_ghost_points = false )`

Add data points for approximation. The points are parameterized and are store as follows: parameter values for point 1 (2 doubles), position for point1 (dim doubles where dim is the dimension of the associated LR spline surface), parameter values for point 2 etc.

29.278.3.2 `int Go::LRSurfSmoothLS::equationSolve ( shared_ptr< LRSplineSurface > & surf )`

Solve equation system, and produce output surface. If failing to solve the routine may throw an exception.

## Parameters

<i>surf</i>	the output surface.
-------------	---------------------

## Returns

0 = OK, negative = failed solving system.

29.278.3.3 `bool Go::LRSurfSmoothLS::hasDataPoints ( ) const`

Check if data points already are available.

29.278.3.4 `void Go::LRSurfSmoothLS::setInitSf ( shared_ptr< LRSplineSurface > surf, std::vector< int > & coef_known )`

Set initial surface Note that the surface is modified

## Parameters

<i>coef_known</i>	indicates if the coefficient associated to the LR B-splines is known already
-------------------	------------------------------------------------------------------------------

29.278.3.5 void Go::LRSurfSmoothLS::setLeastSquares ( const double *weight* )

Compute matrices for least squares approximation. The data points are expected to be added already

Parameters

<i>weight</i>	the contribution of the approximation of the pnts in the system. weight should lie in the unit interval.
---------------	----------------------------------------------------------------------------------------------------------

29.278.3.6 void Go::LRSurfSmoothLS::setLeastSquares ( std::vector< double > & *points*, const double *weight* )

Compute matrices for least squares approximation.

Parameters

<i>points</i>	Parameter values and point for each data point
<i>weight</i>	the contribution of the approximation of the pnts in the system. weight should lie in the unit interval.

29.278.3.7 void Go::LRSurfSmoothLS::setLeastSquares\_omp ( const double *weight* )

OpenMP enabled version of the above function.

29.278.3.8 void Go::LRSurfSmoothLS::setOptimize ( const double *weight1*, const double *weight2*, const double *weight3* )

Compute the smoothing part of the equation system.

Parameters

<i>weight1</i>	contribution weight with respect to the 1st derivative.
<i>weight2</i>	contribution weight with respect to the 2nd derivative.
<i>weight3</i>	contribution weight with respect to the 3rd derivative.

29.278.3.9 void Go::LRSurfSmoothLS::smoothBoundary ( const double *weight1*, const double *weight2*, const double *weight3* )

Compute the boundary smoothing part of the equation system.

Parameters

<i>weight1</i>	contribution weight with respect to the 1st derivative.
<i>weight2</i>	contribution weight with respect to the 2nd derivative.
<i>weight3</i>	contribution weight with respect to the 3rd derivative.

29.278.3.10 void Go::LRSurfSmoothLS::updateLocals ( )

Reset local arrays after changing LR B-spline surface.

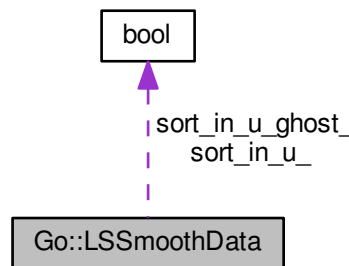

The documentation for this class was generated from the following file:

- [Irsplines2D/include/GoTools/Irsplines2D/LRSurfSmoothLS.h](#)

### 29.291.1 Detailed Description

```
template<typename T, int Dim>
class Go::MatrixXD< T, Dim >
```

Square n-dimensional (compile time constant dim) matrix.

Definition at line 59 of file MatrixXD.h.

### 29.291.2 Constructor & Destructor Documentation

29.291.2.1 `template<typename T, int Dim> Go::MatrixXD< T, Dim >::MatrixXD ( ) [inline]`

Default constructor.

Definition at line 63 of file MatrixXD.h.

29.291.2.2 `template<typename T, int Dim> Go::MatrixXD< T, Dim >::~~MatrixXD ( ) [inline]`

Default destructor.

Definition at line 66 of file MatrixXD.h.

### 29.291.3 Member Function Documentation

29.291.3.1 `template<typename T, int Dim> T Go::MatrixXD< T, Dim >::det ( ) const`

Determinant.

29.291.3.2 `template<typename T, int Dim> T Go::MatrixXD< T, Dim >::frobeniusNorm ( ) const [inline]`

Frobenius norm.

Definition at line 245 of file MatrixXD.h.

29.291.3.3 `template<typename T, int Dim> T** Go::MatrixXD< T, Dim >::get ( ) [inline]`

Access data array directly.

Definition at line 75 of file MatrixXD.h.

29.291.3.4 `template<typename T, int Dim> void Go::MatrixXD< T, Dim >::identity ( ) [inline]`

[Identity](#) matrix.

Definition at line 94 of file MatrixXD.h.

29.291.3.5 `template<typename T, int Dim> template<class FromConstIteratorType , class ToIteratorType > void Go::MatrixXD< T, Dim >::mult ( const FromConstIteratorType from, const ToIteratorType to ) const [inline]`

Matrix-vector multiplication.

Definition at line 216 of file MatrixXD.h.

29.291.3.6 `template<typename T, int Dim> T& Go::MatrixXD< T, Dim >::operator() ( int row, int col ) [inline]`

Element access operator.

Definition at line 69 of file MatrixXD.h.

29.291.3.7 `template<typename T, int Dim> const T& Go::MatrixXD< T, Dim >::operator() ( int row, int col ) const [inline]`

Const element access operator.

Definition at line 78 of file MatrixXD.h.

29.291.3.8 `template<typename T, int Dim> MatrixXD Go::MatrixXD< T, Dim >::operator* ( const MatrixXD< T, Dim > & other ) const [inline]`

Matrix-matrix multiplication.

Definition at line 125 of file MatrixXD.h.

29.291.3.9 `template<typename T, int Dim> MatrixXD Go::MatrixXD< T, Dim >::operator* ( T scalar ) const [inline]`

Multiplication by a scalar.

Definition at line 149 of file MatrixXD.h.

```
29.291.3.10 template<typename T, int Dim> template<class VectorType > VectorType Go::MatrixXD< T, Dim
 >::operator* (const VectorType & vec) const [inline]
```

Matrix-vector multiplication.

Definition at line 200 of file MatrixXD.h.

```
29.291.3.11 template<typename T, int Dim> MatrixXD& Go::MatrixXD< T, Dim >::operator*= (const MatrixXD< T,
 Dim > & other) [inline]
```

Multiply this matrix with a matrix.

Definition at line 142 of file MatrixXD.h.

```
29.291.3.12 template<typename T, int Dim> MatrixXD& Go::MatrixXD< T, Dim >::operator*= (T scalar) [inline]
```

Multiplication by a scalar.

Definition at line 157 of file MatrixXD.h.

```
29.291.3.13 template<typename T, int Dim> MatrixXD Go::MatrixXD< T, Dim >::operator+ (const MatrixXD< T, Dim
 > & other) const [inline]
```

Addition.

Definition at line 168 of file MatrixXD.h.

```
29.291.3.14 template<typename T, int Dim> MatrixXD& Go::MatrixXD< T, Dim >::operator+= (const MatrixXD< T,
 Dim > & other) [inline]
```

Add a matrix to this matrix.

Definition at line 176 of file MatrixXD.h.

```
29.291.3.15 template<typename T, int Dim> MatrixXD Go::MatrixXD< T, Dim >::operator- () const [inline]
```

Negation.

Definition at line 187 of file MatrixXD.h.

```
29.291.3.16 template<typename T, int Dim> void Go::MatrixXD< T, Dim >::setToRotation (T angle, T x, T y, T z)
 [inline]
```

Similar to `glRotate()`, sets the matrix to be a rotation of `angle` radians about the axis given by `(x, y, z)`. `(x, y, z)` does not have to be normalized. Only makes sense for `Dim == 3` or `Dim == 4`.

Definition at line 281 of file MatrixXD.h.

29.291.3.17 `template<typename T, int Dim> void Go::MatrixXD< T, Dim >::setToRotation ( const Vector3D & p, const Vector3D & q ) [inline]`

Sets the matrix to be a rotation that takes the point p to q. p and q are assumed to lie on the 2-sphere. Only makes sense for Dim == 3.

Definition at line 343 of file MatrixXD.h.

29.291.3.18 `template<> void Go::MatrixXD< double, 3 >::setToRotation ( double angle, double x, double y, double z ) [inline]`

Definition at line 290 of file MatrixXD.h.

29.291.3.19 `template<> void Go::MatrixXD< double, 4 >::setToRotation ( double angle, double x, double y, double z ) [inline]`

Definition at line 326 of file MatrixXD.h.

29.291.3.20 `template<> void Go::MatrixXD< double, 3 >::setToRotation ( const Vector3D & p, const Vector3D & q ) [inline]`

Definition at line 352 of file MatrixXD.h.

29.291.3.21 `template<typename T, int Dim> MatrixXD<T, Dim-1> Go::MatrixXD< T, Dim >::submatrix ( int r, int c ) const [inline]`

Submatrix with given row and column removed.

Definition at line 258 of file MatrixXD.h.

29.291.3.22 `template<typename T, int Dim> T Go::MatrixXD< T, Dim >::trace ( ) const [inline]`

Trace.

Definition at line 233 of file MatrixXD.h.

29.291.3.23 `template<typename T, int Dim> void Go::MatrixXD< T, Dim >::transpose ( ) [inline]`

Transpose matrix.

Definition at line 103 of file MatrixXD.h.

29.291.3.24 `template<typename T, int Dim> void Go::MatrixXD< T, Dim >::zero ( ) [inline]`

Set all elements to zero.

Definition at line 84 of file MatrixXD.h.

### 29.296.3 Member Function Documentation

29.296.3.1 [virtual](#) void [Go::ModelQuality::acuteEdgeAngle](#) ( [std::vector](#)< [std::pair](#)< [ftEdge](#) \*, [ftEdge](#) \* > > & *edge\_acute* ) [[virtual](#)]

Uses existing topological entities.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.2 virtual void Go::ModelQuality::acuteFaceAngle (std::vector< std::pair< ftSurface *, ftSurface * > > &
 face_acute) [virtual]
```

Uses existing topological entities. Existing surfaces available.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.3 virtual void Go::ModelQuality::cvC1G1Discontinuity (std::vector< shared_ptr< ParamCurve > > & c1_discont,
 std::vector< shared_ptr< ParamCurve > > & g1_discont) [virtual]
```

Contains curves fetched from topological entities.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.4 virtual void Go::ModelQuality::cvCurvatureRadius (std::vector< std::pair< shared_ptr< PointOnCurve >,
 double > > & small_curv_rad, std::pair< shared_ptr< PointOnCurve >, double > & minimum_curv_rad)
 [virtual]
```

Contains generated points and curves fetched from topological entities.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.5 virtual void Go::ModelQuality::degenerateSfCorners (std::vector< shared_ptr< ftPoint > > & deg_corners)
 [virtual]
```

Generates new points, pointers to existing surfaces.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.6 virtual void Go::ModelQuality::degenSurfaces (std::vector< shared_ptr< ParamSurface > > & deg_sfs)
 [virtual]
```

Does not generate new geometry.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.7 virtual void Go::ModelQuality::edgePosAndTangDiscontinuity (std::vector< std::pair< ftEdge *, ftEdge * > >
 & pos_disconts, std::vector< std::pair< ftEdge *, ftEdge * > > & tang_disconts) [virtual]
```

Uses existing topological entities.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.8 virtual void Go::ModelQuality::edgeVertexDistance (std::vector< std::pair< ftEdge *, shared_ptr< Vertex > >
 > & edge_vertices) [virtual]
```

Uses existing topological entities.

Reimplemented in [Go::FaceSetQuality](#).

29.296.3.9 `virtual void Go::ModelQuality::faceEdgeDistance ( std::vector< std::pair< ftSurface *, ftEdge * > > & face_edges ) [virtual]`

Existing topology. Partly generated geometry, existing surfaces.

Reimplemented in [Go::FaceSetQuality](#).

29.296.3.10 `virtual void Go::ModelQuality::faceNormalConsistency ( std::vector< shared_ptr< ftSurface > > & inconsistent_faces ) [virtual]`

Uses existing topological entities. Existing surfaces available.

Reimplemented in [Go::FaceSetQuality](#).

29.296.3.11 `virtual void Go::ModelQuality::facePositionDiscontinuity ( std::vector< std::pair< ftEdge *, ftEdge * > > & pos_disconts ) [virtual]`

Uses existing topological entities. Existing surfaces available.

Reimplemented in [Go::FaceSetQuality](#).

29.296.3.12 `virtual void Go::ModelQuality::faceTangentDiscontinuity ( std::vector< std::pair< ftEdge *, ftEdge * > > & tangent_disconts ) [virtual]`

Uses existing topological entities. Existing surfaces available.

Reimplemented in [Go::FaceSetQuality](#).

29.296.3.13 `virtual void Go::ModelQuality::faceVertexDistance ( std::vector< std::pair< ftSurface *, shared_ptr< Vertex > > > & face_vertices ) [virtual]`

Existing topology. Partly generated geometry, existing surfaces.

Reimplemented in [Go::FaceSetQuality](#).

29.296.3.14 `shared_ptr<QualityResults> Go::ModelQuality::getResults ( ) [inline]`

Definition at line 215 of file ModelQuality.h.

29.296.3.15 `virtual void Go::ModelQuality::identicalOrEmbeddedEdges ( std::vector< std::pair< shared_ptr< ftEdge >, shared_ptr< ftEdge > > > & identical_edges, std::vector< std::pair< shared_ptr< ftEdge >, shared_ptr< ftEdge > > > & embedded_edges ) [virtual]`

Uses existing topological entities. May contain generated curves.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.16 virtual void Go::ModelQuality::identicalOrEmbeddedFaces (std::vector< std::pair< shared_ptr< ftSurface >, shared_ptr< ftSurface > > > & identical_faces, std::vector< std::pair< shared_ptr< ftSurface >, shared_ptr< ftSurface > > > & embedded_faces) [virtual]
```

Uses existing topological entities. Points to existing surfaces.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.17 virtual void Go::ModelQuality::identicalVertices (std::vector< std::pair< shared_ptr< Vertex >, shared_ptr< Vertex > > > & identical_vertices) [virtual]
```

Uses existing topological entity.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.18 virtual void Go::ModelQuality::indistinctKnots (std::vector< shared_ptr< ParamCurve > > & cv_knots, std::vector< shared_ptr< ParamSurface > > & sf_knots, double tol = 1.0e-8) [virtual]
```

Uses existing surface and possibly generated curves.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.19 virtual void Go::ModelQuality::loopIntersection (std::vector< std::pair< shared_ptr< PointOnEdge >, shared_ptr< PointOnEdge > > > & loop_intersection) [virtual]
```

Uses existing topological entities. Contains generated geometry.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.20 virtual void Go::ModelQuality::loopOrientationConsistency (std::vector< shared_ptr< Loop > > & inconsistent_loops) [virtual]
```

Uses existing topological entities.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.21 virtual void Go::ModelQuality::loopSelfIntersection (std::vector< std::pair< shared_ptr< PointOnEdge >, shared_ptr< PointOnEdge > > > & loop_self_intersection) [virtual]
```

Uses existing topological entities. Contains generated geometry.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.22 virtual void Go::ModelQuality::miniEdges (std::vector< shared_ptr< ftEdge > > & mini_edges) [virtual]
```

Uses existing topological entities.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.23 virtual void Go::ModelQuality::miniSurfaces (std::vector< shared_ptr< ftSurface > > & mini_surfaces)
 [virtual]
```

Uses existing topological entities. Points to existing surfaces.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.24 virtual void Go::ModelQuality::narrowRegion (std::vector< std::pair< shared_ptr< PointOnEdge > ,
 shared_ptr< PointOnEdge > > > & narrow_regions) [virtual]
```

Uses existing topological entities. Contains generated geometry.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.25 void Go::ModelQuality::setCurvatureRadius (double radius) [inline]
```

Definition at line 70 of file ModelQuality.h.

```
29.296.3.26 void Go::ModelQuality::setMiniElementSize (double element_size) [inline]
```

Definition at line 65 of file ModelQuality.h.

```
29.296.3.27 virtual void Go::ModelQuality::sfC1Discontinuity (std::vector< shared_ptr< ftSurface > > & scont_sfs)
 [virtual]
```

Uses existing topological entities. Existing surfaces available.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.28 virtual void Go::ModelQuality::sfCurvatureRadius (std::vector< std::pair< shared_ptr< ftPoint > , double >
 > & small_curv_rad, std::pair< shared_ptr< ftPoint > , double > & minimum_curv_rad) [virtual]
```

Generates new points, pointers to existing surfaces.

Reimplemented in [Go::FaceSetQuality](#).

```
29.296.3.29 virtual void Go::ModelQuality::sfG1Discontinuity (std::vector< shared_ptr< ftSurface > > & scont_sfs)
 [virtual]
```

Uses existing topological entities. Existing surfaces available.

Reimplemented in [Go::FaceSetQuality](#).

29.296.3.30 `virtual void Go::ModelQuality::sliverSurfaces ( std::vector< shared_ptr< ParamSurface > > & sliver_sfs, double thickness, double factor = 2.0 ) [virtual]`

Uses existing geometry.

Reimplemented in [Go::FaceSetQuality](#).

29.296.3.31 `virtual void Go::ModelQuality::vanishingCurveTangent ( std::vector< shared_ptr< PointOnCurve > > & sing_points, std::vector< std::pair< shared_ptr< PointOnCurve >, shared_ptr< PointOnCurve > > > & sing_curves ) [virtual]`

Contains generated points and curves fetched from topological entities.

Reimplemented in [Go::FaceSetQuality](#).

29.296.3.32 `virtual void Go::ModelQuality::vanishingSurfaceNormal ( std::vector< shared_ptr< ftPoint > > & singular_points, std::vector< shared_ptr< ftCurve > > & singular_curves ) [virtual]`

Returns ftPoints and ftCurves that will contain generated geometry.

Reimplemented in [Go::FaceSetQuality](#).

### 29.298.1 Detailed Description

[MultiDijkstra](#) Class implementing the [Dijkstra](#) algorithm, where each node is labeled according to which "candidate node" its path ends up in.

Definition at line 76 of file PrMultiDijkstra.h.

### 29.298.2 Constructor & Destructor Documentation

#### 29.298.2.1 [MultiDijkstra::MultiDijkstra \( \)](#)

Constructor.

#### 29.298.2.2 [MultiDijkstra::~~MultiDijkstra \( \)](#)

Destructor.

### 29.298.3 Member Function Documentation

#### 29.298.3.1 [int MultiDijkstra::closestNeighbour \( int node\\_idx \)](#)

Get the index of the closest neighbour to the node 'node\_idx'. Does not give a valid answer until the [Dijkstra](#) algorithm has been [run\(\)](#).

#### 29.298.3.2 [double MultiDijkstra::getDistance \( int node\\_idx \)](#) `[inline]`

Get the distance associated with the node 'node\_ix'. Does not give a valid answer until the [Dijkstra](#) algorithm has been [run\(\)](#).

Definition at line 129 of file PrMultiDijkstra.h.

**29.298.3.3** `double MultiDijkstra::getDistance ( int node_idx, int neighbour )` `[inline]`

Compute the euclidean distance between two nodes, supposedly neighbours. If they are boundary nodes, their mutual distance will be set to a very large number.

Definition at line 166 of file PrMultiDijkstra.h.

**29.298.3.4** `int MultiDijkstra::getLabel ( int node_idx )` `[inline]`

After the algorithm has been run (using the `run()` function *without* arguments), this function can be used to find which label each node has been assigned.

Definition at line 125 of file PrMultiDijkstra.h.

**29.298.3.5** `void MultiDijkstra::initialize ( )`

Initialize internal data structures. Must be done after '`setGraph()`' has been called.

**29.298.3.6** `void MultiDijkstra::insertInCandidates ( int node_idx )` `[inline]`, `[protected]`

Definition at line 158 of file PrMultiDijkstra.h.

**29.298.3.7** `int MultiDijkstra::isFinished ( int node_idx )` `[inline]`, `[protected]`

Definition at line 150 of file PrMultiDijkstra.h.

**29.298.3.8** `void MultiDijkstra::run ( )`

Run the algorithm. Compute the associated distance for all nodes in the graph.

**29.298.3.9** `void MultiDijkstra::run ( double radius )`

Run the algorithm. Compute the associated distance for all nodes in the graph. Edges longer than '`radius`' will be ignored.

**29.298.3.10** `void MultiDijkstra::run ( int target )`

Run the algorithm. Compute the associated distance for nodes in the graph until the distance for the '`target`' node has been found. Then skip further computations.

**29.298.3.11** `void MultiDijkstra::setFinished ( int node_idx )` `[inline]`, `[protected]`

Definition at line 143 of file PrMultiDijkstra.h.

**29.298.3.12** `void MultiDijkstra::setGraph ( GraphType * tri )` `[inline]`

Set the graph to run the algorithm on. Must be run before '`initialize()`'.

Definition at line 99 of file PrMultiDijkstra.h.

**29.298.3.13** `void MultiDijkstra::setSource ( int node_idx, int node_label, double dist = 0 )`

Set a '`source`' for the algorithm. This is a node for which the associated minimum distance is known. At least one source must be set for the algorithm to work properly.

## Parameters

<i>node_idx</i>	the index of the node to be designated as a source
<i>node_label</i>	set a label for this source (makes it possibly to identify which nodes in the graph whose solution depends on this node).
<i>dist</i>	the distance at this node (typically 0).

- `const bool & getFlag () const`  
*Returns the flag (TTL\_USE\_NODE\_FLAG must be defined)*

## Additional Inherited Members

### 29.303.1 Detailed Description

**Node** class for data structures (Inherits from [HandleId](#))

#### Note

- To enable node IDs, TTL\_USE\_NODE\_ID must be defined.
- To enable node flags, TTL\_USE\_NODE\_FLAG must be defined.
- TTL\_USE\_NODE\_ID and TTL\_USE\_NODE\_FLAG should only be enabled if this functionality is required by the application, because they increase the memory usage for each [Node](#) object.

Definition at line 80 of file HeTriang.h.

### 29.303.2 Constructor & Destructor Documentation

#### 29.303.2.1 hed::Node::Node ( ) [inline]

Default constructor.

Definition at line 101 of file HeTriang.h.

#### 29.303.2.2 hed::Node::Node ( double x, double y, double z = 0.0 ) [inline]

Constructor.

Definition at line 104 of file HeTriang.h.

#### 29.303.2.3 hed::Node::~~Node ( ) [inline]

Destructor.

Definition at line 107 of file HeTriang.h.

### 29.303.3 Member Function Documentation

**29.303.3.1** `const bool& hed::Node::getFlag ( ) const` `[inline]`

Returns the flag (TTL\_USE\_NODE\_FLAG must be defined)

Definition at line 138 of file HeTriang.h.

**29.303.3.2** `const int& hed::Node::id ( ) const` `[inline]`

Returns the id (TTL\_USE\_NODE\_ID must be defined)

Definition at line 130 of file HeTriang.h.

**29.303.3.3** `void hed::Node::init ( double x, double y, double z )` `[inline]`

Initialize the position.

Definition at line 110 of file HeTriang.h.

**29.303.3.4** `void hed::Node::setFlag ( bool flag )` `[inline]`

Sets the flag (TTL\_USE\_NODE\_FLAG must be defined)

Definition at line 135 of file HeTriang.h.

**29.303.3.5** `const double& hed::Node::x ( void ) const` `[inline]`

Returns the x-coordinate.

Definition at line 120 of file HeTriang.h.

**29.303.3.6** `const double& hed::Node::y ( void ) const` `[inline]`

Returns the y-coordinate.

Definition at line 123 of file HeTriang.h.

**29.303.3.7** `const double& hed::Node::z ( void ) const` `[inline]`

Returns the z-coordinate.

Definition at line 126 of file HeTriang.h.

The documentation for this class was generated from the following file:

## Additional Inherited Members

### 29.305.1 Detailed Description

[IntersectionCurve](#) that cannot be evaluated.

Definition at line 275 of file `IntersectionCurve.h`.

### 29.305.2 Constructor & Destructor Documentation

29.305.2.1 `virtual Go::NonEvaluableIntersectionCurve::~~NonEvaluableIntersectionCurve ( ) [virtual]`

### 29.305.3 Member Function Documentation

29.305.3.1 `virtual void Go::NonEvaluableIntersectionCurve::evaluateAt ( double pval, Point & pos, Point & tan ) [inline], [virtual]`

Evaluate the [IntersectionCurve](#) at parameter value *pval*. Its position at this parameter value will be returned in *pos* and its tangent direction will be returned in *tan*.

## Parameters

<i>pval</i>	the parameter value for which to evaluate the <a href="#">IntersectionCurve</a> . It should be within the parametric span (which can be obtained from <code>GetParamSpan()</code> ).
-------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Return values

<i>pos</i>	the calculated position of the point on the curve at parameter <i>pval</i> .
------------	------------------------------------------------------------------------------

## Parameters

<i>tan</i>	the calculated tangent of the curve at parameter <i>pval</i> .
------------	----------------------------------------------------------------

Implements [Go::IntersectionCurve](#).

Definition at line 290 of file `IntersectionCurve.h`.

```
29.305.3.2 virtual shared_ptr<ParamCurve> Go::NonEvaluableIntersectionCurve::getCurve () const [inline],
 [virtual]
```

Get out a (shared) pointer to a parametric curve that approximates this [IntersectionCurve](#).

Implements [Go::IntersectionCurve](#).

Definition at line 281 of file `IntersectionCurve.h`.

```
29.305.3.3 virtual shared_ptr<ParamCurve> Go::NonEvaluableIntersectionCurve::getParamCurve (int obj_nmb) const
 [inline], [virtual]
```

Get out a (shared) pointer to the curve in the parametric plane of the first or second object. Should only be called when the concerned object is 2-parametric.

## Parameters

<i>obj_nmb</i>	should be either 1 or 2, depending on whether you want to get the parametric curve in object 1 or object 2.
----------------	-------------------------------------------------------------------------------------------------------------

## Returns

a shared pointer to a curve that approximates the intersection curve in the parametric domain of the specified object.

Implements [Go::IntersectionCurve](#).

Definition at line 284 of file `IntersectionCurve.h`.

```
29.305.3.4 virtual void Go::NonEvaluableIntersectionCurve::getParamSpan (double & start, double & end) const
 [inline], [virtual]
```

Get the start and end value for the parametric span of the [IntersectionCurve](#).

## Return values

<i>start</i>	upon function return this variable will contain the start value of the parametric span.
<i>end</i>	upon function return this variable will contain the end value of the parametric span.

Implements [Go::IntersectionCurve](#).

Definition at line 287 of file IntersectionCurve.h.

**29.305.3.5** `virtual bool Go::NonEvaluableIntersectionCurve::isDegenerated ( ) const [inline], [virtual]`

Determine if the [IntersectionCurve](#) is in fact a degenerated curve (a single point in space).

## Returns

'true' if the [IntersectionCurve](#) is degenerated. 'false' otherwise.

Implements [Go::IntersectionCurve](#).

Definition at line 305 of file IntersectionCurve.h.

**29.305.3.6** `virtual bool Go::NonEvaluableIntersectionCurve::isIsocurve ( ) const [inline], [virtual]`

Determine if the [IntersectionCurve](#) is in fact representing an isoparametric intersection.

## Returns

'true' if the [IntersectionCurve](#) is part of an isocurve for one of the objects, 'false' otherwise.

Implements [Go::IntersectionCurve](#).

Definition at line 302 of file IntersectionCurve.h.

**29.305.3.7** `virtual void Go::NonEvaluableIntersectionCurve::refine ( const double & pos_tol, const double & angle_tol ) [inline], [virtual]`

Refine the curve (which means to increase the number of [IntersectionPoint](#) s defining it), so that the curve matches a specific positional and angle tolerance.

## Parameters

<i>pos_tol</i>	the positional tolerance that the curve should match after refinement.
<i>angle_tol</i>	the angular tolerance that the tangent of the curve should match after refinement.

Implements [Go::IntersectionCurve](#).

Definition at line 296 of file IntersectionCurve.h.

### 29.305.4 Friends And Related Function Documentation

29.305.4.1 `template<class iterator > shared_ptr<IntersectionCurve> constructIntersectionCurve ( const iterator begin, const iterator end ) [friend]`

Definition at line 601 of file IntersectionCurve.h.

*Get the ClassType stored in this [ObjectHeader](#).*
- int [majorVersion](#) () [const](#)  
*Get the major version number stored in this [ObjectHeader](#).*
- int [minorVersion](#) () [const](#)  
*Get the minor version number stored in this [ObjectHeader](#).*
- int [auxdataSize](#) () [const](#)
- int [auxdata](#) (int i) [const](#)

### 29.312.1 Detailed Description

An object representing the "header" usually preceding a [GeomObject](#) in a stream. This header contains information about the [GeomObject](#), and this information can be read by [ObjectHeader](#) and accessed by its member functions.

Definition at line 58 of file `ObjectHeader.h`.

### 29.312.2 Constructor & Destructor Documentation

#### 29.312.2.1 `Go::ObjectHeader::ObjectHeader ( )` `[inline]`

Default constructor (uninitialized header)

Definition at line 62 of file `ObjectHeader.h`.

#### 29.312.2.2 `Go::ObjectHeader::ObjectHeader ( ClassType t, int major, int minor )` `[inline]`

Constructor creating an [ObjectHeader](#) that is initialized with a given `ClassType`, major and minor version.

## Parameters

<i>t</i>	the ClassType of the <a href="#">GeomObject</a> that this <a href="#">ObjectHeader</a> shall represent.
<i>major</i>	major version number
<i>minor</i>	minor version number

Definition at line 74 of file ObjectHeader.h.

**29.312.2.3** `Go::ObjectHeader::ObjectHeader ( ClassType t, int major, int minor, const std::vector< int > & auxdata )`  
`[inline]`

Constructor creating an [ObjectHeader](#) that is initialized with a given ClassType, major and minor version and auxiliary, class- specific data.

## Parameters

<i>t</i>	the ClassType of the <a href="#">GeomObject</a> that this <a href="#">ObjectHeader</a> shall represent.
<i>major</i>	major version number
<i>minor</i>	minor version number
<i>auxdata</i>	auxiliary data, specific to the ClassType.

Definition at line 88 of file ObjectHeader.h.

**29.312.2.4** `virtual Go::ObjectHeader::~~ObjectHeader ( )` `[virtual]`

Virtual destructor, allowing safe destruction of derived objects.

**29.312.3 Member Function Documentation**

**29.312.3.1** `int Go::ObjectHeader::auxdata ( int i ) const` `[inline]`

Get a certain piece of auxiliary data (an integer).

## Parameters

<i>i</i>	the requested integer's position in the auxiliary data vector
----------	---------------------------------------------------------------

Definition at line 122 of file ObjectHeader.h.

**29.312.3.2** `int Go::ObjectHeader::auxdataSize ( ) const` `[inline]`

Get the size of the auxiliary data stored in this [ObjectHeader](#) (size measured in number of ints).

Definition at line 118 of file ObjectHeader.h.

29.312.3.3 `ClassType Go::ObjectHeader::classType ( ) const [inline]`

Get the `ClassType` stored in this [ObjectHeader](#).

Definition at line 108 of file `ObjectHeader.h`.

29.312.3.4 `int Go::ObjectHeader::majorVersion ( ) const [inline]`

Get the major version number stored in this [ObjectHeader](#).

Definition at line 111 of file `ObjectHeader.h`.

29.312.3.5 `int Go::ObjectHeader::minorVersion ( ) const [inline]`

Get the minor version number stored in this [ObjectHeader](#).

Definition at line 114 of file `ObjectHeader.h`.

29.312.3.6 `virtual void Go::ObjectHeader::read ( std::istream & is ) [virtual]`

Read the [ObjectHeader](#) from an input stream

Parameters

<code>is</code>	the input stream from which the <a href="#">ObjectHeader</a> is read
-----------------	----------------------------------------------------------------------

Implements [Go::Streamable](#).

29.312.3.7 `virtual void Go::ObjectHeader::write ( std::ostream & os ) const [virtual]`

Write the [ObjectHeader](#) to an output stream

Parameters

<code>os</code>	the output stream to which the <a href="#">ObjectHeader</a> is written
-----------------	------------------------------------------------------------------------

Implements [Go::Streamable](#).

The documentation for this class was generated from the following file:

- `gotools-core/include/GoTools/geometry/ObjectHeader.h`

## 29.313 RBD\_COMMON::OneDimSolve Class Reference

## Additional Inherited Members

### 29.317.1 Detailed Description

This class is performing intersections between two constants.

Definition at line 52 of file Par0FuncIntersector.h.

### 29.317.2 Constructor & Destructor Documentation

29.317.2.1 `Go::Par0FuncIntersector::Par0FuncIntersector ( shared_ptr< ParamFunctionInt > func, shared_ptr< ParamFunctionInt > C, shared_ptr< GeoTol > epsge, Intersector * prev = 0, int eliminated_parameter = -1, double eliminated_value = 0 )`

Constructor. Both objects should refer to constants (this is not checked compile-time, so we rely on the user to obey this rule). The last two variables are relevant only if the parent has one more parameter than the [Intersector](#) to be constructed.

#### Parameters

<i>func</i>	of type <a href="#">Param0FunctionInt</a> .
<i>C</i>	of type <a href="#">Param0FunctionInt</a> .
<i>epsge</i>	the associated tolerance.
<i>prev</i>	the "parent" <a href="#">Intersector</a> (0 if there is no parent).
<i>eliminated_parameter</i>	the index (0) of the parameter that was removed from the parent <i>prev</i> .
<i>eliminated_value</i>	the value of the parameter that was removed from the parent <i>prev</i> .

29.317.2.2 `virtual Go::Par0FuncIntersector::~~Par0FuncIntersector ( ) [virtual]`

Destructor.

### 29.317.3 Member Function Documentation

29.317.3.1 `virtual int Go::Par0FuncIntersector::checkCoincidence ( ) [protected],[virtual]`

## 29.320.1 Detailed Description

Class that represents a parabola. It is a subclass of [ElementaryCurve](#) and thus has a parametrization.

An parabola has a natural parametrization in terms of its values:  $f(t) = C + F*(t^2 * x + 2 * t * y)$ . The parametrization is unbounded:  $-\infty < t < \infty$ .

Definition at line 59 of file [Parabola.h](#).

## 29.320.2 Constructor & Destructor Documentation

### 29.320.2.1 Go::Parabola::Parabola ( ) [inline]

Default constructor. Constructs an uninitialized [Parabola](#) which can only be assigned to or read into.

Definition at line 64 of file Parabola.h.

### 29.320.2.2 Go::Parabola::Parabola ( Point location, Point direction, Point normal, double focal\_dist, bool isReversed = false )

Constructor. Input is location, direction (x-axis), normal and focal dist. The default [Parabola](#) is unbounded in its parametrization. To bound it, use [setParamBounds\(\)](#).

### 29.320.2.3 virtual Go::Parabola::~~Parabola ( ) [virtual]

virtual destructor - ensures safe inheritance

## 29.320.3 Member Function Documentation

### 29.320.3.1 virtual void Go::Parabola::appendCurve ( ParamCurve \* cv, bool reparam = true ) [virtual]

append a curve to this curve, with eventual reparametrization NB: This virtual member function currently only works for [SplineCurves](#) and [CurveOnSurfaces](#). Moreover, 'this' curve and the 'cv' curve must be of the same type.

#### Parameters

<i>cv</i>	the curve to append to 'this' curve.
<i>reparam</i>	specify whether or not there should be reparametrization

Implements [Go::ParamCurve](#).

### 29.320.3.2 virtual void Go::Parabola::appendCurve ( ParamCurve \* cv, int continuity, double & dist, bool reparam = true ) [virtual]

append a curve to this curve, with eventual reparametrization

#### Parameters

<i>cv</i>	the curve to append to 'this' curve.
<i>continuity</i>	the required continuity at the transition. Can be $G^{(-1)}$ and upwards.
<i>dist</i>	a measure of the local distortion around the transition in order to achieve the specified continuity.
<i>reparam</i>	specify whether or not there should be reparametrization

Implements [Go::ParamCurve](#).

29.320.3.3 virtual **BoundingBox** Go::Parabola::boundingBox ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.320.3.4 static **ClassType** Go::Parabola::classType ( ) [static]

29.320.3.5 virtual **Parabola\*** Go::Parabola::clone ( ) const [virtual]

The clone-function is herited from [GeomObject](#), but overridden here to get a covariant return type (for those compilers that allow this).

Implements [Go::ElementaryCurve](#).

29.320.3.6 virtual void Go::Parabola::closestPoint ( const **Point** & *pt*, double *tmin*, double *tmax*, double & *clo\_t*, **Point** & *clo\_pt*, double & *clo\_dist*, double const \* *seed* = 0 ) const [virtual]

Compute the closest point from an interval of this curve to a specified point.

Parameters

<i>pt</i>	point we want to find the closest point to
<i>tmin</i>	start parameter of search interval
<i>tmax</i>	end parameter of search interval
<i>clo_t</i>	upon function return, 'clo_t' will contain the parameter value of the closest point found.
<i>clo_pt</i>	upon function return, 'clo_pt' will contain the position of the closest point found.
<i>clo_dist</i>	upon function return, 'clo_dist' will contain the distance between 'pt' and the closest point found.
<i>seed</i>	pointer to initial guess value, provided by the user (can be 0, for which the algorithm will determine a (hopefully) reasonable choice).

Implements [Go::ParamCurve](#).

29.320.3.7 virtual **SplineCurve\*** Go::Parabola::createSplineCurve ( ) const [virtual]

Fetch spline representation of curve.

Implements [Go::ElementaryCurve](#).

29.320.3.8 virtual int Go::Parabola::dimension ( ) const [virtual]

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.320.3.9 virtual [DirectionCone](#) Go::Parabola::directionCone ( ) const [virtual]

Creates a [DirectionCone](#) which covers all tangent directions of this curve.

Returns

the smallest [DirectionCone](#) containing all tangent directions of this curve.

Implements [Go::ParamCurve](#).

29.320.3.10 virtual double Go::Parabola::endparam ( ) const [virtual]

Query the end parameter of the curve

Returns

the curve's end parameter

Implements [Go::ParamCurve](#).

29.320.3.11 virtual [SplineCurve\\*](#) Go::Parabola::geometryCurve ( ) [virtual]

If the definition of this [ParamCurve](#) contains a [SplineCurve](#) describing its spatial shape, then this function will return a pointer to this [SplineCurve](#). Otherwise it will return a null pointer. The returned curve is NEWed, so the user is responsible for deleting it. This function may have side-effects.

Returns

a pointer to a [SplineCurve](#) representation of the [ParamCurve](#), if it exists. Null pointer otherwise.

Implements [Go::ParamCurve](#).

29.320.3.12 virtual [ClassType](#) Go::Parabola::instanceType ( ) const [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.320.3.13 bool Go::Parabola::isBounded ( ) const

Query if parametrization is bounded. Both upper and lower parameter bounds must be finite for this to be true.

Returns

*true* if bounded, *false* otherwise

29.320.3.14 virtual bool Go::Parabola::isDegenerate ( double *degenerate\_epsilon* ) [virtual]

Query whether the curve is degenerate (collapsed into a single point).

## Parameters

<i>degenerate_epsilon</i>	the tolerance used in determine whether the curve is degenerate. A curve is considered degenerate if its total length is shorter than this value.
---------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

`true` if the curve is degenerate, `false` otherwise.

Implements [Go::ParamCurve](#).

29.320.3.15 `virtual bool Go::Parabola::isInPlane ( const Point & norm, double eps, Point & pos ) const` [virtual]

Check if the parabola lies in a plane with a given normal.

Reimplemented from [Go::ParamCurve](#).

29.320.3.16 `virtual double Go::Parabola::length ( double tol )` [virtual]

Compute the total length of this curve up to some tolerance

## Parameters

<i>tol</i>	the relative tolerance when approximating the length, i.e. stop iteration when error becomes smaller than $tol/(curve\ length)$
------------	---------------------------------------------------------------------------------------------------------------------------------

## Returns

the length calculated

Implements [Go::ParamCurve](#).

29.320.3.17 `virtual void Go::Parabola::point ( Point & pt, double tpar ) const` [virtual]

Evaluate the curve's position at a given parameter

## Parameters

<i>pt</i>	the evaluated position will be written to this <a href="#">Point</a>
<i>tpar</i>	the parameter for which we wish to evaluate the curve

Implements [Go::ParamCurve](#).

29.320.3.18 `virtual void Go::Parabola::point ( std::vector< Point > & pts, double tpar, int derivs, bool from_right = true ) const [virtual]`

Evaluate the curve's position and a certain number of derivatives at a given parameter.

#### Parameters

<i>pts</i>	the evaluated position and derivatives (tangent, curvature vector, etc.) will be written to this vector. The first entry will be the position, the second entry will be the first derivative, etc. The size of this vector must be set to 'derivs'+ 1 prior to calling this function.
<i>tpar</i>	the parameter for which we want to evaluate the curve
<i>derivs</i>	the number of derivatives we want to have calculated
<i>from_right</i>	specify whether we should calculate derivatives 'from the right' or 'from the left' (default is from the right). This matters only when the curve presents discontinuities in its derivatives.

Implements [Go::ParamCurve](#).

29.320.3.19 `virtual void Go::Parabola::read ( std::istream & is ) [virtual]`

Read object from stream

#### Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.320.3.20 `virtual void Go::Parabola::setParamBounds ( double startpar, double endpar ) [virtual]`

Set bounds for the parametrization of the [Parabola](#).

#### Parameters

<i>startpar</i>	start parameter
<i>endpar</i>	end parameter

Implements [Go::ElementaryCurve](#).

29.320.3.21 `virtual void Go::Parabola::setParameterInterval ( double t1, double t2 ) [virtual]`

Limit the curve by limiting the parameter interval.

Implements [Go::ParamCurve](#).

29.320.3.22 `void Go::Parabola::setSpanningVectors ( ) [protected]`

29.320.3.23 `virtual double Go::Parabola::startparam ( ) const [virtual]`

Query the start parameter of the curve

#### Returns

the curve's start parameter

Implements [Go::ParamCurve](#).

29.320.3.24 `virtual Parabola* Go::Parabola::subCurve ( double from_par, double to_par, double fuzzy = DEFAULT_PARAMETER_EPSILON ) const [virtual]`

Returns a curve which is a part of this curve. The result is NEWed, so the user is responsible for deleting it. NB: It is not guaranteed that the [ParamCurve](#) that is returned is of the same type as the curve itself. Thus, the returned curve might be a [SplineCurve](#).

#### Parameters

<i>from_par</i>	start value of parameter interval that will define the subcurve
<i>to_par</i>	end value of parameter interval that will define the subcurve
<i>fuzzy</i>	since subCurve works on those curves who are spline-based, this tolerance defines how close the start and end parameter must be to an existing knot in order to be considered <i>on</i> the knot.

#### Returns

a pointer to a new subcurve which represents the part of the curve between 'from\_par' and 'to\_par'. It will be spline-based and have a k-regular knotvector. The user is responsible for deleting this subcurve when it is no longer needed.

Implements [Go::ElementaryCurve](#).

29.320.3.25 `virtual void Go::Parabola::swapParameters2D ( ) [virtual]`

If the curve is 2 dimensional, x and y coordinates will be swapped. Used when curve is a parameter curve.

Implements [Go::ElementaryCurve](#).

29.320.3.26 `virtual void Go::Parabola::translateCurve ( const Point & dir ) [virtual]`

Implements [Go::ElementaryCurve](#).

29.320.3.27 `virtual void Go::Parabola::write ( std::ostream & os ) const [virtual]`

Write object to stream

## Parameters

<i>os</i>	stream to which object is written
-----------	-----------------------------------

Implements [Go::Streamable](#).

#### 29.321.1 Detailed Description

Class that represents a solid parallelepiped. It is a subclass of [ElementaryVolume](#), and thus has a parametrization.

A [Parallelepiped](#) has a natural parametrization in terms of the distances  $u$ ,  $v$  and  $w$  along the edges:  $\mathbf{p}(u, v, w) = \mathbf{C} + u \mathbf{x} + v \mathbf{y} + w \mathbf{z}$ . The parametrization is bounded by:  $0 \leq u \leq a$ ,  $0 \leq v \leq b$ ,  $0 \leq w \leq c$ , where  $a$ ,  $b$ ,  $c$  are the edge lengths. The dimension is 3.

Definition at line 64 of file [Parallelepiped.h](#).

#### 29.321.2 Constructor & Destructor Documentation

##### 29.321.2.1 [Go::Parallelepiped::Parallelepiped](#) ( ) [inline]

Default constructor. Constructs an uninitialized [Parallelepiped](#) which can only be assigned to or read into.

Definition at line 69 of file [Parallelepiped.h](#).

##### 29.321.2.2 [Go::Parallelepiped::Parallelepiped](#) ( [Point](#) *corner*, [Point](#) *dir\_u*, [Point](#) *dir\_v*, [Point](#) *dir\_w*, double *len\_u*, double *len\_v*, double *len\_w* )

Constructor.

##### 29.321.2.3 [virtual Go::Parallelepiped::~~Parallelepiped](#) ( ) [virtual]

virtual destructor - ensures safe inheritance

#### 29.321.3 Member Function Documentation

##### 29.321.3.1 [virtual BoundingBox](#) [Go::Parallelepiped::boundingBox](#) ( ) const [virtual]

Return the object's bounding box.

Implements [Go::GeomObject](#).

29.321.3.2 `static ClassType Go::Parallelepiped::classType ( ) [inline],[static]`

Definition at line 94 of file `Parallelepiped.h`.

29.321.3.3 `virtual Parallelepiped* Go::Parallelepiped::clone ( ) const [inline],[virtual]`

make a clone of this volume and return a pointer to it (user is responsible for clearing up memory afterwards).

Returns

pointer to cloned object

Implements [Go::ElementaryVolume](#).

Definition at line 101 of file `Parallelepiped.h`.

29.321.3.4 `void Go::Parallelepiped::closestPoint ( const Point & pt, double & clo_u, double & clo_v, double & clo_w, Point & clo_pt, double & clo_dist, double epsilon, double * seed = 0 ) const [virtual]`

Iterates to the closest point to `pt` on the volume.

Parameters

<code>pt</code>	the point to find the closest point to
<code>clo_u</code>	u parameter of the closest point
<code>clo_v</code>	v parameter of the closest point
<code>clo_w</code>	w parameter of the closest point
<code>clo_pt</code>	the geometric position of the closest point
<code>clo_dist</code>	the distance between <code>pt</code> and <code>clo_pt</code>
<code>epsilon</code>	parameter tolerance (will in any case not be higher than $\sqrt{\text{machine\_precision}}$ x magnitude of solution)
<code>seed</code>	pointer to parameter values where iteration starts.

Implements [Go::ParamVolume](#).

29.321.3.5 `virtual int Go::Parallelepiped::dimension ( ) const [virtual]`

Return the dimension of the space in which the object lies (usually 2 or 3)

Implements [Go::GeomObject](#).

29.321.3.6 `SplineVolume* Go::Parallelepiped::geometryVolume ( ) const [virtual]`

Make a NURBS representation of the object.

Implements [Go::ElementaryVolume](#).

29.321.3.7 `virtual std::vector<shared_ptr<ParamSurface> > Go::Parallelepiped::getAllBoundarySurfaces ( ) const` [virtual]

Fetch all boundary surfaces corresponding to the volume.

Implements [Go::ParamVolume](#).

29.321.3.8 `virtual ClassType Go::Parallelepiped::instanceType ( ) const` [virtual]

Return the class type identifier of a given, derived instance of [GeomObject](#).

Implements [Go::GeomObject](#).

29.321.3.9 `double Go::Parallelepiped::nextSegmentVal ( int dir, double par, bool forward, double tol ) const` [virtual]

Determine the parameter value of the start of the 'next segment' from a parameter value, along a given parameter direction. A 'segment' is here defined as a parameter interval in which there will be no discontinuities in derivatives or other artifacts. For spline objects, a segment will typically be the interval between two consecutive, non-coincident knots.

#### Parameters

<i>dir</i>	the parameter direction in which we search for the next segment (0, 1 or 2)
<i>par</i>	the parameter value starting from which we search for the start value of the next segment
<i>forward</i>	define whether we shall move forward ('true') or backwards when searching along this parameter
<i>tol</i>	tolerance used for determining whether the 'par' is already located <i>on</i> the next segment value

#### Returns

the value of the start value of the next segment (or the end of the previous segment, if we are moving backwards...)

Implements [Go::ParamVolume](#).

29.321.3.10 `const Array<double,6> Go::Parallelepiped::parameterSpan ( ) const` [virtual]

Return the parameter domain of the volume. This is an array containing the start and end parameter values. The spline's parameter *i* has its start value at the array position (2*i*) and its end parameter value at the array position (2*i*+1)

#### Returns

An array describing the parametric domain of the volume

Implements [Go::ParamVolume](#).

29.321.3.11 `void Go::Parallelepiped::point ( Point & pt, double upar, double vpar, double wpar ) const` [virtual]

Evaluates the volume's position for a given parameter triple.

## Parameters

<i>pt</i>	the result of the evaluation is written here
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>wpar</i>	the third parameter

Implements [Go::ParamVolume](#).

```
29.321.3.12 void Go::Parallelepiped::point (std::vector< Point > & pts, double upar, double vpar, double wpar, int
derivs, bool u_from_right = true, bool v_from_right = true, bool w_from_right = true, double resolution =
1.0e-12) const [virtual]
```

Evaluates the volume's position and a certain number of derivatives for a given parameter triple.

## Parameters

<i>pts</i>	the vector containing the evaluated values. Its size must be set by the user prior to calling this function. Upon completion of the function, its first entry is the volume's position at the given parameter pair. Then, if 'derivs' > 0, the two next entries will be the volume tangents along the first, second and third parameter direction. The next three entries are the second- and cross derivatives, in the order (du2, dudv, dudw, dv2, dvdw, dw2), and similar for even higher derivatives.
<i>upar</i>	the first parameter
<i>vpar</i>	the second parameter
<i>wpar</i>	the third parameter
<i>derivs</i>	number of requested derivatives
<i>u_from_right</i>	specify whether derivatives along the first parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>v_from_right</i>	specify whether derivatives along the second parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>w_from_right</i>	specify whether derivatives along the third parameter are to be calculated from the right ('true', default) or from the left ('false')
<i>resolution</i>	tolerance used when determining whether parameters are located at special values of the parameter domain (in particular; knot values in case of spline objects).

Implements [Go::ParamVolume](#).

```
29.321.3.13 virtual void Go::Parallelepiped::read (std::istream & is) [virtual]
```

read object from stream

## Parameters

<i>is</i>	stream from which object is read
-----------	----------------------------------

Implements [Go::Streamable](#).

29.321.3.14 `void Go::Parallelepiped::reverseParameterDirection ( int pardir )` [virtual]

Reverses the direction of the basis in input direction.

#### Parameters

<i>pardir</i>	which parameter direction to reverse
